Further information

1

Introduction to the manual

Contents of this chapter

This chapter gives basic information on the manual.

Applicability

This manual is applicable to ACS880-104LC inverter modules for user-defined cabinet installations.

Safety instructions

Obey all safety instructions of the drive.

- Read the **complete safety instructions** before you install, commission, use or service the drive. The complete safety instructions are given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#).
- Read the warnings of the software function before you take the function in use or change its default parameter settings. Read the warnings of the parameter before you change its default setting. Refer to the firmware manual.

Target audience

This manual is intended for people who plan the installation, install, commission and do maintenance work on the drive, or create instructions for the end user of the drive concerning the installation and maintenance of the drive.

Read the manual before you work on the drive. You are expected to know the fundamentals of electricity, wiring, electrical components and electrical schematic symbols.

Categorization by frame size and option code

The instructions and technical data which concern only certain module or frame sizes are marked with a size identifier.

The module size can be identified from the basic code visible on the type designation label, for example, “ACS880-104LC-0850A-7”, where 0850A is the module size. The option codes of the module are listed after a plus sign. Chapter Ordering information, section Frame R8i and multiples explains the type designation code in detail.

The frame size of the module can be, for example, R8i or 2×R8i, the latter representing an inverter unit consisting of two parallel-connected R8i inverter modules. The table under section [Ratings \(page 247\)](#) lists the units and frame sizes.

Use of component designations

Some device names in the manual include the component designation in brackets (for example, [Q20]). This will help you to identify the components in the circuit diagrams of the drive.

Related documents

You can find manuals on the Internet. See below for the relevant code/link. For more documentation, go to www.abb.com/drives/documents.

[Manuals for ACS880 multidrives modules](#)

Terms and abbreviations

Term	Description
BCON	Type of control board
BCU	Type of control unit
BDPS	Module internal power supply board
Brake chopper	Conducts the surplus energy from the intermediate circuit of the drive to the brake resistor when necessary. The chopper operates when the DC link voltage exceeds a certain maximum limit. The voltage rise is typically caused by deceleration (braking) of a high inertia motor.
CIO	I/O module for controlling cooling fans
CMF	Common mode filtering
Cubicle	One section of a cabinet-installed drive. A cubicle is typically behind a door of its own.
DC link	DC circuit between rectifier and inverter
DC link capacitors	Energy storage which stabilizes the intermediate circuit DC voltage
DDCS	Distributed drives communication system protocol
DPMP	Optional mounting platform for door mounting of control panel
Drive	Frequency converter for controlling AC motors
EFB	Embedded fieldbus
EMC	Electromagnetic compatibility
EMI	Electromagnetic interference
FAIO	Analog I/O extension module
FBA	Fieldbus adapter
FCAN	Optional CANopen® adapter module
FCNA	Optional ControlNet™ adapter module
FDCO	Optical DDCS communication module
FDNA	Optional DeviceNet™ adapter module
FDPI	Diagnostics and panel interface board
FECA	Optional EtherCAT® adapter module
FEN-01	Optional TTL incremental encoder interface module
FEN-11	Optional absolute encoder interface module
FEN-21	Optional resolver interface module
FEN-31	Optional HTL incremental encoder interface module
FENA-11	Optional Ethernet adapter module for EtherNet/IP™, Modbus TCP® and PROFINET IO® protocols
FENA-21	Optional Ethernet adapter module for EtherNet/IP™, Modbus TCP and PROFINET IO protocols, 2-port
FEPL	Optional Ethernet POWERLINK adapter module
FIO-01	Optional digital I/O extension module
FIO-11	Optional analog I/O extension module
Four-quadrant operation	Operation of a machine in both the forward and reverse directions in both motoring and generating modes. Also used as an attribute of a drive; a regenerative drive can operate the electric machine in all four modes, while a non-regenerative drive can only operate the machine in motoring mode.
FPBA-01	Optional PROFIBUS DP® adapter module
Frame, frame size	Physical size of the drive or power module
FSCA	Optional Modbus RTU adapter module
FSO-12, FSO-21	Optional functional safety modules
Generic enclosure	See chapter Ordering information.
HTL	High-threshold logic
IGBT	Insulated gate bipolar transistor
Intermediate circuit	DC circuit between rectifier and inverter
INU	Inverter unit

20 Introduction to the manual

Term	Description
Inverter	Converts direct current and voltage to alternating current and voltage.
Inverter module	Inverter bridge, related components and drive DC link capacitors enclosed in a metal frame or enclosure. Intended for cabinet installation.
Inverter unit	Inverter module(s) under control of one control unit, and related components. One inverter unit typically controls one motor.
Multidrive	Drive for controlling several motors which are typically coupled to the same machinery. Includes one supply unit, and one or several inverter units.
NBRA	Series of optional brake chopper modules
NBRW	Series of optional, liquid-cooled brake chopper modules
Parameter	In the drive control program, user-adjustable operation instruction to the drive, or signal measured or calculated by the drive. In some (for example fieldbus) contexts, a value that can be accessed as an object. For example, variable, constant, or signal.
PLC	Programmable logic controller
RFI	Radio-frequency interference
SIL	Safety integrity level (1...3) (IEC 61508, IEC 62061, IEC 61800-5-2)
STO	Safe torque off (IEC/EN 61800-5-2)
THD	Total harmonic distortion
TTL	Transistor-transistor logic
UPS	Uninterruptible power supply
VX25	Enclosure system by Rittal (http://www.rittal.com)
ZMU	Type of memory unit, attached to the control unit

2

Operation principle and hardware description

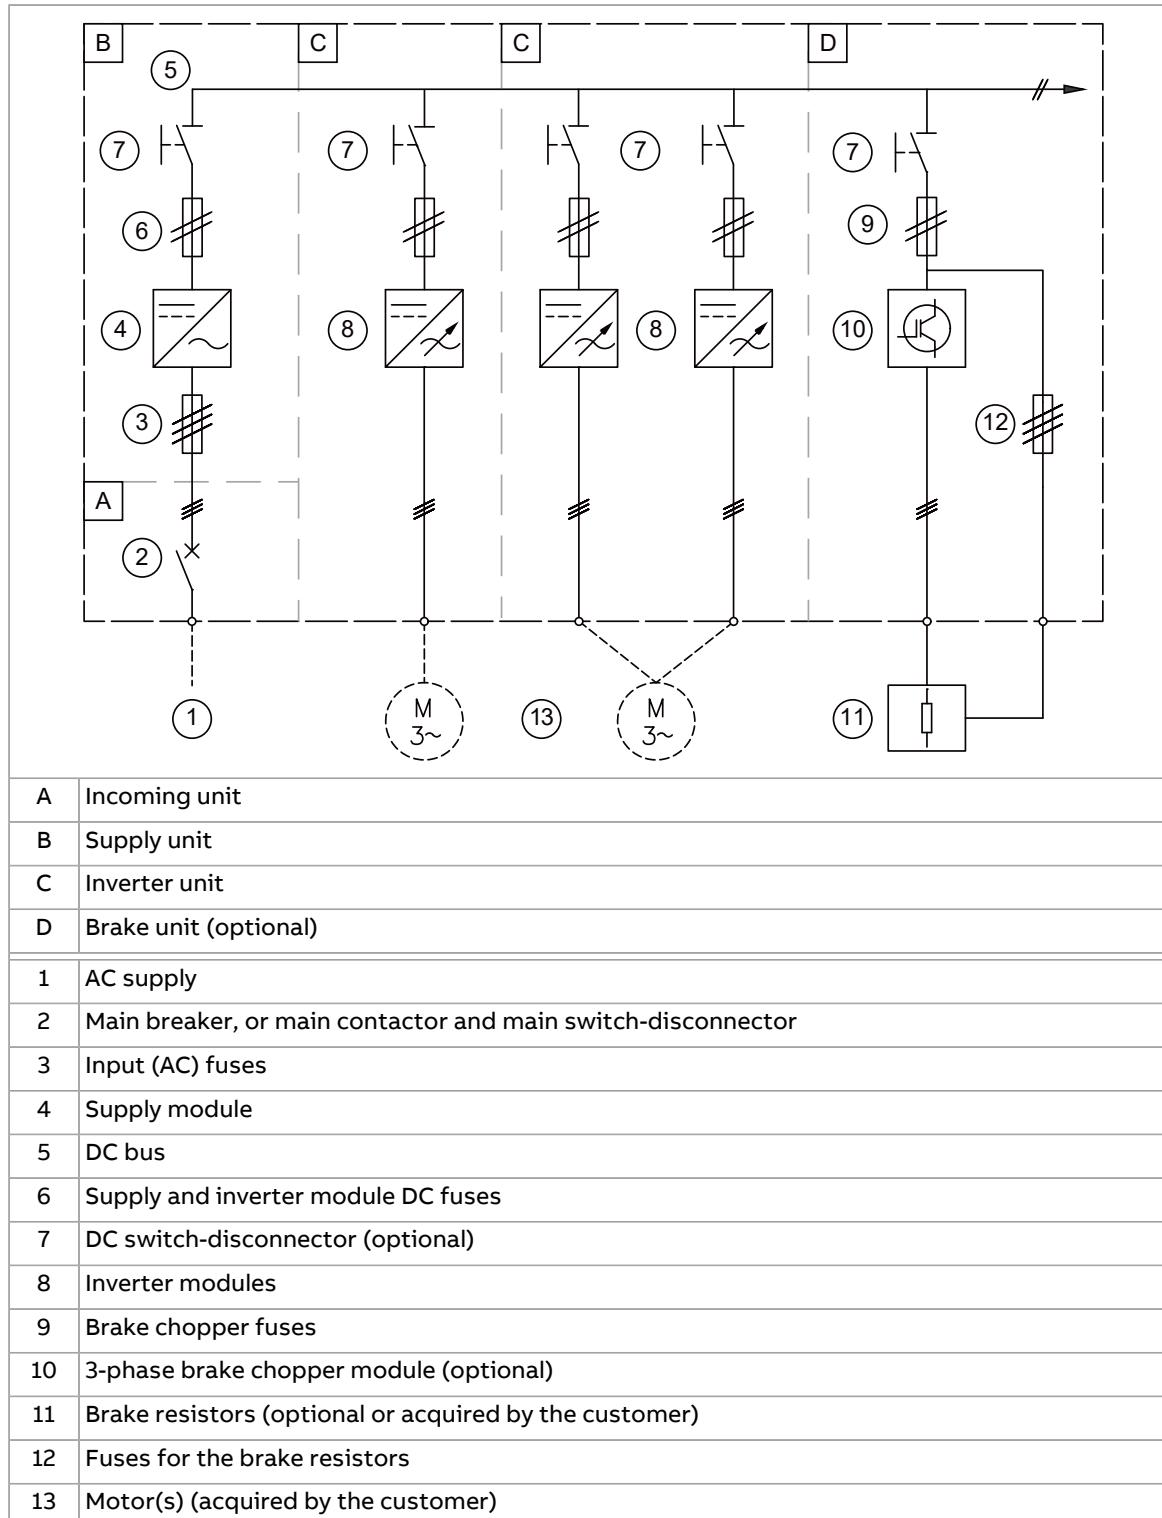

Contents of this chapter

This chapter describes a typical drive system and the hardware of ACS880-104LC inverter modules.

Overview diagram of the drive system

The diagram that follows shows an example of a multidrive. The supply unit connects the drive to the AC supply network. It converts the AC voltage into DC. The DC voltage is distributed through the DC bus to all inverter units and optional brake units. The inverter unit converts the DC back to AC that rotates the motor. The brake unit (optional) conveys energy to brake resistors whenever needed.

22 Operation principle and hardware description

Inverter module hardware

■ General

An inverter unit contains the components required to control one motor. These include one or more inverter modules connected in parallel, together with the necessary auxiliary equipment such as control electronics, fusing, cabling and switchgear.

ACS880-104LC modules can be used to construct inverter units with a power rating of 45 kW up to several megawatts. Up to approximately 800 kW, inverter units consist of one module only; higher power ratings are achieved by connecting multiple modules in parallel.

All inverter modules have coated circuit boards as standard.

■ DC connection and capacitor charging

The module must be equipped with external DC fuses.

A DC switch-disconnector can be installed if quick isolation of the module from the DC bus is required.

A capacitor charging circuit must be fitted if:

- the module is connected to the DC bus through a DC switch-disconnector, or
- the module is directly connected to the DC bus and the supply unit of the system does not have a charging capability.

The charging circuit design presented in this manual consists of a charging switch, resistors and a charging controller. When the module is connected to an energized DC bus, the charging switch is closed first. When the charging is finished, the main DC switch-disconnector can be closed and the charging switch opened. The module will not start if the charging switch is closed.

Common mode filtering is implemented by running the DC busbars through ferrite cores. Common mode filtering protects the motor from common mode noise.

Frame R7i and R8i (and multiples, if any) modules are controlled by a single BCU control unit installed separately from the module(s). The control unit is connected to each module by a fiber optic link. The control unit can be powered from the module (terminal block X53), from an external 24 V DC supply, or both for redundancy. The control unit contains the basic I/Os and slots for optional I/O modules. Other equipment is primarily installed on separate mounting plates.

■ Frame R7i and multiples

Frame R7i modules provide output power in the range of 45 to 355 kW in single-module configurations, and 315 to 1400 kW in parallel configurations. The power range of parallel-connected R7i modules overlaps the range of single R8i modules, but parallel-connected R7i modules can be better suited for compact, low cabinet configurations than the taller frame R8i modules.

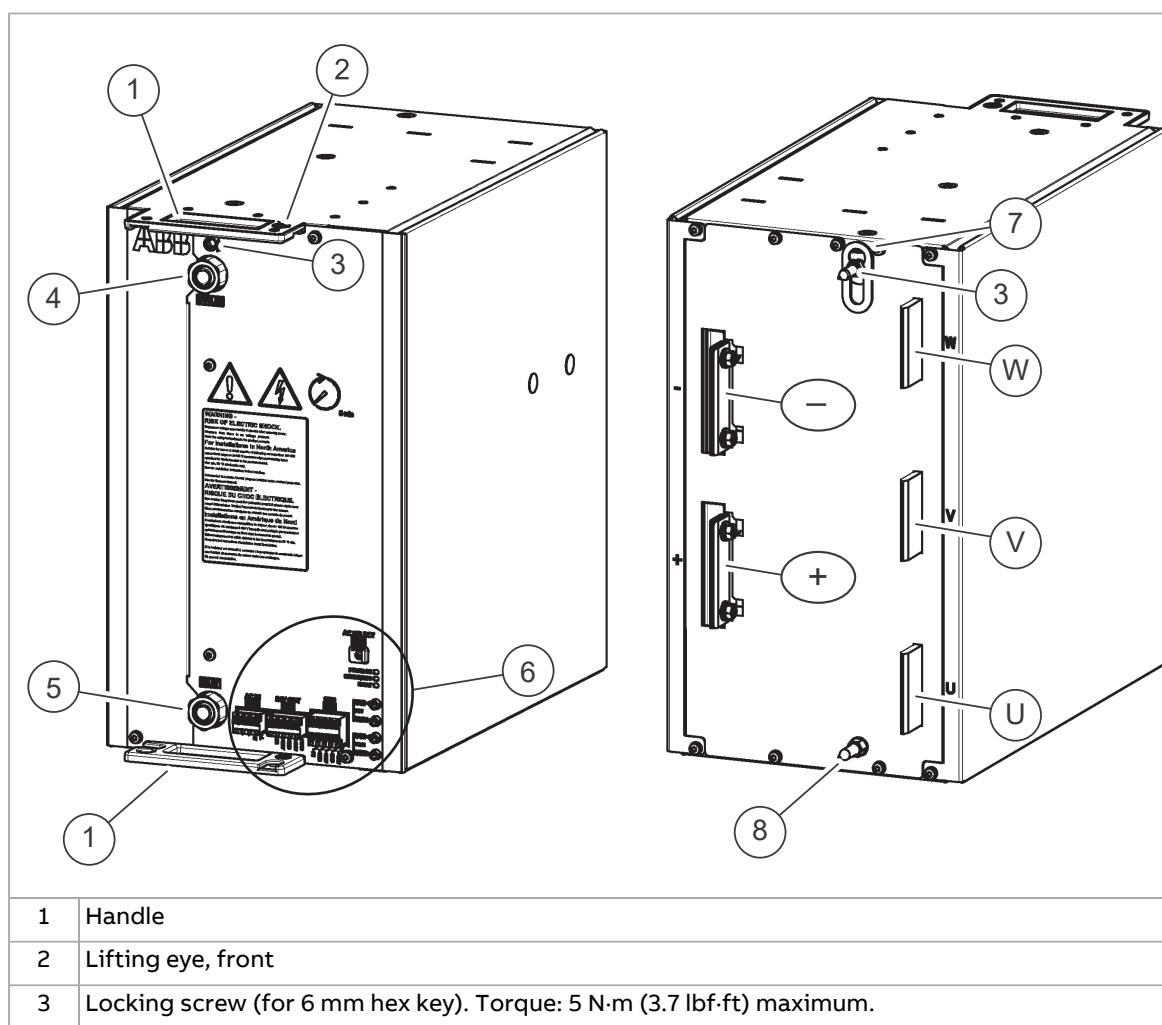

The R7i module is designed for mounting in an installation frame, which in turn is mounted into the cubicle. The AC and DC power connectors of the frame are bolted to busbars. When the module is inserted into the frame, the AC and DC power connections of the module engage with quick connectors in the frame. The module is secured by a locking screw that is accessible from the front.

The front cover plate of the module can be pulled out for access to the circuit board compartment without removing the module.

This manual presents cubicle designs for one and two modules. In the two-module design, each module has its own output terminals, so they can be cabled to the same motor or two different motors.

The modules have internal du/dt filtering as an option. In parallel configurations, du/dt filtering is mandatory. The du/dt filter decreases voltage spikes, which reduces stress on the motor insulation.

Module layout

4	Coolant out connector
5	Coolant in connector
6	Connectors X50, X52 and X53; fiber optic connectors; LEDs; auxiliary voltage selector X59.
7	Lifting ring, rear
8	Guide pin
+	DC connection busbars. The busbars engage with the quick connectors of the installation frame.
-	
U	
V	
W	AC connection busbars. The busbars engage with the quick connectors of the installation frame.

Coolant connectors

The coolant pipe inlet and outlet connectors are located at the bottom front and top front of the module respectively. The connectors are for 16/13 millimeter PA (polyamide) pipe.

Installation frame

See the dimension drawings.

Connectors X50, X52 and X53; Auxiliary voltage selector X59

R7i modules contain a power supply board that provides 24 V DC for the circuit boards of the module. The 24 V DC voltage provided by the power supply board is also available on X53, and can be used to power the control unit of a single R7i module.

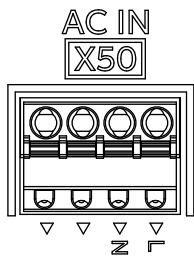

Note: With parallel-connected modules, it is strongly recommended to use an external 24 V DC supply to power the control unit.

The power supply board of the module is powered internally from the DC link. An auxiliary voltage of 230 V AC or 115 V AC (selectable) can optionally be connected to terminal block X50 to feed the power supply board even when the DC link is not live. The selection between 115 V and 230 V is made with selector plug X59. The setting can be changed by removing the screw, moving the plug into the 115 V position, and reinstalling the screw.

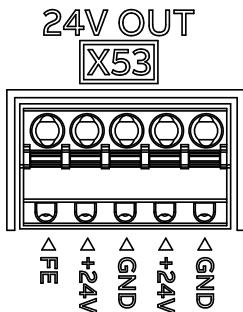

If the Safe torque off (STO) function is not used, the “24V” inputs on X52 must be connected to +24 V (on connector X53, for example) on the inverter module. On a new module, a jumper wire set installed at the factory makes this connection. If the STO function is to be implemented, the jumper wire set must be removed.

For STO, X52 (STO IN) is wired to the STO OUT connector on the control unit. Connector X51 on the module is wired to connector X52 on the next parallel-connected module (if present). For details, see chapter [The Safe torque off function \(page 289\)](#).

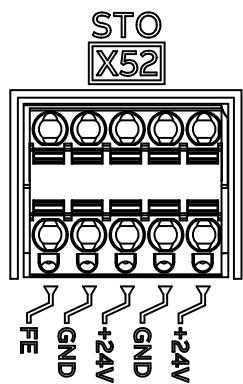

26 Operation principle and hardware description

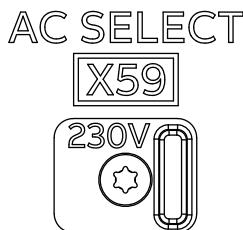

Auxiliary voltage input for internal power supply of module. Voltage selected by X59.

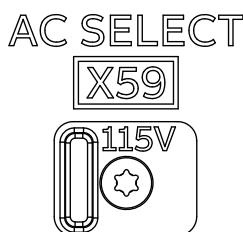

24 V DC output (for eg. control unit)

Incoming STO signals from the control unit, outgoing STO signals to next inverter module in parallel configurations (plug with twin connections included with multiples of frame R7i)

Auxiliary voltage: 230 V AC

Auxiliary voltage: 115 V AC

Fiber optic connectors

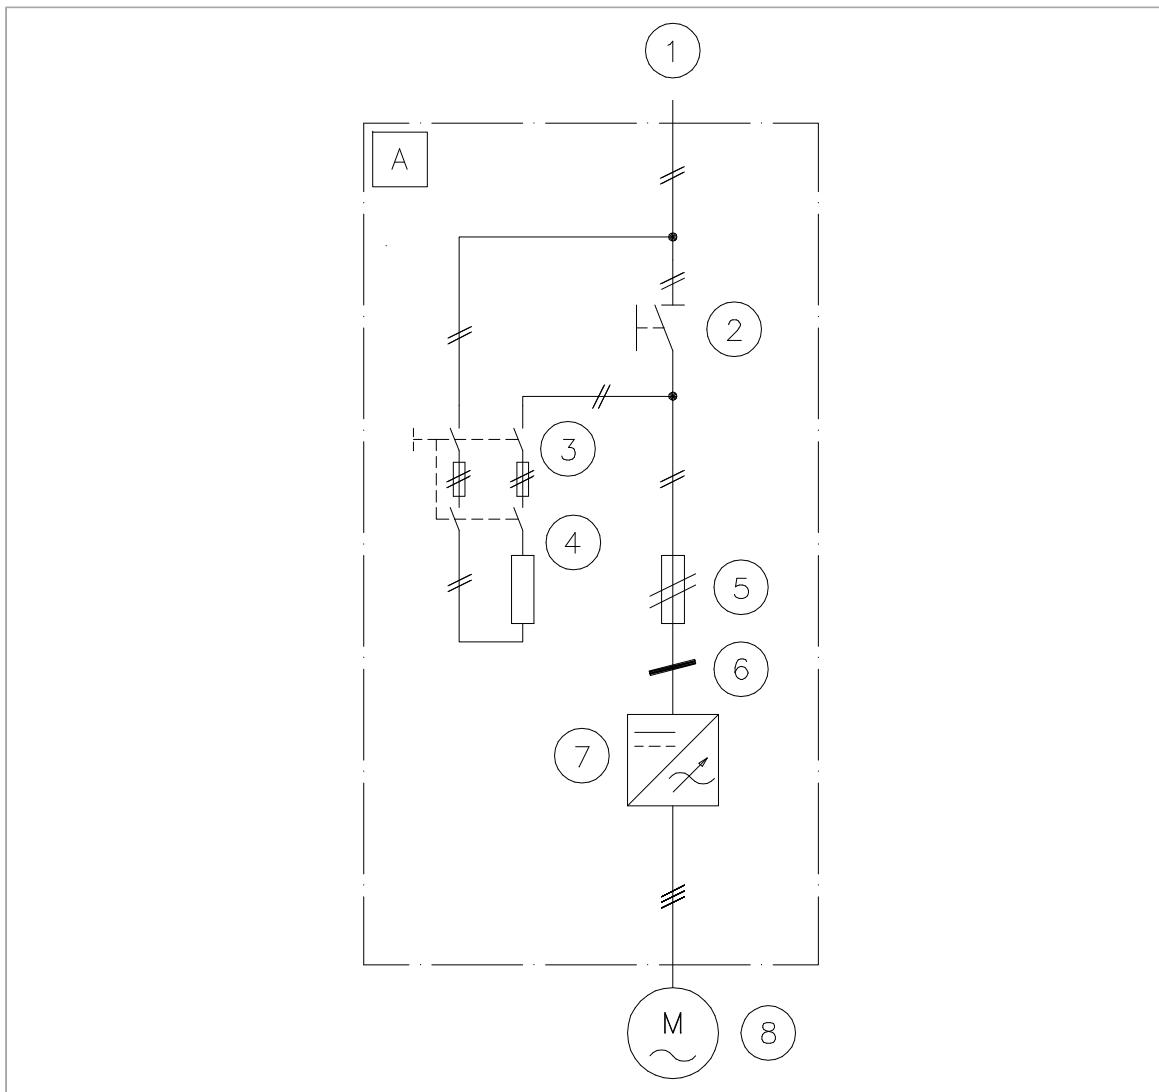

Control unit connection. Must be connected by the installer.	V20	
	V10	
Charging controller connection. Must be connected by the installer.	V60	
	V50	

LEDs

LED	Color	Indication
FAULT	Continuous red	There is an active fault in the module.
ENABLE / STO	Continuous green	The module is ready for use.
ENABLE / STO	Continuous yellow	XSTO connectors are de-energized.
POWER OK	Continuous green	Supply voltage of the internal circuit boards is OK (> 21 V).

Overview circuit diagram of a frame R7i inverter unit

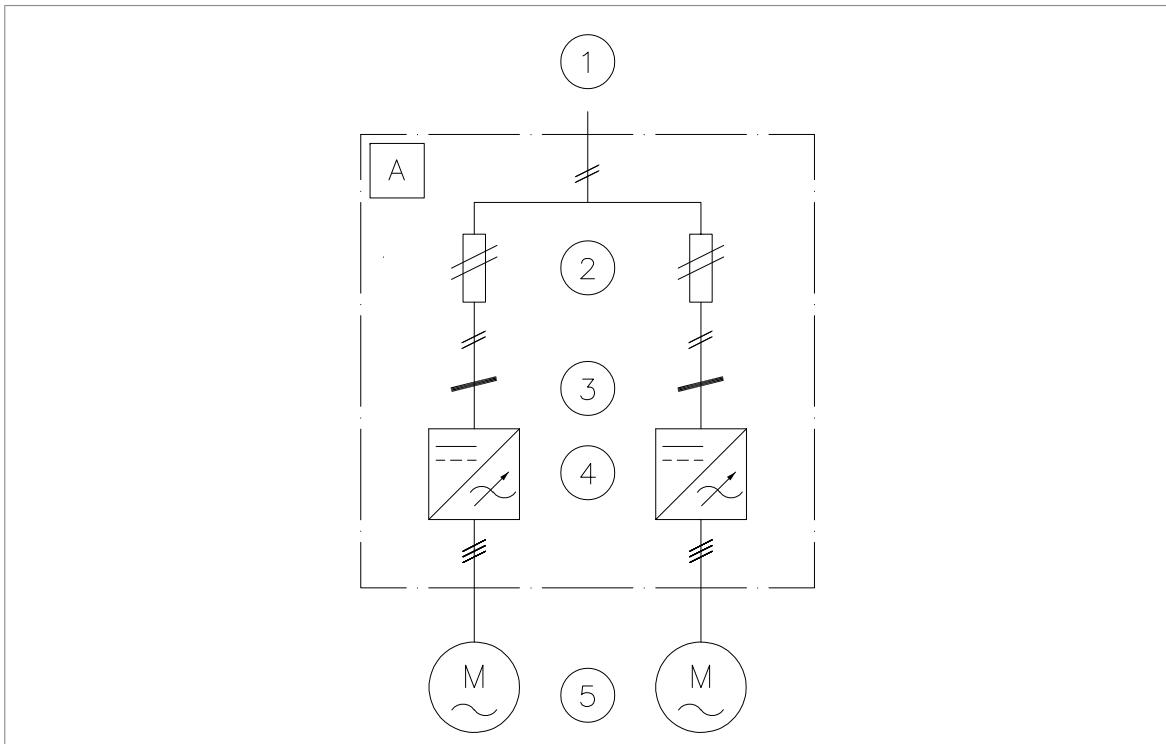

The following figure shows a simplified connection example of an inverter unit based on a single inverter module.

Item	Explanation	Available through
A	Inverter cubicle	-
1	DC supply	-
2	DC switch-disconnector (optional)	ABB or third party
3	Charging switch (optional)	ABB or third party
4	Charging resistor (optional)	ABB or third party
5	DC fuses	ABB or third party
6	Common mode filters	ABB
7	Inverter module	ABB
8	Motor	ABB (not part of ACS880-104LC product offering) or third party

Overview circuit diagram of two R7i inverter modules controlling different motors

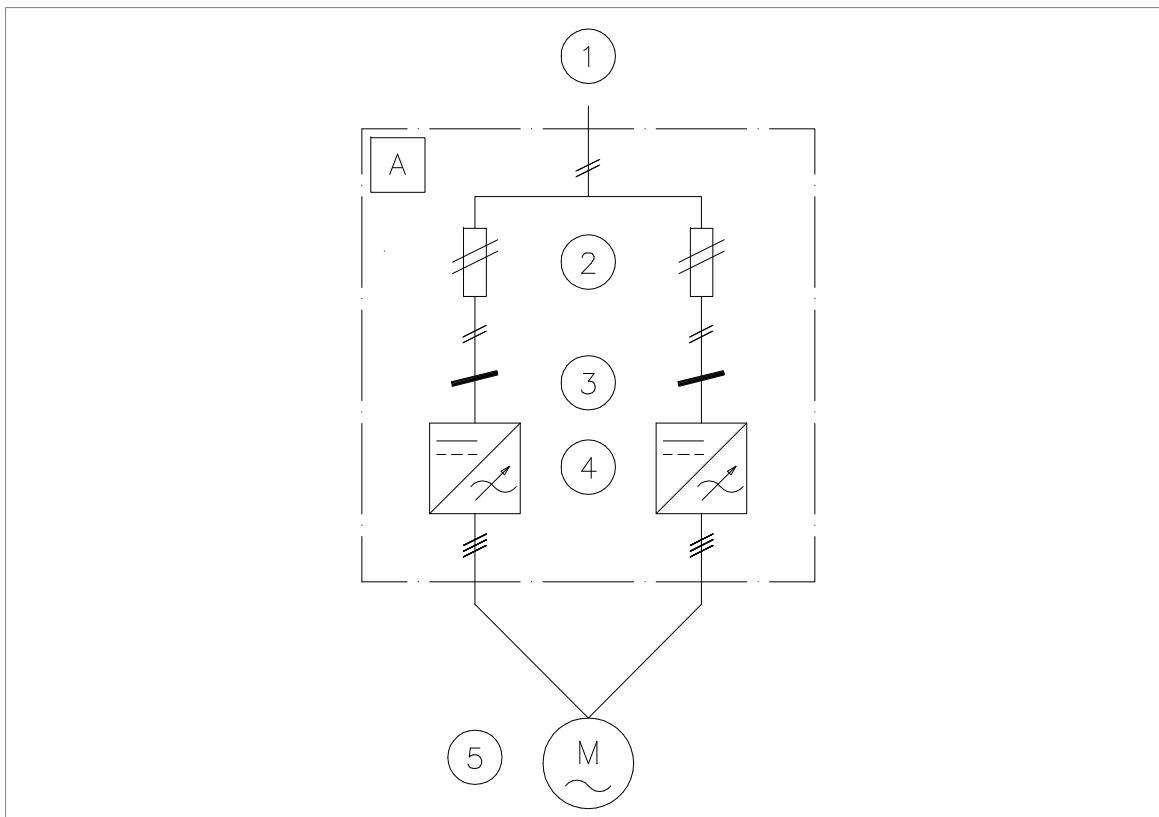

The diagram below shows the two-module cubicle design. The two inverter modules are installed into the same cubicle but each controls a different motor.

Item	Explanation	Available through
A	Inverter cubicle	-
1	DC supply	-
2	DC fuses	ABB or third party
3	Common mode filter	ABB
4	Inverter module	ABB
5	Motor	ABB (not part of ACS880-104LC product offering) or third party

Overview circuit diagram of a 2×R7i inverter unit

The diagram below shows the two-module cubicle design. The inverter modules are installed into the same cubicle and connected in parallel to control one motor.

Item	Explanation	Available through
A	Inverter cubicle	-
1	DC supply	-
2	DC fuses	ABB or third party
3	Common mode filter	ABB
4	Inverter module	ABB
5	Motor	ABB (not part of ACS880-104LC product offering) or third party

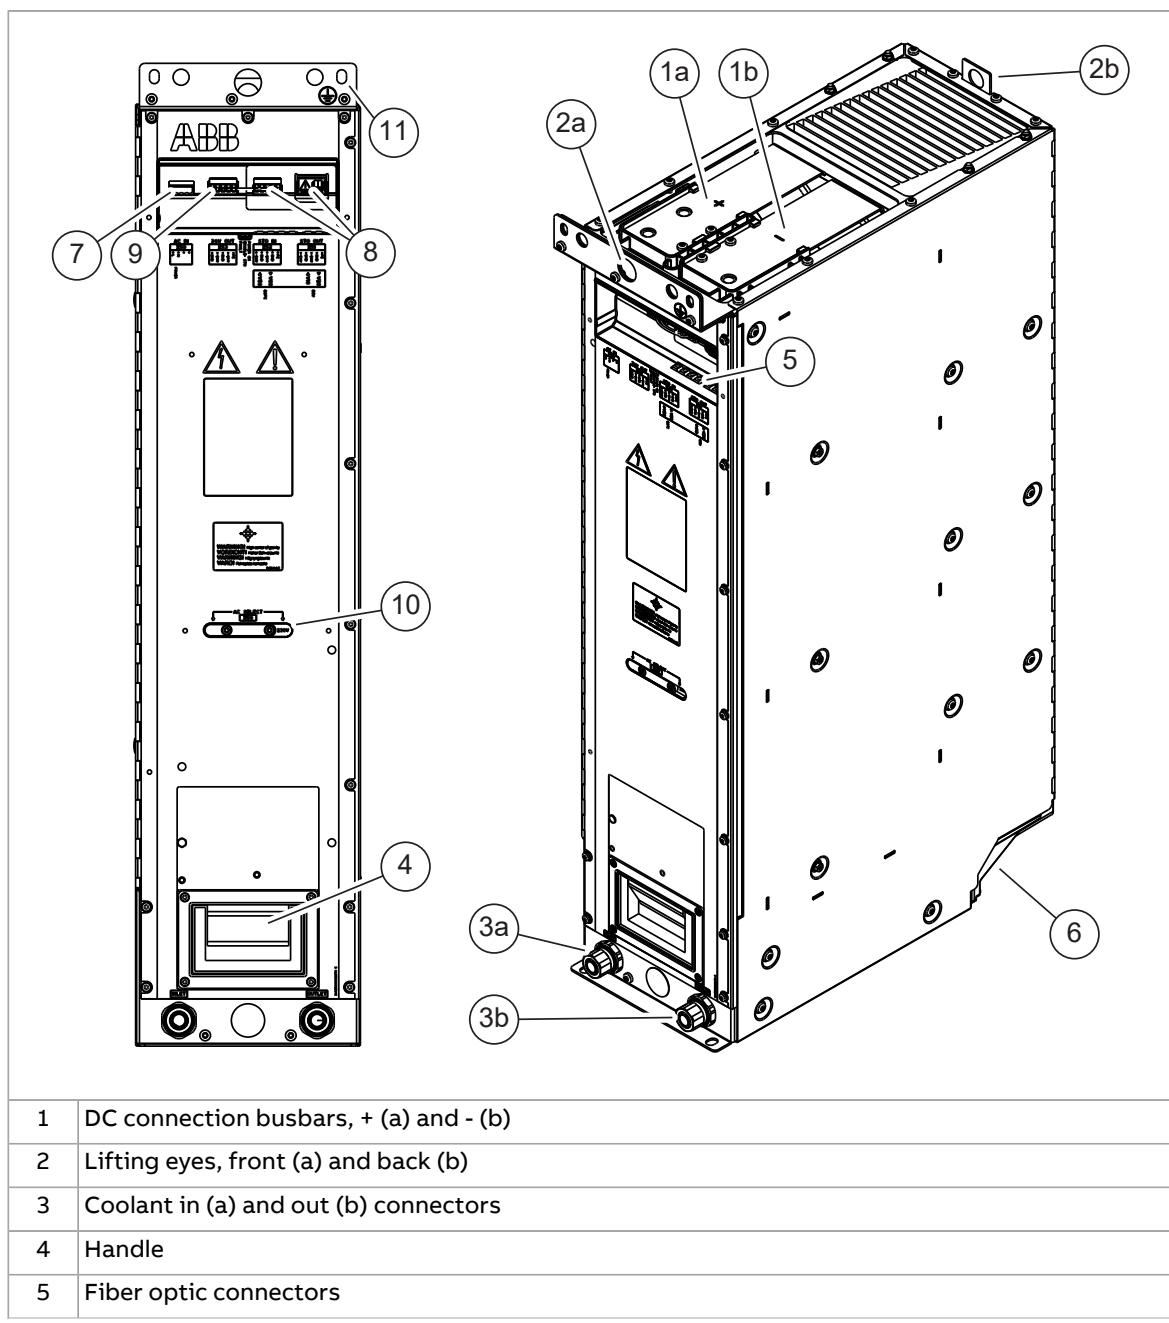

■ Frame R8i and multiples

Frame R8i modules are used to achieve output powers from approximately 350 kW upwards in single or parallel configurations.

The DC connection of the module is by busbars and located at the top. The motor connection is via a quick connector at the back of the module that couples when the module is inserted into the cubicle. Each parallel-connected module is cabled separately to the motor, or connected by busbars to adjacent modules to reduce the number of cables. It is also possible to build an AC bus from each module to a separate output cubicle.

Internal du/dt filtering is mandatory with all 690 volt units and all parallel-connected modules. 690 volt modules have internal du/dt filtering as standard. The du/dt filter decreases voltage spikes, which reduces stress on the motor insulation.

Module layout

32 Operation principle and hardware description

6	Quick connector (AC connection) (the counterpart fastened to the cabinet behind the module)
7	Terminal block X50 (auxiliary power input for internal boards)
8	Terminal block X51 and X52 (Safe torque off in inverter modules only)
9	Terminal block X53 (24 V DC power output)
10	Auxiliary voltage selector X59 (115 or 230 V)
11	Unpainted fastening hole. The grounding point between module frame and cabinet frame.

Coolant connectors

The coolant pipe inlet and outlet connectors are located at the bottom front of the module. The connectors are for 16/13 millimeter PA (polyamide) pipe.

Connectors X50...X59

R8i modules contain a power supply (BDPS) that provides 24 V DC for the circuit boards of the module. The 24 V DC voltage provided by the BDPS is also available on X53, and can be used to power the control unit of a single R8i module.

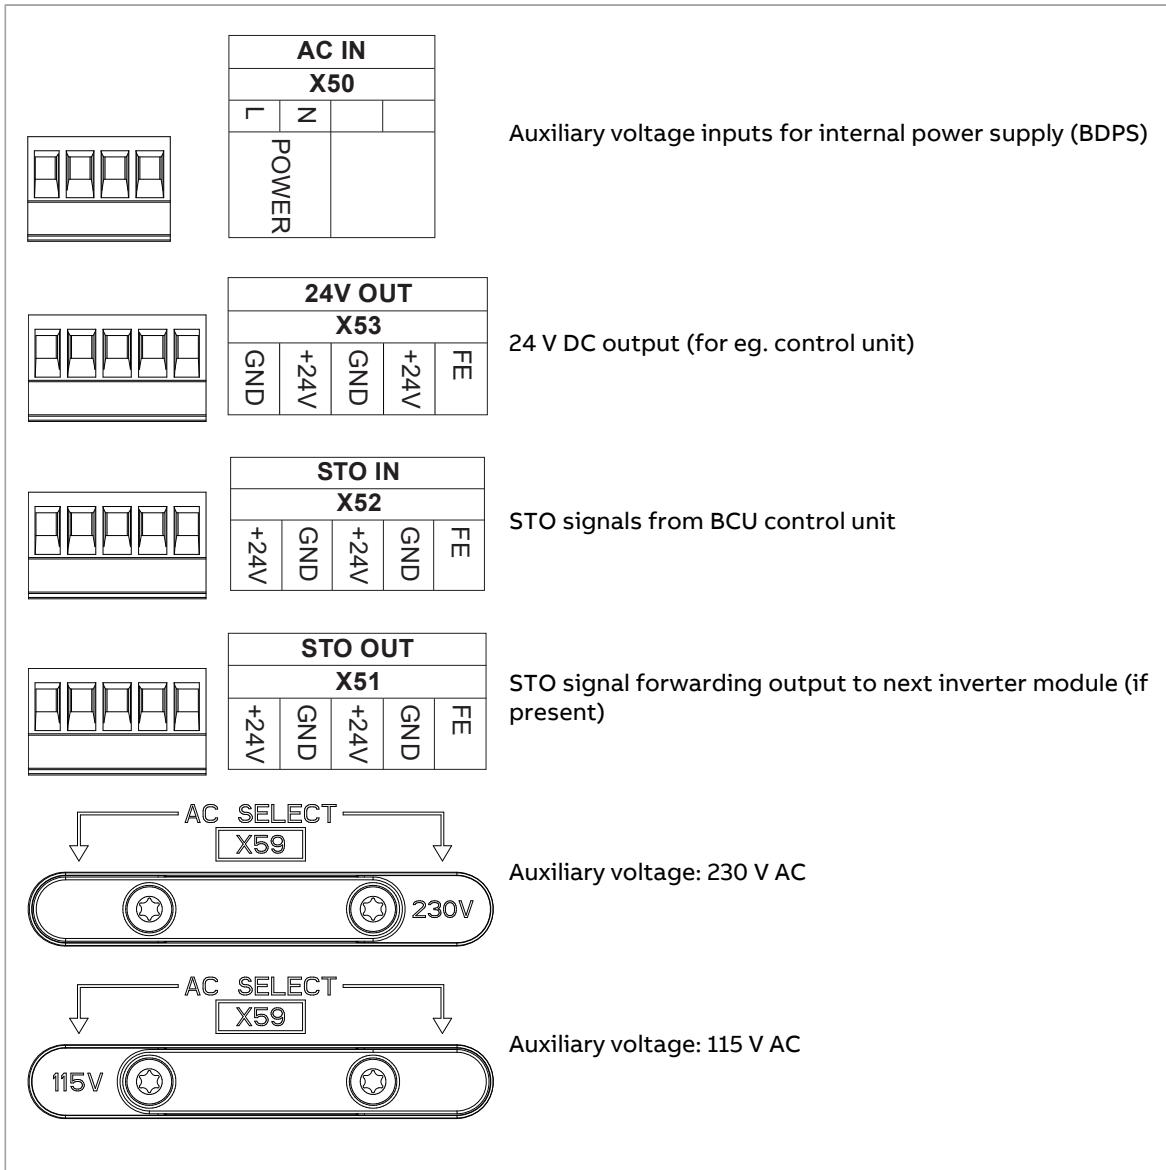

Note: With parallel-connected modules, it is strongly recommended to use an external 24 V DC supply to power the control unit.

The BDPS is powered internally from the DC link. An auxiliary voltage of 230 V AC or 115 V AC (selectable) can optionally be fed to terminal block X50 to power the BDPS even when the DC link is not live. The selection between 115 V and 230 V is made with selector plug X59. The setting can be changed by removing the two screws, turning the plug 180 degrees, and reinstalling the screws.

If the Safe torque off (STO) function is not used, the “24V” inputs on X52 must be connected to +24 V (on connector X53, for example) on each inverter module. On a new module, a jumper wire set installed at the factory makes this connection.

If the STO function is to be implemented, the jumper wire set must be removed – a mechanical interlocking device is factory-installed on connectors X51 and X52 to this effect.

For STO, X52 (STO IN) is wired to the STO OUT connector on the BCU control unit. Connector X51 on the module is wired to connector X52 on the next module (if present). For details, see chapter [The Safe torque off function \(page 289\)](#).

Fiber optic connectors

Control unit connection. Must be connected by the installer.	V20	
	V10	
Charging controller BSFC connection. Must be connected by the installer.	V60	
	V50	

LEDs

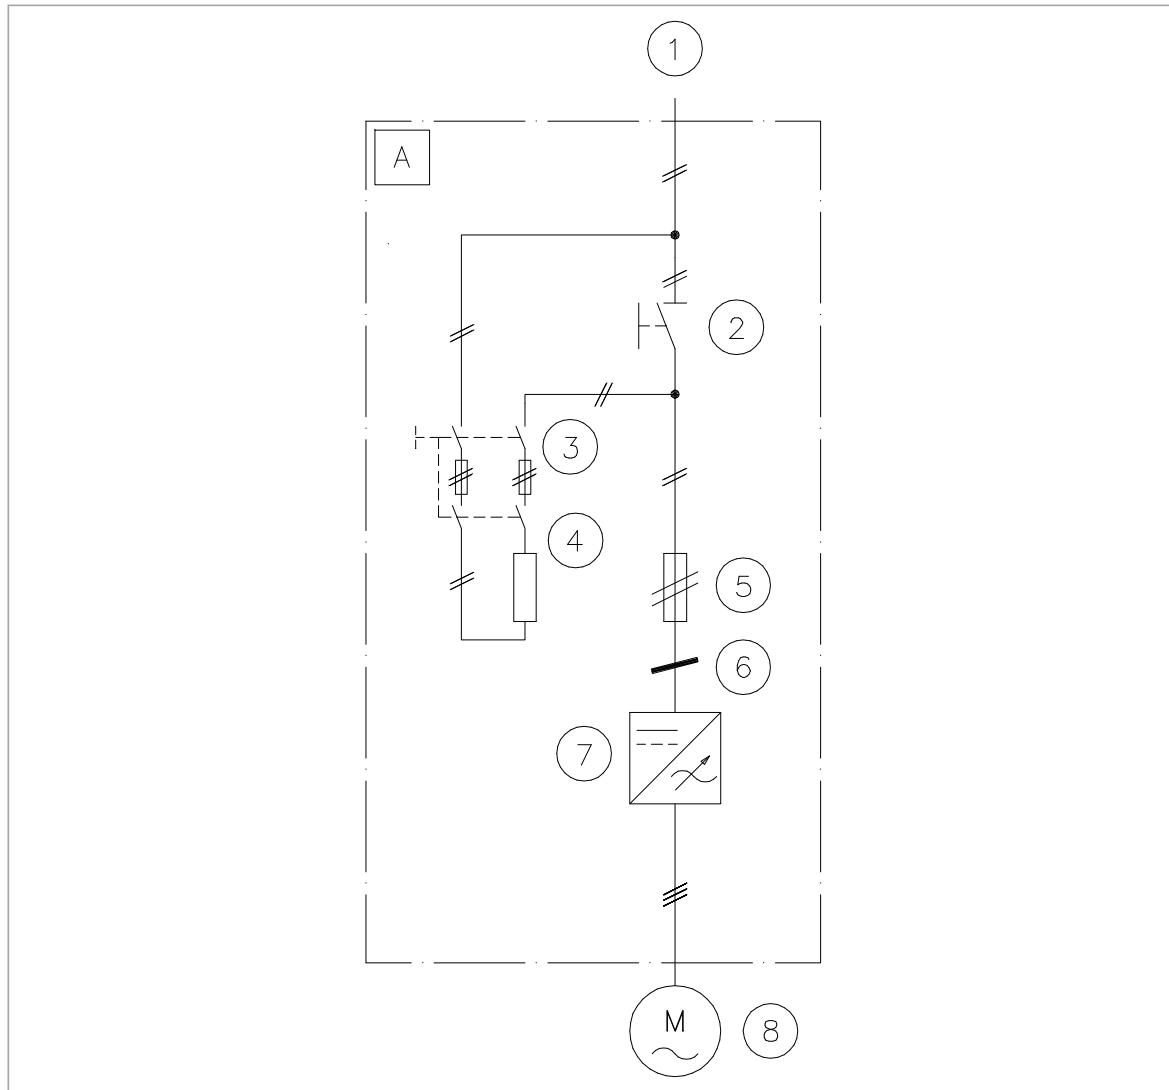

LED	Color	Indication
FAULT	Continuous red	There is an active fault in the module.

34 Operation principle and hardware description

LED	Color	Indication
ENABLE / STO	Continuous green	The module is ready for use.
ENABLE / STO	Continuous yellow	XSTO connectors are de-energized.
POWER OK	Continuous green	Supply voltage of the internal circuit boards is OK (> 21 V).

Overview circuit diagram of a frame R8i inverter unit

Cooling system

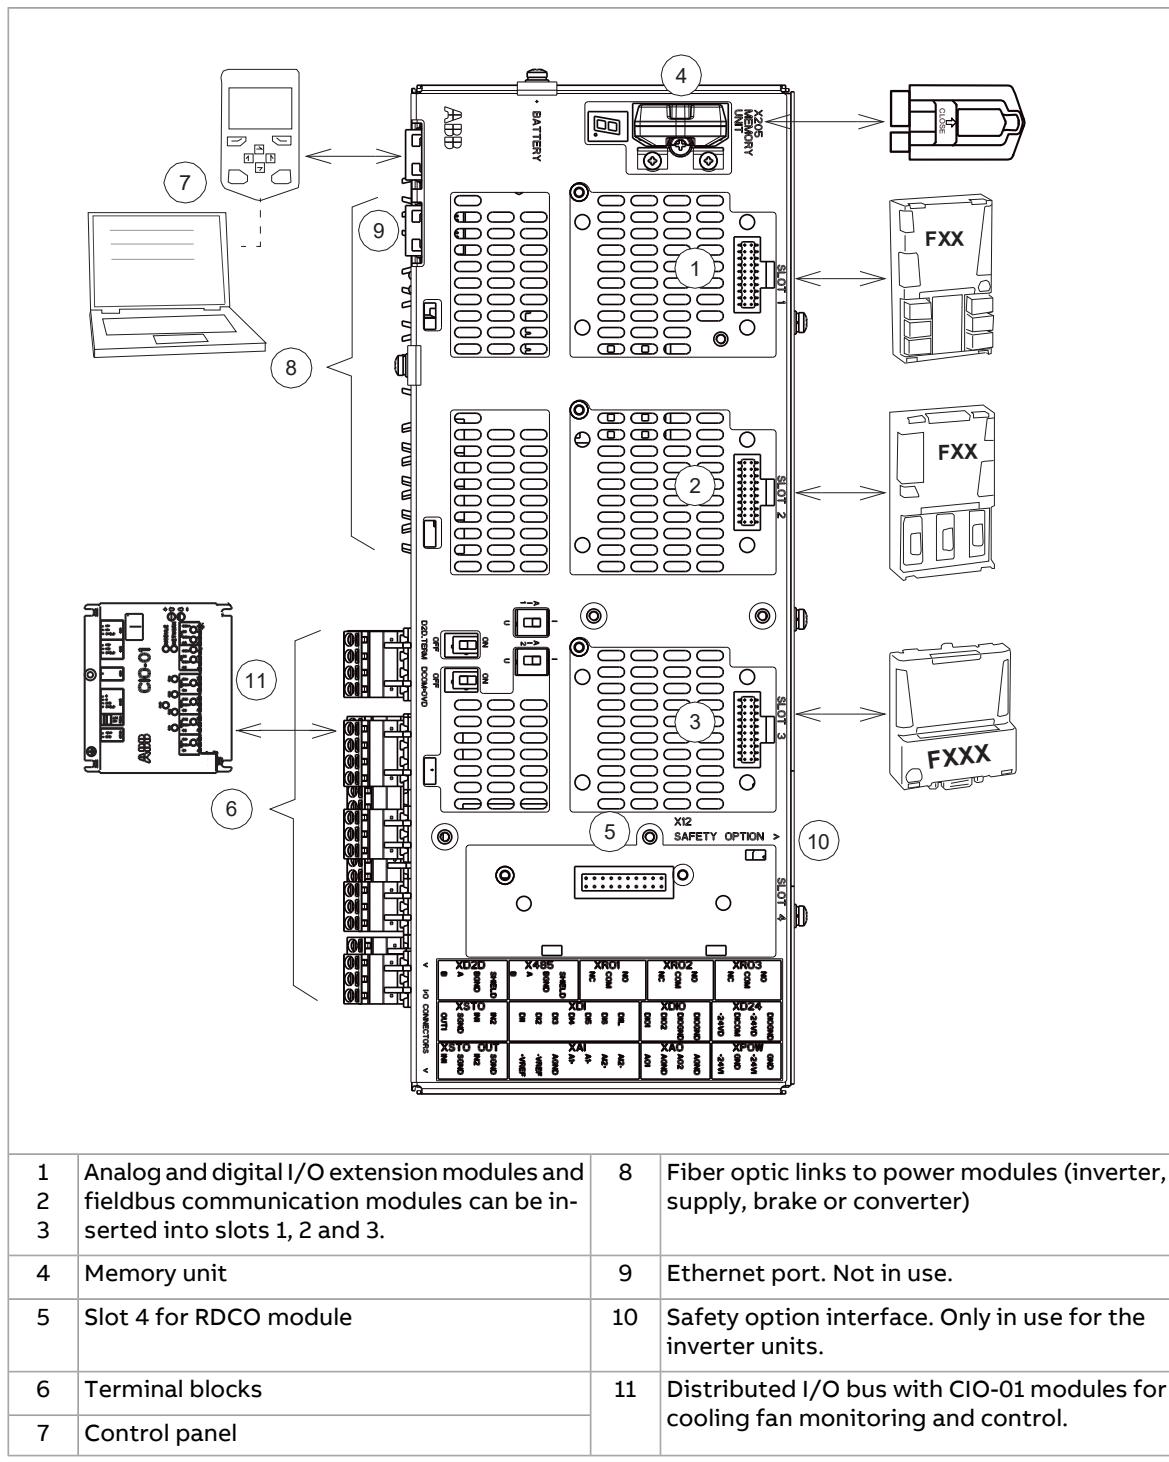

See chapter [Internal cooling circuit \(page 381\)](#).

Cabinet layout and cooling

See chapter [Cabinet construction \(page 43\)](#).

Control interfaces

■ Overview of the control connections of the BCU control unit

■ The control panel

The ACS-AP-W or ACS-AP-I control panel is the user interface of the inverter unit, providing the essential controls such as Start/Stop/Direction/Reset/Reference, and the parameter settings for the control program.

The control panel can be mounted on the cabinet door using a DPMP-01 or DPMP-02 mounting platform (available separately).

One control panel can be used to control several inverter units through a panel link provided that each unit is equipped with panel holder or an FDPI-02 module.

Note: A control panel is required for the commissioning of an ACS880 drive system, even if the Drive Composer PC tool is used.

For details on the control panel, refer to [ACS-AP-I, -S, -W and ACH-AP-H, -W Assistant control panels user's manual \(3AUA0000085685 \[English\]\)](#).

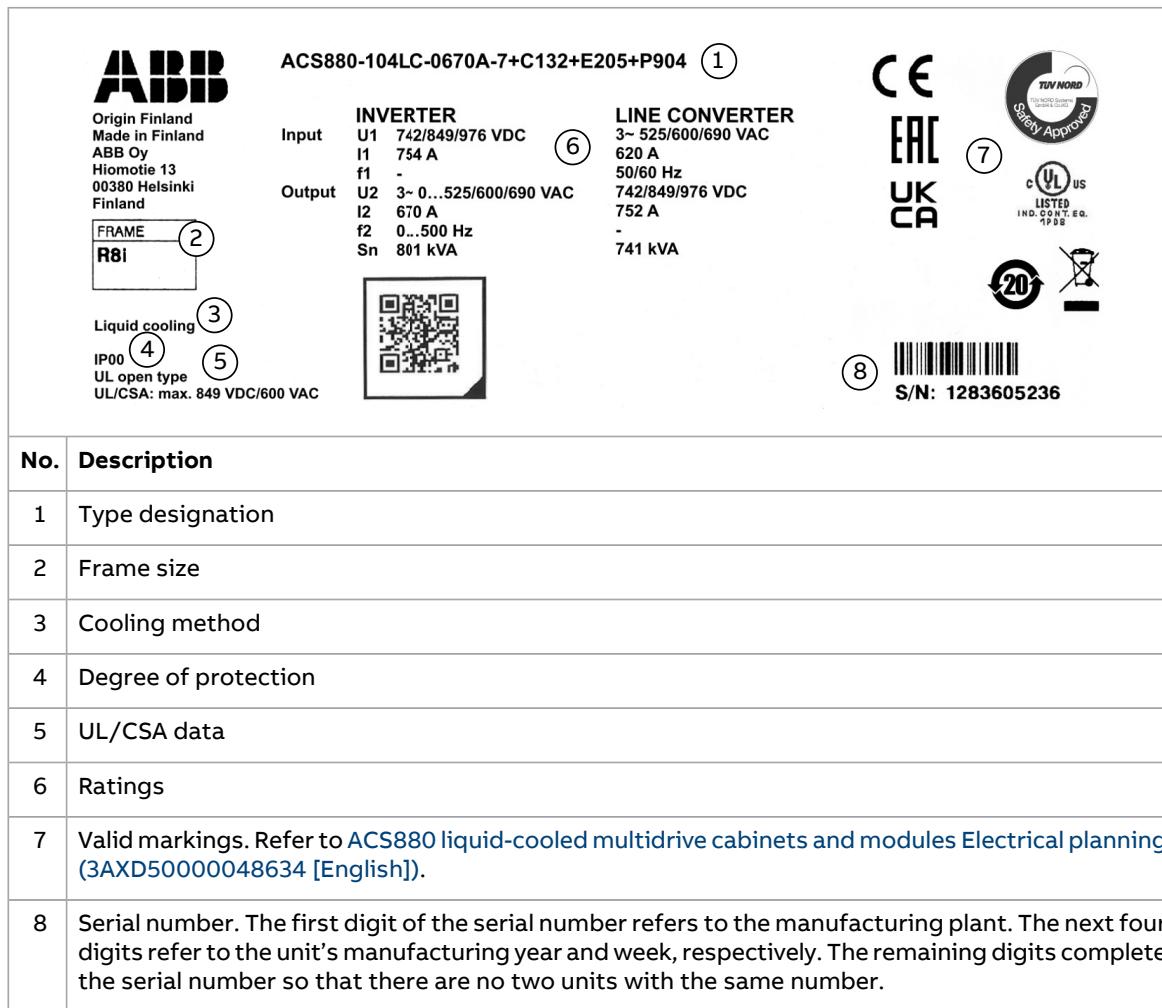

Control by PC tools

There is a USB connector on the front of the panel that can be used to connect a PC to the drive. When a PC is connected to the control panel, the control panel keypad is disabled.

Type designation label

Each inverter module has a type designation label attached to it. The type designation stated on the label contains information on the specifications and configuration of the unit. The first digits express the basic construction of the unit, for example "ACS880-104LC-0850A-7". Any optional selections are given thereafter, separated by plus signs.

Quote the complete type designation and serial number when contacting technical support on the subject of individual inverter modules. An example of the label is shown below.

Type designation key of the module

The type designation contains information on the specifications and configuration of the module. The first digits from left express the basic unit type. The optional selections are given thereafter, separated by plus signs, for example, +E205.

Code	Description
Basic code	
ACS880	Product series
104LC	Construction: Liquid-cooled inverter, supply, converter or brake module.

40 Operation principle and hardware description

Code	Description
Size	
xxxxx	Refer to the ratings table in the technical data.
Voltage range	
3	DC voltage corresponding AC input voltages 3 ~ 380...415 V. This is indicated in the type designation label as typical input voltage level 566 V DC.
5	DC voltage corresponding AC input voltages 3 ~ 380...500 V. This is indicated in the type designation label as typical input voltage level 566 / 679 / 707 V DC.
7	DC voltage corresponding AC input voltages 3 ~ 525...690 V. This is indicated in the type designation label as typical input voltage level 742 / 849 / 976 V DC.
Option codes	
C132	Marine type approval
C209	Marine product certification issued by Bureau Veritas
E205	Internal du/dt filtering
P904	Extended warranty (30 months from delivery or 24 months from commissioning)
P909	Extended warranty (42 months from delivery or 36 months from commissioning)
P911	Extended warranty (66 months from delivery or 60 months from commissioning)
P948	Customized extended warranty
Q971	ATEX-certified safe disconnection function

3

Moving and unpacking the module

Contents of this chapter

This chapter gives basic information on unpacking and moving the module.

WARNING!

Obey the safety instructions given in [ACS880 liquid-cooled multidrive cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#).

Moving and unpacking the module

The modules are delivered on a wooden base, boxed in corrugated cardboard. The cardboard box is tied to the base with PET bands.

1. Cut off the bands.
2. Lift off the cardboard box.
3. Remove any filling material.
4. Cut open the plastic wrapping of the module.
5. Lift off the module.
6. Check that there are no signs of damage.

Dispose of or recycle the packaging according to the local regulations.

If you need to pack the modules, see the package information in the technical data.

4

Cabinet construction

Contents of this chapter

This chapter gives instructions on how to install the modules and additional equipment into a cabinet.

For general instructions, see [Drive modules cabinet design and construction instructions \(3AUA0000107668 \[English\]\)](#).

Limitation of liability

The installation must always be designed and made according to applicable local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches the local laws and/or other regulations. Furthermore, if the recommendations given by ABB are not followed, the drive may experience problems that the warranty does not cover.

■ North America

Installations must be compliant with NFPA 70 (NEC)¹⁾ and/or Canadian Electrical Code (CE) along with state and local codes for your location and application.

¹⁾ National Fire Protection Association 70 (National Electric Code).

Module-specific cooling requirements and allowable mounting orientations

Refer to chapter [Technical data \(page 247\)](#).

Installation and maintenance of the control unit

Refer to the hardware manual of the control unit:

Manual	Code
BCU-02/12/22 control units hardware manual	3AUUA0000113605 (English)

Cabinet temperature supervision

You must ensure sufficient air flow inside the cabinet to cool down air-cooled components, such as fuses, busbars and filters. In liquid-cooled drive systems, the cabinet can be totally sealed from the ambient air. The air inside the cabinet must be able to circulate freely. Install a fan inside the cabinet to push air through a heat exchanger.

The inverter module has its own temperature supervision. For the diagnostics and settings, refer to the firmware manual of the inverter unit. The temperature supervision of frame R8i module is sufficient for the cabinet temperature supervision. Use thermal switches to supervise the temperature inside the R7i module cubicle. Wire the switches to a digital input (DI) of the supply control unit (1 = OK, 0 = overtemperature). In case of overtemperature, the switch opens and trips the supply unit on a fault. You can adjust the delay time by parameters.

ABB recommends to use thermal switches with the following temperature limits:

Frame	Voltage	Temperature limit
R7i	400...500 V	95 °C (203 °F)
2×R7i	400...500 V	85 °C (185 °F)
R7i	690 V	85 °C (185 °F)
2×R7i	690 V	85 °C (185 °F)

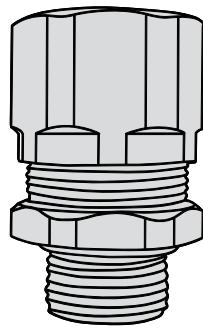

If you install the switches on the busbars, make sure there is correct insulation between the busbars and thermal switches.

Make sure that components located in other cubicles are correctly cooled.

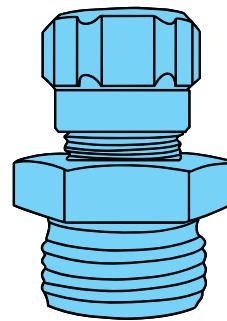

Liquid pipe connector installation instructions

These instructions are applicable to the liquid pipe connectors that are used in ABB drives. There are two types of pipe connectors: type A and type B. Refer to the illustrations below. When you install a pipe connector, identify the connector type first. Obey the type-specific instructions carefully.

Type A pipe connector

Type B pipe connector

**WARNING!**

Do the electrical safety precautions steps before you do work on the drive. Refer to the drive safety instructions. If you are not a qualified electrical professional, do not do work on the drive. If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

■ Type A pipe connector

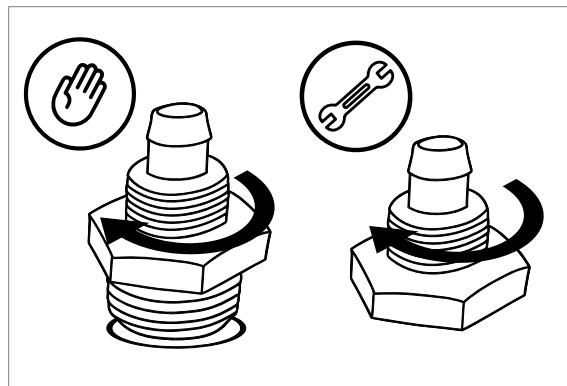

This section is applicable to type A pipe connectors.

Reserve these tools at hand:

- torque wrench.

Installation procedure:

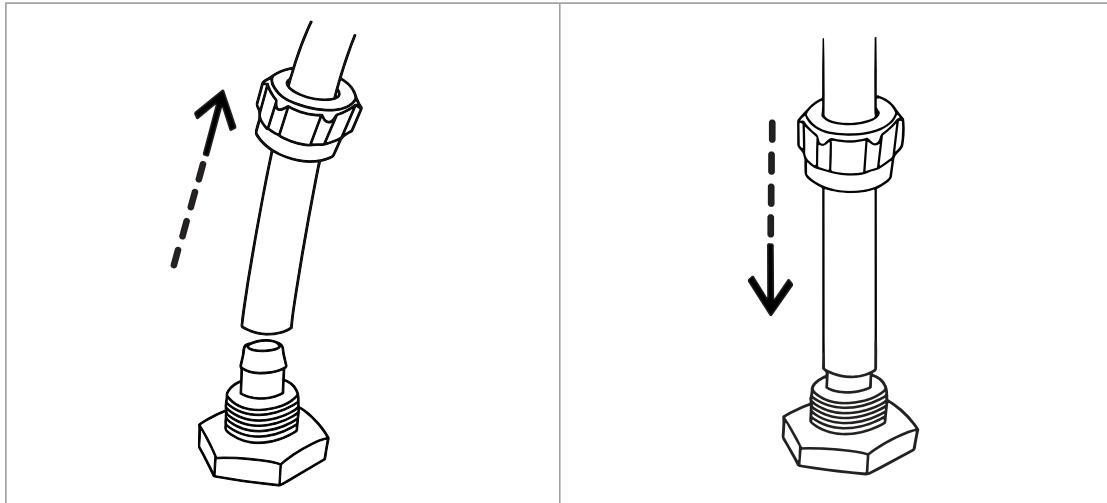

1. Make sure that the pipe connector has an O-ring.
2. Put the pipe connector base carefully onto the threads and start to turn it in by hand. Tighten the pipe connector base to 30 N·m (22.1 lbf·ft).

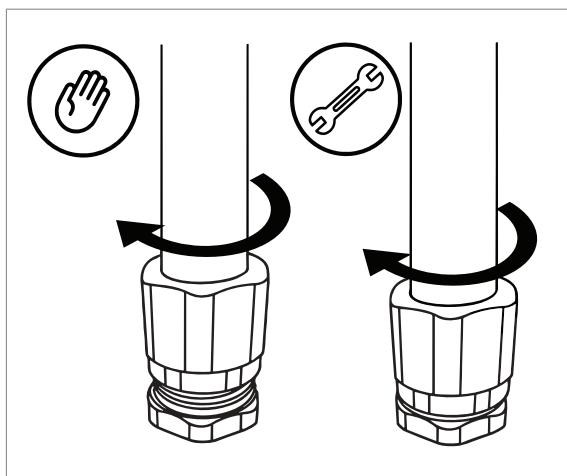

3. Push the locking ring onto the pipe.

4. Push the pipe onto the pipe connector base and pull down the locking ring. Make sure that the pipe is perpendicular to the pipe connector base.

5. Start to turn the locking ring by hand. Tighten the locking ring with a torque wrench to 20 N·m (14.8 lbf·ft).

■ Type B pipe connector

This section is applicable to type B pipe connectors.

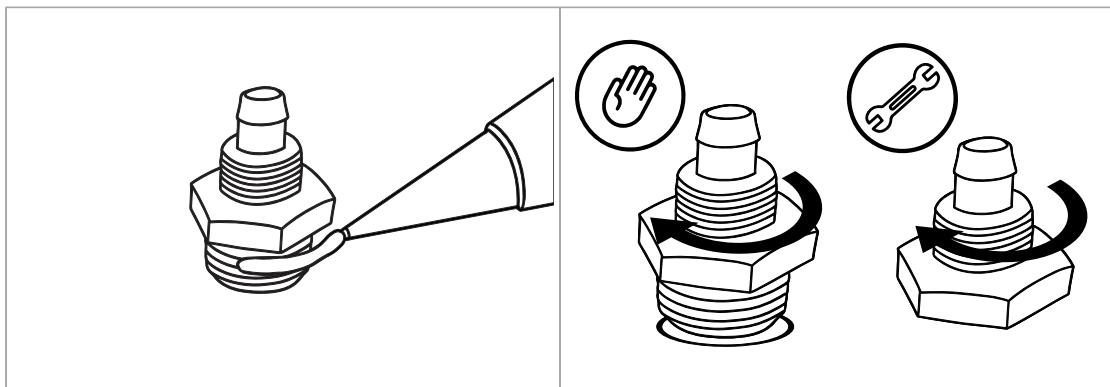

Reserve these materials and tools at hand:

- Loctite® 2700 threadlocker. If Loctite 2700 is not available, use an equivalent threadlocker.
- torque wrench
- adjustable pliers.

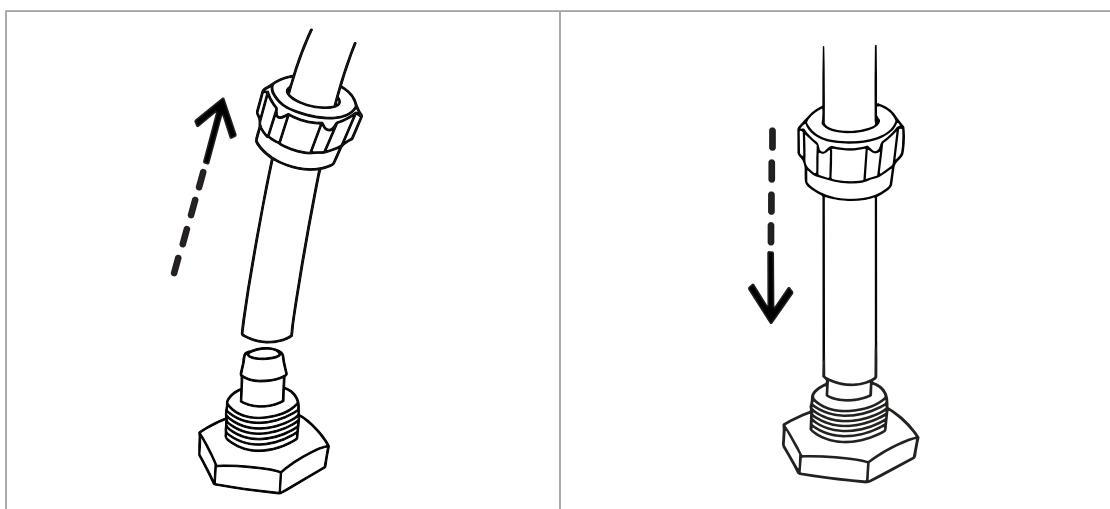

Installation procedure:

1. If the pipe connector has an O-ring, remove and discard the O-ring.
2. Apply threadlocker to the threads of the pipe connector base. Always add the threadlocker onto the outer thread. This prevents the threadlocker from entering the cooling circuit.

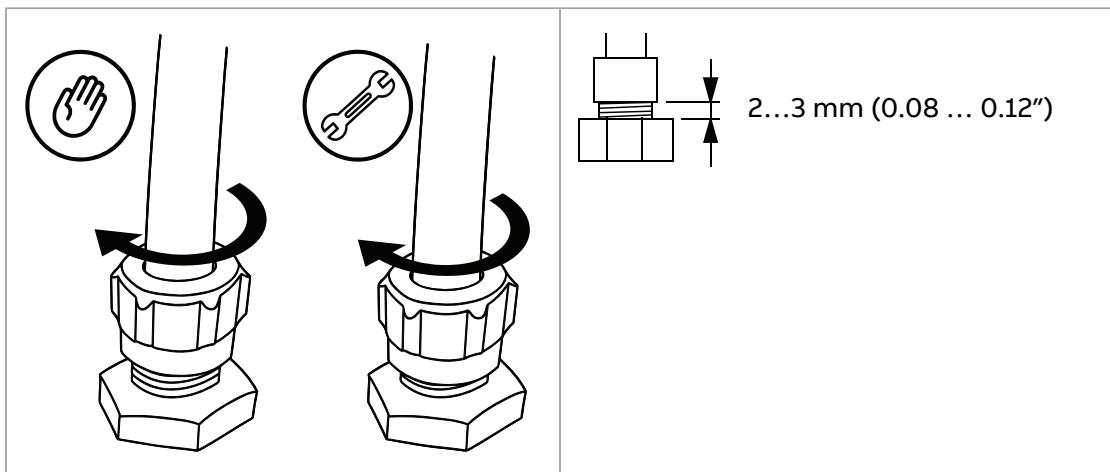

3. Put the pipe connector base carefully onto the threads and start to turn it in by hand. Tighten the pipe connector base to 20 N·m (14.8 lbf·ft). Wipe out extra threadlocker.

4. Push the locking ring onto the pipe.
5. Push the pipe onto the pipe connector base and pull down the locking ring. Make sure that the pipe is perpendicular to the pipe connector base.

6. Start to turn the locking ring by hand. Tighten the locking ring with adjustable pliers. Leave 2...3 mm thread visible.

WARNING!

Do not tighten the locking ring of the type B pipe connector too much. It can cause damage to the pipe.

7. Let the threadlocker dry completely before you fill the cooling circuit. The drying time for Loctite 2700 is 24 hours at room temperature.

Installation examples

This section includes installation examples of inverter modules in Rittal VX25 series as well as generic enclosures. Each example includes a table that lists:

- installation stages of different equipment in the order in which the installation into the cabinet should be performed
- code of the step-by-step instructions
- equipment kit code
- kit ordering code.

You can find kit-specific assembly drawings, step-by-step instructions and kit information on the Internet (<https://sites-apps.abb.com/sites/lvacdrivesengineeringsupport/content>).

The example includes also cabinet assembly drawings that show each stage listed in the table. More detailed steps of each stage are described in the kit-specific assembly drawings.

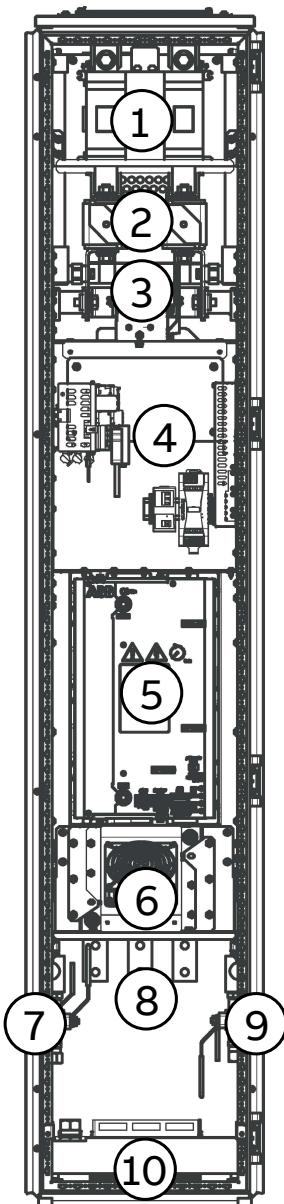

For general instructions, refer to [Cabinet design and construction instructions for drive modules \(3AU0000107668 \[English\]\)](#).

WARNING!

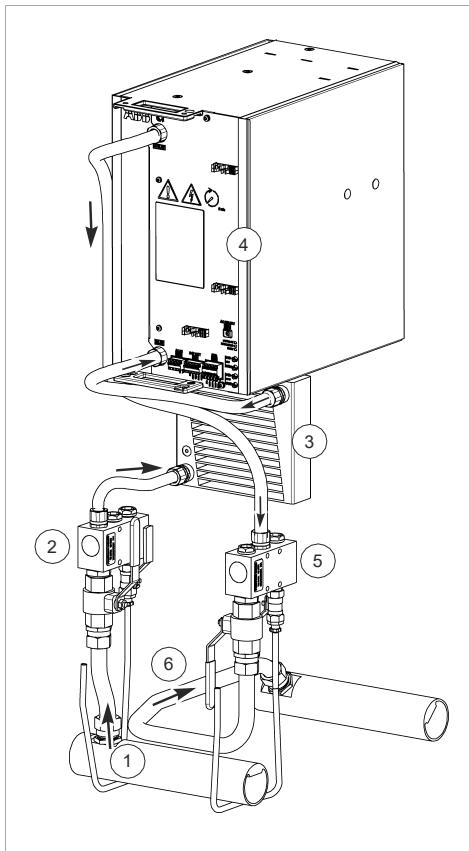

Remove the code labels attached to mechanical parts such as busbars, shrouds and sheet metal parts before installation. They may cause bad electrical connections, or, after peeling off and collecting dust in time, cause arcing or block the cooling air flow.

Stage 6: Installation of module

Stage 7: Installation of swing-out frame and shrouding

■ Three R8i modules in a 800 mm wide Rittal VX25 enclosure**Layout drawing**

No.	Description
1	DC fuses (DC switch can alternatively be installed)
2	Common mode filters
3	Inverter module
4	Output busbars (located behind the module)
5	Heat exchanger (between module and cooling fan)
6	Cooling fan
7	Inlet manifold with stop and drain valves
8	Outlet manifold with stop and drain valves
9	Cable entries

Pipe routing example

No.	Description
1	Coolant in
2	Inlet manifold with stop and drain valves
3	Heat exchanger
4	Inverter module
5	Outlet manifold with stop and drain valves
6	Coolant out

Electrical installation

Contents of this chapter

This chapter describes the electrical installation of the modules.

The wiring diagrams in this chapter are simplified presentations. For details, see the example circuit diagrams included in the manual.

Note: The instructions do not cover all possible cabinet constructions.

For more information on electrical installation, see [ACS880 liquid-cooled multidrives cabinets and modules electrical planning \(3AXD5000048634 \[English\]\)](#).

Safety and liability

WARNING!

Only qualified electrical professionals are allowed to do the work described in this chapter. Read the **complete safety instructions** before you install, commission, use or service the drive. The complete safety instructions are given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD5000048633 \[English\]\)](#).

Note: The installation must always be designed and made according to applicable local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches the local laws and/or other regulations. Furthermore, if the recommendations given by ABB are not followed, the drive system may experience problems that the warranty does not cover.

Electrical safety precautions

These electrical safety precautions are for all personnel who do work on the drive, motor cable or motor.

This procedure gives information on how to de-energize the drive and make it safe to do work on it. The procedure does not include all possible drive configurations.

**WARNING!**

Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

Do these steps before you begin any installation or maintenance work.

1. Prepare for the work.
 - Make sure that you have a work order.
 - Do an on-site risk assessment or job hazard analysis.
 - Make sure that you have the correct tools available.
 - Make sure that the workers are qualified.
 - Select the correct personal protective equipment (PPE).
 - Stop the motor(s).
2. Clearly identify the work location and equipment.
3. Disconnect all possible voltage sources. Make sure that re-connection is not possible. Lock out and tag out.
 - If the drive is equipped with a DC/DC converter unit or a DC feeder unit: Open the disconnecting device of the energy storage connected to the unit. The disconnecting device is outside the drive cabinet. Then open the DC switch-disconnector [Q11] of the unit.
 - Open the main disconnecting device of the drive.
 - Open the charging switch if present.
 - Open the disconnector of the supply transformer. (The main disconnecting device in the drive cabinet does not disconnect the voltage from the AC input power busbars of the drive cabinet.)
 - Open the auxiliary voltage switch-disconnector (if present), and all other possible disconnecting devices that isolate the drive from dangerous voltage sources.
 - In the liquid cooling unit (if present), open the switch-disconnector of the cooling pumps.
 - If you have a permanent magnet motor connected to the drive, disconnect the motor from the drive with a safety switch or by other means.
 - Open the main isolating device of the drive.
 - Disconnect all dangerous external voltages from the control circuits.
 - After you disconnect power from the drive, always wait 5 minutes to let the intermediate circuit capacitors discharge before you continue.
4. Protect other energized parts in the work location against contact and take special precautions when close to bare conductors.
5. Measure that the installation is de-energized. Use a quality voltage tester. If the measurement requires removal or disassembly of shrouding or other cabinet structures, obey the local laws and regulations applicable to live working (including – but not limited to – electric shock and arc protection).
 - Before and after you measure the installation, verify the operation of the voltage tester on a known voltage source.
 - Make sure that the voltage between the drive input power terminals (L1, L2, L3) and the grounding (PE) busbar is zero.

- Make sure that the voltage between the drive output terminals (T1/U, T2/V, T3/W) and the grounding (PE) busbar is zero.
Important! Repeat the measurement also with the DC voltage setting of the tester. Measure between each phase and ground. There is a risk of dangerous DC voltage charging due to leakage capacitances of the motor circuit. This voltage can remain charged for a long time after the drive power-off. The measurement discharges the voltage.
 - Make sure that the voltage between the drive DC busbars and the grounding (PE) busbar is zero.
 - If the drive is equipped with a DC/DC converter unit or a DC feeder unit: Make sure that the voltage between the energy storage terminals of the unit (ES+ and ES-) and the grounding (PE) busbar is zero.
6. Install temporary grounding as required by the local regulations.
 7. Ask for a permit to work from the person in control of the electrical installation work.

General notes

■ Printed circuit boards

WARNING!

Use a grounding wristband when you handle printed circuit boards. Do not touch the boards unnecessarily. The boards contain components sensitive to electrostatic discharge.

■ Handling fiber optic cables

WARNING!

Obey these instructions. If you ignore them, damage to the equipment can occur.

- Handle the fiber optic cables with care.
- When you disconnect the fiber optic cables, always hold the connector, not the cable.
- Do not touch the ends of the fibers. They are sensitive to dirt.
- Do not bend the fiber optic cables too tightly. The minimum allowed bend radius is 35 mm (1.4 in).

Measuring the insulation resistance of the drive

WARNING!

Do not do voltage withstand or insulation resistance tests on the drive. The tests can cause damage to the drive. Every drive is tested for insulation between the main circuit and the chassis at the factory. Also, there are voltage-limiting circuits inside the drive which cut down the testing voltage automatically.

Measuring the insulation resistance of the motor and motor cable

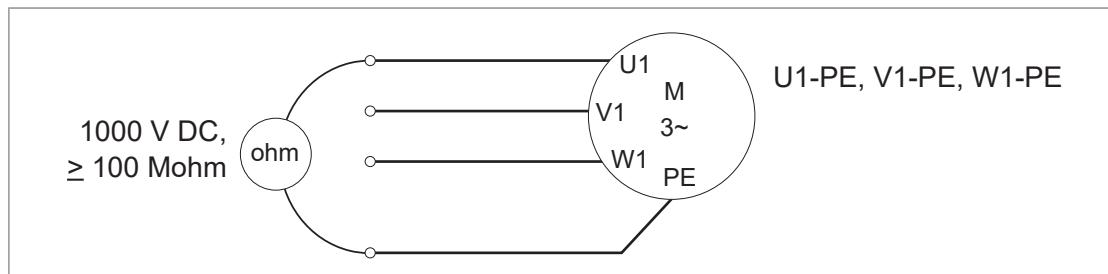

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

1. Do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Make sure that the motor cable is disconnected from the drive output terminals.
3. Measure the insulation resistance between each phase conductor and the protective earth conductor. Use a measuring voltage of 1000 V DC. The insulation resistance of an ABB motor must be more than 100 Mohm (reference value at 25 °C [77 °F]). For the insulation resistance of other motors, refer to the manufacturer's instructions.

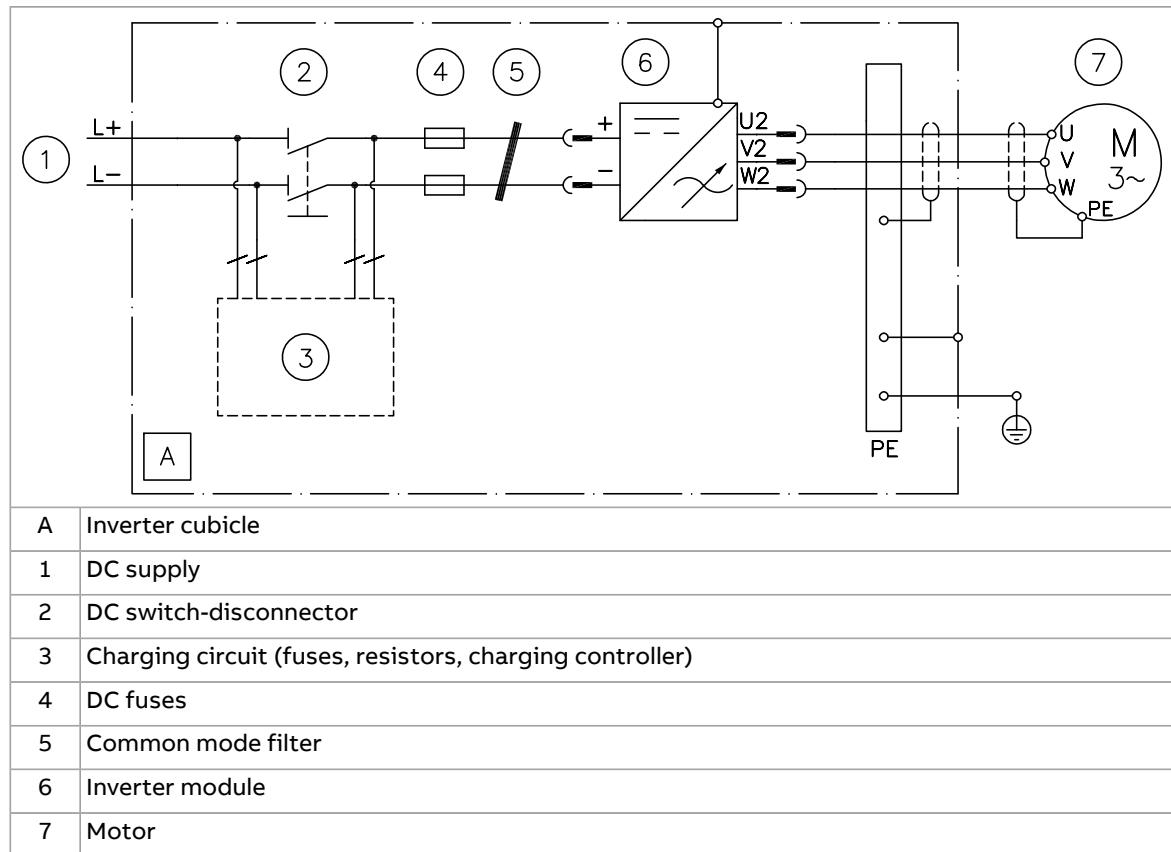

Note: Moisture inside the motor reduces the insulation resistance. If you think that there is moisture in the motor, dry the motor and do the measurement again.

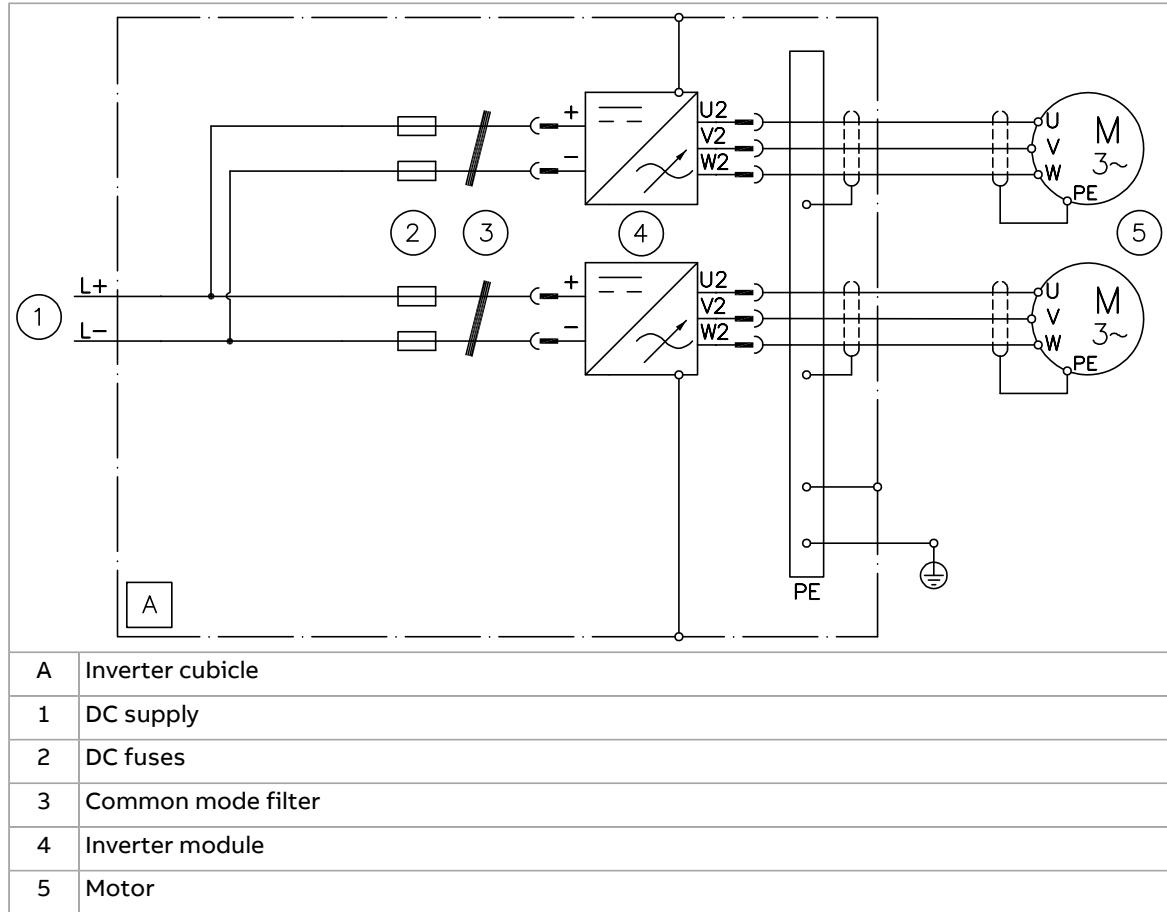

Power connections

Simplified diagrams of the power connections are presented below.

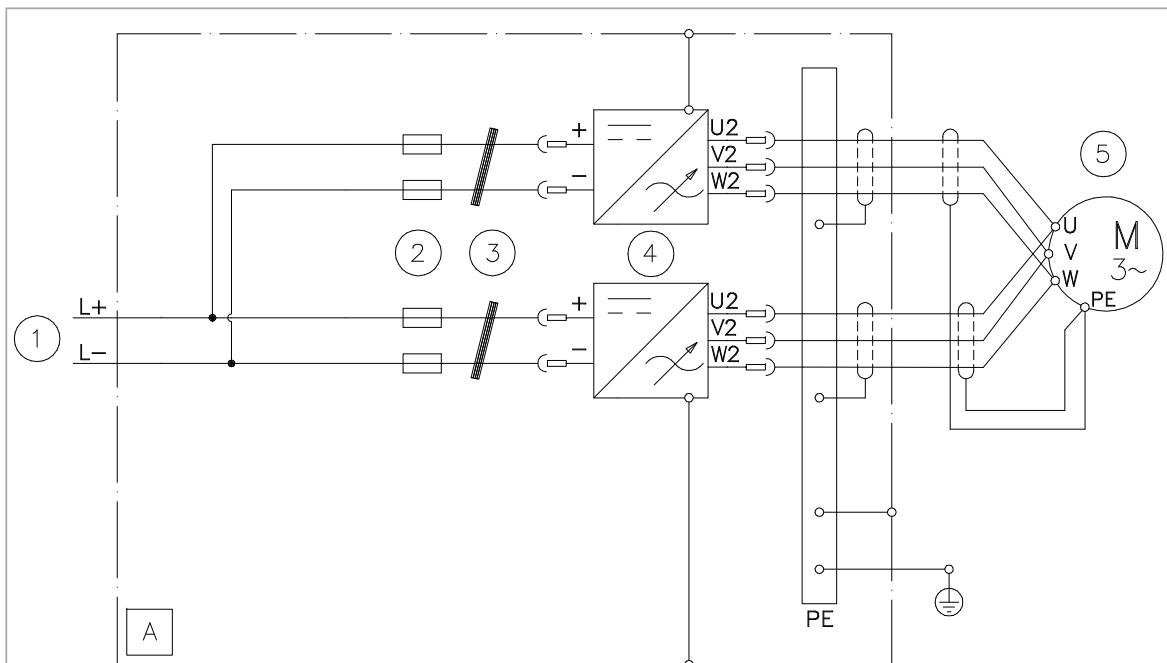

■ R7i inverter module

■ **Two R7i inverter modules controlling different motors**

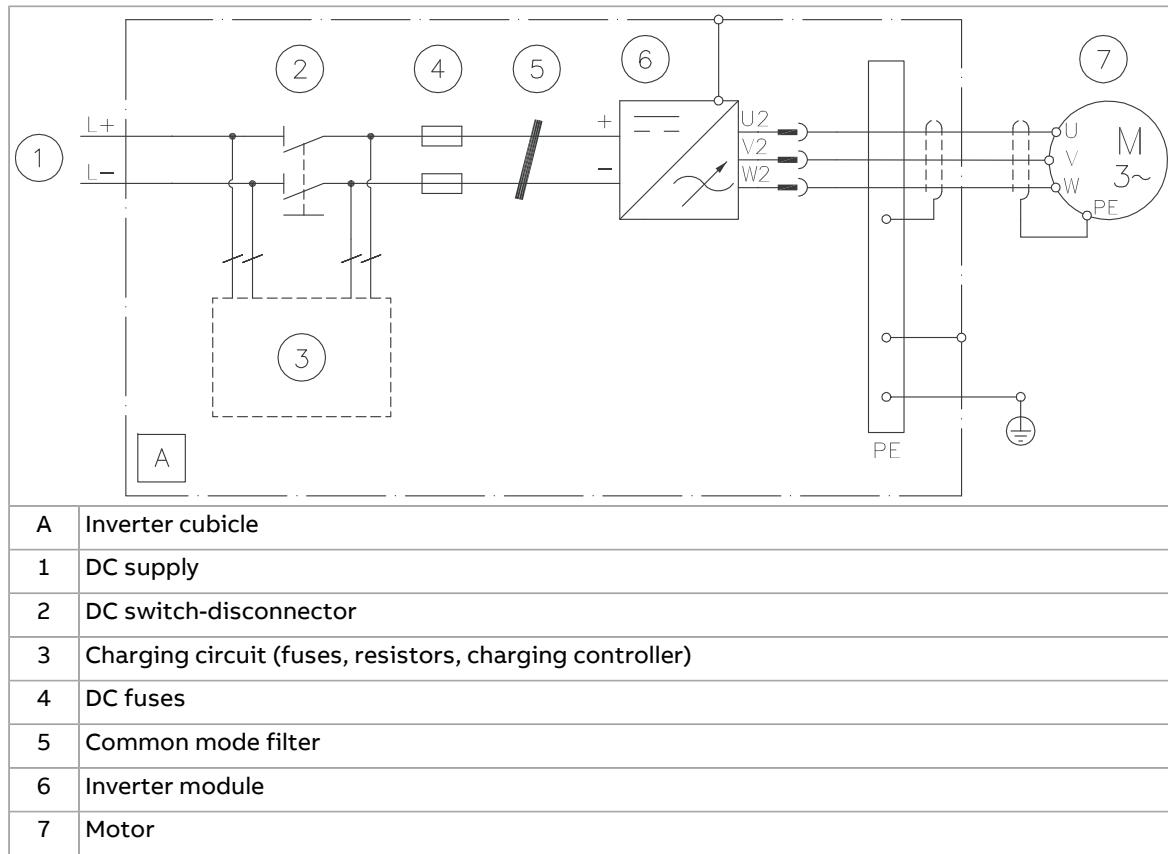

■ 2×R7i inverter unit

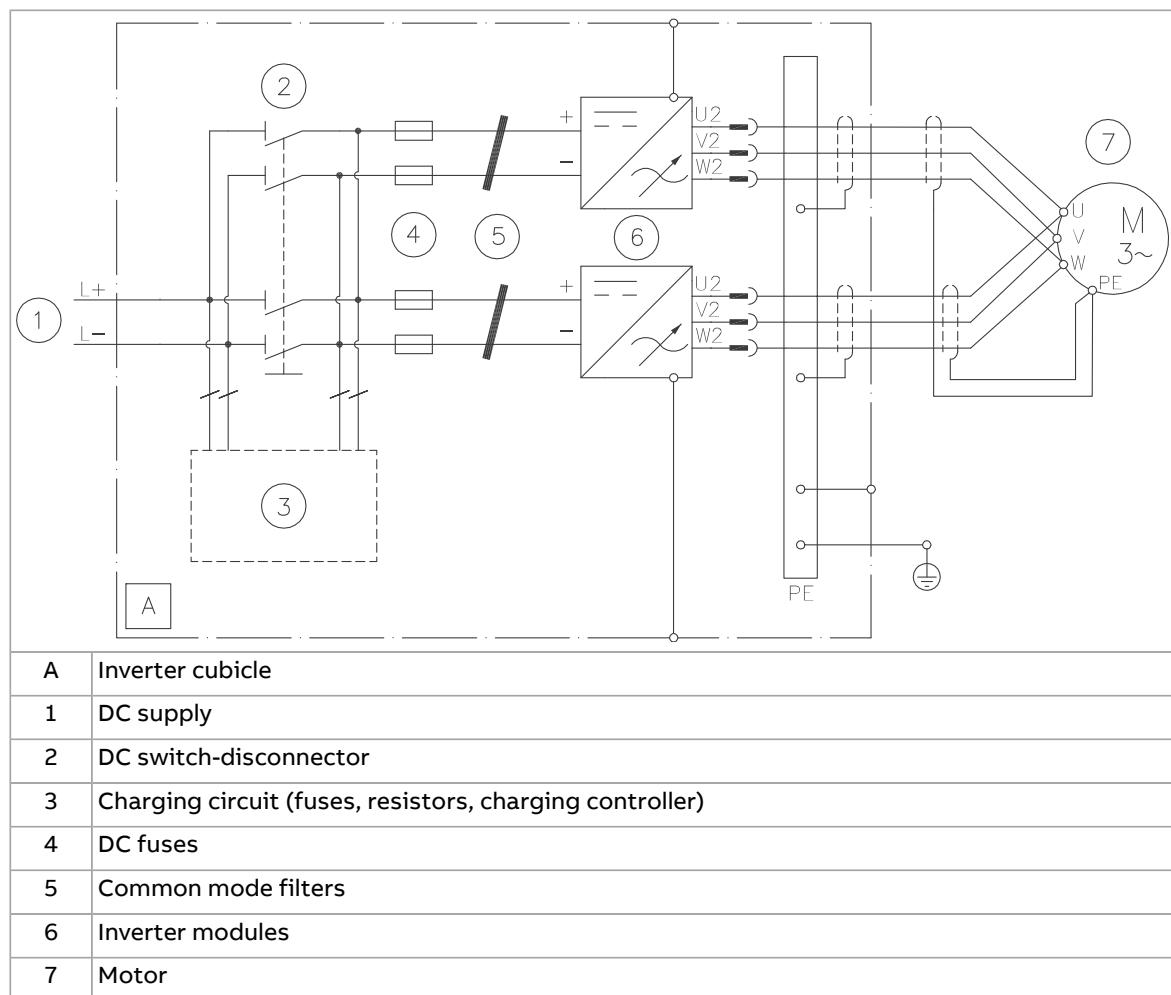

A	Inverter cubicle
1	DC supply
2	DC fuses
3	Common mode filter
4	Inverter module
5	Motor

R8i inverter module

■ 2×R8i inverter unit

■ Connection procedure

WARNING!

Read and follow the instructions given in [ACS880 multidrives cabinets and modules safety instructions \(3AU0000102301 \[English\]\)](#). Ignoring the instructions can cause physical injury or death, or damage to the equipment.

1. Ground the inverter modules by the top edge of the front plate. The grounding point is marked on the module. Connect the front plate to the frame support bracket with screws. The bracket should have a galvanic connection to the PE busbar through the cabinet frame.

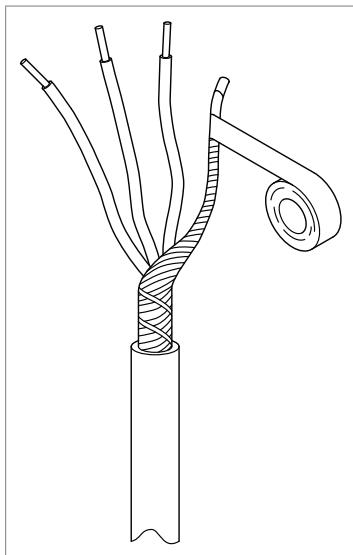

Note:

- If the cabinet frame is painted (such as with Rittal enclosures), it is important to make sure that a good galvanic connection to ground (PE busbar) is achieved. You can, for example, remove the paint from the connection points and use star washers.
- The connection to ground merely through the mounting screws and the cabinet chassis is not always good enough. To ensure the continuity of the protective bonding circuit, you can connect the modules to the cabinet PE busbar with a copper busbar or cable. The inductance and impedance of the PE conductor must be rated according to permissible touch voltage appearing under fault conditions (so that the fault point voltage will not rise excessively when a ground fault occurs).

See [ACS880 liquid-cooled multidrives cabinets and modules electrical planning instructions \(3AXD50000048634 \[English\]\)](#).

2. Run the output (motor) cable into the cubicle through a cable gland or grommet. 360° grounding of the cable shield is recommended to suppress interference. In case a grounding cable gland is available, remove the outer jacket of the cable where it passes through the cable gland.
3. Cut the output cable to suitable length and strip the ends of the individual conductors.

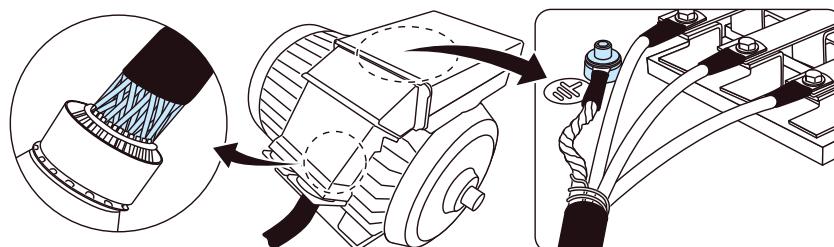

4. Twist the shield strands of the output cable together to form a separate conductor and wrap tape around it as shown.

5. Crimp suitable cable lugs to the conductors as well as the twisted shield. Connect the phase conductors to the output busbars. Connect the cable shield to a PE busbar. In a two-module cubicle, the set of busbars nearer the back wall are the output of the upper module.
6. Secure the cables inside and outside the cabinet mechanically.
7. Tighten the cable gland if present.

Grounding the motor cable shield at the motor end

For minimum radio-frequency interference, ground the cable shield 360° at the cable entry of the motor terminal box.

Connecting the control cables

For technical data and default I/O connections of the control unit, see [Control unit \(BCU\) \(page 153\)](#).

WARNING!

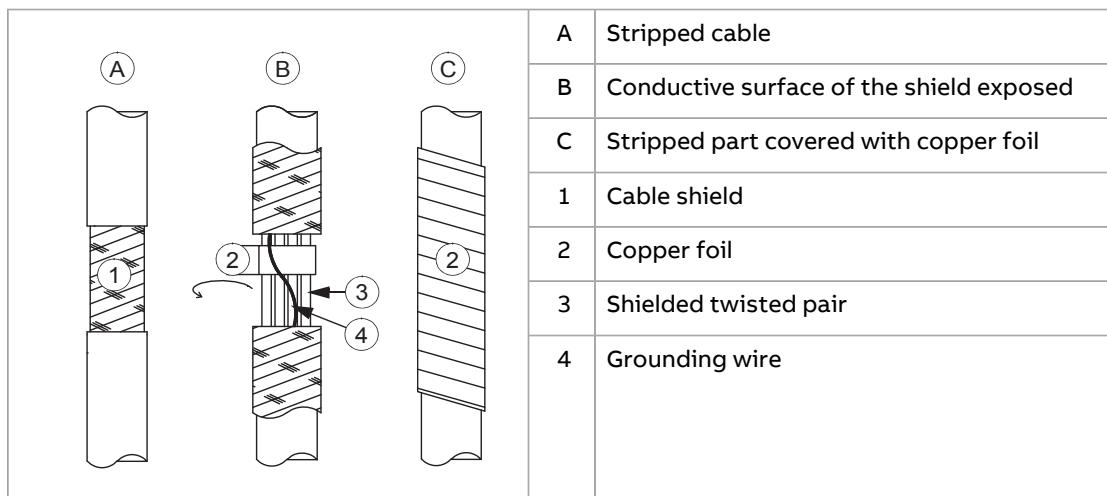

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#).

If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

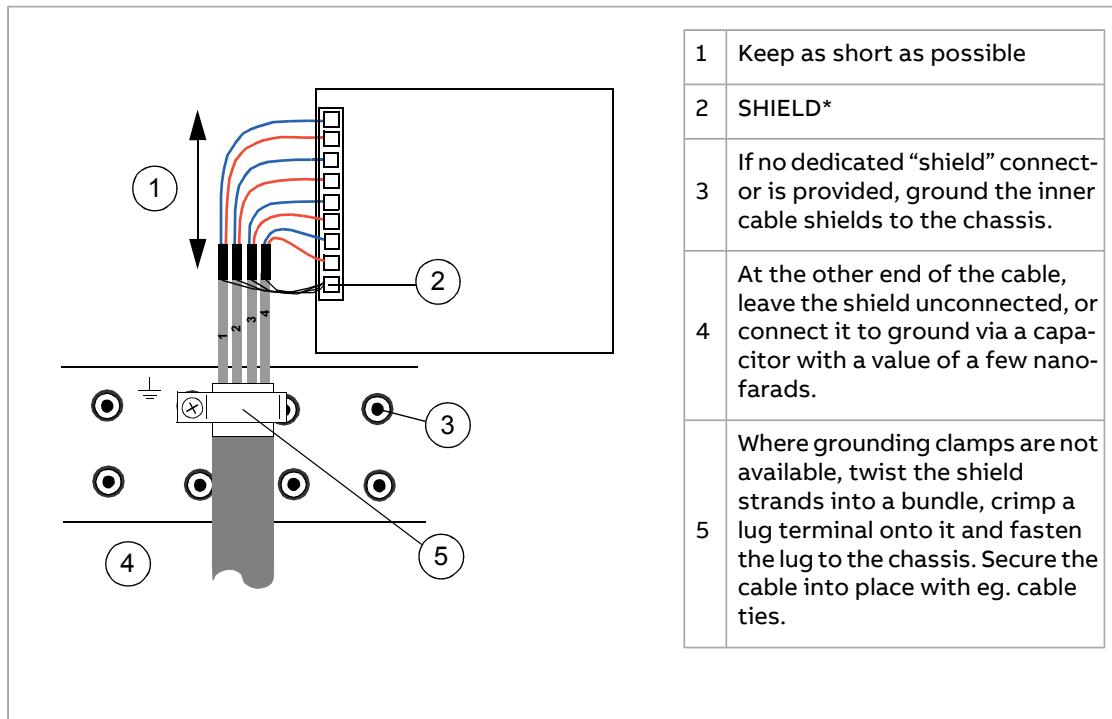

1. Remove shrouding to access the cable entries and trunking inside the cubicle.
2. Run the control cables into the cubicle. If possible, arrange for a 360° grounding of the cable shield at the cable entry.

If the outer surface of the shield is non-conductive, turn the shield inside out as shown below and wrap copper foil around the cable to keep the shielding continuous. Do not cut the grounding wire (if present).

3. Run the cables to the control unit (or other connection point). Use the existing trunking wherever possible.
4. Cut the cables to suitable length.

5. Strip the cable ends and conductors. When connecting to the drive I/O, also remove the shield along with the outer sheathing, and use electrical tape or shrink tubing to contain the strands. Elsewhere, twist the outer shield strands into a bundle, crimp a lug onto it and connect it to the nearest chassis grounding point.

6. Connect the conductors to appropriate terminals.
7. Refit any shrouds removed earlier.

Installing optional modules

■ Installation of I/O extension and fieldbus adapter modules on BCU

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur.

Pay attention to the free space required by the cabling or terminals coming to the option modules.

1. Do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
 2. Pull out the lock (a) with a screw driver.
- Note:** The location of the lock depends on the module type.
3. Install the module to a free option module slot on the control unit.
 4. Push in the lock (a).
 5. Tighten the grounding screw (b) to a torque of 0.8 N·m (7 lbf·in).

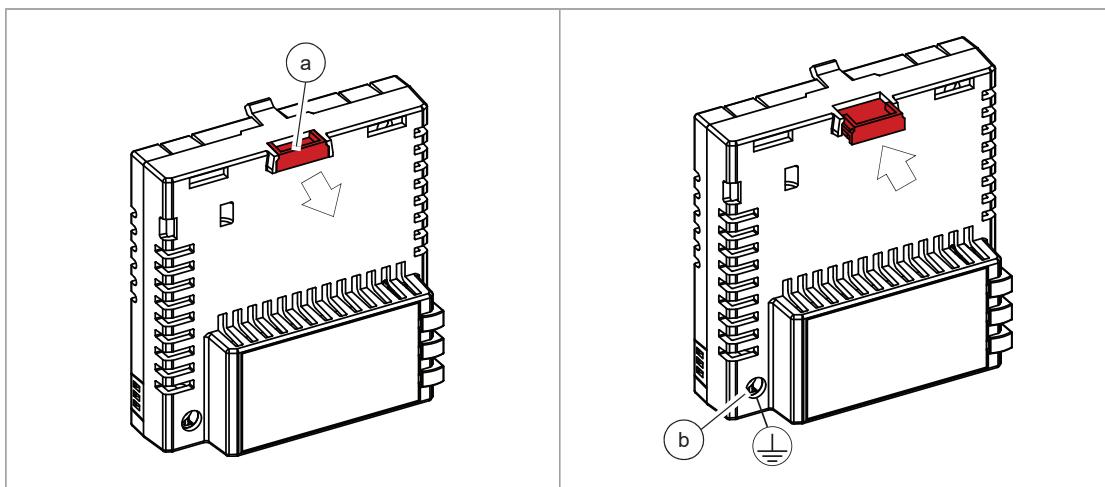

Note: The screw tightens the connections and grounds the module. It is essential for fulfilling the EMC requirements and for proper operation of the module.

WARNING!

Do not use excessive force, or leave the screw too loose. Over-tightening can cause damage to the screw or module. A loose screw can cause an operation failure.

6. Connect the wiring to the module. Obey the instructions given in the documentation of the module.

If you need to remove the option module after it has been installed into the drive, use a suitable tool (e.g. small pliers) to carefully pull out the lock.

■ Installation of an FSO safety functions module to BCU

Installation of an FSO safety functions module onto BCU

WARNING!

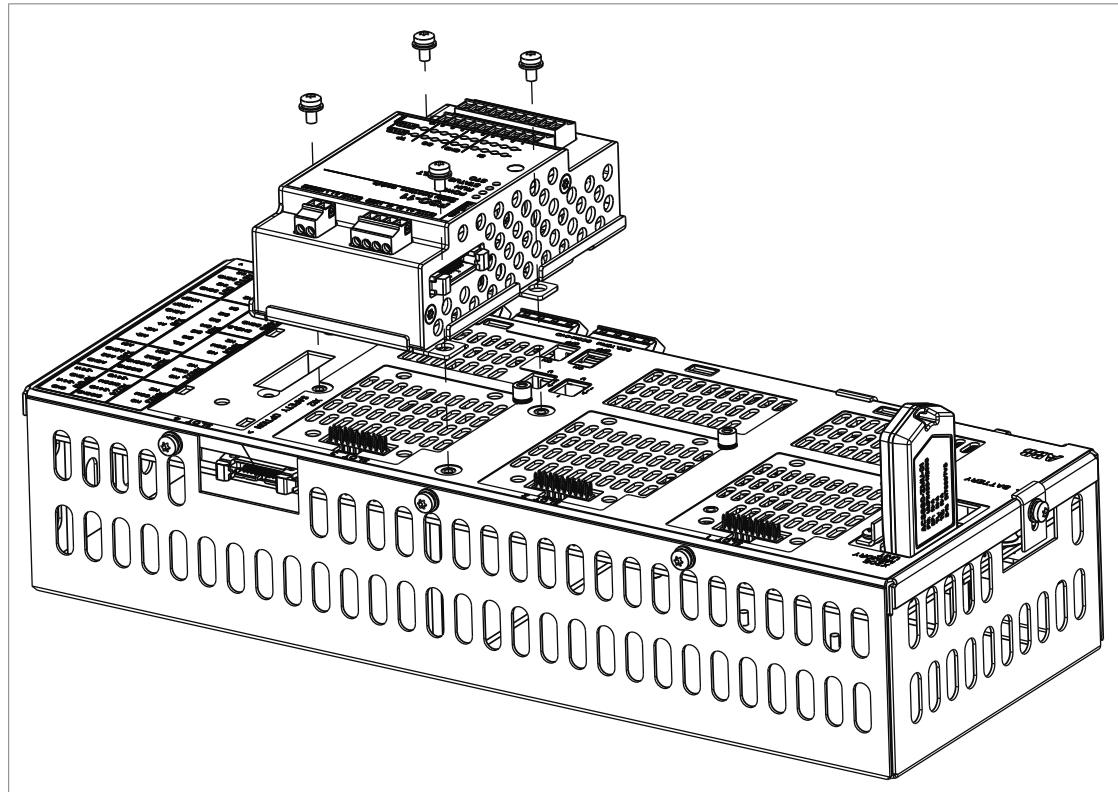

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD5000048633 \[English\]\)](#). If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

This procedure describes the installation of an FSO safety functions module onto the BCU control unit. As an alternative, the FSO module can be installed adjacent to the control unit, which is the standard method for factory-installed FSO modules. For instructions, refer to the applicable FSO module user's manual.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. The FSO module comes with alternative bottom plates for installation onto different control units. For installation onto a BCU control unit, the mounting points should be located at the long edges of the module as shown in the illustration below. If necessary, replace the bottom plate of the FSO module.

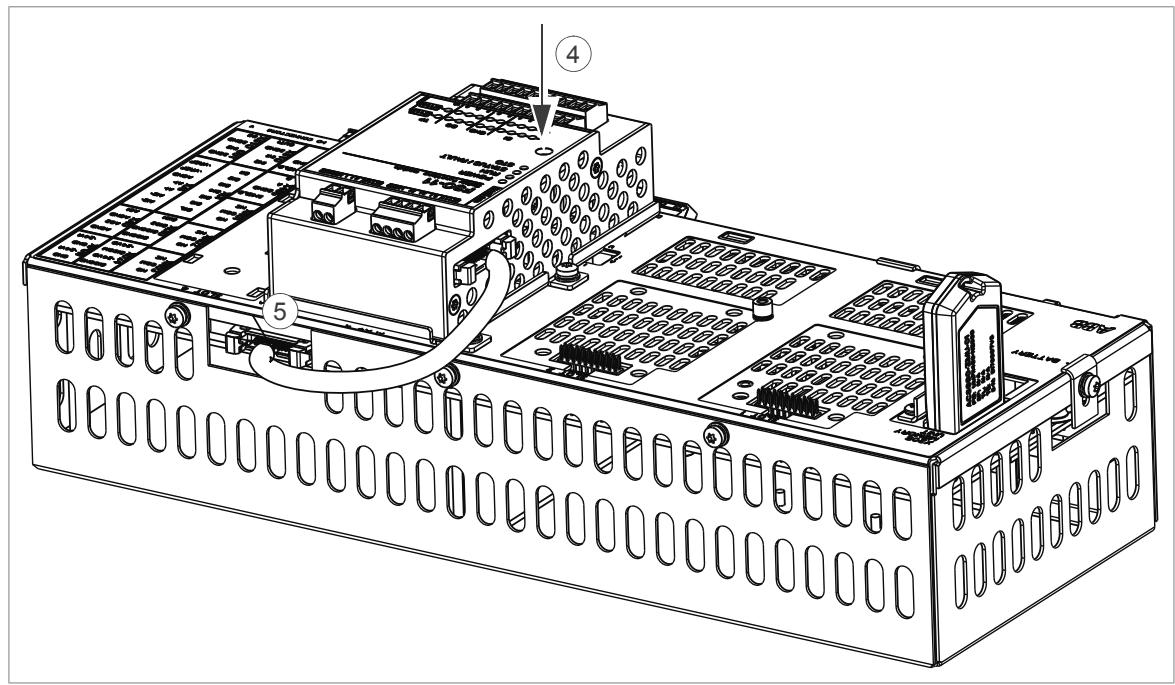

3. Attach the FSO module onto slot 3 of the BCU control unit [A41] with four screws.

4. Torque the FSO module electronics grounding screw to 0.8 N·m (7.1 lbf·in).

Note: The screw tightens the connections and grounds the module. It is essential for fulfilling the EMC requirements and for proper operation of the module.

5. Connect the FSO module data cable between FSO connector X110 and BCU connector X12.
6. To complete the installation, refer to the instructions in the applicable FSO module user's manual.

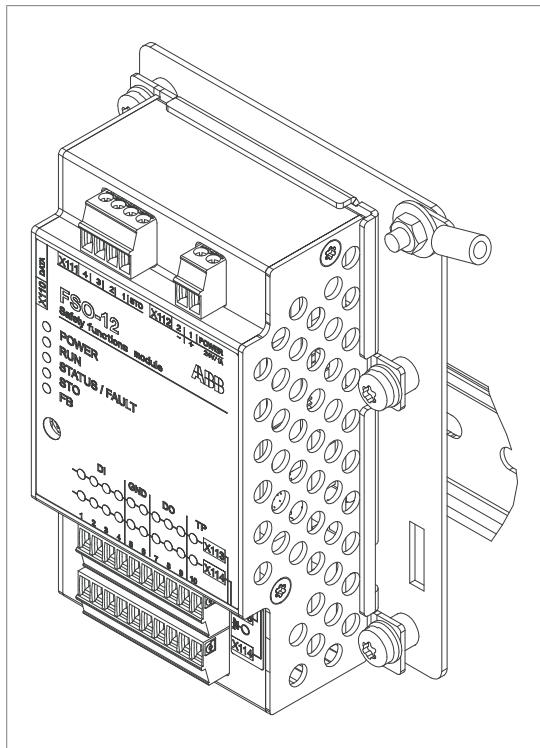

Installation of an FSO safety functions module adjacent to the control unit

To reserve the slots of the control unit for other modules, you can install the FSO module separately from the control unit using mounting kit 3AXD50000025495. The kit contains:

- parts for mounting the FSO module onto a DIN rail nearby the control unit
- longer cables for connecting the FSO module to the control unit
- installation instructions (assembly drawing).

The illustration below shows the FSO module installed onto a DIN rail.

Connecting a PC

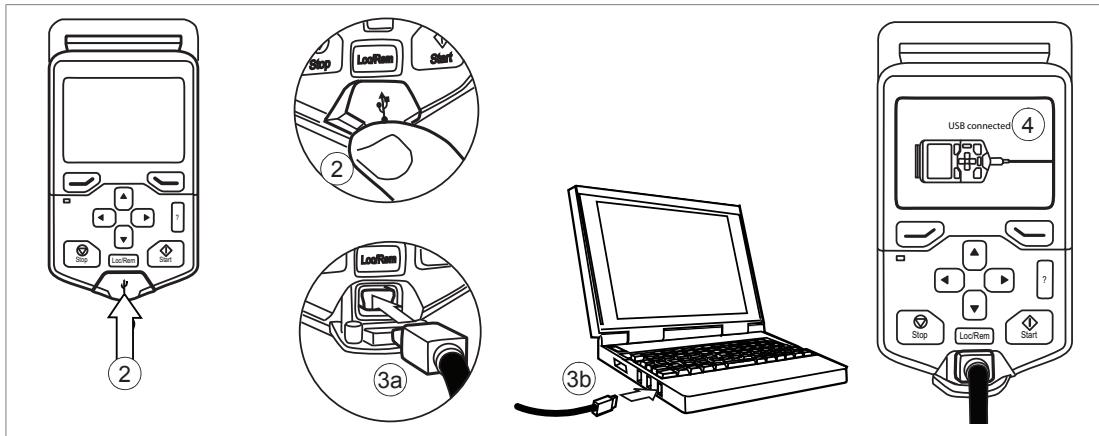

WARNING!

Do not connect the PC directly to the control panel connector of the control unit. It can cause damage.

A PC (with, for example, the Drive Composer PC tool) can be connected as follows:

1. To connect a control panel to the unit, either
 - insert the control panel into the panel holder or platform, or
 - use an Ethernet (eg, Cat 5e) networking cable.
2. Remove the USB connector cover on the front of the control panel.
3. Connect an USB cable (Type A to Type Mini-B) between the USB connector on the control panel (3a) and a free USB port on the PC (3b).
4. The panel will display an indication whenever the connection is active.
5. See the documentation of the PC tool for setup instructions.

Panel bus (Control of several inverter units from one control panel)

One control panel (or PC) can be used to control several drives (or inverter units, supply units etc.) by constructing a panel bus. This is done by daisy-chaining the panel connections of the drives. Some drives have the necessary (twin) panel connectors in the control panel holder; those that do not require the installation of an FDPI-02 module (available separately). For further information, see the hardware description and [FDPI-02 diagnostics and panel interface user's manual \(3AUAA0000113618 \[English\]\)](#).

The maximum allowed length of the cable chain is 100 m (328 ft).

1. Connect the panel to one drive using an Ethernet (for example Cat 5e) cable.
 - Use Menu - Settings - Edit texts - Drive to give a descriptive name to the drive
 - Use parameter 49.01* to assign the drive with a unique node ID number
 - Set other parameters in group 49* if necessary
 - Use parameter 49.06* to validate any changes.

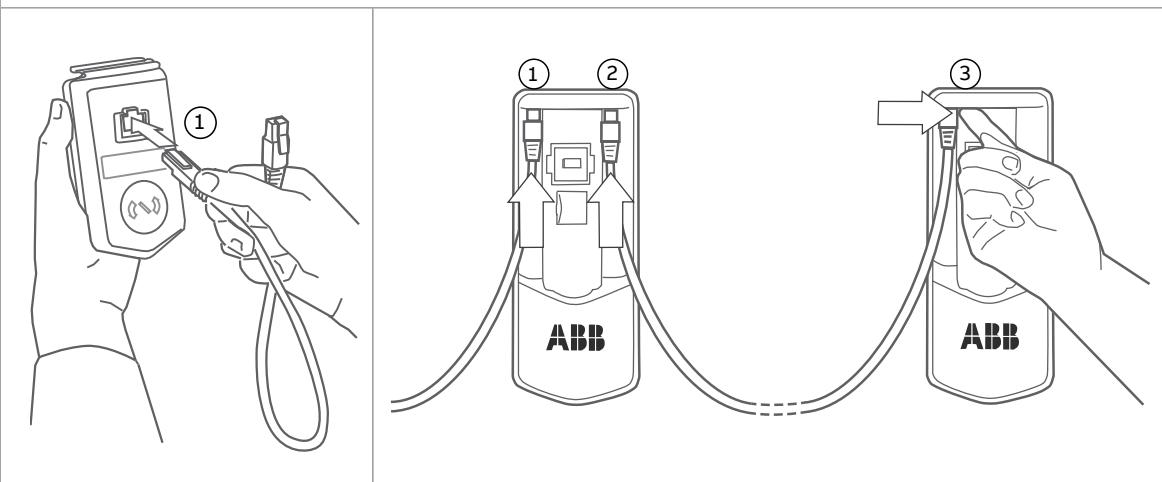

*The parameter group is 149 with supply (line-side), brake or DC/DC converter units.

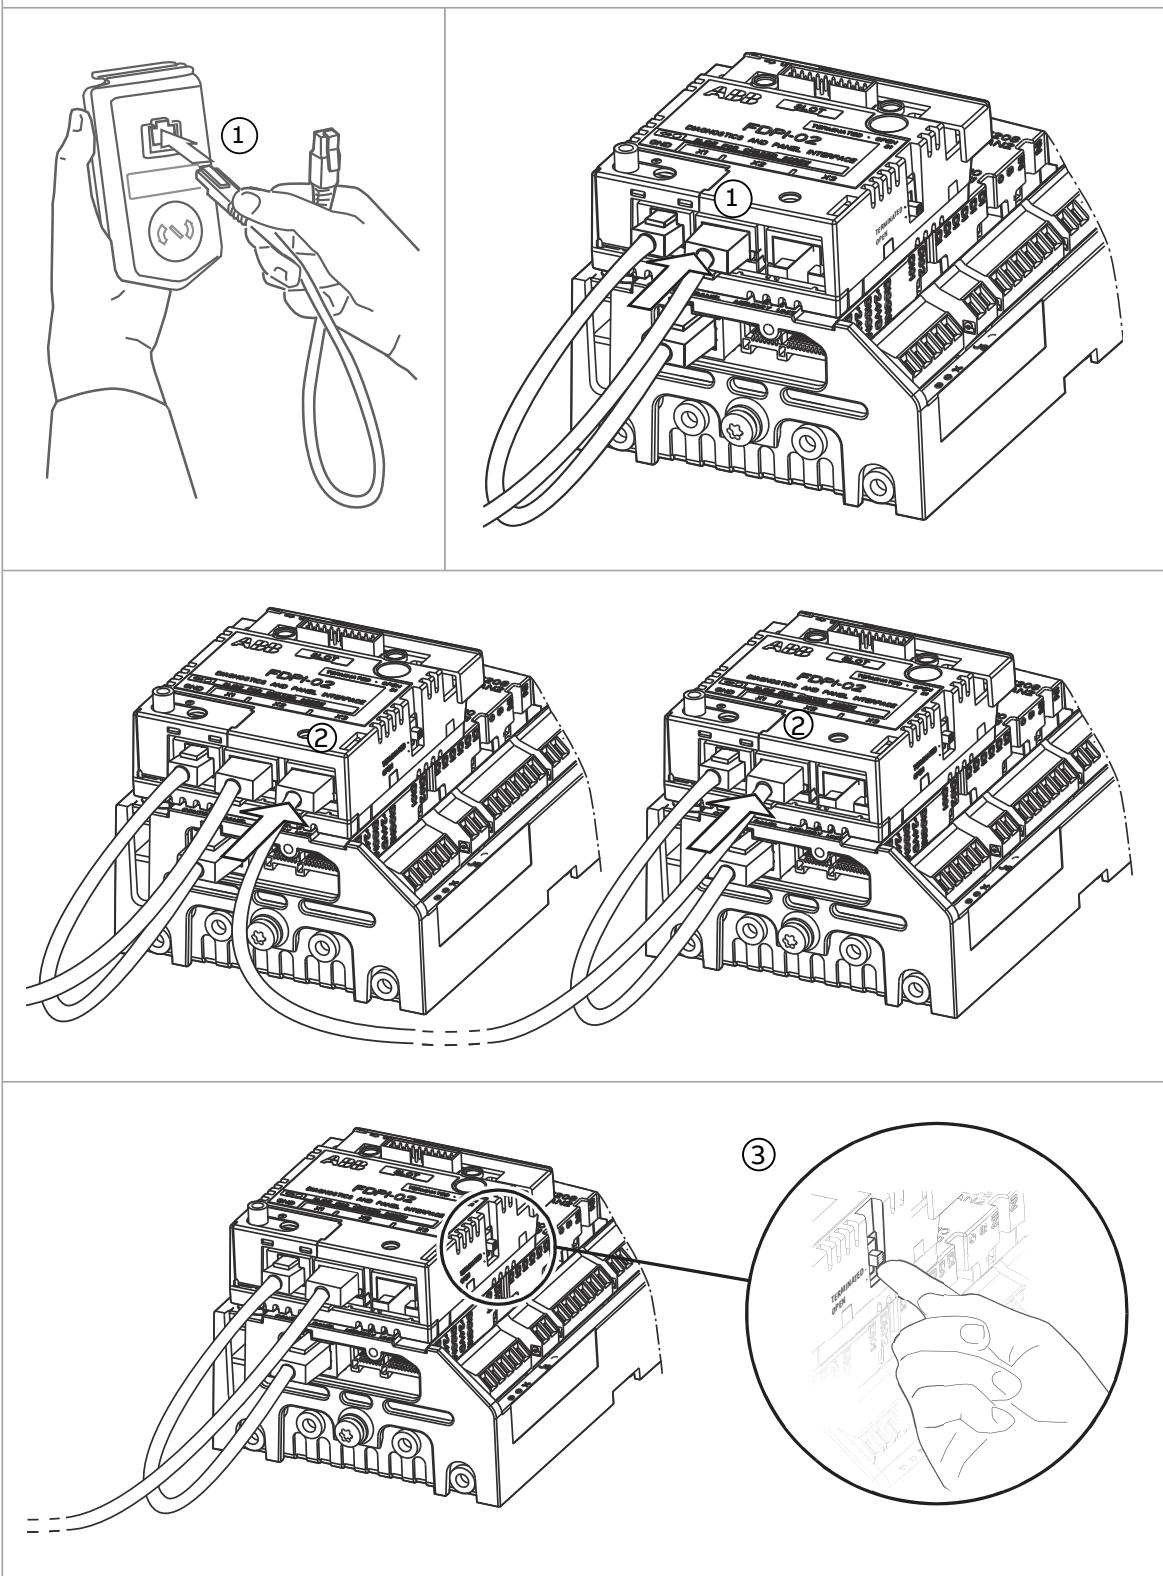

Repeat the above for each drive.

2. With the panel connected to one unit, link the units using Ethernet cables.
 3. Switch on the bus termination on the drive that is farthest from the control panel in the chain.
 - With drives that have the panel mounted on the front cover, move the terminating switch into the outer position.
 - With the FDPI-02 module: move termination switch S1 on the FDPI-02 module into the TERMINATED position.
- Make sure that bus termination is off on all other drives.
4. On the control panel, switch on the panel bus functionality (Options - Select drive - Panel bus). The drive to be controlled can now be selected from the list under Options - Select drive.

If a PC is connected to the control panel, the drives on the panel bus are automatically displayed in the Drive Composer PC tool.

With twin connectors in the control panel holder:

With FDPI-02 modules:

6

Control unit (BCU)

Contents of this chapter

This chapter

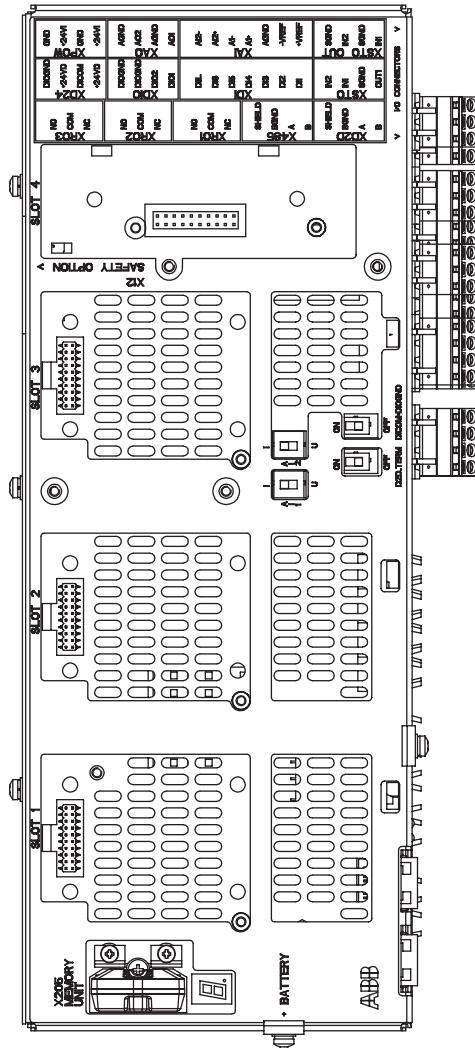

- describes the connections of the control unit(s) used in the drive,
- contains the specifications of the inputs and outputs of the control unit(s).

General

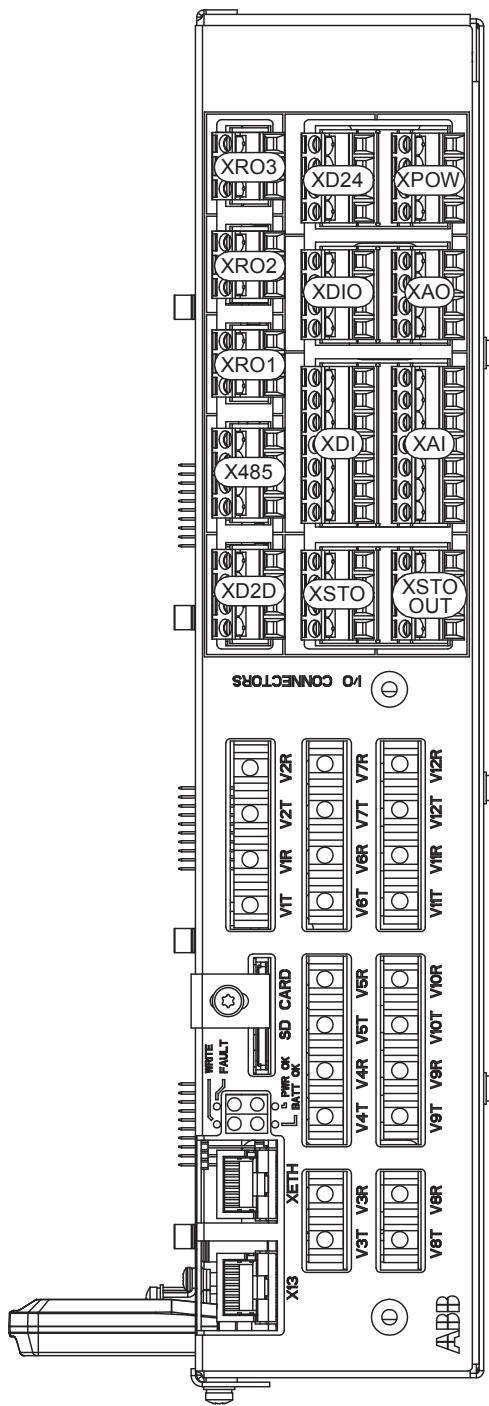

The BCU-x2 is used with frame sizes R7i and R8i in single and parallel configurations. The BCU-x2 consists of a BCON-12 control board (and a BIOC-01 I/O connector board and power supply board) built in a metal housing. The control unit is connected to the inverter module(s) by fiber optic cables.

In this manual, the name “BCU-x2” represents the control unit types BCU-02, BCU-12 and BCU-22. These have a different number of power module connections (2, 7 and 12 respectively) but are otherwise similar.

BCU layout

	Description
I/O	I/O terminals (see following diagram)
SLOT 1	I/O extension, encoder interface or fieldbus adapter module connection. (This is the sole location for an FDPI-02 diagnostics and panel interface.)
SLOT 2	I/O extension, encoder interface or fieldbus adapter module connection
SLOT 3	I/O extension, encoder interface, fieldbus adapter or FSO safety functions module connection
SLOT 4	RDCO DDCS communication option module connection
X205	Memory unit connection
BATTERY	Holder for real-time clock battery (BR2032)
AI1	Mode selector for analog input AI1 (I = current, U = voltage)
AI2	Mode selector for analog input AI2 (I = current, U = voltage)
D2D TERM	Termination switch for drive-to-drive link (D2D)
DICOM= DIOGND	Ground selection. Determines whether DICOM is separated from DIOGND (ie. the common reference for the digital inputs floats). See the ground isolation diagram.
7-segment display	
Multicharacter indications are displayed as repeated sequences of characters	
	("U" is indicated briefly before "o.") Control program running
	Control program startup in progress
	(Flashing) Firmware cannot be started. Memory unit missing or corrupted
	Firmware download from PC to control unit in progress
	At power-up, the display may show short indications of eg. "1", "2", "b" or "U". These are normal indications immediately after power-up. If the display ends up showing any other value than those described, it indicates a hardware failure.

	Description
XAI	Analog inputs
XAO	Analog outputs
XDI	Digital inputs, Digital input interlock (DIIL)
XDIO	Digital input/outputs
XD2D	Drive-to-drive link
XD24	+24 V output (for digital inputs)
XETH	Ethernet port – Not in use
XPOW	External power input
XRO1	Relay output RO1
XRO2	Relay output RO2
XRO3	Relay output RO3
XSTO	Safe torque off connection (input signals)
XSTO OUT	Safe torque off connection (to inverter modules)
X12	(On the opposite side) Connection for FSO safety functions module (optional)
X13	Control panel / PC connection
X485	Not in use by default
V1T/V1R, V2T/V2R	Fiber optic connection to modules 1 and 2 (VxT = transmitter, VxR = receiver)
V3T/V3R ... V7T/V7R	Fiber optic connection to modules 3...7 (BCU-12/22 only) (VxT = transmitter, VxR = receiver)
V8T/V8R ... V12T/V12R	Fiber optic connection to modules 8...12 (BCU-22 only) (VxT = transmitter, VxR = receiver)
SD CARD	Data logger memory card for inverter module communication
BATT OK	Real-time clock battery voltage is higher than 2.8 V. If the LED is off when the control unit is powered, replace the battery.
FAULT	The control program has generated a fault. See the firmware manual of the supply/inverter unit.
PWR OK	Internal voltage supply is OK
WRITE	Writing to memory card in progress. Do not remove the memory card.

Default I/O diagram of the inverter control unit (BCU)

The table below describes the use of the connections in the inverter unit.

The wire size accepted by all screw terminals (for both stranded and solid wire) is 0.5 ... 2.5 mm² (22...12 AWG). The tightening torque is 0.45 N·m (4 lbf·in).

Terminal			Description
XD2D			Drive-to-drive link
1	1	B	Drive-to-drive link. Refer to section The XD2D connector (page 160) .
2	2	A	
3	3	BGND	
4	4	Shield	
OF	D2D.TERM		Drive-to-drive link termination switch. Must be set to ON when the inverter unit is the first or last unit in the drive-to-drive (D2D) link. On intermediate units, set termination to OFF.
X485			RS485 connection
5	5	B	Not in use by default
6	6	A	
7	7	BGND	
8	8	Shield	
XRO1, XRO2, XRO3			Relay outputs
11	11	NC	Norm. closed
12	12	COM	Common
13	13	NO	Norm. open
21	21	NC	Norm. closed
22	22	COM	Common
23	23	NO	Norm. open
31	31	NC	Norm. closed
32	32	COM	Common
33	33	NO	Norm. open
XSTO, XSTO OUT			Safe torque off
1	1	OUT	XSTO: Factory connection. Both circuits must be closed for the drive to start (IN1 and IN2 must be connected to OUT). Refer to chapter The Safe torque off function .
2	2	SGND	
3	3	IN1	
4	4	IN2	
5	5	IN1	
6	6	SGND	
7	7	IN2	
8	8	SGND	
XDI			Digital inputs

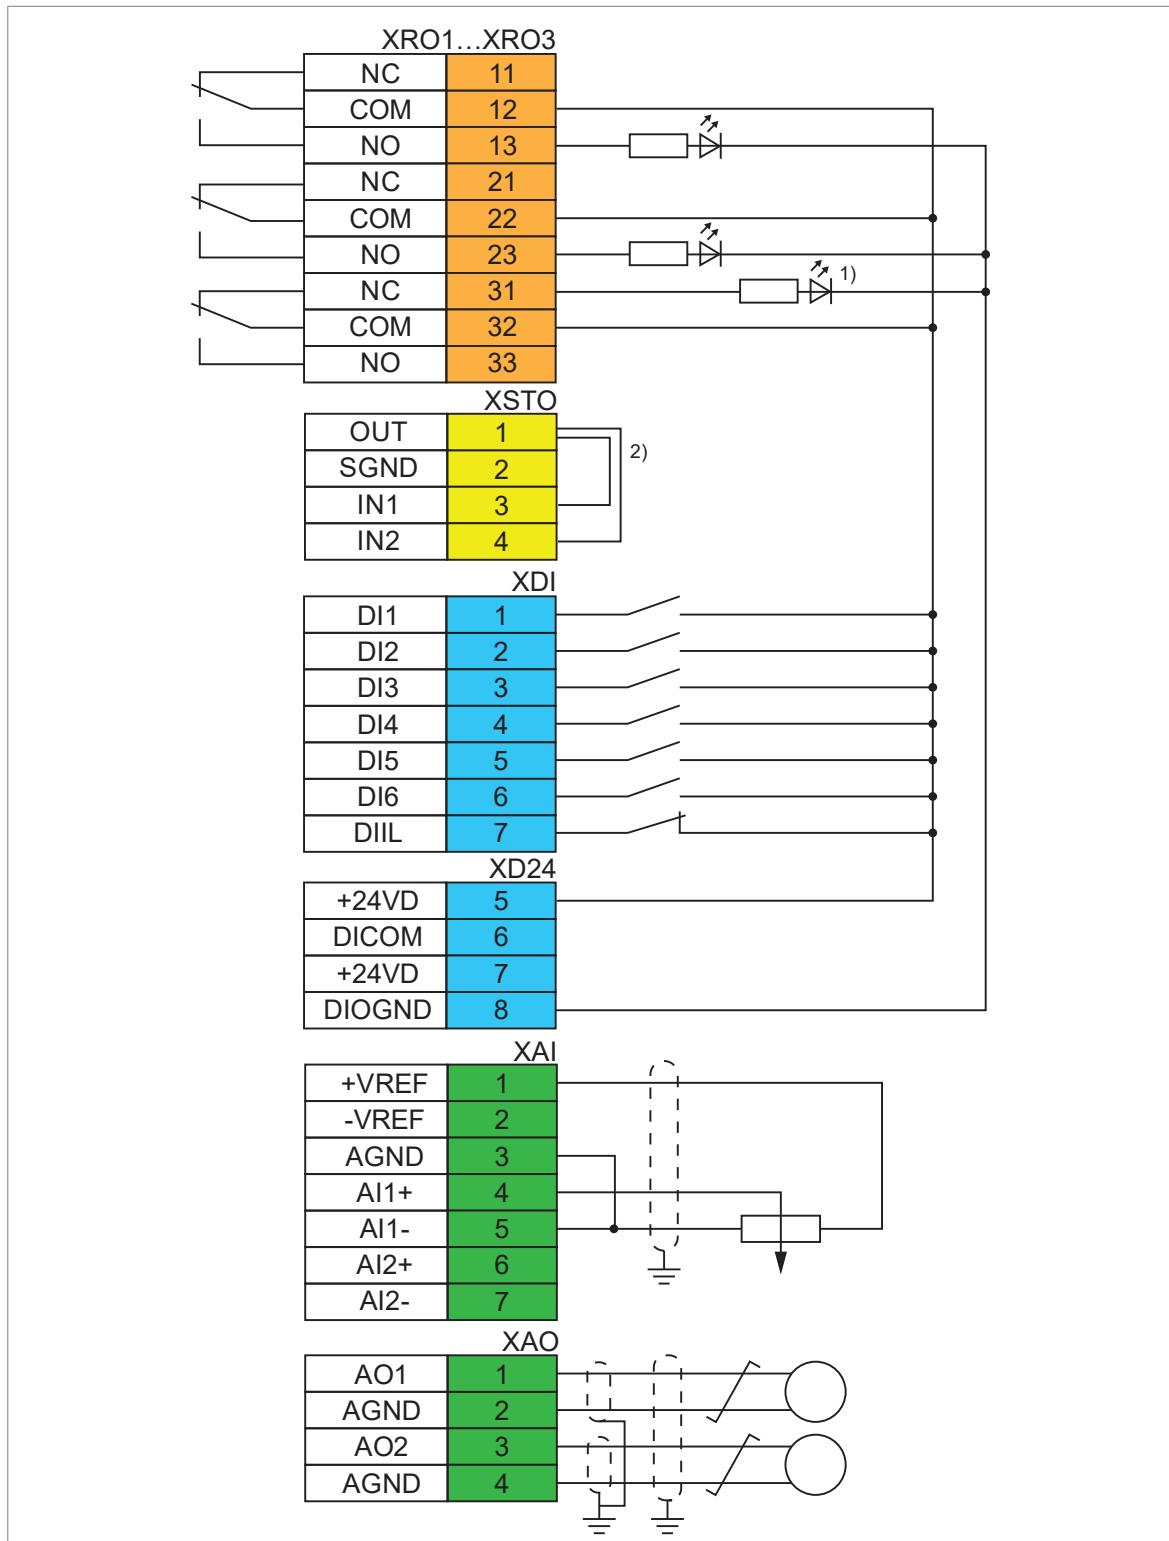

Terminal			Description
1 2 3 4 5 6 7	1	DI1	Stop (0) / Start (1)
	2	DI2	Forward (0) / Reverse (1)
	3	DI3	Reset
	4	DI4	Acceleration & deceleration select ¹⁾
	5	DI5	Constant speed 1 select (1 = on) ²⁾
	6	DI6	Not in use by default.
	7	DIIL	Run enable ³⁾
XDIO			Digital input/outputs
1 2 3 4	1	DIO1	Output: Ready
	2	DIO2	Output: Running
	3	DIOGND	Digital input/output ground
	4	DIOGND	Digital input/output ground
XD24			Auxiliary voltage output
5 6 7 8	5	+24VD	+24 V DC 200 mA ⁴⁾
	6	DICOM	Digital input ground
	7	+24VD	+24 V DC 200 mA ⁴⁾
	8	DIOGND	Digital input/output ground
±  O	DICOM=DIOGND		Ground selection switch. Determines whether DICOM is separated from DIOGND (ie, common reference for digital inputs floats). ON: DICOM connected to DIOGND. OFF: DICOM and DIOGND separate.
XAI			Analog inputs, reference voltage output
1 2 3 4 5 6 7	1	+VREF	10 V DC, R_L 1 ... 10 kohm
	2	-VREF	-10 V DC, R_L 1 ... 10 kohm

158 Control unit (BCU)

Terminal	Description
X205	Memory unit connection

- 1) 0 = Acceleration/deceleration ramps defined by parameters 23.12/23.13 in use.
1 = Acceleration/deceleration ramps defined by parameters 23.14/23.15 in use.
- 2) Constant speed 1 is defined by parameter 22.26.
- 3) The DIIL input is configured to stop the unit when the input signal is removed. This input does not have a SIL or PL classification.
- 4) Total load capacity of these outputs is 4.8 W (200 mA at 24 V) minus the power taken by DIO1 and DIO2.
- 5) Current [0(4)...20 mA, $R_{in} = 100 \text{ ohm}$] or voltage [0(2)...10 V, $R_{in} > 200 \text{ kohm}$] input selected by switch AI1. Change of setting requires reboot of control unit.
- 6) Current [0(4)...20 mA, $R_{in} = 100 \text{ ohm}$] or voltage [0(2)...10 V, $R_{in} > 200 \text{ kohm}$] input selected by switch AI2. Change of setting requires reboot of control unit.

The diagram below shows the default I/O connections on the inverter control unit (A41).

1) Fault

2) If necessary, you can connect a safety device (for example, a safety relay) to the XSTO terminal. Refer to chapter [The Safe torque off function](#).

Additional information on the connections

■ Power supply for the control unit (XPOW)

The control unit is powered from a 24 V DC, 2 A supply through terminal block XPOW.

A second supply can be connected to the same terminal block for redundancy. Use a second supply, if:

- the control unit must be kept operational during input power breaks, for example, because of continuous fieldbus communication
- immediate restart is necessary after a power break (that is, no control unit power-up delay is permitted).

■ DIIL input

The DIIL input is used for the connection of safety circuits. The input is parametrized to stop the unit when the input signal is lost.

Note: This input is **not** SIL or PL classified.

■ The XD2D connector

The XD2D connector provides an RS-485 connection that can be used for

- basic master/follower communication with one master drive and multiple followers,
- fieldbus control through the embedded fieldbus interface (EFB), or
- drive-to-drive (D2D) communication implemented by application programming.

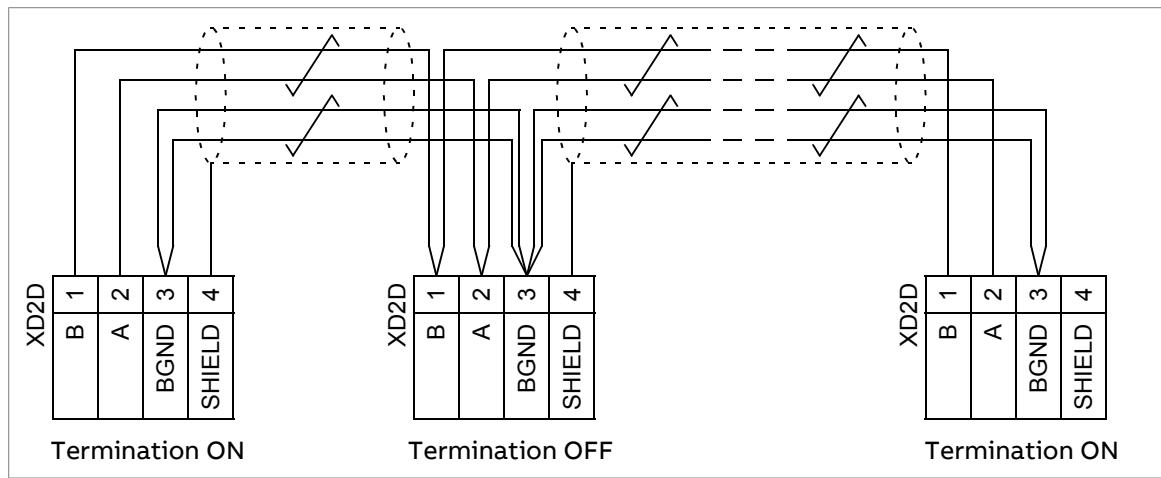

See the firmware manual of the drive for the related parameter settings.

Terminate the bus on the units at the ends of the drive-to-drive link. Disable bus termination on the intermediate units.

Use a shielded twisted-pair cable for data, and another pair or a wire for signal ground (nominal impedance 100...165 ohm, for example Belden 9842). For the best immunity, ABB recommends high quality cable. Keep the cable as short as possible. Avoid unnecessary loops and parallel runs near power cables such as motor cables.

The diagram that follows shows the wiring of the drive-to-drive link. The diagram is applicable to these control units:

- BCU-02/12/22

■ Safe torque off (XSTO, XSTO OUT)

See chapter [The Safe torque off function \(page 289\)](#).

Note: The XSTO input only acts as a true Safe torque off input on the inverter control unit. De-energizing the STO input terminals of other units (supply, DC/DC converter, or brake unit) will stop the unit but not constitute a SIL/PL classified safety function.

■ FSO safety functions module connection (X12)

Refer to the applicable FSO module user's manual. Note that the FSO safety functions module is not used in supply, DC/DC converter or brake units.

Note: Inverter modules and control units that have a sticker with the text "No FSO support" are not compatible with the FSO safety functions module.

■ SDHC memory card slot

The BCU control unit has an on-board data logger that collects real-time data from the power modules to help fault tracing and analysis. The data is stored onto the SDHC memory card inserted into the SD CARD slot and can be analyzed by ABB service personnel.

Connector data

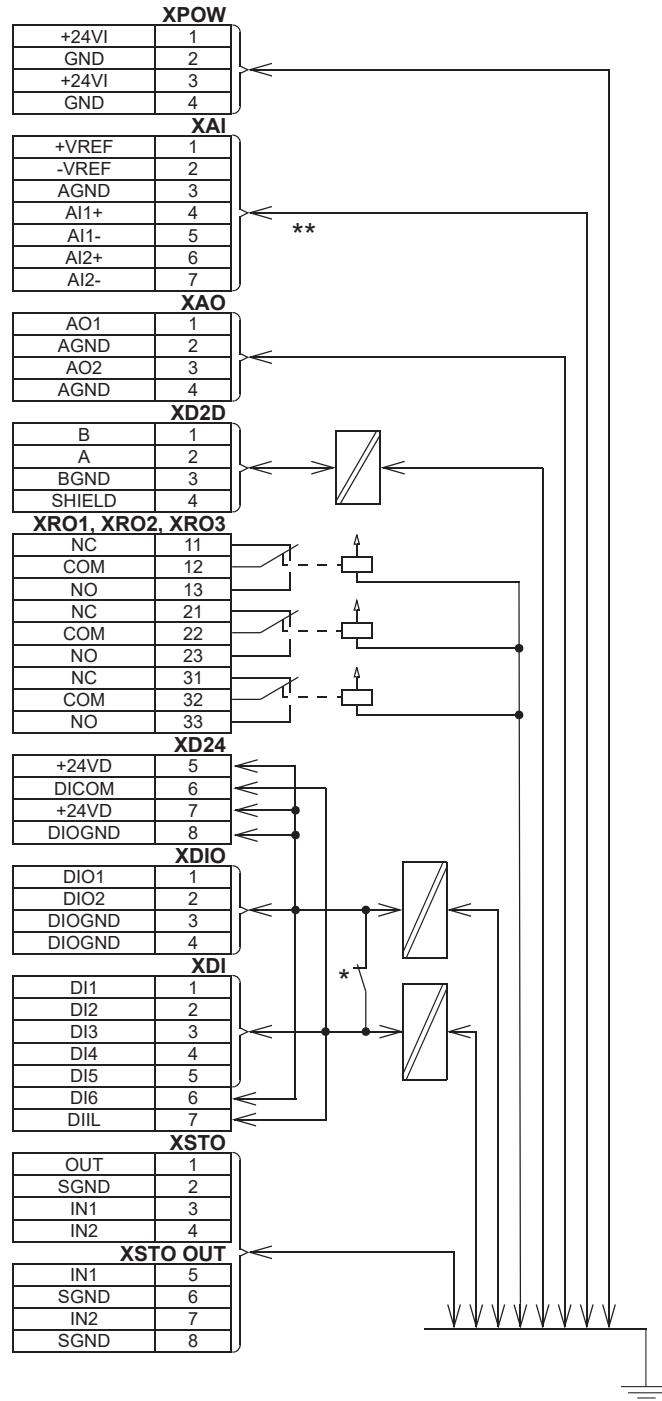

The wire size accepted by all screw terminals (for both stranded and solid wire) is 0.5 ... 2.5 mm² (22...12 AWG). Connector pitch is 5 mm.

The maximum tightening torque for screw terminals is 0.45 N·m (4 lbf·in)

Power supply (XPOW)	24 V ($\pm 10\%$) DC, 2 A External power input. Two supplies can be connected to the BCU control unit for redundancy.
Relay outputs RO1...RO3 (XRO1...XRO3)	250 V AC / 30 V DC, 2 A Protected by varistors
+24 V output (XD24:5 and XD24:7)	Total load capacity of these outputs is 4.8 W (200 mA / 24 V) minus the power taken by DIO1 and DIO2.
Digital inputs DI1...DI6 (XDI:1...XDI:6)	24 V logic levels: "0" < 5 V, "1" > 15 V R_{in} : 2.0 kohm Input type: NPN/PNP (DI1...DI5), PNP (DI6) Hardware filtering: 0.04 ms, digital filtering up to 8 ms I_{max} : 15 mA (DI1...DI5), 5 mA (DI6)
Start interlock input DIIL (XDI:7)	24 V logic levels: "0" < 5 V, "1" > 15 V R_{in} : 2.0 kohm Input type: NPN/PNP Hardware filtering: 0.04 ms, digital filtering up to 8 ms
Digital inputs/outputs DIO1 and DIO2 (XDIO:1 and XDIO:2) Input/output mode selection by parameters. DIO1 can be configured as a frequency input (0...16 kHz with hardware filtering of 4 microseconds) for 24 V level square wave signal (sinusoidal or other wave form cannot be used). In some control programs, DIO2 can be configured as a 24 V level square wave frequency output. Refer to the firmware manual, parameter group 11.	<u>As inputs:</u> 24 V logic levels: "0" < 5 V, "1" > 15 V. R_{in} : 2.0 kohm. Filtering: 1 ms. <u>As outputs:</u> Total output current from +24VD is limited to 200 mA
Reference voltage for analog inputs +VREF and -VREF (XAI:1 and XAI:2)	10 V $\pm 1\%$ and -10 V $\pm 1\%$, R_{load} 1...10 kohm Maximum output current: 10 mA
Analog inputs AI1 and AI2 (XAI:4 ... XAI:7). Current/voltage input mode selection by switches	Current input: -20...20 mA, $R_{in} = 100$ ohm Voltage input: -10...10 V, $R_{in} > 200$ kohm Differential inputs, common mode range ± 30 V Sampling interval per channel: 0.25 ms Hardware filtering: 0.25 ms Resolution: 11 bit + sign bit Inaccuracy: 1% of full scale range
Analog outputs AO1 and AO2 (XAO)	0...20 mA, $R_{load} < 500$ ohm Frequency range: 0...500 Hz Resolution: 11 bit + sign bit Inaccuracy: 2% of full scale range

XD2D connector	<p>Physical layer: RS-485</p> <p>Transmission rate: 8 Mbit/s</p> <p>Cable type: Shielded twisted-pair cable with a twisted pair for data and a wire or another pair for signal ground (nominal impedance 100 ... 165 ohm, for example Belden 9842)</p> <p>Maximum length of link: 50 m (164 ft)</p> <p>Termination by switch</p>
RS-485 connection (X485)	<p>Physical layer: RS-485</p> <p>Cable type: Shielded twisted-pair cable with a twisted pair for data and a wire or another pair for signal ground (nominal impedance 100 ... 165 ohm, for example Belden 9842)</p> <p>Maximum length of link: 50 m (164 ft)</p>
Safe torque off connection (XSTO)	<p>Input voltage range: -3...30 V DC</p> <p>Logic levels: "0" < 5 V, "1" > 17 V.</p> <p>Note: For the unit to start, both connections must be "1". This applies to all control units (including drive, inverter, supply, brake, DC/DC converter etc. control units), but SIL/PL classified Safe torque off functionality is only achieved through the XSTO connector of the drive/inverter control unit.</p> <p>Current consumption: 66 mA (continuous) per STO channel per inverter module</p> <p>Current consumption: 66 mA (continuous) per STO channel per drive/inverter module</p> <p>EMC (immunity) according to IEC 61326-3-1 and IEC 61800-5-2</p> <p>See also chapter The Safe torque off function (page 289).</p>
Safe torque off output (XSTO OUT)	To STO connector of inverter module.
Control panel connection (X13)	<p>Connector: RJ-45</p> <p>Cable length < 100 m (328 ft)</p>
Ethernet connection (XETH)	<p>Connector: RJ-45</p> <p>This connection is not supported by the firmware</p>
SDHC memory card slot (SD CARD)	<p>Memory card type: SDHC</p> <p>Maximum memory size: 4 GB</p>
Battery	Real-time clock battery type: BR2032
The terminals of the control unit fulfill the Protective Extra Low Voltage (PELV) requirements. The PELV requirements of a relay output are not fulfilled if a voltage higher than 48 V is connected to the relay output.	

■ BCU ground isolation diagram

*Ground selector (DICOM=DIOGND) settings

DICOM=DIOGND: ON

All digital inputs share a common ground (DICOM connected to DIOGND). This is the default setting.

DICOM=DIOGND: OFF

Ground of digital inputs DI1...DI5 and DIIL (DICOM) is isolated from DIO signal ground (DIOGND). Isolation voltage 50 V.

**The maximum common mode voltage between each AI input and AGND is +30 V

7

Installation checklist

Contents of this chapter

This chapter contains a checklist for the mechanical and electrical installation of the drive.

Checklist

Examine the mechanical and electrical installation of the drive before start-up. Go through the checklist together with another person.

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

WARNING!

Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.

Make sure that ...	<input checked="" type="checkbox"/>
The ambient operating conditions meet the drive ambient conditions specification and enclosure rating (IP code).	<input type="checkbox"/>
The supply voltage matches the nominal input voltage of the drive. See the type designation label.	<input type="checkbox"/>
The insulation resistance of the input power cable, motor cable and motor is measured according to local regulations and the manuals of the drive.	<input type="checkbox"/>
The drive cabinet is attached to the floor, and if necessary due to vibration etc, also by its top to the wall or roof.	<input type="checkbox"/>
The drive module is fastened properly to the enclosure.	<input type="checkbox"/>

Make sure that ...	<input checked="" type="checkbox"/>
If the drive is connected to a network other than a symmetrically grounded TN-S system: You have done all the required modifications (for example, you may need to disconnect the EMC filter or ground-to-phase varistor) See the electrical installation instructions in the supply unit manual.	<input type="checkbox"/>
The enclosures of the equipment in the cabinet have proper galvanic connection to the cabinet protective earth (ground) busbar; The connection surfaces at the fastening points are bare (un-painted) and the connections are tight, or separate grounding conductors have been installed.	<input type="checkbox"/>
The main circuit connections inside the drive cabinet correspond to the circuit diagrams.	<input type="checkbox"/>
The control unit has been connected. See the circuit diagrams.	<input type="checkbox"/>
Appropriate AC fuses and main disconnecting device are installed.	<input type="checkbox"/>
There is an adequately sized protective earth (ground) conductor(s) between the drive and the switchboard, the conductor is connected to correct terminal, and the terminal is tightened to the correct torque.	<input type="checkbox"/>
Grounding has also been measured according to the regulations.	<input type="checkbox"/>
If the drive is equipped with a DC/DC converter unit: There is an adequately sized protective earth (ground) conductor between the energy storage and the DC/DC converter, the conductor is connected to the correct terminal, and the terminal is tightened to the correct torque. Proper grounding has also been measured according to the regulations.	<input type="checkbox"/>
If the drive is equipped with a DC/DC converter unit: The energy storage cable is connected to the correct terminals of the DC/DC converter and energy storage, and the terminals are tightened to the correct torque.	<input type="checkbox"/>
If the drive is equipped with a DC/DC converter unit: The energy storage is equipped with fuses for protecting the energy storage cable in a cable short-circuit situation.	<input type="checkbox"/>
If the drive is equipped with a DC/DC converter unit: The energy storage is equipped with a disconnecting device.	<input type="checkbox"/>
The input power cable is connected to the correct terminals, the phase order is correct, and the terminals are tightened to the correct torque.	<input type="checkbox"/>
There is an adequately sized protective earth (ground) conductor between the motor and the drive. The conductor is connected to the correct terminal, and the terminal is tightened to the correct torque.	<input type="checkbox"/>
Grounding has also been measured according to the regulations.	<input type="checkbox"/>
The motor cable is connected to the correct terminals, the phase order is correct, and the terminals are tightened to the correct torque.	<input type="checkbox"/>
The motor cable is routed away from other cables.	<input type="checkbox"/>
No power factor compensation capacitors are connected to the motor cable.	<input type="checkbox"/>
If an external brake resistor is connected to the drive: There is an adequately sized protective earth (ground) conductor between the brake resistor and the drive, and the conductor is connected to the correct terminal, and the terminals are tightened to the correct torque. Grounding has also been measured according to the regulations.	<input type="checkbox"/>
If an external brake resistor is connected to the drive: The brake resistor cable is connected to the correct terminals, and the terminals are tightened to the correct torque.	<input type="checkbox"/>
If an external brake resistor is connected to the drive: The brake resistor cable is routed away from other cables.	<input type="checkbox"/>
The control cables are connected to the correct terminals, and the terminals are tightened to the correct torque.	<input type="checkbox"/>
If a drive bypass connection will be used: The direct-on-line contactor of the motor and the drive output contactor are either mechanically and/or electrically interlocked, that is, they cannot be closed at the same time. A thermal overload device must be used for protection when bypassing the drive. Refer to local codes and regulations.	<input type="checkbox"/>
There are no tools, foreign objects or dust from drilling inside the drive.	<input type="checkbox"/>
The terminal box cover of the motor is in place. Cabinet shrouds are in place and doors are closed.	<input type="checkbox"/>
The motor and the driven equipment are ready for power-up.	<input type="checkbox"/>

Make sure that ...	<input checked="" type="checkbox"/>
The coolant connections between cubicles (if any) and to the cooling circuit are tight.	<input type="checkbox"/>
If the drive is equipped with a cooling unit: Make sure that the mechanical and electrical installation of the cooling unit is completed. Refer to the cooling unit documentation.	<input type="checkbox"/>

8

Start-up

Contents of this chapter

This chapter contains the start-up procedure of the inverter.

Note: These instructions do not cover all possible cabinet constructions. Always refer to the delivery-specific circuit diagrams when proceeding with the start-up.

Note: The customer is fully responsible for implementing and testing the functional safety circuits according to the relevant legislation and acceptance testing regulations. The functional safety option manuals give examples on implementing the safety circuits in ACS880 multidrives. For information on the Safe torque off functions, see chapter [The Safe torque off function \(page 289\)](#).

Start-up procedure

Tasks	<input checked="" type="checkbox"/>
Safety	<input type="checkbox"/>
 WARNING! Obey the safety instructions during the start-up procedure. See ACS880 liquid-cooled multidrives cabinets and modules safety instructions (3AXD50000048633 [English]) . If you ignore the safety instructions, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation or maintenance work.	<input type="checkbox"/>
Checks/Settings with no voltage connected	
Examine the mechanical and electrical installation. Refer to chapter Installation checklist .	<input type="checkbox"/>
The insulation resistance of the motor and motor cable has been measured.	<input type="checkbox"/>
The supply unit of the drive system has been set up according to the instructions in its manuals.	<input type="checkbox"/>
The supply unit is off, and the drive system has been isolated from the supply network.	<input type="checkbox"/>

Tasks	<input checked="" type="checkbox"/>
Set the parameters for each inverter unit. Refer to the firmware manual and/or start-up guide of the control program. You can also use the start-up assistant if available in the particular control program.	<input type="checkbox"/>
In addition to the parameter settings required by the application, make the following settings:	<input type="checkbox"/>
<ul style="list-style-type: none"> • Set parameter 31.23 Wiring or earth fault to value No action. • Set parameter 95.04 Control board supply according to how the inverter control unit is powered. • Edit parameter 95.09 Fuse switch control if necessary (ie. with R8i modules without a DC switch-disconnector and charging controller). • With parallel-connected inverter modules, select the inverter unit type with parameter 95.31 Parallel type configuration. You can filter the list using parameter 95.30. • Reboot the control unit. You can cycle the power or use parameter 96.08 Control board boot. 	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
Powering up the inverter unit	
Close the cabinet doors.	<input type="checkbox"/>
Make sure that it is safe to connect voltage to the drive system.	<input type="checkbox"/>
Make sure that:	
<ul style="list-style-type: none"> • nobody is working on the unit or circuits that have been wired from outside into the cabinets • the cover of the motor terminal box is installed. 	
Close the main disconnecting device of the drive system.	<input type="checkbox"/>
 WARNING! When connecting voltage to the supply unit, the DC busbars and all inverters connected to the DC bus will become energized.	
 WARNING! <u>Inverter units with a DC switch-disconnector:</u> Some types of inverter module can be energized through a charging circuit even when the DC switch-disconnector is open or the DC fuses are removed. <u>Inverter units without a DC switch-disconnector:</u> If the inverter unit only has DC fuses without a switch fuse, all the inverter units with the DC fuses in place will be energized when the main breaker/contactor closes. To prevent this, remove the fuses from the inverter units which are to remain unenergized before connecting voltage. When the main breaker/contactor of the supply unit is closed (DC busbars are live), never remove or insert the DC fuses of an inverter unit.	
<u>Inverter units equipped with DC switch-disconnector (or fuse disconnectors):</u>	<input type="checkbox"/>
Close the DC switch-disconnector (or fuse disconnectors) of the inverter units that are to be powered up.	
Note: Inverter units that have a manually-operated charging circuit (charging switch) should be connected to a live DC bus later during the procedure.	
 WARNING! Before closing the main contactor/breaker, make sure that sufficient inverter power is connected to the intermediate (DC) bus. As a rule of thumb, <ul style="list-style-type: none"> • the sum power of the inverters connected must be at least 30% of the sum power of all inverters • the sum power of the inverters connected must be at least 30% of the rated power of the brake unit ($P_{br,max}$) (if present). If the above-mentioned rules are not followed, the DC fuses of the connected inverter units can blow, or the brake chopper (if present) can be damaged.	<input type="checkbox"/>
Close the main contactor (or breaker) of the supply unit.	<input type="checkbox"/>
The DC bus is now powered, along with all inverters and other units that are directly connected to it.	

Tasks	<input checked="" type="checkbox"/>
Inverter units equipped with a charging switch: Close the charging switch. Wait for the charging to finish (indicated by a "charging OK" light if the wiring presented in this manual has been implemented). Close the DC switch-disconnector. Open the charging switch.	<input type="checkbox"/>
Checks with voltage connected to the inverter unit Complete the pending ID (motor identification) run. Refer to the firmware manual and/or start-up guide of the control program.	<input type="checkbox"/>
 WARNING! Make sure the motor can be started and rotated as required by the selected ID run mode (parameter 99.13 ID run requested).	<input type="checkbox"/>
Check the rotation direction of the motor.	<input type="checkbox"/>
Check the operation of the pulse encoder (if present). Refer to the user manual of the pulse encoder interface module.	<input type="checkbox"/>
Check the functioning of the emergency stop function from each operating location.	<input type="checkbox"/>
Validate the Safe torque off function. Refer to chapter The Safe torque off function , section Start-up including validation test (page 298) .	<input type="checkbox"/>
 WARNING! The safety functions cannot be considered safe until they are validated.	<input type="checkbox"/>
Validate any other safety functions (Emergency stop, Prevention of unexpected start-up, etc.) according to the applicable procedures. Refer to the applicable safety function user's manual.	<input type="checkbox"/>
 WARNING! The safety functions cannot be considered safe until they are validated.	<input type="checkbox"/>
Control from an overriding system	
Disconnect all voltages from the drive system.	<input type="checkbox"/>
Connect the communication link between the overriding system and the inverter unit.	<input type="checkbox"/>
Power up the drive system.	<input type="checkbox"/>
Check the start/stop functions.	<input type="checkbox"/>
Check the references received from the overriding system.	<input type="checkbox"/>
Check the warning/fault words.	<input type="checkbox"/>
Check the reaction of the inverter unit in case of a communication break.	<input type="checkbox"/>
Check the updating intervals of the communication.	<input type="checkbox"/>
Check any other relevant points.	<input type="checkbox"/>

9

Maintenance

Contents of this chapter

This chapter instructs how to maintain the inverter module and how to interpret its fault conditions. The information is valid for ACS880-104LC inverter modules and the cabinet construction examples presented in this manual.

WARNING!

Only qualified electrical professionals can do the work described in this chapter. Read the complete safety instructions before you install, commission, use or service the converter. The safety instructions are given in [ACS880 liquid-cooled multidrive cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#).

Maintenance intervals

The tables below show the maintenance tasks which can be done by the end user. For ABB Service offering, refer to [www.abb.com/drivesservices](#) or consult your local ABB Service representative ([www.abb.com/searchchannels](#)).

■ Description of symbols

Action	Description
I	Inspection (visual inspection and maintenance action if needed)
P	Performance of on/off-site work (commissioning, tests, measurements or other work)
R	Replacement

■ Recommended maintenance intervals after start-up

Recommended annual actions by the user	
Connections and environment	
Quality of supply voltage	P
Spare parts	
Spare parts	I
DC circuit capacitors reforming, spare modules and spare capacitors	P
Inspections by user	
Tightness of terminals	I
Dustiness, corrosion and temperature	I
Cooling liquid pipe connections	I
Coolant antifreeze concentration	P
Other	
ABB-SACE Air circuit breaker maintenance	I
ABB Contactors maintenance	I

Recommended every 2nd year actions by the user	
Inspection of coolant quality	P
Inspection of expansion tank air pressure	P
External circuit of Main heat exchanger (Temperature/Flow/Pressure)	I

Item	Years from start-up						
	3	6	9	12	15	18	21
Coolant							
Coolant draining and refill*		R		R		R	
Internal cooling fan for circuit boards							
Frame R7i		R		R		R	
Internal cooling fan for circuit boards							
Control unit battery	R		R		R		
Control panel battery (Real-time clock)		R			R		
Functional safety							
Safety function test	I Refer to the maintenance information of the safety function.						
Safety component expiry (Mission time T_M)	20 years						

Note:

- Maintenance and component replacement intervals are based on the assumption that the equipment is operated within the specified ratings and ambient conditions. ABB recommends annual drive inspections to ensure the highest reliability and optimum performance.
- Long term operation near the specified maximum ratings or ambient conditions may require shorter maintenance intervals for certain components. Consult your local ABB Service representative for additional maintenance recommendations.

Maintenance timers and counters

The control program has maintenance timers and counters that can be configured to generate a warning when a pre-defined limit is reached. Each timer/counter can be set to monitor any parameter. This feature is especially useful as a service reminder. For more information, see the firmware manual.

Cabinet

■ Cleaning the interior of the cabinet

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

WARNING!

Use a vacuum cleaner with antistatic hose and nozzle, and wear a grounding wristband. Using a normal vacuum cleaner creates static discharges which can damage circuit boards.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Open the cabinet door.
3. Clean the interior of the cabinet. Use a vacuum cleaner and a soft brush.
4. Clean the air inlets of the fans and air outlets of the modules (top).
5. Clean the air inlet gratings (if any) on the door.
6. Close the door.

Power connections

■ Retightening the power connections

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Examine the tightness of the cable connections. Use the tightening torques given in the technical data.

Liquid cooling system

For instructions on coolant replacement and checking the cooling system, see chapter [Internal cooling circuit \(page 381\)](#).

Cooling fans

The lifespan of the cooling fans of the drive depends on running time, ambient temperature and dust concentration. See the firmware manual for the actual signal which indicates the running time of the cooling fan. Reset the running time signal after fan replacement. See also [CIO-01 I/O module and distributed I/O bus user's manual \(3AXD50000126880 \[English\]\)](#).

Replacement fans are available from ABB. Do not use other than ABB-specified spare parts.

■ Frame R7i – internal module fan replacement

WARNING!

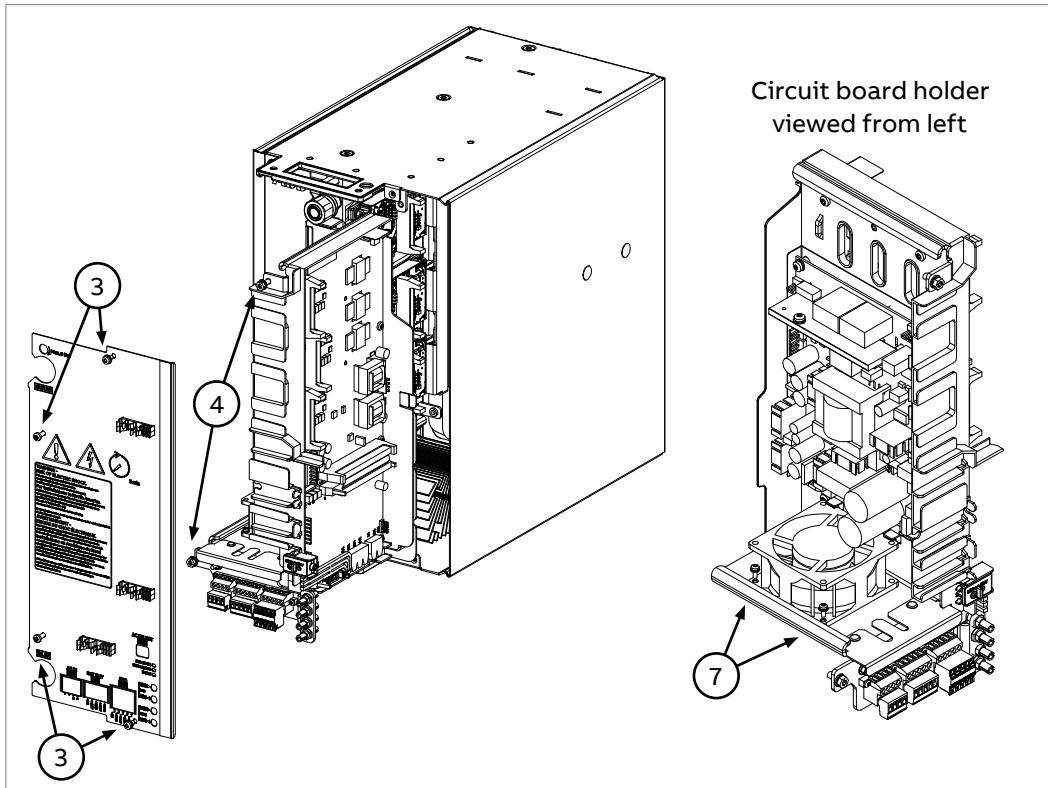

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

WARNING!

Use the required personal protective equipment. Wear protective gloves and long sleeves. Some parts have sharp edges.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Detach and move aside the wiring in front of the module.
3. Remove the four screws that hold the faceplate of the module. Remove the faceplate.
4. Remove the two screws that attach the circuit board holder to the module frame.
5. Carefully pull the circuit board holder outward until you have access to the cooling fan at the bottom of the holder. Detach the wiring coming to the circuit boards if necessary.
6. Disconnect the wiring of the fan.
7. Remove the two screws that hold the fan. Remove the fan.
8. Install a new fan in reverse order to the above. Note that the direction of airflow is up.

■ Frame R8i fan replacement

WARNING!

Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

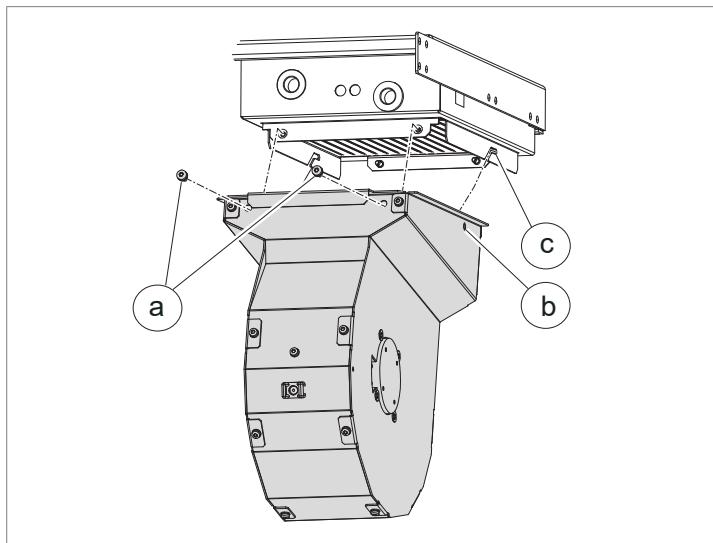

WARNING!

Use the required personal protective equipment. Wear protective gloves and long sleeves. Some parts have sharp edges.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Remove any shrouding in front of the cooling fan in case of marine construction.
3. Disconnect the fan wiring. Remove the CIO module.
4. Remove the two retaining screws (a).
5. Pull the fan outwards to separate it from the heat exchanger housing.
6. Install new fan in reverse order. Align the guide pins (b) at the rear of the fan cowling with the slots (c) in the module bottom guide, then install the retaining screws (a).

178 Maintenance

Inverter module

■ Frame R7i

**WARNING!**

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#). If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

**WARNING!**

Make sure that the replacement module has exactly the same type code as the old module.

**WARNING!**

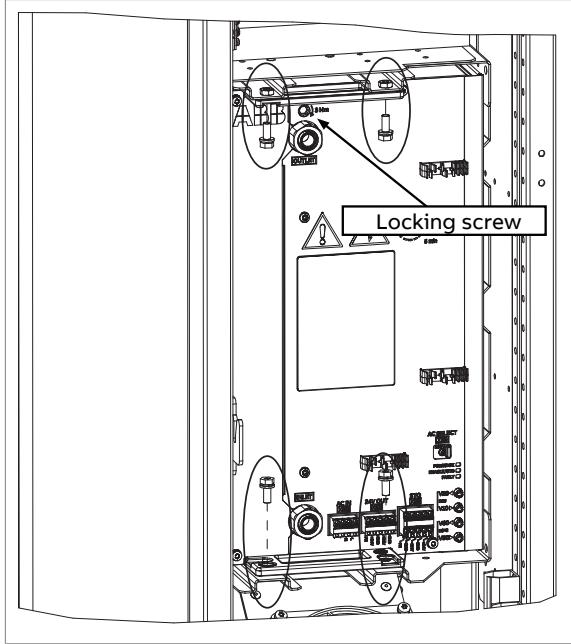

Stop the pumps and drain the coolant before you do work on the liquid cooling system. There is high-pressure hot coolant (6 bar, max. 50 °C) in the cooling circuit when it is in operation.

**WARNING!**

Use the required personal protective equipment. Wear protective gloves and long sleeves. Some parts have sharp edges.

Removing the module

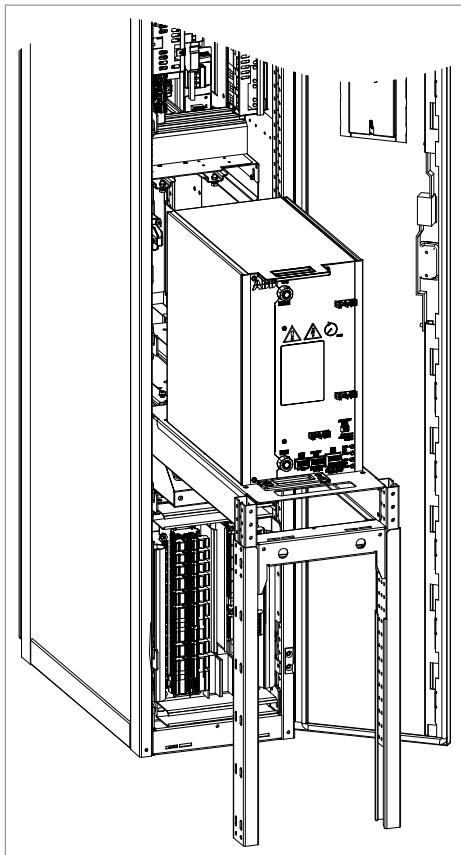

1. Do the steps in section [Electrical safety precautions \(page 133\)](#).
2. Disconnect the wiring from the R7i module. Move the wiring aside.
3. Close the inlet and outlet valves of the cubicle.
4. Lead the drain hoses (on the left-hand and right-hand sides of the cubicle) into a suitable container. Open the drain valves. This will drain all the equipment in the cubicle.
5. After the module has drained, disconnect the coolant piping from the module.
6. Install a service platform (or equal) where you can pull the module out of the cubicle.
7. Remove the module retaining screws at the top and the bottom of the module (two screws each). Undo the locking screw (6 mm hex key) at the top of the module.

8. Pull the module carefully out onto a suitable platform, eg, a service platform. For information on using the lifting device, see [Converter module lifting device for drive cabinets hardware manual \(3AXD50000210268 \[English\]\)](#).

WARNING! Move the module with another person as it is heavy. Keep the module secured to a hoist or equivalent to prevent the module from falling.

Installing the module

1. Push the module carefully into its bay.
2. Tighten the locking screw (6 mm hex key) at the top of the module to 5 N·m (3.6 lbf·ft) maximum.
3. Fasten the module retaining screws at the top and the bottom of the module (two screws each).
4. Reconnect the coolant pipes to the module. Tighten to 20 N·m (14.75 lbf·ft).
5. Reconnect the control wiring to the module.
6. Fill up the cooling system. For instructions, see section [Filling up and bleeding the internal cooling circuit](#).
7. If the Safe torque off function is in use, perform a validation test as described under [Start-up including validation test \(page 298\)](#).

■ Frame R8i

Replacing an inverter module

WARNING!

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#). If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

WARNING!

Make sure that the replacement module has exactly the same type code as the old module.

WARNING!

Stop the pumps and drain the coolant before you do work on the liquid cooling system. There is high-pressure hot coolant (6 bar, max. 50 °C) in the cooling circuit when it is in operation.

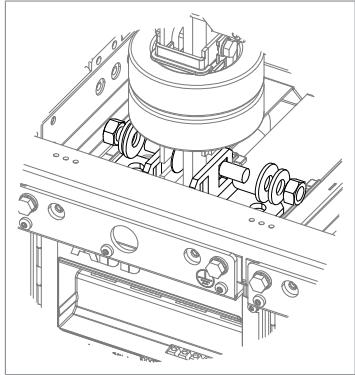

WARNING!

Use the required personal protective equipment. Wear protective gloves and long sleeves. Some parts have sharp edges.

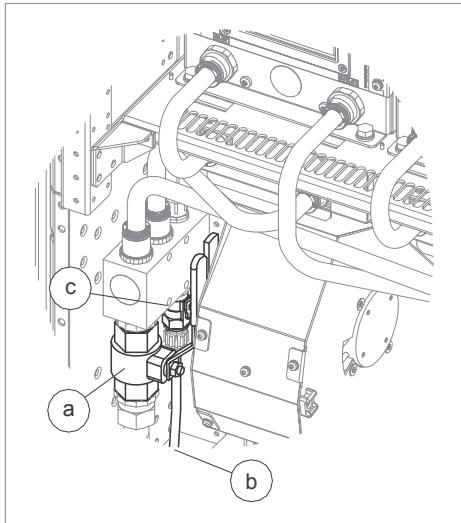

Removing the module

1. Do the steps in section [Electrical safety precautions \(page 133\)](#).
2. Remove the shrouding in front of the module.
3. Remove the locking screws of the swing-out frame (if present) and open it.
4. Disconnect the wiring from the module and move it aside. Use cable ties to keep the wiring out of the way.

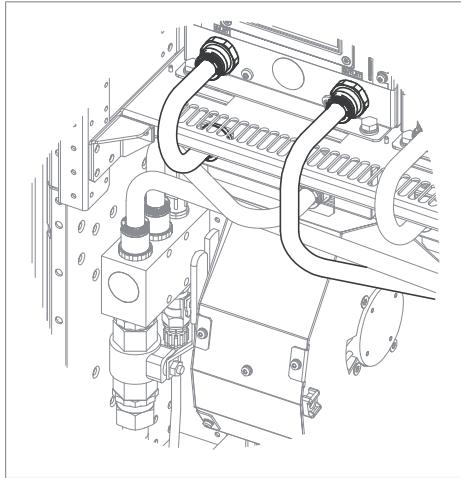

5. Remove the L-shaped DC busbars at the top of the module. Make note of the orientation of the screws as well as the order of the washers.

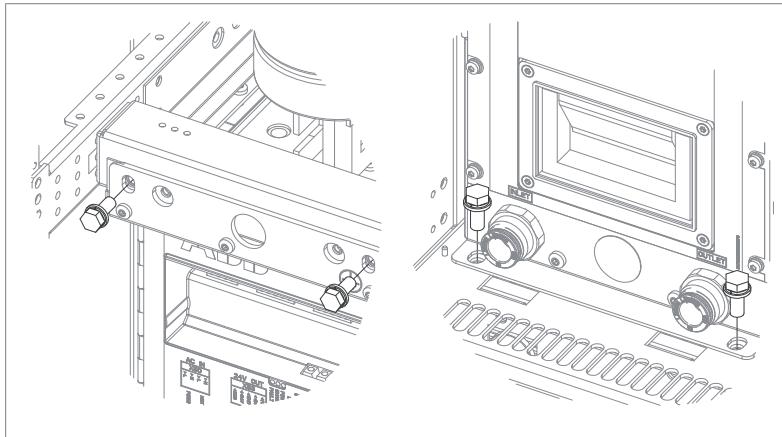

6. Close the inlet valve (a) and outlet valve (located on the right-hand side of the cubicle). Lead the drain hoses (b, on both sides of the cubicle) into a suitable container. Open the drain valves (c, on both sides of the cubicle). This will drain all modules in the cubicle.

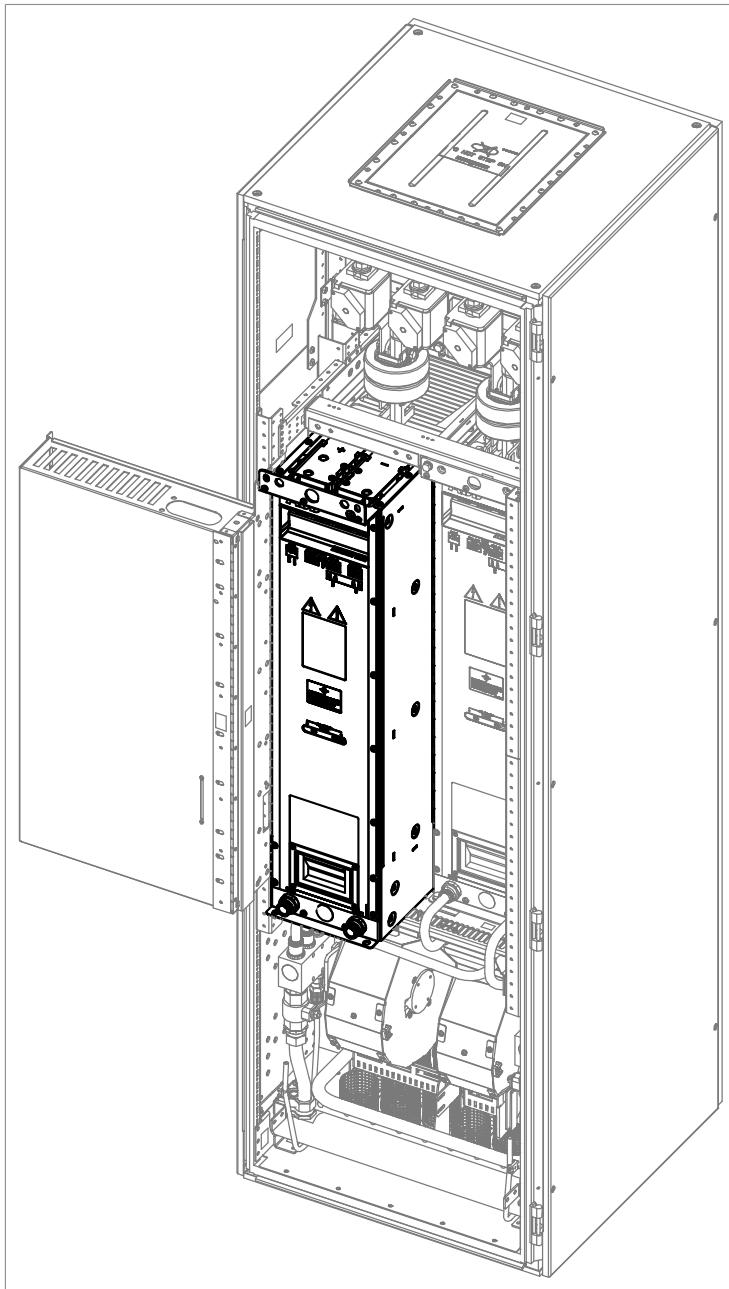

7. After the module has drained, disconnect the piping from the module.

8. Remove the module retaining screws at the top and the bottom of the module.

9. Pull the module carefully out onto a suitable platform. Keep the module secured to a hoist or equivalent to prevent the module from falling. For information on using the lifting device, see [Converter module lifting device for drive cabinets hardware manual \(3AXD50000210268 \[English\]\)](#).

Installing the module

1. Push the module carefully into its bay.
2. Fasten the retaining screws at the top and the bottom of the module.
3. Reinstall the DC busbars at the top of the module.
4. Reconnect the coolant pipes to the module. Tighten to specified torque. [R8i module coolant connections: 15 N·m \(11.1 lbf·ft\)](#). [Other connections: 20 N·m \(14.75 lbf·ft\)](#).
5. Reconnect the control wiring to the module.

6. Fill up the cooling system. For instructions, see section [Filling up and bleeding the internal cooling circuit](#).
7. Close the swing-out frame (if present). Reinstall all shrouds removed earlier.

Activating the reduced run function of the inverter unit

A “reduced run” function is available for inverter units consisting of parallel-connected inverter modules. The function makes it possible to continue operation with limited current even if one (or more) module is out of service, for example, because of maintenance work. In principle, reduced run is possible with only one module, but the physical requirements of operating the motor still apply; for example, the modules remaining in use must be able to provide the motor with enough magnetizing current.

The wiring accessories needed during the procedure are available from ABB.

Starting reduced run operation

WARNING!

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#). If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. If the inverter control unit is powered from the faulty module, connect the control unit to another 24 V DC power supply. We strongly recommend using an external power supply with inverter units consisting of parallel-connected modules.
3. Remove the module to be serviced from its bay.
4. Plug the coolant pipes that were disconnected from the module.
5. If the STO (Safe torque off) function is in use, install the STO jumper wire set in place of the missing module (unless the module was the last on the chain).
6. Install an air baffle to the top module guide to block the airflow through the empty module bay.
7. In case the inverter unit has a DC switch with a charging circuit, disable the appropriate channel on the charging monitoring unit.
8. Switch on the power to the inverter unit.
9. Enter the number of inverter modules present into parameter 95.13 Reduced run mode.
10. Reset all faults and start the inverter unit. The maximum current is now automatically limited according to the new inverter configuration. A mismatch between the number of detected modules (95.14) and the value set in 95.13 will generate a fault.
11. If the STO function is in use, validate it as described in chapter [The Safe torque off function \(page 289\)](#).

Resuming normal operation**WARNING!**

Obey the safety instructions given in [ACS880 liquid-cooled multidrives cabinets and modules safety instructions \(3AXD50000048633 \[English\]\)](#).

If you ignore the safety instructions, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

1. Stop the drive and do the steps in section [Electrical safety precautions \(page 133\)](#) before you start the work.
2. Remove the STO (Safe torque off) jumper wire set (if present).
3. Remove the air baffle from the module bay.
4. Reinstall the module into its bay.
5. Remove the plugs from the coolant pipes and reconnect the pipes to the module.
6. Reconnect the STO wiring (if used) to the module.
7. In case the inverter unit has a DC switch with a charging circuit, re-enable all channels on the charging monitoring unit.
8. Switch on the power to the inverter unit.
9. Enter “0” into parameter 95.13 Reduced run mode.
10. If the STO function is in use, validate it as described in chapter [The Safe torque off function \(page 289\)](#).

Control panel

Refer to [ACS-AP-I, -S, -W Assistant control panels user's manual \(3AUA0000085685 \[English\]\)](#).

Refer to [ACS-BP-S basic control panels user's manual \(3AXD50000032527 \[English\]\)](#).

BCU control unit

Refer to [BCU-02/12/22 control units hardware manual \(3AUA0000113605 \[English\]\)](#) for replacement of

- real-time clock battery
- memory unit
- SD/SDHC memory card
- control unit.

Capacitors

The intermediate DC circuit of the drive contains several electrolytic capacitors. Operating time, load, and surrounding air temperature have an effect on the life of the capacitors. Capacitor life can be extended by decreasing the surrounding air temperature.

Capacitor failure is usually followed by damage to the unit and an input cable fuse failure, or a fault trip. If you think that any capacitors in the drive have failed, contact ABB.

■ **Reforming the capacitors**

The capacitors must be reformed if the drive has not been powered (either in storage or unused) for a year or more. The manufacturing date is on the type designation label. For information on reforming the capacitors, refer to [Capacitor reforming instructions \(3BFE64059629 \[English\]\)](#).

Functional safety components

The mission time of functional safety components is 20 years which equals the time during which failure rates of electronic components remain constant. This applies to the components of the standard Safe torque off circuit as well as any modules, relays and, typically, any other components that are part of functional safety circuits.

The expiry of mission time terminates the certification and SIL/PL classification of the safety function. The following options exist:

- Renewal of the whole drive and all optional functional safety module(s) and components.
- Renewal of the components in the safety function circuit. In practice, this is economical only with larger drives that have replaceable circuit boards and other components such as relays.

Note that some of the components may already have been renewed earlier, restarting their mission time. The remaining mission time of the whole circuit is however determined by its oldest component.

Contact your local ABB service representative for more information.

LED indications

Warnings and faults reported by the control program are displayed on the control panel or in the Drive Composer PC tool. For further information, see the firmware manual of the inverter control program.

■ Control panel and panel platform/holder LEDs

The ACS-AP-... control panel has a status LED. The control panel mounting platform or holder has two status LEDs. For their indications, see the following table.

Location	LED	Indication
Control panel	Continuous green	The unit is functioning normally.
	Flickering green	Data is transferred between the PC and the unit through the USB connection of the control panel.
	Flashing green	There is an active warning in the unit.
	Continuous red	There is an active fault in the unit.
	Flashing red	There is a fault that requires the stopping and restarting of the drive/converter/inverter.
	Flashing blue (ACS-AP-W only)	The Bluetooth interface is enabled, in discoverable mode, and ready for pairing.
	Flickering blue (ACS-AP-W only)	Data is being transferred through the Bluetooth interface of the control panel.
Control panel mounting platform or holder (with the control panel removed)	Red	There is an active fault in the unit.
	Green	Power supply for the control unit is OK.

■ R7i and R8i module LEDs

See chapter [Operation principle and hardware description \(page 21\)](#).

10

Ordering information

Contents of this chapter

This chapter lists the types and ordering codes of the unit components.

You can find the kit-specific assembly drawings, step-by-step instructions and detailed kit information on the Internet. Go to <https://sites-apps.abb.com/sites/lvacdrivesengineeringsupport/content>. If necessary, contact your local ABB representative.

Note:

- This chapter only lists the installation accessories available from ABB. All other parts must be sourced from a third party (such as Rittal) by the system integrator. For a listing, refer to the kit-specific installation instructions available at <https://sites-apps.abb.com/sites/lvacdrivesengineeringsupport/content>. For access, contact your local ABB representative.
- Parts that are labeled suitable for generic enclosures are not designed for any specific enclosure system. These parts are intended as a basis for further engineering, and may require additional parts to be fully usable. Installation accessories designed for generic enclosures are in fact designed for an inside width of 50 mm less than the nominal width of the enclosure. For example, a mechanical kit intended for 800 mm wide generic enclosure is designed for an inside width of 750 mm, and will not fit a 800 mm wide Rittal VX25 enclosure.

Kit code key

The kit codes shown in this chapter break down as follows.

The format of the kit code is x-w-s-yyy(-VX), for example, L-6-8-401 where:

- x = cooling method
 - A = air-cooled (some of these kits are also used with liquid-cooled drives)
 - L = liquid-cooled
- w = cabinet width
 - 4 = 400 mm
 - 6 = 600 mm
 - 8 = 800 mm
- s = module frame size / sizes
 - 1 = R1i
 - 2 = R2i
 - 3 = R3i
 - 4 = R4i
 - 5 = R5i
 - 6 = R6i/D6D
 - 7 = R7i/D7D/D7T
 - 8 = R8i/D8D/D8T
 - X = any, or not defined.
- yyy = consecutive numbering
 - 001...099 = Kits related to cabinets, for example, adapter plates
 - 001...019 Common AC- and DC-related kits
 - 020...049 Cabinet mechanics kits
 - 050...059 Swing frame kits
 - 100...199 = Kits related to AC connection, for example, busbars
 - 100...129 Kits with connection to AC
 - 130...149 Kits with connection to module
 - 150...199 Other kits related to AC connection
 - 200...299 = Kits related to DC connection, for example, busbars
 - 200...229 Kits with connection to common DC
 - 230...249 Kits with connection to module
 - 250...299 Other kits related to DC connection

- 300...399 = Kits related to module installation, for example, mechanical supports
 - 300...330 Module supporting kits, basic mechanical support
 - 350...379 Shroud kits
- 400...499 = Other kits
 - 400...419 Fan kits
 - 420...439 Air guides
 - 440...459 Cooling circuit kits
- VX = Kit specifically designed for the Rittal VX25 enclosure system. Many kits without this designation are also used with the VX25 system.

Frame R7i and multiples

■ Inverter modules

Inverter units consisting of frame R7i inverter modules are to be ordered as separate modules. For inverter unit ratings, see the technical data.

Inverter unit		Modules used	
Type	Frame size	Qty	Ordering code (for options see below)
<i>U_n = 400 V</i>			
ACS880-104LC-0094A-3	R7i	1	ACS880-104LC-0094A-3(+E205)
ACS880-104LC-0120A-3	R7i	1	ACS880-104LC-0120A-3(+E205)
ACS880-104LC-0140A-3	R7i	1	ACS880-104LC-0140A-3(+E205)
ACS880-104LC-0170A-3	R7i	1	ACS880-104LC-0170A-3(+E205)
ACS880-104LC-0210A-3	R7i	1	ACS880-104LC-0210A-3(+E205)
ACS880-104LC-0250A-3	R7i	1	ACS880-104LC-0250A-3(+E205)
ACS880-104LC-0300A-3	R7i	1	ACS880-104LC-0300A-3(+E205)
ACS880-104LC-0380A-3	R7i	1	ACS880-104LC-0380A-3(+E205)
ACS880-104LC-0470A-3	R7i	1	ACS880-104LC-0470A-3(+E205)
The units below consist of multiple R7i modules connected in parallel. The power ratings of these units overlap the ratings of units built out of frame R8i modules. R8i modules are likely to be suitable for most applications, but these units can be considered instead if vertical space is limited, for example.			
ACS880-104LC-0590A-3	2×R7i	2	ACS880-104LC-0300A-3+E205

Ordering code format	Option codes
[Module type] +code [+code] ... For example, ACS880-104LC-0062A-7 +E205	+E205: Internal du/dt filtering (mandatory for parallel-connected modules). +C132: Marine type approval (pending).

Note: These components are required to construct a working unit and must be ordered separately:

- Inverter module(s)
- Common mode filters
- ACS-AP-W or ACS-AP-I control panel (required for commissioning)
- Control unit kit
- Fiber optic cables
- Installation frame (3AXD50000836444). One installation frame is necessary for each inverter module.

Other parts given in this chapter can be required by the application or make the installation of the module easier.

■ Control panel

The control panel is not included with the module but must be ordered separately. One control panel is required for the commissioning of an ACS880 drive system, even if the Drive Composer PC tool is used.

The control panel can be flush mounted on the cabinet door with the help of a door mounting kit. For more information on the control panel, see [ACS-AP-I, -S, -W and ACH-AP-H, -W Assistant control panels user's manual \(3AU0000085685 \[English\]\)](#).

Type	Description	Ordering code	Illustration
ACS-AP-W	Control panel with Bluetooth	3AXD50000025965	
DPMP-01	Door mounting kit (IP55)	3AU0000108878	
DPMP-02	Door mounting kit (IP65)	3AXD50000009374	

For more information on the door mounting kits, such as the contents of the kit, see the installation manuals:

- [DPMP-01 mounting platform for control panels installation guide \(3AUA0000100140 \[English\]\)](#)
- [DPMP-02/03 mounting platform for control panels installations guide \(3AUA0000136205 \[English\]\).](#)

■ Control electronics

Inverter control unit

One control unit is required for each inverter unit. The type of the control unit depends on the number of inverter modules as shown below. The control unit is delivered with a memory unit containing the ACS880 primary control program, optionally with application programmability. For availability of other control programs, contact your local ABB representative.

Frame size	Control unit type	Application programmability	Ordering code
R7i 2×R7i	BCU-02	No	3AXD50000003417
		*Yes	3AXD50000011540
3×R7i 4×R7i	BCU-12	No	3AXD50000006340
		*Yes	3AXD50000011541

*Application programmability using function block based on the IEC 61131-3 standard. For more information, see [Programming manual: Drive application programming \(IEC 61131-3\) \(3AUA0000127808 \[English\]\)](#).

Note: Fiber optic communication with another control unit (such as that of the supply unit) requires an RDCO or FDCO DDCS communication module. For more information, see [RDCO-01/02/03/04 DDCS communication option modules \(3AFE64492209 \[English\]\)](#) and [FDCO-01/02 DDCS communication modules user's manual \(3AUA0000114058 \[English\]\)](#).

Fiber optic cables

Each frame R7i module is connected to the inverter control unit with a pair of fiber optic cables.

The following kits, each consisting of a pair of plastic fiber optic cables, are available from ABB:

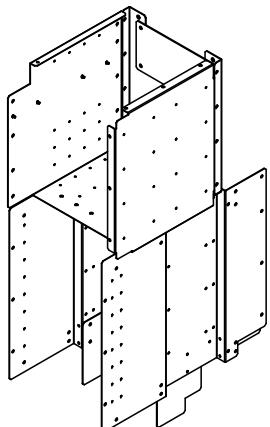

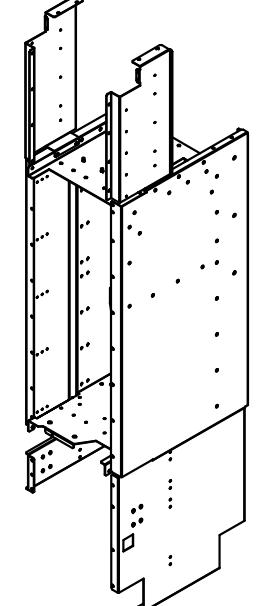

Length	Kit type designation	Ordering code
2 m (6.6 ft)	NLWC-02	58988821
3 m (9.8 ft)	NLWC-03	58948233
5 m (16.4 ft)	NLWC-05	58948250
7 m (23 ft)	NLWC-07	58948268
10 m (32.8 ft)	NLWC-10	58948276

■ Mechanical installation accessories

These kits include parts that are used for installing the module in the enclosure.

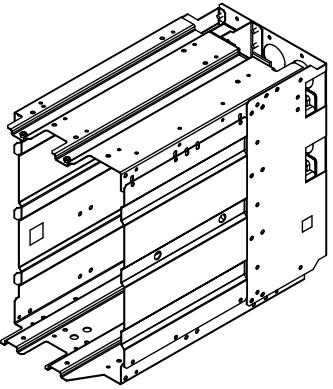

Module and electronics mounting parts

These parts attach to the VX25 enclosure frame and act as a mounting base for the module installation frame, the control unit, and other components.

Used with...	Qty	Ordering code	Kit code	Illustration
400 mm VX25 enclosure with 1 module	1	3AXD50000861637	L-4-7-035-VX	 Instruction code: 3AXD50000863679
400 mm VX25 enclosure with 2 modules	1	3AXD50000866892	L-4-7-036-VX	 Instruction code: 3AXD50000879212

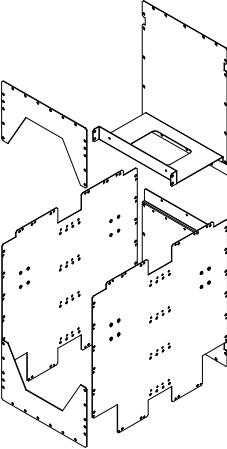

Module installation frame

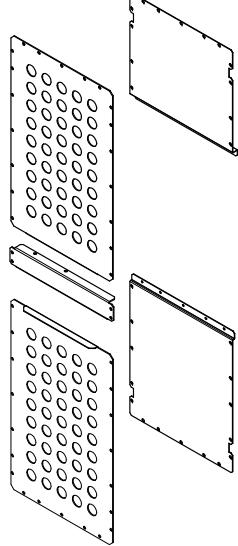

The module can easily be inserted into (and extracted from) the installation frame. The frame has quick connectors at the back for the AC and DC power connections. The DC connection is placed at either the rear top or rear right edge of the frame depending on the way the frame is assembled.

Used with...	Qty	Ordering code	Kit code	Illustration
R7i	1 per module	3AXD50000836444	L-468-7-320	 Instruction code: 3AXD50000837915

Marine support kit

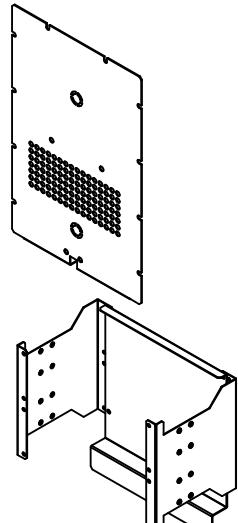

This kit contains parts that can be used for reinforcing the cabinet structure for installation sites with vibration, for example in marine applications.

Used with...	Qty	Ordering code	Kit code	Illustration
400 mm VX25 enclosure with 1 module	1	3AXD50000897506	L-4-7-502-VX	 Instruction code: 3AXD50000899098

Shrouding

This kit contains the shrouds, as well as the necessary brackets and screws, to cover the top and bottom parts of the cubicle.

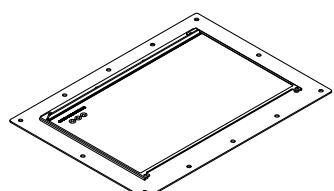

Used with...	Qty	Ordering code	Kit code	Illustration
400 mm VX25 enclosure with 1 module	1	3AXD50000861651	L-4-7-351-VX	 <p>Instruction code: 3AXD50000863563</p>

200 Ordering information

Used with...	Qty	Ordering code	Kit code	Illustration
400 mm VX25 enclosure with 2 modules	1	3AXD50000866953	L-4-7-352-VX	 <p>Instruction code: 3AXD50000879052</p>

Pressure relief kit

The explosion exhaust plate acts as a pressure relief vent in case of arcing inside the cubicle. This part is installed on the roof of the cabinet.

Used with ...	Qty	Ordering code	Kit code	Illustration
VX25 enclosure	1 per cubicle	3AXD50000667260	L-4-X-460-VX	 <p>Instruction code: 3AXD50000666430</p>

■ DC-side components

Frame R7i modules are connected to the DC bus through fuses. The designs presented in this manual have flush-end fuse blocks bolted to the DC busbars.

If quick isolation of the module from the DC bus is required, a switch-disconnector can be installed in 400 mm wide cubicles with one R7i module. (The design for two modules presented in this manual has DC fuses only without a DC switch-disconnector.) One of the auxiliary contacts of the switch is used for monitoring the open/closed state of the switch. A capacitor charging circuit is to be installed with the DC switch-disconnector.

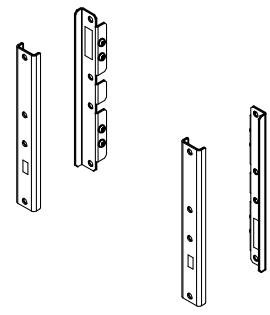

Note: A separate capacitor charging circuit must be designed and installed by the customer if the inverter unit is directly connected to the DC bus and the supply unit of the system does not have a charging capability.

The common mode filters are mounted onto the busbars that connect to the DC input of the inverter module.

DC bus installation parts (for Rittal VX25 enclosures)

The brackets in this kit act as a mounting base for the busbar supports of the Rittal Flat-PLS DC bus and ensure its correct placement and alignment inside the cabinet line-up.

The designs shown in this manual for Rittal VX25 enclosures use the Rittal Flat-PLS busbar system. Make sure that the current in the drive system does not exceed the current-carrying capacity of the busbars.

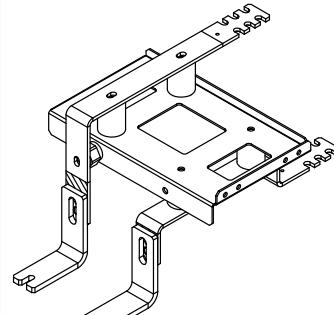

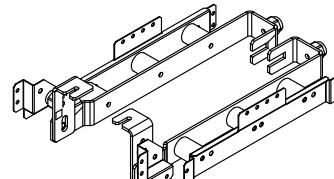

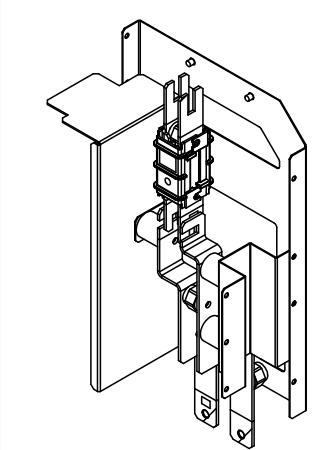

Used with ...	Qty	Ordering code	Kit code	Illustration
VX25 enclosure	1 kit per cubicle	3AXD5000033387	A-468-X-001-VX	 Instruction code: 3AXD50000333639

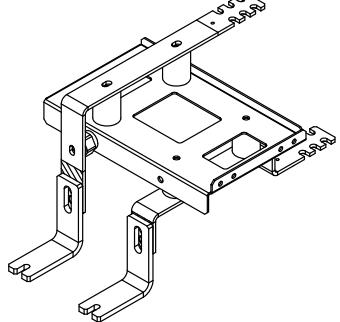

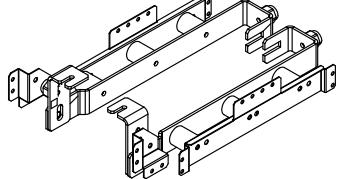

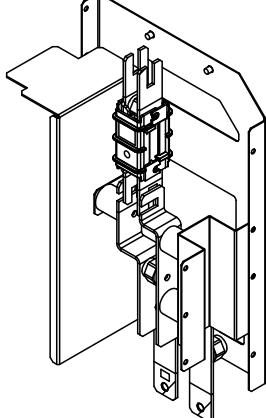

DC connection parts (for Rittal VX25 enclosures)

These parts connect the Flat-PLS busbars to the DC input of the module. The holders for fuses and common mode filters are included. When applicable, the mounting parts for the DC switch-disconnector are also included. For fuse sizes, see section [DC fuses \(IEC, UL\) \(page 209\)](#).

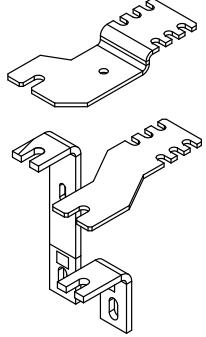

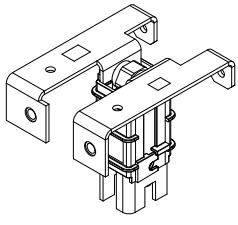

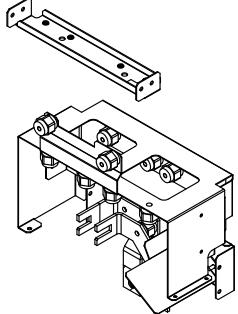

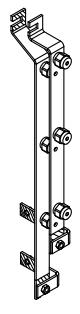

Note: DC fuses, switch-disconnectors, charging components and common mode filters are not included in the kits and must be ordered separately.

	UL	OT600U11 OHB145J12 OXP12X465	1	3AXD50000823390	3AXD50000823352

The kit contains the following components:

- DC switch-disconnector (type indicated in table)
- Operating handle (type indicated in table)
- Operating shaft (type indicated in table)
- Two OA1G10 and two OA3G01 auxiliary contacts
- OTZT2A (OT4...) or OTZT3A (OT6...) interlock
- PDAL2/24DC interlock
- OHZX10 alignment ring.

DC charging components (for units with DC switch-disconnector)

A charging circuit is required if the unit is equipped with a DC switch-disconnector.

Note: A separate capacitor charging circuit must be designed and installed by the customer if the inverter unit is directly connected to the DC bus and the supply unit of the system does not have a charging capability.

Charging switch kit

IEC/UL	Switch type	Qty	Ordering code	Instruction code
IEC	OS160GD04F	1	3AXD50000826933	3AXD50000827046
UL	OS100GJ04F	1	3AXD50000826940	3AXD50000827046 3AXD50000008591

The kit contains the following components:

- Charging switch (type indicated in table) with terminal shrouds
- OHB65J6 operating handle
- OXP6X430 operating shaft
- 2 pcs of OA3G01 auxiliary contacts
- BSFC-12C charging controller

- 4 pcs 170M2676 fuses and fuse holders (kit 3AXD50000826940 contains FWJ-30A fuses and conversion parts)
- OHZX10 alignment ring.

Charging resistors

Used with...	Qty	Ordering code	Data
Frame R7i with DC switch (IEC, UL)	4	10028531	33 ohm

Fiber optic cables

A pair of optical cables is needed to connect the charging controller to the inverter module.

The following kits, each consisting of a pair of plastic fiber optic cables, are available from ABB:

Length	Kit type designation	Ordering code
2 m (6.6 ft)	NLWC-02	58988821

Common mode filters

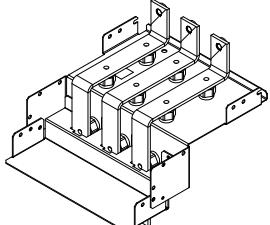

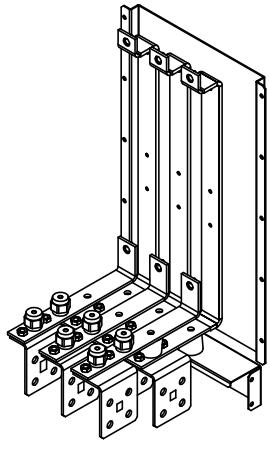

Common mode filtering reduces bearing currents and is required for electromagnetic compatibility (EMC). The filtering is implemented by installing two toroidal cores onto the DC busbars.

The manifold kits contain:

Inlet and outlet manifolds

Inlet and outlet valves

Drain valves

Nipples for connecting the valves to manifolds

Connectors for PA piping

Plugs for unused piping connectors

Chokes for flow limitation – not used with the ACS880-104LC.

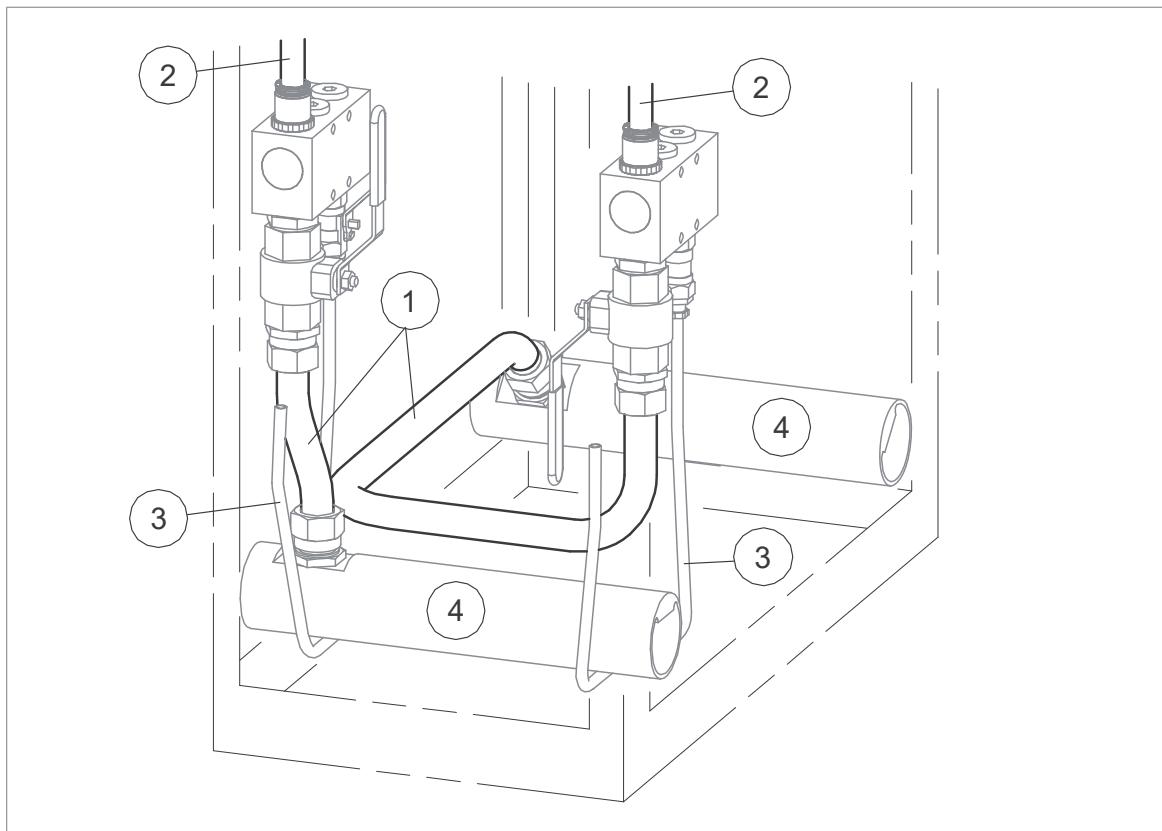

You must order the following parts separately as they are not included in the manifold kits:

- Connectors to attach to inlet, outlet and drain valves
- Connectors to attach to main pipes
- Pipes between main pipe and inlet/outlet valves
- Main pipes
- Drain pipes.

Note: The inlet and outlet valves have an R3/4" internal thread. The drain valves have an R3/8" internal thread.

Piping

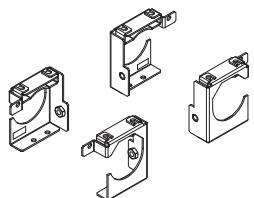

PA (polyamide) pipe is available in various diameters on reels. Refer to the figure for application.

Item	Data	Ordering code
1	PA12P40, 22/18 mm, 50 m	3AXD50000441419
2 ¹⁾	PA12P40, 16/13 mm, 50 m PA12P40, 6/4 mm, 100 m	3AXD50000047488 3AXD50001075316
3	PA11P40, 8/6 mm, 50 m	3AXD50000419302
4	Not part of standard product offering	

¹⁾ Use 16/13 mm pipe between the modules and the manifolds. If the heat exchanger is connected in parallel with the module(s), use 8/6 mm or 6/4 mm pipe between the heat exchanger and the manifolds. If the heat exchanger is connected in series with the module(s), use 16/13 mm pipe.

CIO-01 I/O module

CIO-01 I/O module for distributed I/O bus control is not included in the module delivery, but can be ordered separately. The distributed I/O bus controls and supervises each cabinet fan separately. It indicates malfunctioning fans by warning or fault messages. One CIO-01 can monitor and control up to 4 cabinet fans.

For more information, see [CIO-01 I/O module and distributed I/O bus user's manual \(3AXD50000126880 \[English\]\)](#).

Ordering code format	Option codes
[Module type] +code [+code] ... For example, ACS880-104LC-0480A-7 +E205	+E205: Internal du/dt filtering. Standard with 690 V modules. +C132: Marine type approval.

Note: These components are required to construct a working unit and must be ordered separately:

- Inverter module(s)
- Common mode filters
- ACS-AP-W or ACS-AP-I control panel (required for commissioning)
- Control unit kit
- Fiber optic cables
- Quick connector.

Other parts given in this chapter can be required by the application or make the installation of the module easier.

■ Control panel

The control panel is not included with the module but must be ordered separately. One control panel is required for the commissioning of an ACS880 drive system, even if the Drive Composer PC tool is used.

The control panel can be flush mounted on the cabinet door with the help of a door mounting kit. For more information on the control panel, see [ACS-AP-I, -S, -W and ACH-AP-H, -W Assistant control panels user's manual \(3AUA0000085685 \[English\]\)](#).

Type	Description	Ordering code	Illustration
ACS-AP-W	Control panel with Bluetooth	3AXD50000025965	
DPMP-01	Door mounting kit (IP55)	3AUA0000108878	
DPMP-02	Door mounting kit (IP65)	3AXD50000009374	

For more information on the door mounting kits, such as the contents of the kit, see the installation manuals:

- [DPMP-01 mounting platform for control panels installation guide \(3AUA0000100140 \[English\]\)](#)
- [DPMP-02/03 mounting platform for control panels installations guide \(3AUA0000136205 \[English\]\).](#)

■ Control electronics

Inverter control unit

One control unit is required per inverter unit. The type of the control unit depends on the number of inverter modules as shown below. The control unit is delivered with a memory unit containing the ACS880 primary control program, optionally with application programmability. For availability of other control programs, contact your local ABB representative.

Frame size	Control unit type	Application programmability	Ordering code
R8i, 2×R8i	BCU-02	No	3AXD50000003417
		*Yes	3AXD50000011540
3×R8i...6×R8i	BCU-12	No	3AXD50000006340
		*Yes	3AXD50000011541

*Application programmability using function block based on the IEC 61131-3 standard. For more information, see [Programming manual: Drive application programming \(IEC 61131-3\) \(3AUA0000127808 \[English\]\)](#).

Note: Fiber optic communication with another control unit (such as that of the supply unit) requires an RDCO or FDCO DDCS communication module. For more information, see [RDCO-01/02/03/04 DDCS communication option modules \(3AFE64492209 \[English\]\)](#) and [FDCO-01/02 DDCS communication modules user's manual \(3AUA0000114058 \[English\]\)](#).

Fiber optic cables

Each frame R8i module is connected to the inverter control unit with a pair of fiber optic cables.

The following kits, each consisting of a pair of plastic fiber optic cables, are available from ABB:

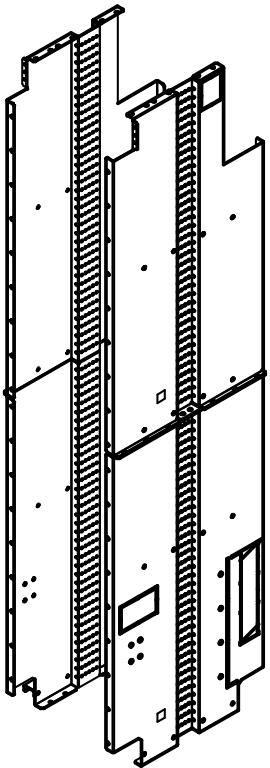

Length	Kit type designation	Ordering code
2 m (6.6 ft)	NLWC-02	58988821
3 m (9.8 ft)	NLWC-03	58948233
5 m (16.4 ft)	NLWC-05	58948250
7 m (23 ft)	NLWC-07	58948268
10 m (32.8 ft)	NLWC-10	58948276

■ Mechanical installation accessories

These kits include parts that are used for installing the module in the enclosure.

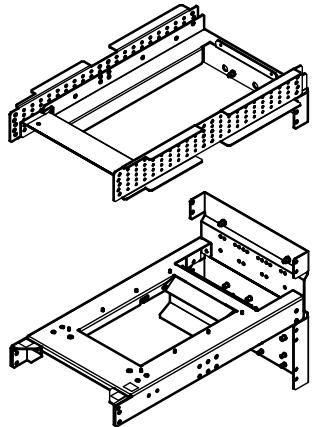

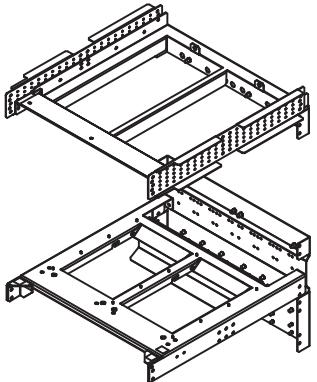

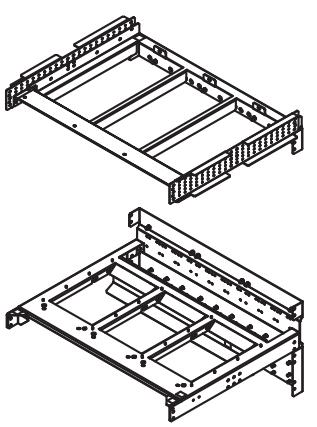

Side plate kit

These parts attach to the left-hand and right-hand sides of the VX25 enclosure frame and act as a mounting base for the module guides.

■ DC-side components

Frame R8i modules are connected to the DC bus through fuses. The design presented in this manual has flush-end fuse blocks bolted to the DC busbars.

A DC switch-disconnector can be installed if quick isolation of the module from the DC bus is required. One of the auxiliary contacts of the switch is used for monitoring the open/closed state of the switch. A capacitor charging circuit is to be installed with the DC switch-disconnector.

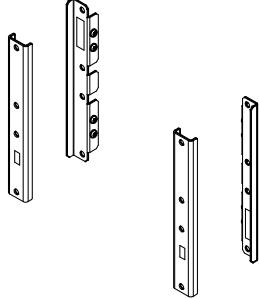

Note: A separate capacitor charging circuit must be designed and installed by the customer if the inverter unit is directly connected to the DC bus and the supply unit of the system does not have a charging capability.

The common mode filters are mounted onto the busbars that connect to the DC input of the inverter module.

DC bus installation parts (for Rittal VX25 enclosures)

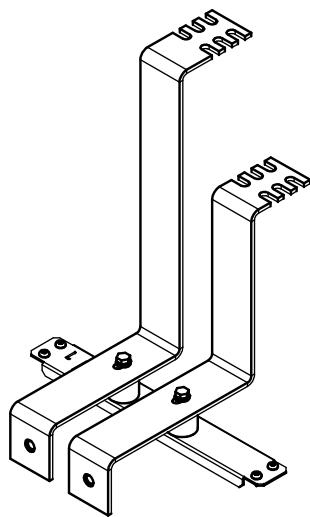

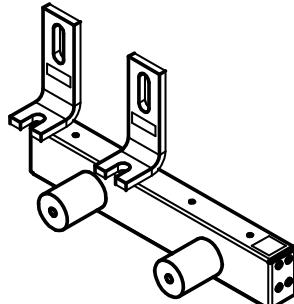

The brackets in this kit act as a mounting base for the busbar supports of the Rittal Flat-PLS DC bus and ensure its correct placement and alignment inside the cabinet line-up.

The designs shown in this manual for Rittal VX25 enclosures use the Rittal Flat-PLS busbar system. Make sure that the current in the drive system does not exceed the current-carrying capacity of the busbars.

Frame 3×R8i with DC switch (IEC)	OT2500E22 OHB274J12	1	3AXD50000227051	

The kit contains the following components:

- DC switch-disconnector (type indicated in table)
- Operating handle (type indicated in table)
- OXP12X395 operating shaft
- Two OA1G10 and two OA3G01 auxiliary contacts
- OTZT4A and PDAL2/24DC interlocks
- OHZX10 alignment ring.

DC charging components

A charging circuit is required if the unit is equipped with a DC switch-disconnector.

Note: A separate capacitor charging circuit must be designed and installed by the customer if the inverter unit is directly connected to the DC bus and the supply unit of the system does not have a charging capability.

Charging switch kits

The manifold kits contain:

Inlet and outlet manifolds

Inlet and outlet valves

Drain valves

Nipples for connecting the valves to manifolds

Connectors for PA piping

Plugs for unused piping connectors

Chokes for flow limitation – not used with the ACS880-104LC.

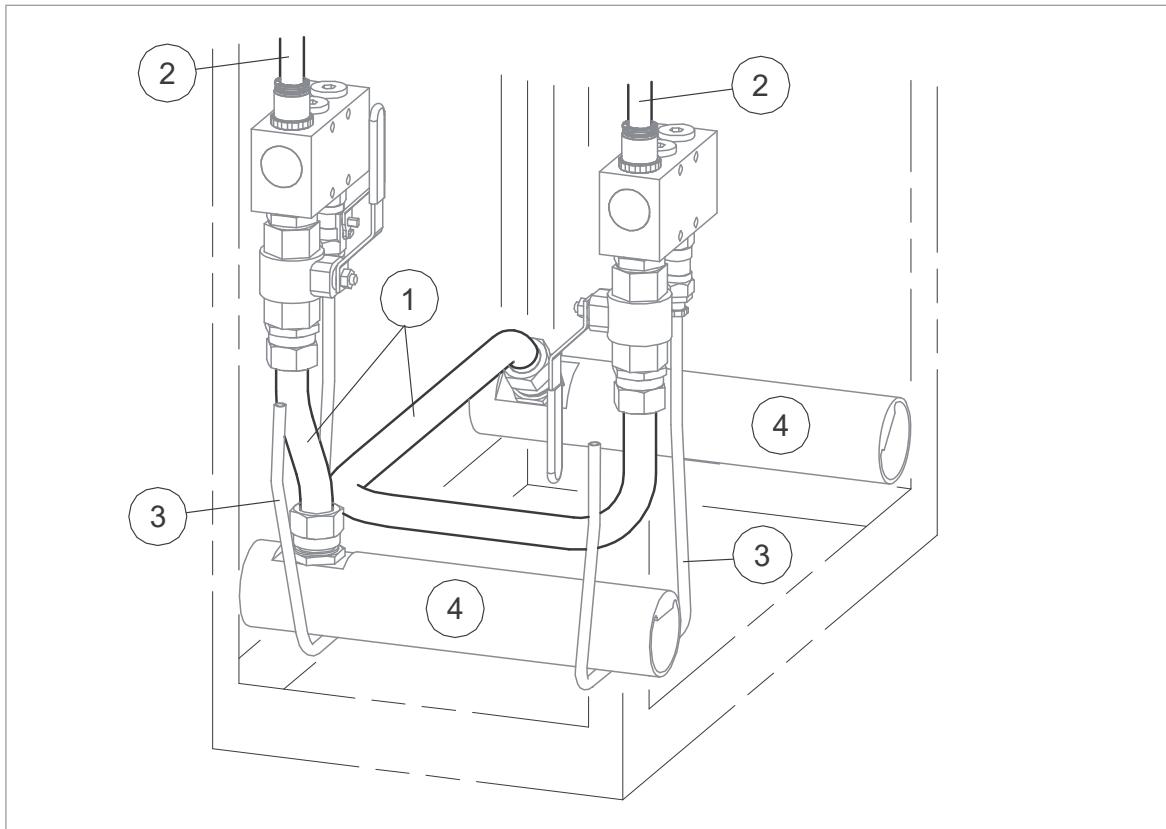

You must order the following parts separately as they are not included in the manifold kits:

- Connectors to attach to inlet, outlet and drain valves
- Connectors to attach to main pipes
- Pipes between main pipe and inlet/outlet valves
- Main pipes
- Drain pipes.

Note: The inlet and outlet valves have an R3/4" internal thread. The drain valves have an R3/8" internal thread.

Piping

PA (polyamide) pipe is available in various diameters on reels. Refer to the figure for application.

Item	Data	Ordering code
1	PA12P40, 22/18 mm, 50 m	3AXD50000441419
2 ¹⁾	PA12P40, 16/13 mm, 50 m PA12P40, 6/4 mm, 100 m	3AXD50000047488 3AXD50001075316
3	PA11P40, 8/6 mm, 50 m	3AXD50000419302
4	Not part of standard product offering	

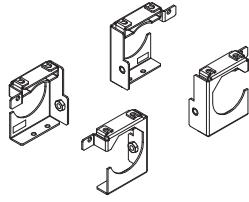

¹⁾ Use 16/13 mm pipe between the modules and the manifolds. If the heat exchanger is connected in parallel with the module(s), use 8/6 mm or 6/4 mm pipe between the heat exchanger and the manifolds. If the heat exchanger is connected in series with the module(s), use 16/13 mm pipe.

Heat exchanger

The kit includes the heat exchanger and the connectors for piping.

Used with ...	Qty	Ordering code	Kit code	Illustration
All enclosure types	1 per module	3AXD5000041265	L-468-8-440	

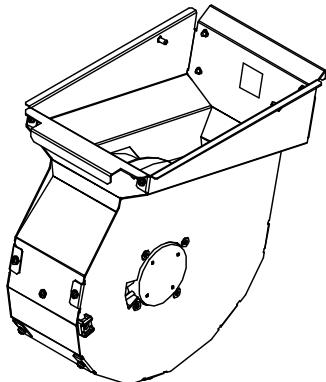

Main pipe support kit

■ Definitions

U_n	Nominal AC supply voltage of drive system
I_1	Nominal DC input current
I_n	Nominal output current (available continuously with no overloading)
P_n	Typical motor power in no-overload use The horsepower ratings are typical NEMA motor sizes at 460 V (ACS880-104LC-xxxxA-5) and 575 V (ACS880-104LC-xxxxA-7) respectively.
S_n	Apparent power in no-overload use
I_{Ld}	Continuous rms output current allowing 10% overload for 1 minute every 5 minutes
P_{Ld}	Typical motor power in light-overload use
I_{\max}	Maximum output current. Available for 10 seconds at start; otherwise as long as allowed by drive temperature.
I_{Hd}	Continuous rms output current allowing 50% overload for 1 minute every 5 minutes
P_{Hd}	Typical motor power in heavy-duty use

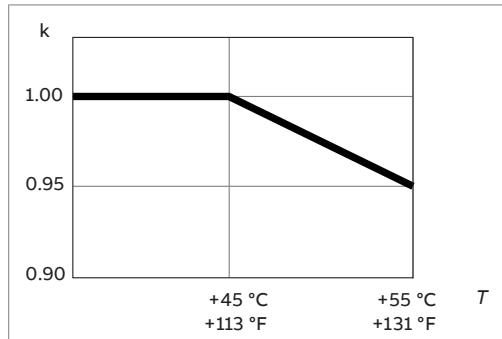

Note:

- The ratings apply at an ambient temperature of 45 °C (113 °F) and a coolant temperature of 40 °C (104 °F).
- To achieve the rated motor power given in the table, the rated current of the drive must be higher than or equal to the rated motor current.
- The DriveSize dimensioning tool available from ABB is recommended for selecting the drive, motor and gear combination.

Derating

■ Surrounding air temperature derating

In the temperature range +45...55 °C (+113...131 °F), the rated output current is derated by 0.5 percentage points for every added 1 °C (1.8 °F). The output current can be calculated by multiplying the current given in the rating table by the derating factor (k):

■ Coolant temperature derating

See section [Temperature limits \(page 386\)](#).

■ Antifreeze content derating

See section [Temperature limits \(page 386\)](#).

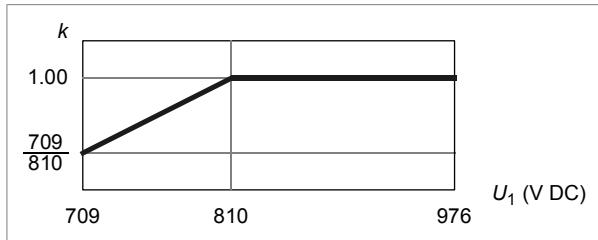

■ Altitude derating

At altitudes more than 1000 m (3281 ft) above sea level, the output current derating is 1 percentage point for every added 100 m (328 ft). For example, the derating factor for 1500 m (4921 ft) is 0.95. The maximum permitted installation altitude is given in the technical data.

For a more accurate derating, use the DriveSize PC tool.

■ Supply voltage derating (frame n×R8i inverter units with diode supply unit)

If the DC supply voltage of the inverter unit (U_1) is below 810 V (which corresponds to a drive supply voltage of 600 V AC when a diode supply unit is used), the rated output current must be derated by multiplying by $U_1/810$ (represented by k in the diagram).

■ Switching frequency derating

Switching frequency derating is necessary, if the switching frequency is more than 3.0 kHz.

Frame R7i

$U_n = 400$ V: In the switching frequency range 3.0 ... 10.5 kHz, the output current is derated by 6 percentage points for each kHz.

$U_n = 500$ V: In the switching frequency range 3.0 ... 10.5 kHz, the output current is derated by 7 percentage points for each kHz.

$U_n = 690$ V: In the switching frequency range 3.0 ... 7.5 kHz, the output current is derated by 10 percentage points for each kHz.

For example, for a 690 V inverter with a switching frequency of 5 kHz, the derating factor is 0.80.

Frame R8i

$U_n = 690$ V: In the switching frequency range 3.0 ... 7.5 kHz, the output current is derated by 8 percentage points for each kHz.

For example, for a 690 V inverter with a switching frequency of 5 kHz, the derating factor is 0.84.

■ Output frequency derating

Output frequency derating is necessary, if:

- the output frequency is continuously or frequently less than 12 Hz, or
- the inverter has du/dt filtering, and the output frequency is more than 150 Hz.

Temporary use at an output frequency of less than 12 Hz does not require derating.

When the switching frequency and the output frequency are both in a frequency range that requires derating, only the larger derating factor needs to be considered.

Frame R7i without du/dt filtering

This section is applicable to R7i modules without du/dt filtering (without option +E205).

At an output frequency of less than 12 Hz, the output current is derated by 3.5 percentage points for each Hz. For example, the derating factor for 9 Hz is 0.895.

Frame R7i with du/dt filtering

This section is applicable to R7i modules with du/dt filtering (with option +E205).

At an output frequency of less than 12 Hz, the output current is derated by 3.5 percentage points for each Hz. For example, the derating factor for 9 Hz is 0.895.

At an output frequency of more than 150 Hz, the output current is derated by 0.7 percentage points for each 10 Hz. For example, the derating factor for 250 Hz is 0.93.

Frame R8i

This section is applicable to R8i modules, which have du/dt filtering as standard.

At an output frequency of less than 12 Hz, the output current is derated by 3.5 percentage points for each Hz. For example, the derating factor for 9 Hz is 0.895.

At an output frequency of more than 150 Hz, the output current is derated by 1 percentage point for each 10 Hz. For example, the derating factor for 250 Hz is 0.90.

Free space required by cooling

Frame R7i

- Left and right sides, below, above, back: None, but the return flow of air must not be restricted.
- Front: Space needed by coolant piping.

Frame R8i

- Left and right sides, back: None, but the return flow of air must not be restricted.
- Front: Space needed by coolant piping.
- Below: Space needed by heat exchanger and cooling fan.
- Above: The cooling air flow through the module should not be restricted.

For an example, see layout drawings.

Allowable mounting positions

- Upright
- On left-hand side (viewed from the front)

Input power (DC) connection

Voltage (U1)	ACS880-104LC-xxxxx-3: 513...566 V DC. This is indicated in the type designation label as typical input voltage level (566 V DC). ACS880-104LC-xxxxx-5: 513...707 V DC. This is indicated in the type designation label as typical input voltage levels (566/679/707 V DC). ACS880-104LC-xxxxx-7: 709...976 V DC. This is indicated in the type designation label as typical input voltage levels (742/849/976 V DC).
Drive AC supply network type	TN (grounded) and IT (ungrounded) systems up to 690 V AC. Corner-grounded systems up to 600 V AC.
Input terminals	<u>Frame R7i</u> : Quick connectors to installation frame. Fastener size and tightening torque: <ul style="list-style-type: none"> • Busbars to installation frame: M12. Torque: 70 N·m (52 lbf·ft) <u>Frame R8i</u> : Fastener size and tightening torque: <ul style="list-style-type: none"> • M12, maximum intrusion into module 20 mm (0.8 in). Torque: 70 N·m (52 lbf·ft).

Motor connection data

Motor types	Asynchronous AC induction motors, permanent magnet synchronous motors, AC induction servomotors and ABB synchronous reluctance (SynRM) motors
--------------------	---

Voltage (U2)	3-phase symmetrical, Umax at field weakening point ACS880-104LC-xxxxx-3: 0...400 V AC. The maximum value (400 V) is a typical drive input voltage level shown on the type designation label of the supply unit corresponding to 380...415 V AC. ACS880-104LC-xxxxx-5: 0...400/480/500 V AC. The maximum values (400/480/500 V) are typical drive input voltage levels shown on the type designation label of the supply unit corresponding to 380...500 V AC. ACS880-104LC-xxxxx-7: 0...525/600/690 V AC. The maximum values (525/600/690 V) are typical drive input voltage levels shown on the type designation label of the supply unit corresponding to 525...690 V AC.
Frequency (f2)	0...500 Hz <ul style="list-style-type: none"> For higher operational output frequencies, contact your local ABB representative. Operation at frequencies higher than 150 Hz can require derating. For more information, contact your local ABB representative.
Current	Refer to the technical data.
Switching frequency	3 kHz (typical)
Maximum recommended motor cable length	500 m (1640 ft) <p>Note: Longer cables cause a motor voltage decrease which limits the available motor power. The decrease depends on the motor cable length and characteristics. Contact ABB for more information.</p>
Output terminals	<u>Frame R7i:</u> Quick connectors to installation frame. Fastener sizes and tightening torques: <ul style="list-style-type: none"> Busbars to installation frame: M12. Torque: 70 N·m (52 lbf·ft) Cables to busbars: M12. Torque: 70 N·m (52 lbf·ft) <u>Frame R8i:</u> Quick connector. Fastener sizes and tightening torques: <ul style="list-style-type: none"> Busbars to quick connector: M12. Torque: 70 N·m (52 lbf·ft) Busbars to support insulators: M8. Torque: 9 N·m (6.5 lbf·ft) Cables to busbars: M12. Torque: 70 N·m (52 lbf·ft)

Typical power cable sizes

The tables below give the current carrying capacity ($I_{L\max}$) and typical size for copper and aluminum cables with PVC or XLPE insulation. A correction factor K = 0.70 is used. Time const. is the temperature time constant of the cable.

The cable sizing is based on a maximum of 9 cables installed side by side on a ladder type cable tray, with three trays on top of each other (with 30 cm of space between the trays), and an ambient temperature of 30 °C (IEC 60364-5-52).

Conductor cross-section (copper)		PVC insulation Conductor temperature 70°		XLPE insulation Conductor temperature 90°		Typical dimensions of copper cable	
mm ²	AWG / kcmil	$I_{L\max}$ (A)	Time const. (s)	$I_{L\max}$ (A)	Time const. (s)	Size	ø [mm]
1.5	16	13	85	16	67	3 × 1.5 + 1.5	13
2.5	12	18	121	23	88	3 × 2.5 + 2.5	14
4	12	24	175	30	133	3 × 4 + 4	16
6	10	30	251	38	186	3 × 6 + 6	18
10	8	42	359	53	268	3 × 10 + 10	21

Conductor cross-section (copper)		PVC insulation Conductor temperature 70°		XLPE insulation Conductor temperature 90°		Typical dimensions of copper cable

Control connections

See chapter [Control unit \(BCU\)](#).

Coolant connections

Inverter module: 16/13 mm, for polyamide (PA) pipe; heat exchanger: 8/6 mm pipe.

Efficiency

Approximately 98% at nominal power level.

The efficiency is not calculated according to IEC 61800-9-2.

Energy efficiency data (ecodesign)

Energy efficiency data is not provided for the drive/unit. Multidrives and multidrive modules are not in the scope of the EU ecodesign requirements (Regulation EU/2019/1781) or the UK ecodesign requirements (Regulation SI 2021 No. 745).

Protection classes

Degrees of protection (IEC/EN 60529)	IP00
Enclosure types (UL 50/50E)	UL Open Type
Oversupply category (IEC/EN 60664-1)	III
Protective class (IEC/EN 61800-5-1)	I

Ambient conditions

This section gives the environmental requirements for the converter module. The converter module must be used in a heated indoor controlled environment.

	Operation installed for stationary use	Storage in protective package	Transportation in protective package
Altitude above sea level	0...4000 m (13123 ft)* Output derated above 1000 m (3281 ft). See section Altitude derating. *Neutral-grounded TN and TT network systems, non-corner-grounded IT network systems. Corner-grounded TN, TT and IT network systems up to 600 V.	-	-
Air temperature	0 ... +45 °C (+32 ... +113 °F), no condensation allowed. Output derated in the range +45 ... +55 °C (+113 ... +131 °F).	-40 ... +70 °C (-40 ... +158 °F)	-40 ... +70 °C (-40 ... +158 °F)
Relative humidity	Maximum 95%, no condensation allowed No condensation allowed. Maximum allowed relative humidity is 60% in the presence of corrosive gases.	Maximum 95%, no condensation allowed	Maximum 95%, no condensation allowed
Contamination	IEC/EN 60721-3-3:2002: Classification of environmental conditions - Part 3-3: Classification of groups of environmental parameters and their severities - Stationary use of weather protected locations	IEC 60721-3-1:1997	IEC 60721-3-2:1997
Chemical gases	Class 3C2	Class 1C2	Class 2C2

	Operation installed for stationary use	Storage in protective package	Transportation in protective package
Solid particles	Class 3S1	Class 1S3 (packing must support this, otherwise 1S2)	Class 2S2
	No conductive dust allowed.		
Vibration	IEC 61800-5-1 IEC 60068-2-6:2007, EN 60068-2-6:2008 Environmental testing Part 2: Tests -Test Fc: Vibration (sinusoidal) 10 ... 57 Hz, max. 0.075 mm amplitude 57 ... 150 Hz 1 g Tested in a typical cabinet assembly according to: Max. 1 mm (0.04 in.) (peak value, 5 ... 13.2 Hz), max. 0.7 g (13.2 ... 100 Hz) sinusoidal	IEC/EN 60721-3-1:1997	IEC/EN 60721-3-1:1997
Shock IEC 60068-2-27:2008, EN 60068-2-27:2009 Environmental testing - Part 2-27: Tests - Test Ea and guidance: Shock	Not allowed	With packing max. 100 m/s ² (330 ft./s ²) 11 ms	With packing max. 100 m/s ² (330 ft./s ²) 11 ms

PMS 1C Cool Gray, PMS Process Black

Materials

■ Module

Refer to [Recycling instructions and environmental information for ACS880 cabinet-installed drives and multidrive modules \(3AXD50000153909 \[English\]\)](#).

■ Packaging of module

This is a complete list of the package materials. The materials vary depending on the frame size (packages do not contain all materials listed below).

- Cardboard (heavy duty quality with wet strength glue in large modules)
- Molded pulp
- Plywood
- Wood
- PP (strapping)
- EPP (foam)

- PE (plastic bag and/or VCI film)
- Metal (fixing clamps, screws).

■ Packaging of options

- Cardboard
- Kraft paper
- PP (straps)
- PE (film, bubble wrap)
- Plywood, wood (only for heavy components).

Materials vary according to the item type, size and shape. Typical package consists of a cardboard box with paper filling or bubble wrap. ESD-safe packing materials are used for printed circuit boards and similar items.

■ Manuals

Printed product manuals are made of recyclable paper. Product manuals are available on the Internet.

Disposal

The main parts of the drive can be recycled to preserve natural resources and energy. Product parts and materials should be dismantled and separated.

Generally all metals, such as steel, aluminum, copper and its alloys, and precious metals can be recycled as material. Plastics, rubber, cardboard and other packaging material can be used in energy recovery.

Printed circuit boards and DC capacitors need selective treatment according to IEC 62635 guidelines.

To aid recycling, most plastic parts are marked with an appropriate identification code. In addition, components containing substances of very high concern (SVHCs) are listed in European Chemicals Agency's SCIP database. SCIP is the database for information on Substances of Concern In articles as such or in complex objects (Products) established under the Waste Framework Directive (2008/98/EC). For further information, contact your local ABB distributor or consult European Chemicals Agency's SCIP database to find out which SVHCs are used in the drive, and to find out where those components are located.

Contact your local ABB distributor for further information on environmental aspects. End of life treatment must follow international and national regulations.

For more information on ABB end of life services, refer to
new.abb.com/service/end-of-life-services.

Standards

See [ACS880 liquid-cooled multidrive cabinets and modules electrical planning \(3AXD50000048634 \[English\]\)](#).

Markings

See ACS880 liquid-cooled multidrive cabinets and modules electrical planning (3AXD50000048634 [English]).

M12	31 N·m (23 lbf·ft)	8.8

■ Cable lugs

Size	Max. torque	Strength class
M8	15 N·m (11 lbf·ft)	8.8 (A2-70 or A4-70)
M10	32 N·m (23.5 lbf·ft)	8.8
M12	50 N·m (37 lbf·ft)	8.8

Disclaimers

■ Generic disclaimer

The manufacturer shall have no obligation with respect to any product which (i) has been improperly repaired or altered; (ii) has been subjected to misuse, negligence or accident; (iii) has been used in a manner contrary to the manufacturer's instructions; or (iv) has failed as a result of ordinary wear and tear.

■ Cyber security disclaimer

This product is designed to be connected to and to communicate information and data via a network interface. It is Customer's sole responsibility to provide and continuously ensure a secure connection between the product and Customer network or any other network (as the case may be). Customer shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information.

ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

The Safe torque off function

Contents of this chapter

This chapter describes the Safe torque off (STO) function of the drive and gives instructions for its use.

Note: In this chapter, the term 'drive' refers to one inverter unit of the drive system.

Description

WARNING!

In case of parallel-connected drives or dual-winding motors, the STO must be activated on each drive to remove the torque from the motor.

The Safe torque off function can be used, for example, as the final actuator device of safety circuits (such as an emergency stop circuit) that stop the drive in case of danger. Another typical application is a prevention of unexpected start-up function that enables short-time maintenance operations like cleaning or work on non-electrical parts of the machinery without switching off the power supply to the drive.

When activated, the Safe torque off function disables the control voltage for the power semiconductors of the drive output stage, thus preventing the drive from generating the torque required to rotate the motor. If the motor is running when Safe torque off is activated, it coasts to a stop.

The Safe torque off function has a redundant architecture, that is, both channels must be used in the safety function implementation. The safety data given in this manual is calculated for redundant use, and does not apply if both channels are not used.

The Safe torque off function complies with these standards:

Standard	Name
IEC 60204-1:2021 EN 60204-1:2018	Safety of machinery – Electrical equipment of machines – Part 1: General requirements
IEC 61000-6-7:2014	Electromagnetic compatibility (EMC) – Part 6-7: Generic standards – Immunity requirements for equipment intended to perform functions in a safety-related system (functional safety) in industrial locations
IEC 61326-3-1:2017	Electrical equipment for measurement, control and laboratory use – EMC requirements – Part 3-1: Immunity requirements for safety-related systems and for equipment intended to perform safety-related functions (functional safety) – General industrial applications
IEC 61508-1:2010	Functional safety of electrical/electronic/programmable electronic safety-related systems – Part 1: General requirements
IEC 61508-2:2010	Functional safety of electrical/electronic/programmable electronic safety-related systems – Part 2: Requirements for electrical/electronic/programmable electronic safety-related systems
IEC 61511-1:2017	Functional safety – Safety instrumented systems for the process industry sector
IEC 61800-5-2:2016 EN 61800-5-2:2007	Adjustable speed electrical power drive systems – Part 5-2: Safety requirements – Functional
EN IEC 62061:2021	Safety of machinery – Functional safety of safety-related control systems
EN ISO 13849-1:2015	Safety of machinery – Safety-related parts of control systems – Part 1: General principles for design
EN ISO 13849-2:2012	Safety of machinery – Safety-related parts of control systems – Part 2: Validation

The function also corresponds to Prevention of unexpected start-up as specified by EN ISO 14118:2018 (ISO 14118:2017), and Uncontrolled stop (stop category 0) as specified in EN/IEC 60204-1.

■ Compliance with the European Machinery Directive and the UK Supply of Machinery (Safety) Regulations

See [Electrical planning instructions for ACS880 liquid-cooled multidrive cabinets and modules \(3AXD50000048634 \[English\]\)](#).

Wiring

For the electrical specifications of the STO connection, see the technical data of the control unit.

■ Activation switch

In the wiring diagrams, the activation switch has the designation [K]. This represents a component such as a manually operated switch, an emergency stop push button switch, or the contacts of a safety relay or safety PLC.

- In case a manually operated activation switch is used, the switch must be of a type that can be locked out to the open position.
- The contacts of the switch or relay must open/close within 200 ms of each other.
- An FSO safety functions module, an FSPS safety functions module or an FPTC thermistor protection module can also be used. For more information, see the module documentation.

■ Cable types and lengths

- ABB recommends double-shielded twisted-pair cable.
- Maximum cable lengths:
 - 300 m (1000 ft) between activation switch [K] and drive control unit
 - 60 m (200 ft) between multiple drives
 - 60 m (200 ft) between external power supply and first control unit
 - 30 m (100 ft) between control unit and last inverter module in the chain.

Note: A short-circuit in the wiring between the switch and an STO terminal causes a dangerous fault. Therefore, it is recommended to use a safety relay (including wiring diagnostics) or a wiring method (shield grounding, channel separation) which reduces or eliminates the risk caused by the short-circuit.

Note: The voltage at the STO input terminals of the control unit (or frame R8i inverter module) must be at least 17 V DC to be interpreted as “1”.

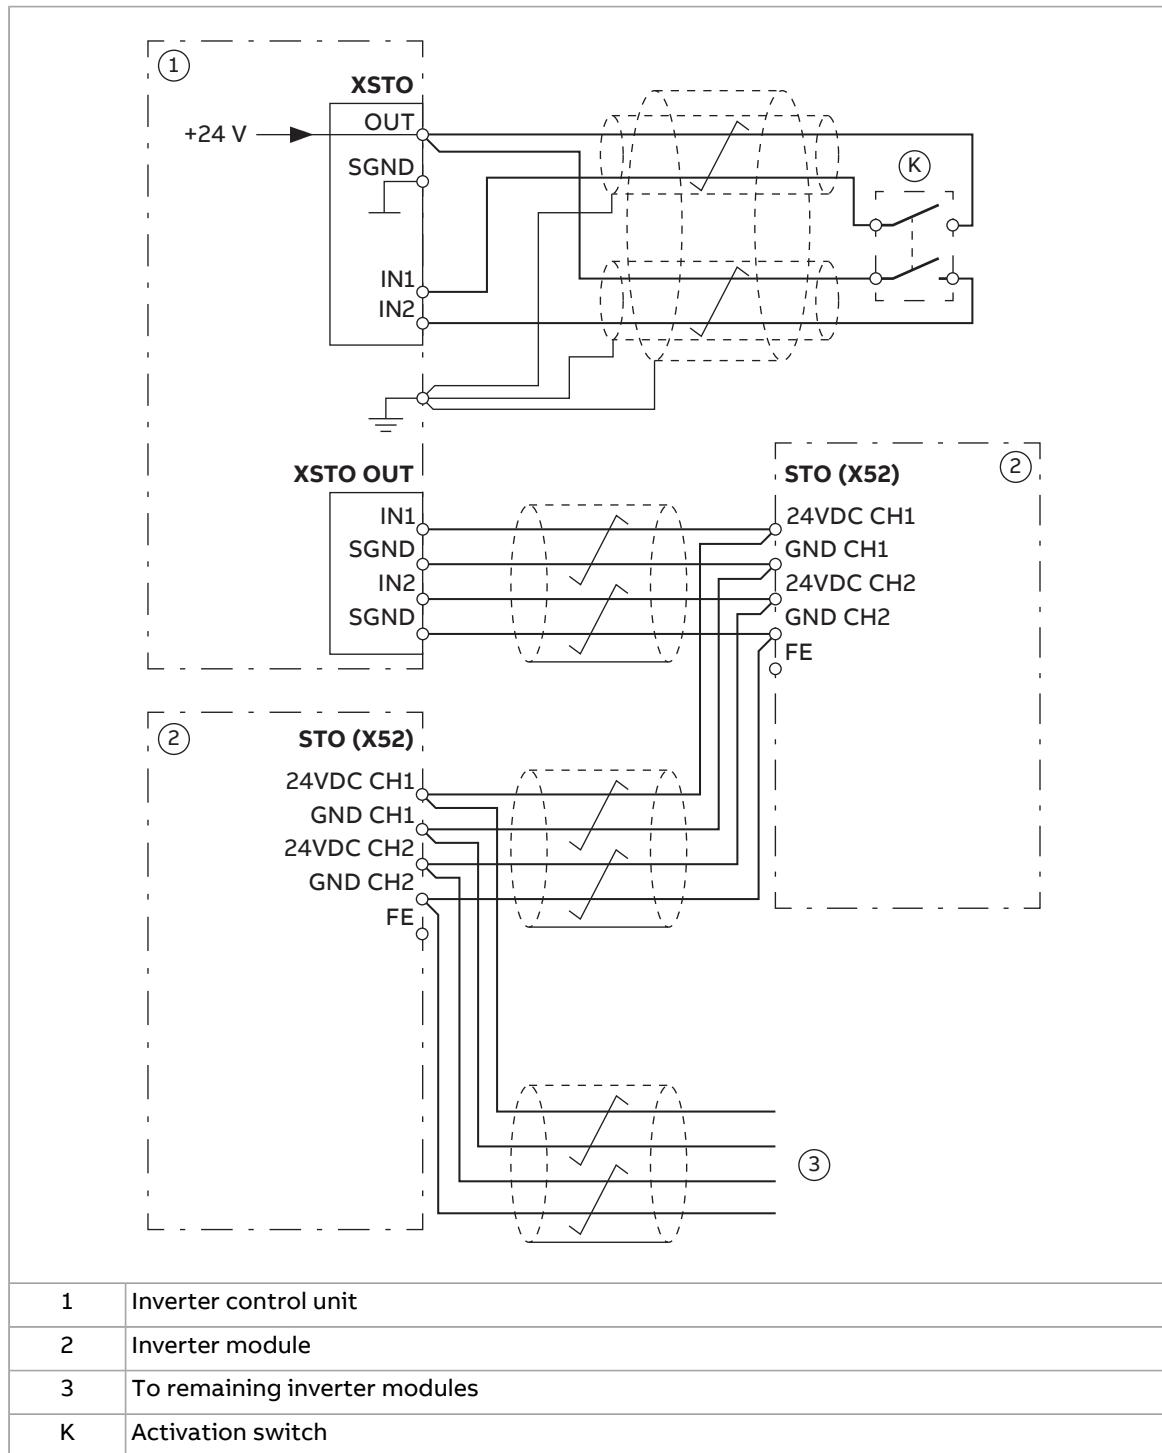

The pulse tolerance of the input channels is 1 ms.

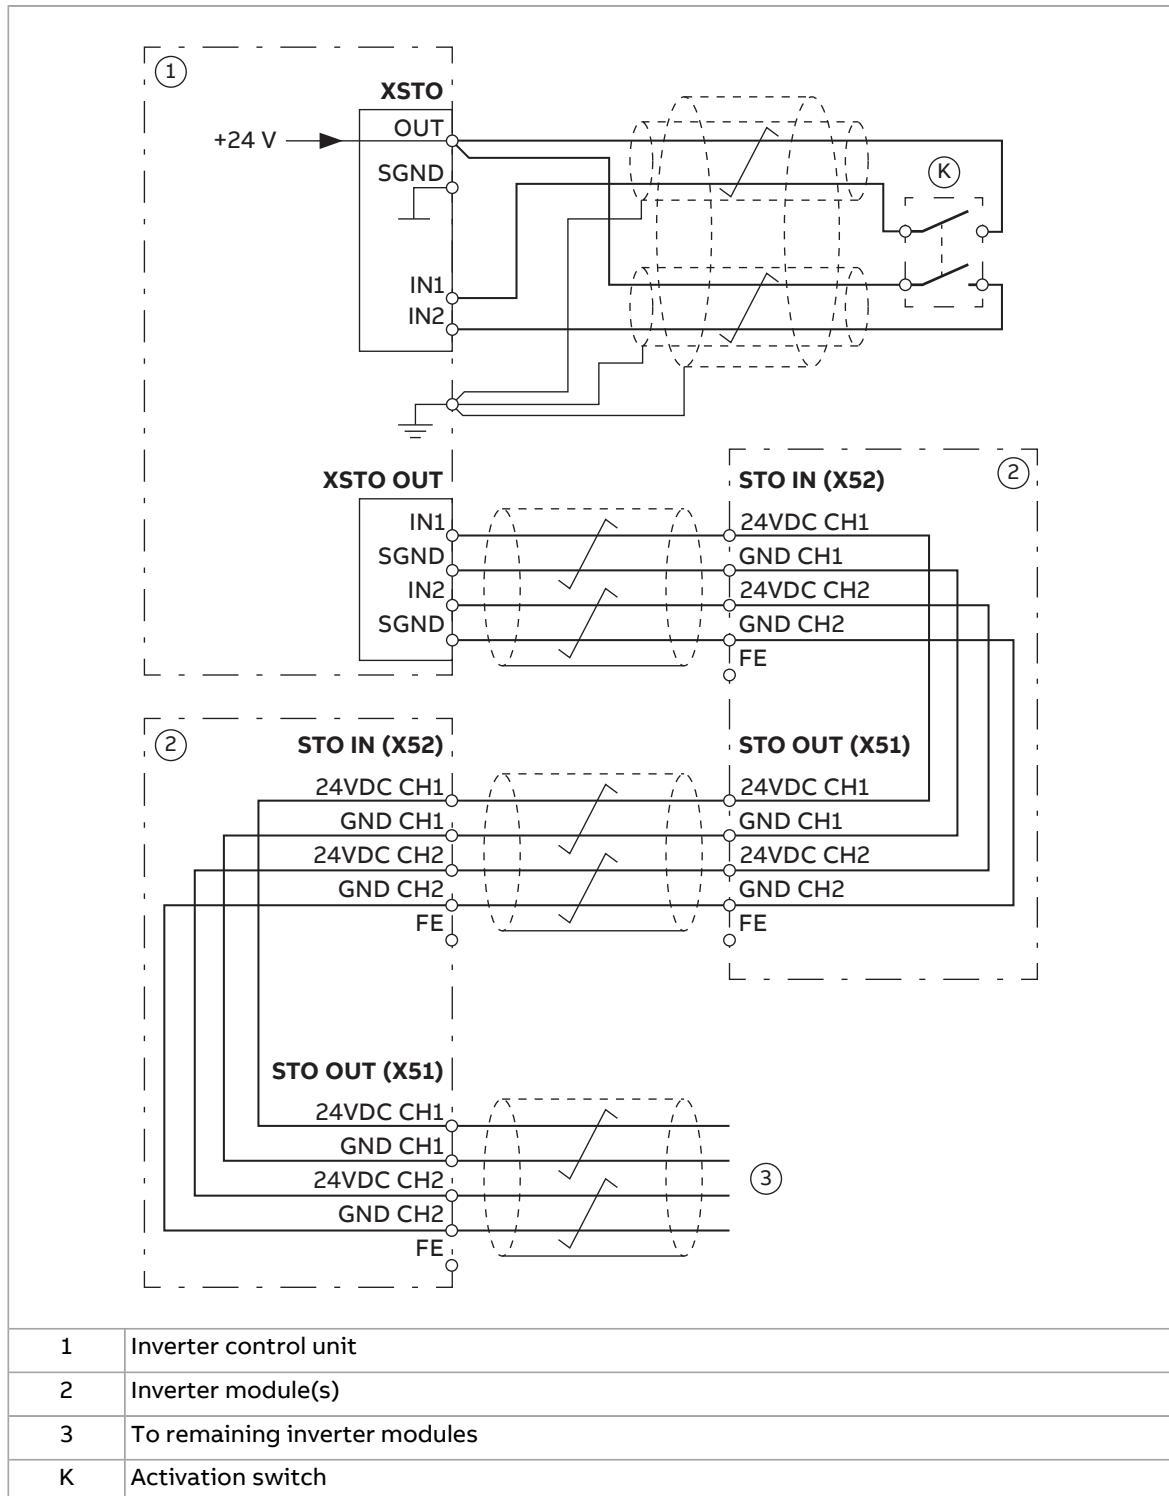

■ Grounding of protective shields

- Ground the shield in the cabling between the activation switch and the control unit at the control unit only.
- Ground the shield in the cabling between two control units at one control unit only.
- Do not ground the shield in the cabling between control unit and inverter module, or between inverter modules.

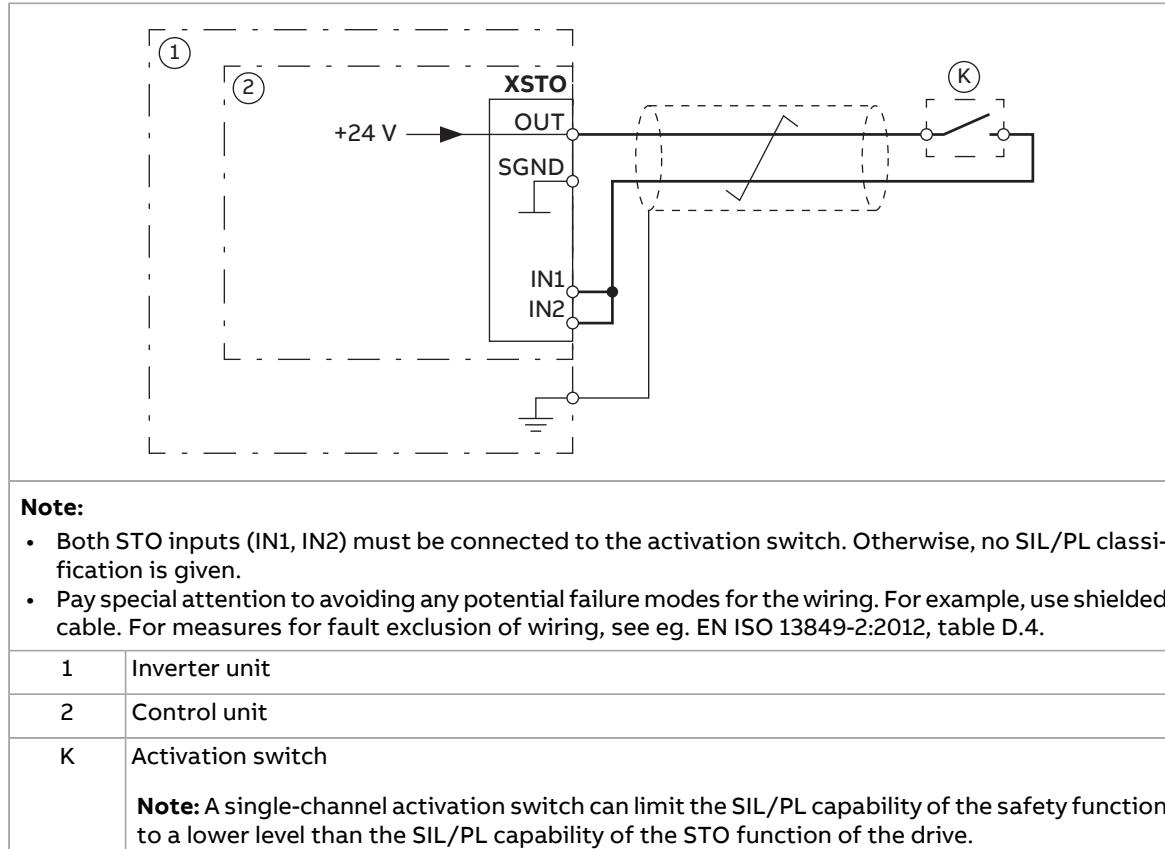

■ Dual-channel connection with internal power supply

Frame R7i and multiples

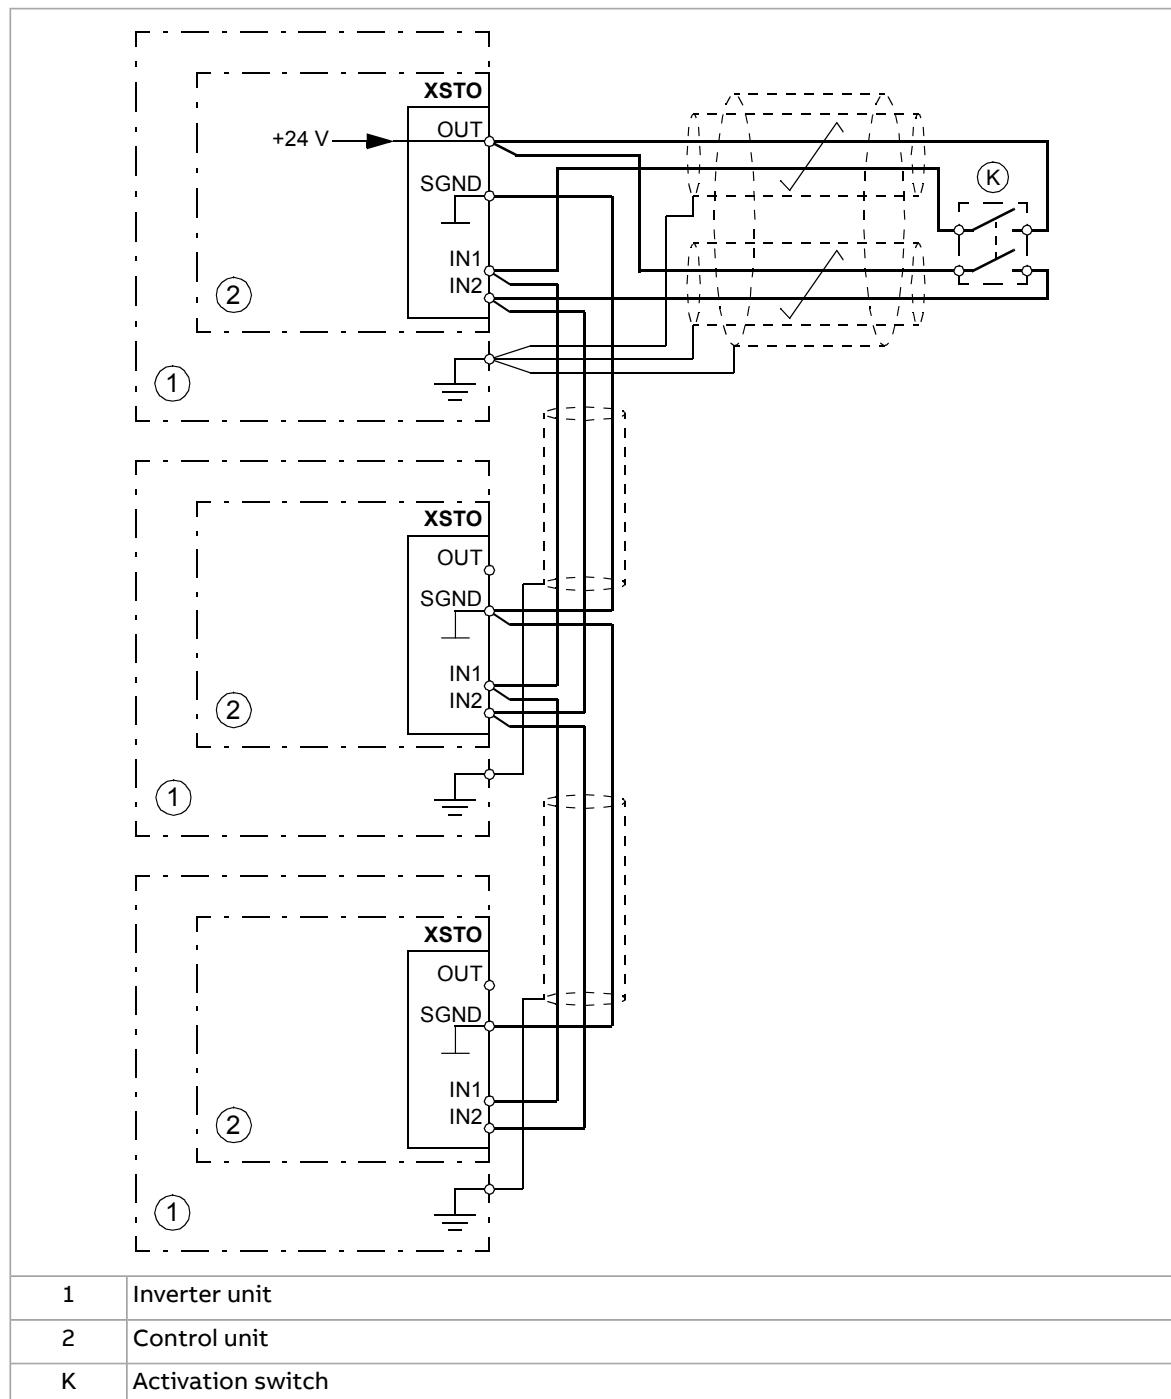

Frame R8i and multiples

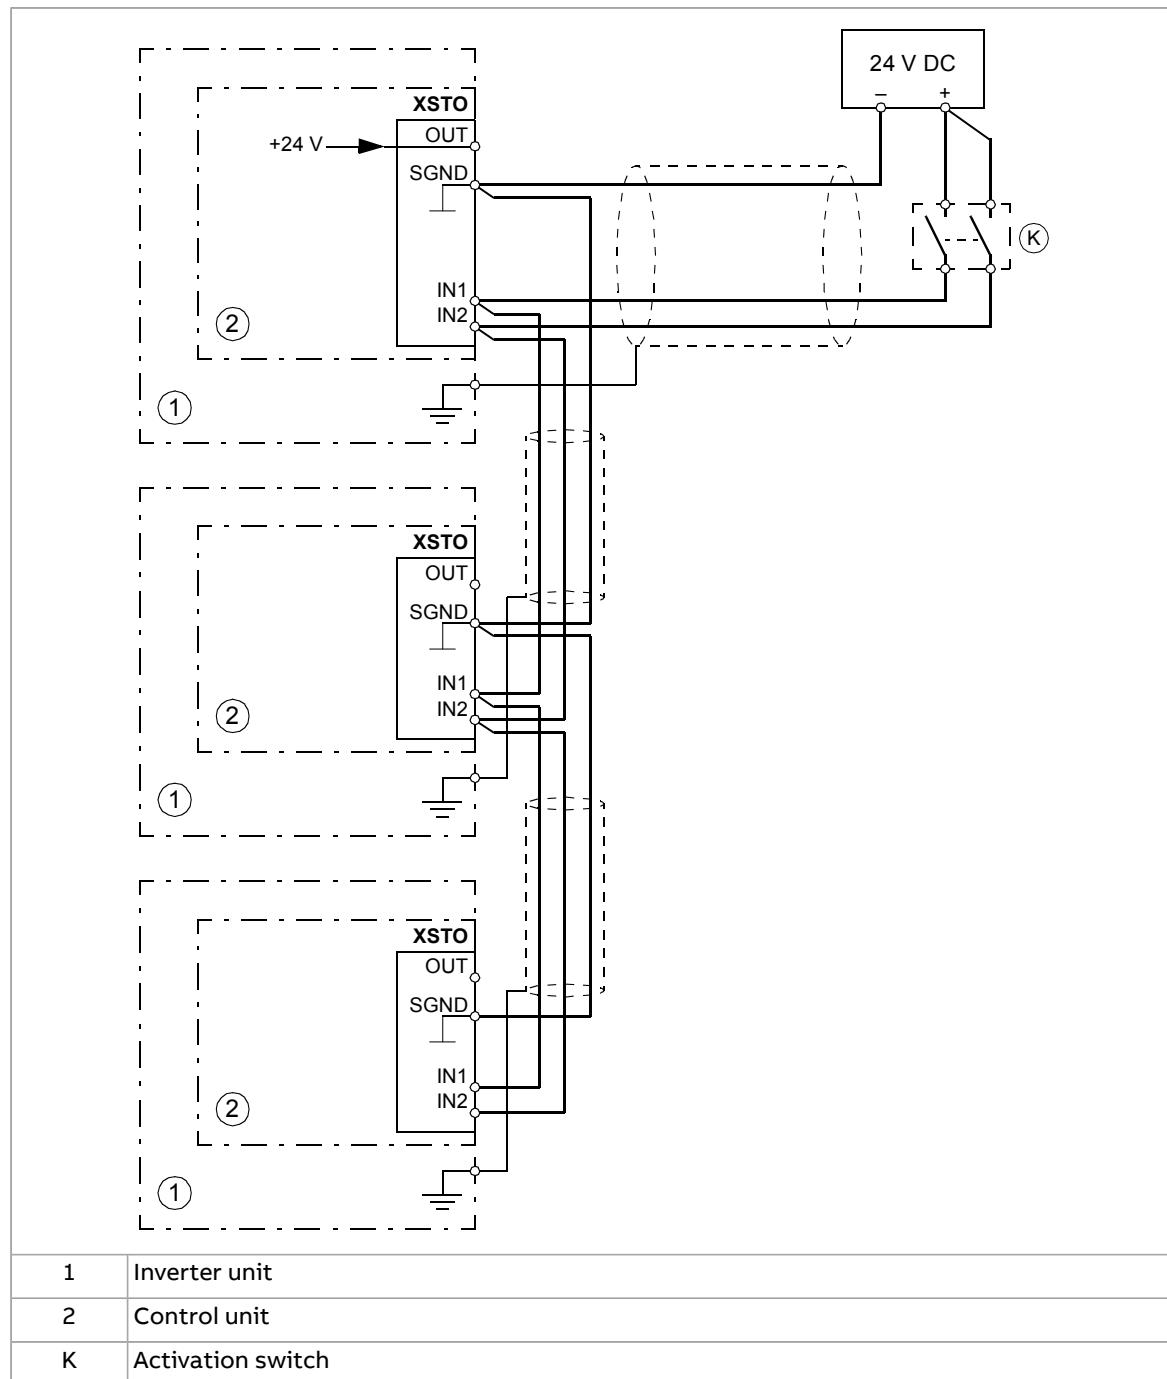

■ Single-channel connection of activation switch

■ Multiple inverter units

Internal power supply

External power supply

Operation principle

1. The Safe torque off activates (the activation switch is opened, or safety relay contacts open).
2. The STO inputs of the drive control unit de-energize.
3. The control unit cuts off the control voltage from the output IGBTs.
4. The control program generates an indication as defined by parameter 31.22 (see the firmware manual of the drive).

The parameter selects which indications are given when one or both STO signals are switched off or lost. The indications also depend on whether the drive is running or stopped when this occurs.

Note: This parameter does not affect the operation of the STO function itself. The STO function will operate regardless of the setting of this parameter: a running drive will stop upon removal of one or both STO signals, and will not start until both STO signals are restored and all faults reset.

Note: The loss of only one STO signal always generates a fault as it is interpreted as a malfunction of STO hardware or wiring.

5. The motor coasts to a stop (if running). The drive cannot restart while the activation switch or safety relay contacts are open. After the contacts close, a reset may be needed (depending on the setting of parameter 31.22). A new start command is required to start the drive.

Start-up including validation test

To ensure the safe operation of a safety function, validation is required. The final assembler of the machine must validate the function by performing a validation test. The test must be performed

1. at initial start-up of the safety function
2. after any changes related to the safety function (circuit boards, wiring, components, settings, replacement of inverter module, etc.)
3. after any maintenance work related to the safety function
4. after a drive firmware update
5. at the proof test of the safety function.

■ Competence

The validation test of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6. The test procedures and report must be documented and signed by this person.

■ Validation test reports

Signed validation test reports must be stored in the logbook of the machine. The report shall include documentation of start-up activities and test results, references to failure reports and resolution of failures. Any new validation tests performed due to changes or maintenance shall be logged into the logbook.

■ Validation test procedure

After wiring the Safe torque off function, validate its operation as follows.

Note: If an FSO safety functions module, FSPS-21 or FPTC module is installed, refer to its documentation.

Note: All inverter modules of the drive must be powered and connected to the STO circuit during the validation test.

Action	<input checked="" type="checkbox"/>
 WARNING! Obey the safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.	<input type="checkbox"/>
Make sure that the motor can be run and stopped freely during start-up.	<input type="checkbox"/>
Stop the drive (if running), switch the input power off and isolate the drive from the power line using a disconnector.	<input type="checkbox"/>
Check the STO circuit connections against the wiring diagram.	<input type="checkbox"/>
Close the disconnector and switch the power on.	<input type="checkbox"/>
In case the drive consists of parallel-connected modules, check that the number of modules detected (parameter 95.14) matches the actual number of modules, and that the drive type is correctly set in parameter 95.31.	<input type="checkbox"/>

Action	<input checked="" type="checkbox"/>
<p>Test the operation of the STO function when the motor is stopped.</p> <ul style="list-style-type: none"> Give a stop command for the drive (if running) and wait until the motor shaft is at a standstill. <p>Make sure that the drive operates as follows:</p> <ul style="list-style-type: none"> Open the STO circuit. The drive generates an indication if one is defined for the 'stopped' state in parameter 31.22 (see the firmware manual). Give a start command to verify that the STO function blocks the drive's operation. The motor should not start. Close the STO circuit. Reset any active faults. Restart the drive and check that the motor runs normally. 	<input type="checkbox"/>
<p>Test the operation of the STO function when the motor is running.</p> <ul style="list-style-type: none"> Start the drive and make sure the motor is running. Open the STO circuit. The motor should stop. The drive generates an indication if one is defined for the 'running' state in parameter 31.22 (see the firmware manual). Reset any active faults and try to start the drive. Make sure that the motor stays at a standstill and the drive operates as described above in testing the operation when the motor is stopped. Close the STO circuit. Reset any active faults. Restart the drive and check that the motor runs normally. 	<input type="checkbox"/>
<p>Test the operation of the failure detection of the drive. The motor can be stopped or running.</p> <ul style="list-style-type: none"> Open the 1st input channel of the STO circuit. If the motor was running, it should coast to a stop. The drive generates an FA81 fault indication (see the firmware manual). Give a start command to verify that the STO function blocks the drive's operation. The motor should not start. Open the STO circuit (both channels). Give a reset command. Close the STO circuit (both channels). Reset any active faults. Restart the drive and check that the motor runs normally. Open the 2nd input channel of the STO circuit. If the motor was running, it should coast to a stop. The drive generates an FA82 fault indication (see the firmware manual). Give a start command to verify that the STO function blocks the drive's operation. The motor should not start. Open the STO circuit (both channels). Give a reset command. Close the STO circuit (both channels). Reset any active faults. Restart the drive and check that the motor runs normally. 	<input type="checkbox"/>
Document and sign the validation test report which verifies that the safety function is safe and accepted for operation.	<input type="checkbox"/>

Use

1. Open the activation switch, or activate the safety functionality that is wired to the STO connection.
2. The STO inputs on the drive control unit de-energize, and the control unit cuts off the control voltage from the output IGBTs.
3. The control program generates an indication as defined by parameter 31.22 (see the firmware manual of the drive).
4. The motor coasts to a stop (if running). The drive will not restart while the activation switch or safety relay contacts are open.
5. Deactivate the STO by closing the activation switch, or resetting the safety functionality that is wired to the STO connection.
6. Reset any faults before restarting.

WARNING!

The Safe torque off function does not disconnect the voltage of the main and auxiliary circuits from the drive. Therefore maintenance work on electrical parts of the drive or the motor can only be carried out after isolating the drive from the supply and all other voltage sources.

WARNING!

The Safe torque off functionality is only achieved through the XSTO connector of the inverter control unit (A41). True Safe torque off functionality is not achieved through the XSTO connectors of other control units (such as the supply control unit or the brake control unit).

The Safe torque off function is supported by any ACS880 inverter or drive control program. It is not supported by supply, DC/DC converter or brake firmware.

WARNING!

The drive cannot detect or memorize any changes in the STO circuitry when the drive control unit is not powered or when the main power to the drive is off. If both STO circuits are closed and a level-type start signal is active when the power is restored, it is possible that the drive starts without a fresh start command. Take this into account in the risk assessment of the system.

WARNING!

Permanent magnet or synchronous reluctance [SynRM] motors only:

In case of a multiple IGBT power semiconductor failure, the drive can produce an alignment torque which maximally rotates the motor shaft by $180/p$ degrees (with permanent magnet motors) or $180/2p$ degrees (with synchronous reluctance [SynRM] motors) regardless of the activation of the Safe torque off function. p denotes the number of pole pairs.

Notes:

- If a running drive is stopped by using the Safe torque off function, the drive will cut off the motor supply voltage and the motor will coast to a stop. If this causes

danger or is not otherwise acceptable, stop the drive and machinery using the appropriate stop mode before activating the Safe torque off function.

- The Safe torque off function overrides all other functions of the drive.
- The Safe torque off function is ineffective against deliberate sabotage or misuse.
- The Safe torque off function has been designed to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. The assembler of the machine must inform the final user about the residual risks.

Maintenance

After the operation of the circuit is validated at start-up, the STO function shall be maintained by periodic proof testing. In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 10 years; see section [Safety data \(page 305\)](#).

There are two alternative procedures for proof testing:

1. Perfect proof testing. It is assumed that all dangerous failures of the STO circuit are detected during the test. PFD_{avg} values for STO with the perfect proof testing procedure are given in the safety data section.
2. Simplified proof testing. This procedure is faster and simpler than perfect proof testing. Not all dangerous failures of the STO circuit are detected during the test. The PFD_{avg} value for STO with the simplified proof testing procedure is given in the safety data section.

Note: The proof testing procedures are only valid for proof testing (periodic test, item 5 under section [Start-up including validation test](#)) but not for re-validation after changes made in the circuit. Re-validation (items 1...4 under [Start-up including validation test](#)) must be done according to the initial validation procedure.

Note: See also the Recommendation of Use CNB/M/11.050 (published by the European co-ordination of Notified Bodies) concerning dual-channel safety-related systems with electromechanical outputs:

- When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be performed at least every month.
- When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be performed at least every 12 months.

The STO function of the drive does not contain any electromechanical components.

In addition to proof testing, it is a good practice to check the operation of the function when other maintenance procedures are carried out on the machinery.

Include the Safe torque off operation test described above in the routine maintenance program of the machinery that the drive runs.

If any wiring or component change is needed after start-up, or the parameters are restored, do the test given in section [Validation test procedure \(page 298\)](#).

Use only spare parts approved by ABB.

Record all maintenance and proof test activities in the machine logbook.

■ Competence

The maintenance and proof test activities of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6.

■ Perfect proof test procedure

Action	<input checked="" type="checkbox"/>
 WARNING! Obey the safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.	<input type="checkbox"/>
Test the operation of the STO function. If the motor is running, it will stop during the test. <ul style="list-style-type: none"> Give a stop command for the drive (if running) and wait until the motor shaft is at a standstill. Make sure that the drive operates as follows: <ul style="list-style-type: none"> Open the STO circuit. The drive generates an indication if one is defined for the 'stopped' state in parameter 31.22 (see the firmware manual). Close the STO circuit. Reset any active faults. Restart the drive and check that the motor runs normally. 	<input type="checkbox"/>
Test the operation of the failure detection of the drive. The motor can be stopped or running. <ul style="list-style-type: none"> Open the 1st input channel of the STO circuit. If the motor was running, it should coast to a stop. The drive generates an FA81 fault indication (see the firmware manual). Open the STO circuit (both channels). Give a reset command. Close the STO circuit (both channels). Reset any active faults. Open the 2nd input channel of the STO circuit. If the motor was running, it should coast to a stop. The drive generates an FA82 fault indication (see the firmware manual). Open the STO circuit (both channels). Give a reset command. Close the STO circuit (both channels). Reset any active faults. Restart the drive and check that the motor runs normally. 	<input type="checkbox"/>
Document and sign the test report to verify that the safety function has been tested according to the procedure.	<input type="checkbox"/>

■ Simplified proof test procedure

Action	<input checked="" type="checkbox"/>
 WARNING! Obey the safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.	<input type="checkbox"/>
Test the operation of the STO function. Document and sign the test report to verify that the safety function has been tested according to the procedure.	<input type="checkbox"/>

Fault tracing

The indications given during the normal operation of the Safe torque off function are selected by drive control program parameter 31.22.

The diagnostics of the Safe torque off function cross-compare the status of the two STO channels. In case the channels are not in the same state, a fault reaction function is performed and the drive trips on an FA81 or FA82 fault. An attempt to use the STO in a non-redundant manner, for example activating only one channel, will trigger the same reaction.

See the firmware manual of the drive control program for the indications generated by the drive, and for details on directing fault and warning indications to an output on the control unit for external diagnostics.

Any failures of the Safe torque off function must be reported to ABB.

Safety data

The safety data for the Safe torque off function is given below.

Note: The safety data is calculated for redundant use, and applies only if both STO channels are used.

Frame size	SL	SC	PL	PFH ($T_1 = 20$ a) (1/h)	PFD _{avg}		MTTF _D (a)	DC (%)	SFF (%)	Cat.	HFT	CCF	T_M (a)	PFH _{diag} (1/h)	$\lambda_{\text{Diag_s}}$ (1/h)	$\lambda_{\text{Diag_d}}$ (1/h)	
					Perfect proof test	Simplified proof test

																	3AXD100000078136 K

- The STO is a type B safety component as defined in IEC 61508-2.
- Relevant failure modes:
 - The STO trips spuriously (safe failure)
 - The STO does not activate when requested
 - A fault exclusion on the failure mode "short circuit on printed circuit board" has been made (EN 13849-2, table D.5). The analysis is based on an assumption that one failure occurs at one time. No accumulated failures have been analyzed.
- STO response times:
 - STO reaction time (shortest detectable break): 1 ms
 - STO response time: 2 ms (typical), 25 ms (maximum)
 - Fault detection time: Channels in different states for longer than 200 ms
 - Fault reaction time: Fault detection time + 10 ms.
- Indication delays:
 - STO fault indication (parameter 31.22) delay: < 500 ms
 - STO warning indication (parameter 31.22) delay: < 1000 ms.

■ Terms and abbreviations

Term or abbreviation	Reference	Description
Cat.	EN ISO 13849-1	Classification of the safety-related parts of a control system in respect of their resistance to faults and their subsequent behavior in the fault condition, and which is achieved by the structural arrangement of the parts, fault detection and/or by their reliability. The categories are: B, 1, 2, 3 and 4.
CCF	EN ISO 13849-1	Common cause failure (%)
DC	EN ISO 13849-1	Diagnostic coverage (%)
HFT	IEC 61508	Hardware fault tolerance
MTTF _D	EN ISO 13849-1	Mean time to dangerous failure: (Total number of life units) / (Number of dangerous, undetected failures) during a particular measurement interval under stated conditions
PFD _{avg}	IEC 61508	Average probability of dangerous failure on demand, that is, mean unavailability of a safety-related system to perform the specified safety function when a demand occurs
PFH	IEC 61508	Average frequency of dangerous failures per hour, that is, average frequency of a dangerous failure of a safety related system to perform the specified safety function over a given period of time
PFH _{diag}	IEC/EN 62061	Average frequency of dangerous failures per hour for the diagnostic function of STO
PL	EN ISO 13849-1	Performance level. Levels a...e correspond to SIL
Proof test	IEC 61508, IEC 62061	Periodic test performed to detect failures in a safety-related system so that, if necessary, a repair can restore the system to an "as new" condition or as close as practical to this condition
SC	IEC 61508	Systematic capability (1...3)
SFF	IEC 61508	Safe failure fraction (%)
SIL	IEC 61508	Safety integrity level (1...3)
STO	IEC/EN 61800-5-2	Safe torque off

308 The Safe torque off function

Term or abbreviation	Reference	Description
T_1	IEC 61508-6	Proof test interval. T_1 is a parameter used to define the probabilistic failure rate (PFH or PFD) for the safety function or subsystem. Performing a proof test at a maximum interval of T_1 is required to keep the SIL capability valid. The same interval must be followed to keep the PL capability (EN ISO 13849) valid. See also section Maintenance.
T_M	EN ISO 13849-1	Mission time: the period of time covering the intended use of the safety function/device. After the mission time elapses, the safety device must be replaced. Note that any T_M values given cannot be regarded as a guarantee or warranty.
$\lambda_{\text{Diag_d}}$	IEC 61508-6	Dangerous failure rate (per hour) of the diagnostics function of STO
$\lambda_{\text{Diag_s}}$	IEC 61508-6	Safe failure rate (per hour) of the diagnostics function of STO

■ TÜV certificate

The TÜV certificate is available on the Internet.

14

Example circuit diagrams

Contents of this chapter

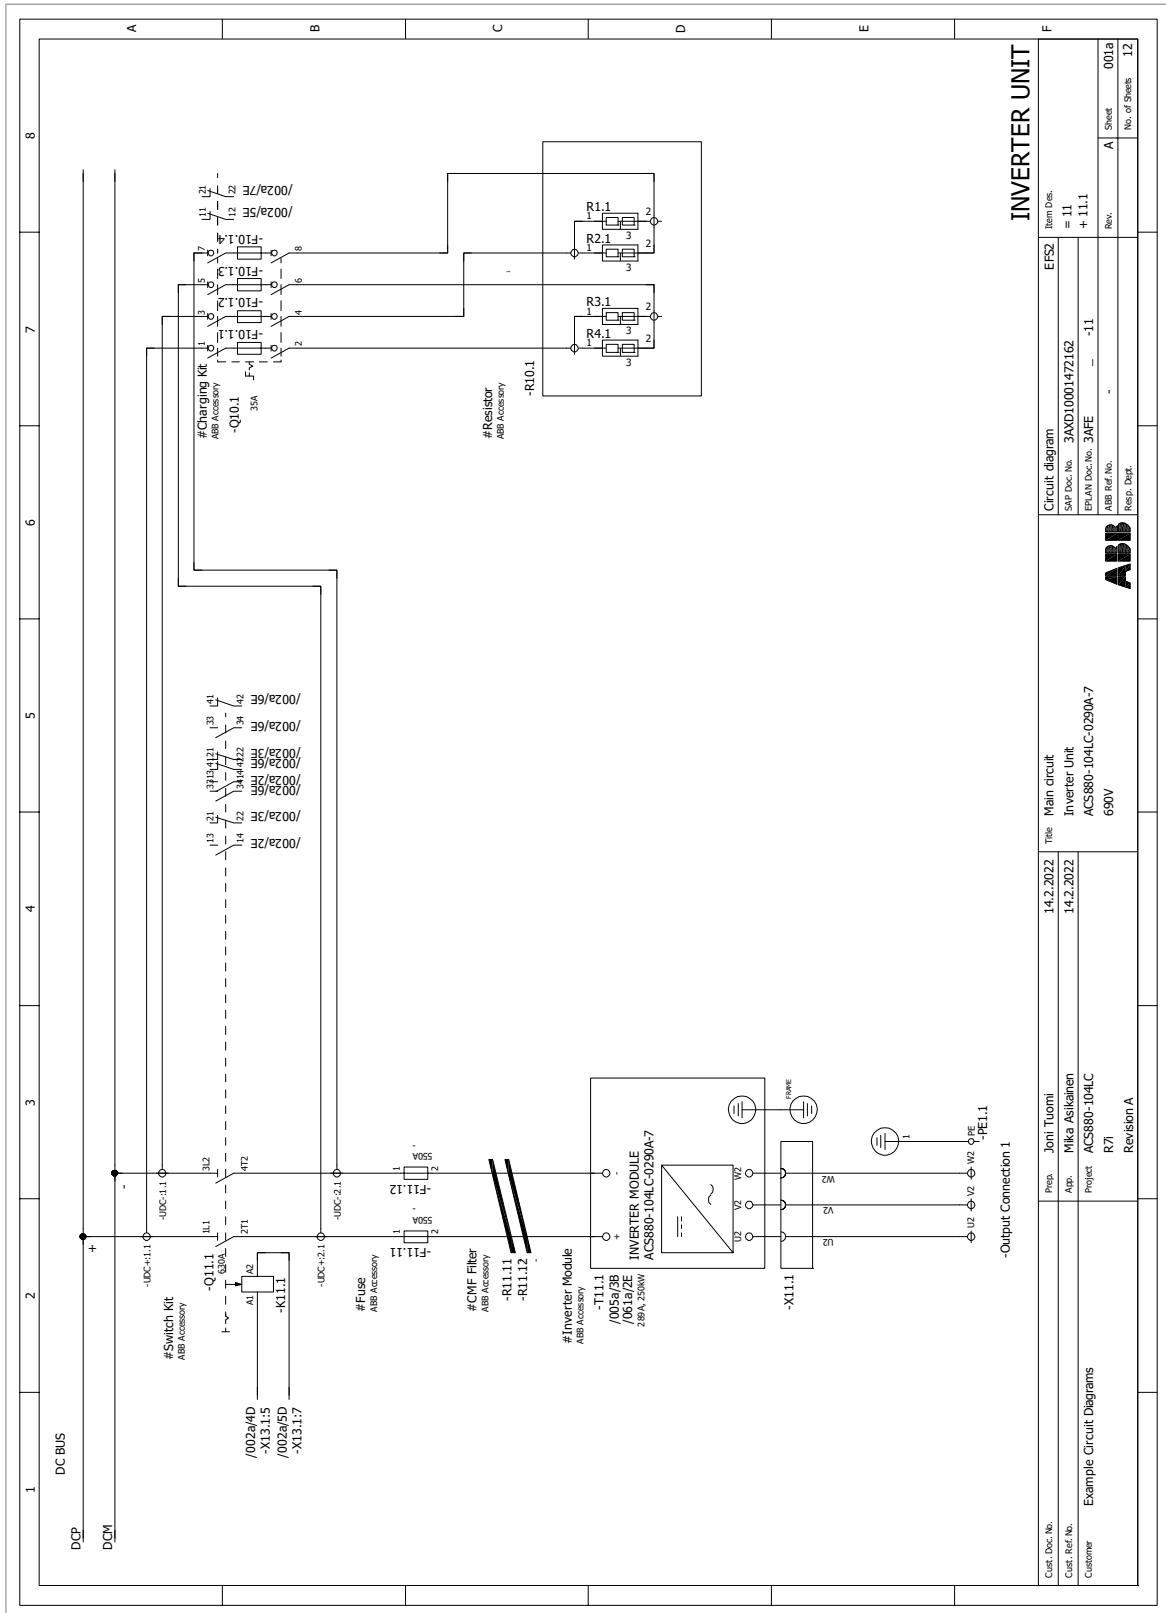

This chapter contains connection diagram examples for the whole inverter unit.

Note: By default, the Safe torque off (STO) function is not in use, and has been bridged at the factory as shown in the diagrams. For information on implementing the function, see chapter [The Safe torque off function](#).

Internal cooling circuit

Contents of this chapter

The cooling system of a liquid-cooled drive consists of two circuits: the internal cooling circuit and the external cooling circuit. The internal cooling circuit covers the heat-generating electrical components of the drive and transfers the heat to the cooling unit. In the cooling unit, the heat is transferred to the external cooling circuit which is usually part of a larger external cooling system. This chapter deals with the internal cooling circuit.

Applicability

The information in this chapter is applicable to cabinet-built ACS880 liquid-cooled drives. Except where otherwise indicated, the information is also applicable to drives built out of ACS880 liquid-cooled multidrives modules.

Internal cooling system

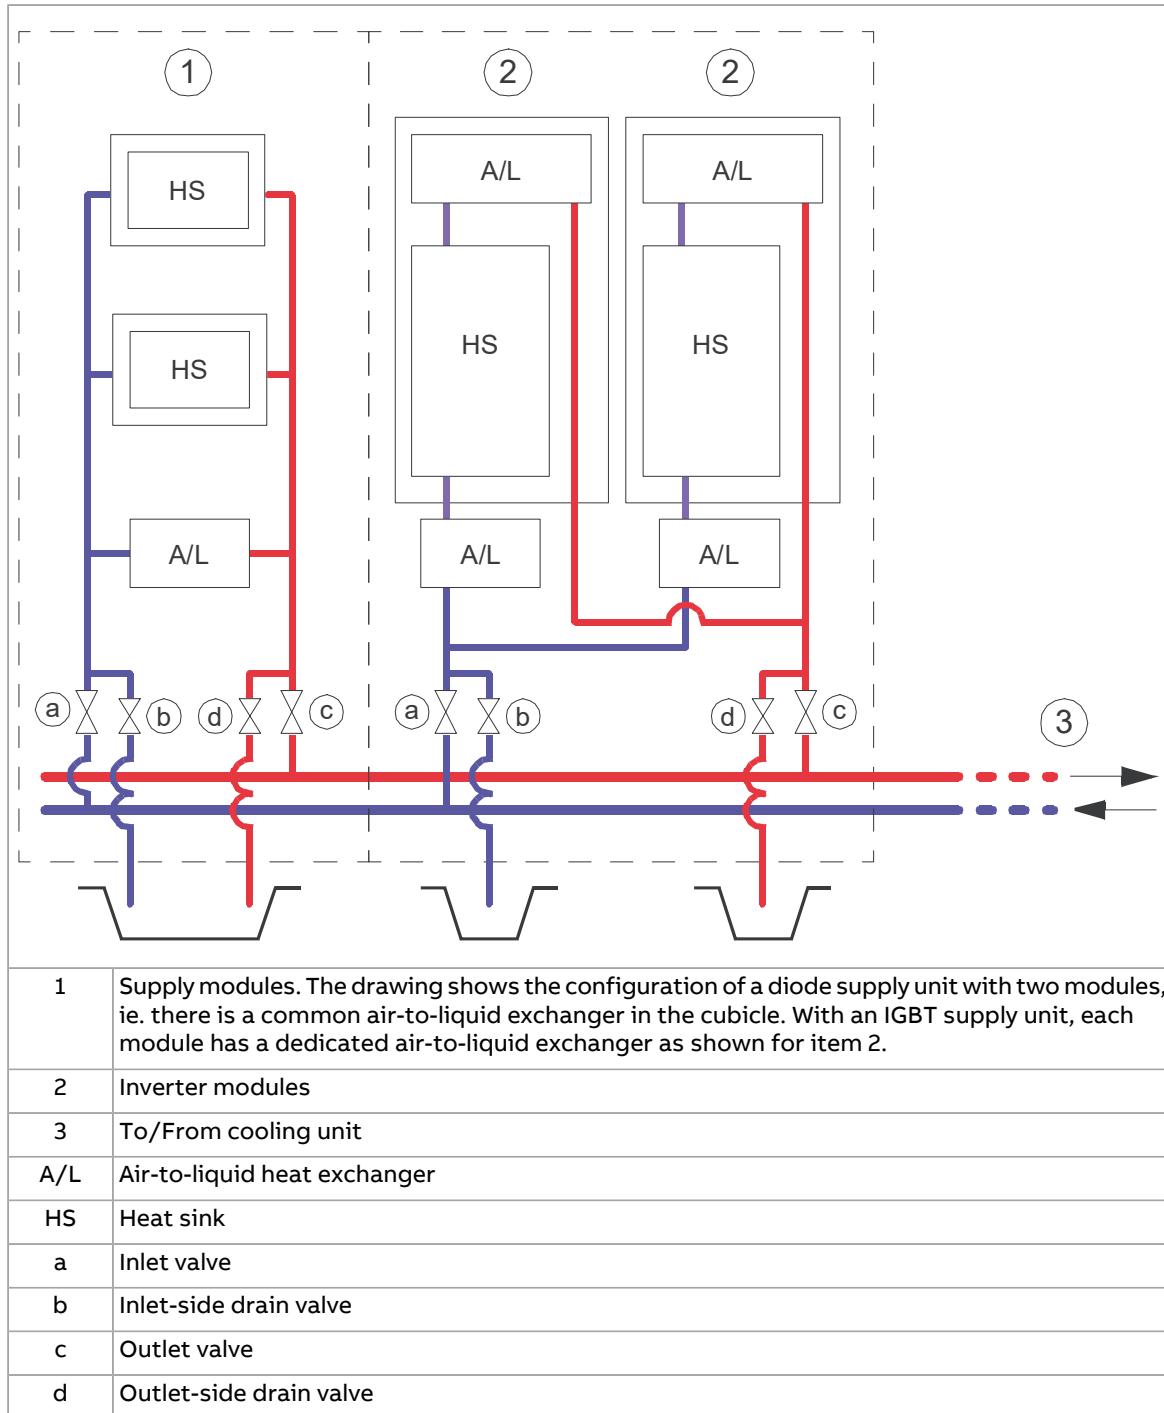

Each cubicle has an inlet and an outlet manifold, fitted with a stop valve and a drain valve. The stop valves can be closed to isolate all modules in the cubicle from the main cooling circuit.

In cabinet line-ups built by ABB, valves are color-coded:

- Blue – Open during operation
- Red – Closed during operation

The following diagram shows the coolant pipe connections in a drive system consisting of a supply unit and an inverter unit. Other units, such as brake units, DC/DC converter units have similar cooling arrangements. Other cubicles containing components that require cooling may also contain heat exchangers.

382 Internal cooling circuit

The coolant used with ACS880 liquid-cooled drive systems is Antifrogen® L 25% or 50% mixture. See [Coolant specification \(page 386\)](#).

Connection to a cooling unit

■ Connection to an ACS880-1007LC cooling unit

Refer to [ACS880-1007LC cooling unit user's manual \(3AXD50000129607 \[English\]\)](#).

■ Connection to a custom cooling unit

General requirements

Equip the system with an expansion vessel to damp pressure rise due to volume changes when the temperature varies. Equip the system with a pump that provides a nominal flow and pressure. Keep the pressure within the limits specified in [Technical data \(page 386\)](#). Install a pressure regulator to make sure that the maximum permissible operating pressure is not exceeded.

Install a bleed valve at the highest point of the cooling circuit, and a drain valve at the lowest point.

The materials that can be used are listed in [Cooling circuit materials \(page 388\)](#).

Coolant temperature control

The temperature of the coolant in the internal cooling circuit must be kept within the limits specified in [Technical data \(page 386\)](#). Note that the minimum temperature is dependent on ambient temperature and relative humidity.

Filling up and bleeding the internal cooling circuit

Both the drive and coolant must be at room temperature before filling up the cooling circuit.

WARNING!

Make sure that the maximum permissible operating pressure is not exceeded. When necessary regulate the pressure to appropriate level by draining excess coolant out of the system.

WARNING!

Bleeding of the cooling circuit is very important and has to be done with great care. Air bubbles in the cooling circuit may reduce or completely block coolant flow and lead to overheating. Let the air out of the cooling system while filling in coolant and, eg. after any power module replacements.

■ Drive line-ups with an ACS880-1007LC cooling unit

Obey the filling up and bleeding instructions in [AC880-1007LC cooling unit user's manual \(3AXD50000129607 \[English\]\)](#).

■ Drive line-ups with a custom cooling unit

Note:

- In filling up the system, the drain valves in the line-up are used only to vent the air from the circuit so that it can be displaced by the coolant. The actual bleeding of the circuit must be done via an external bleed valve installed at the highest point of the cooling circuit. The most practical location for the valve is usually near or at the cooling unit.
- Observe the instructions given by the manufacturer of the cooling unit. Pay special attention to filling up and bleeding the pumps properly as they may be damaged if operated when dry.
- Draining coolant into the sewer system is not allowed.

1. Open the bleed valve at the cooling unit.
2. Open the inlet valve and the outlet-side drain valve of one cubicle. Keep the outlet valve and the inlet-side drain valve closed.
3. Attach a hose to the outlet-side drain valve and lead it into a suitable container.
4. Fill the circuit with coolant. For the coolant specification, refer to section [Coolant specification \(page 386\)](#).
To minimize foaming, do not exceed the filling flow rate of 5 l/min (1.3 US gallon/min).
5. As the piping and modules in the cubicle fills up, coolant starts to flow from the hose. Let some coolant flow out, then close the drain valve.
6. Close the inlet valve.
7. Repeat steps 2...6 for all cubicles in the line-up.
8. Open the inlet and outlet valves in all cubicles. Let any air remaining in the system out through the bleed valve at the cooling unit.

9. Close the bleed valve at the cooling unit.
10. Continue to fill in coolant until a base pressure of approximately 250 kPa is achieved.
11. Open the bleed valve of the pump to let out any air.
12. Re-check the pressure and add coolant if necessary.
13. Start the coolant pump. Let any air remaining in the system out through the bleed valve at the cooling unit.
14. After one to two minutes, stop the pump or block the coolant flow with a valve.
15. Re-check the pressure and add coolant if necessary.
16. Repeat steps 13...15 a few times until all air is let out of the cooling circuit. Listen for a humming sound and/or feel the piping for vibration to find out if there is still air left in the circuit.

Draining the internal cooling circuit

The modules in each cubicle can be drained through the drain valves without draining the whole internal cooling circuit.

WARNING!

Hot, pressurized coolant can be present in the cooling circuit. Do not work on the cooling circuit before the pressure is released by stopping the pumps and draining coolant.

1. Attach hoses to each drain valve in the cubicle to be drained. Lead the hoses into a suitable container. Make sure the ends of the hoses are not immersed in coolant at any point so that air can displace the coolant in the system.
2. Open the drain valves. Wait until all coolant has drained.

Note: Draining coolant into the sewer system is not allowed.

3. If required, dry the piping with compressed oil-free air of less than 6 bar.
4. If the drive is to be stored in temperatures below 0 °C (32 °F),
 - dry the cooling circuit with air,
 - fill the cooling circuit with coolant specified under [Coolant specification \(page 386\)](#),
 - drain the cooling circuit again.

Maintenance intervals

As a general rule, the quality of the coolant should be checked at intervals of two years. This can be done by distributors of Antifrogen® L (see www.clariant.com) if a 250 milliliter sample is provided.

Technical data

■ Coolant specification

Coolant type

Antifrogen® L (by Clariant International Ltd, www.clariant.com) 25% or 50% mixture, available from Clariant distributors and ABB Service representatives.

Do not dilute the coolant. It is ready to use.

Antifrogen® L 25% mixture is usable in storage temperatures down to -16 °C (3.2 °F). Antifrogen® L 50% mixture is usable in storage temperatures down to -40 °C (-40 °F).

Note that operation below 0 °C (32 °F) is not permitted regardless of the freezing point of the coolant.

WARNING!

The warranty does not cover damage that occurs from the use of incorrect coolant.

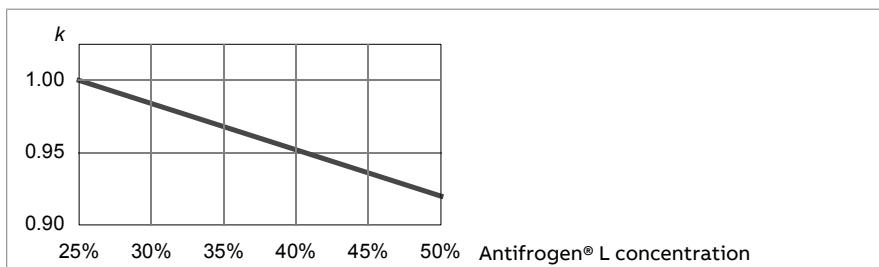

■ Temperature limits

Ambient temperature: See the technical data of the drive/unit.

Freeze protection: The freezing point of the coolant is determined by the concentration of heat transfer fluid in the mixture.

The higher the concentration of heat transfer fluid, the higher the viscosity of the coolant. This results in a higher pressure loss in the system. See [Pressure limits \(page 388\)](#).

The nominal current ratings of drive system modules apply to an Antifrogen® L / water solution of 25/75% (volume). With the Antifrogen® L concentration between 25% and 50%, the drive output current must be derated by 1/3 percentage point per 1 p.p. increase in Antifrogen® L concentration. The drawing below shows the derating factor (k) in relation to Antifrogen® L concentration.

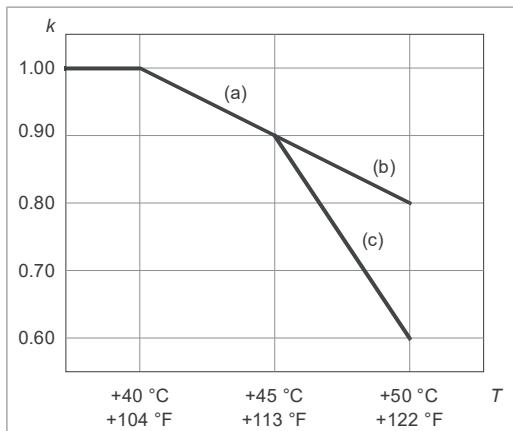

Incoming coolant temperature:

- 0...40 °C (32...104 °F): no drive output current derating required
- 40...45 °C (104...113 °F): drive output current must be derated by 2 percentage points per 1 °C (1.8 °F) temperature increase, as shown by curve (a).
- 45...50 °C (113...122 °F):
 - If components with a maximum operating temperature of 55 °C (131 °F) are installed in the same space as the drive modules, drive output current must

be derated by 6 percentage points per 1°C (1.8°F) temperature increase, as shown by curve (c).

- If there are no components with a maximum operating temperature of 55°C (131°F) installed in the same space as the drive modules, drive output current must be derated by 2 percentage points per 1°C (1.8°F) temperature increase, as shown by curve (b).

The drawing below shows the derating factor (k) in relation to coolant temperature.

Condensation is not permitted. The minimum coolant temperature to avoid condensation (at an atmospheric pressure of 1 bar) is shown below as a function of relative humidity (RH) and ambient temperature (T_{air}).

T_{air} ($^{\circ}\text{C}$)	Min. T_{coolant} ($^{\circ}\text{C}$)				
	RH = 95%	RH = 80%	RH = 65%	RH = 50%	RH = 40%
5	4.3	1.9	-0.9	-4.5	-7.4
10	9.2	6.7	3.7	-0.1	-3.0
15	14.2	11.5	8.4	4.6	1.5
20	19.2	16.5	13.2	9.4	6.0
25	24.1	21.4	17.9	13.8	10.5
30	29.1	26.2	22.7	18.4	15.0
35	34.1	31.1	27.4	23.0	19.4
40	39.0	35.9	32.2	27.6	23.8
45	44.0	40.8	36.8	32.1	28.2
50	49.0	45.6	41.6	36.7	32.8
55	53.9	50.4	46.3	42.2	37.1
= Not permitted as standard but the coolant temperature must be 0°C (32°F) or more.					
Example:	At an air temperature of 45°C and relative humidity of 65% the coolant temperature must not be less than $+36.8^{\circ}\text{C}$				

Maximum temperature rise: Depends on heat losses and mass flow. Typically 10°C (18°F) with nominal losses and flow.

■ Pressure limits

Base pressure: 250 kPa (recommended); 300 kPa (maximum). “Base pressure” denotes the pressure of the system compared with the atmospheric pressure when the cooling circuit is filled with coolant.

Air counterpressure in expansion vessel (with ACS880-1007LC cooling unit): 80 kPa

Design pressure (PS): 600 kPa

Nominal pressure difference: 120 kPa with Antifrogen® L 25% coolant solution, 140 kPa with Antifrogen® L 50% coolant solution. This has to be taken into account when dimensioning the liquid cooling circuit.

Maximum pressure difference: 160 kPa

■ Coolant flow rate limits

The maximum coolant flow rate for all drive equipment is $1.3 \times$ nominal. See the technical data chapter for nominal values.

■ Cooling circuit materials

Materials used in the internal cooling circuit are listed below.

- stainless steel AISI 316L (UNS 31603)
- heavy gauge aluminum
- plastic materials such as PA, PEX and PTFE

Note: PVC hoses are not suitable for use with antifreeze.

- rubber gasketing NBR (nitrile rubber).

WARNING!

If you connect external piping to the internal cooling circuit, use only materials that are specified above. Other materials can cause galvanic corrosion. If the external piping contains other materials, use a cooling unit with a heat exchanger (for example, ACS880-1007LC) to keep the external piping separate from the internal cooling circuit.

Further information

Product and service inquiries

Address any inquiries about the product to your local ABB representative, quoting the type designation and serial number of the unit in question. A listing of ABB sales, support and service contacts can be found by navigating to www.abb.com/contact-centers.

Product training

For information on ABB product training, navigate to new.abb.com/service/training.

Providing feedback on ABB manuals

Your comments on our manuals are welcome. Navigate to forms.abb.com/form-26567.

Document library on the Internet

You can find manuals and other product documents in PDF format on the Internet at www.abb.com/drives/documents.
