1 Introduction

This user guide identifies PROFIBUS® slot and index parameter tables for WaterMaster FEX100-DP series flowmeters that are defined in accordance with structure formats specified by PROFIBUS-PA version 3.01.

FEX100-DP is the PROFIBUS International registered model name registered for WaterMaster flowmeters supporting PROFIBUS communications over RS485 physical layer and covers several variants of the flowmeter system (FEV1xx, FEF1xx, FET1xx etc). Refer to the data sheet DS/WM-EN for details of applicable models and order codes.

Refer to PROFIBUS supplement IM/WMPBS-EN for details of parameter block context, diagnostic errors / warnings, Identification and Maintenance (I&M) functions and all other PROFIBUS-related information for this model series of WaterMaster flowmeters.

1.1 Acronyms and Abbreviations

AI	Analog Input Function Block
AO	Analog Output Function Block
FB	PROFIBUS-PA Function Block
Input	Data passed into a Master device (for example, from a Slave device)
I&M	PROFIBUS Identification and Maintenance function
MS1	Class 1 Master-Slave acyclic transaction
MS2	Class 2 Master-Slave acyclic transaction
Output	Data passed out of a Master device (for example, to a Slave device)
PB	PROFIBUS-PA Physical Block
PI/PNO	PROFIBUS International / PROFIBUS User Organisation (www.profibus.com).
TB	PROFIBUS-PA Transducer Block
TOT	Totalizer Function Block

Table 1.1 Acronyms and Abbreviations

2 Parameter Tables

Table 2.1 contains a description for the legends in tables 2.2 to 2.14.

Tables 2.2 to 2.14 (Slot 0 to Slot 12) contain descriptions for the parameters of each block

Legend	Description
Abs. Idx / Rel. Idx	Relative index of parameters within the block and the absolute index of the parameters within the slot. In accordance with the PROFIBUS PA Profile, all blocks start on absolute index 16 with the BLOCK_OBJECT structure parameter.
Data Type	Data type of the parameter. Some parameters consist of structures (refer to Appendix B, page 64 for details).
Size	Size of the parameter in bytes.
Store (Storage Type)	Cst = Constant parameter – not subject to any changes. S = Static parameter. Stored permanently in non-volatile memory. Changes to this parameter increment the ST_REV counter of the block and the REV_COUNTER parameter of the Identification and Maintenance Block 0 (I&M0) structure. N = Non-volatile parameters that are saved permanently. Writing to these parameters does not affect the ST_REV counter of the block or the REV_COUNTER parameter of the I&M0 structure. D = Dynamic parameters that are lost during power down.
Access	r = Parameter can be read. w = Parameter can be written to.
Usage	C = Contained. Parameter is for internal use only. Cannot be accessed cyclically. I = Input parameter that can be accessed cyclically. O = Output parameter that can be accessed cyclically.
Transport (Data Transport)	a = Parameter can be accessed acyclically only. cyc = Parameter can be accessed cyclically and acyclically.
Default	Specifies the parameter value after parameter FACTORY_RESET (PB.19) is triggered with the 'Reset ROM defaults' option. Note that the WaterMaster's Station Address and parameter IDENT_NUMBER_SELECTION (PB.24) do not get changed in this condition.

Table 2.1 Block Table Legends

2.1 Slot 0 – Physical Block

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT This object contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	–
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	‘ ’
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto 128: Out Of Service	DS-37	3	D	r / C / a	Actual: Auto Permitted: Auto Out Of Service Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained. 0: None 1: Discrete Alarm 2: Hi Hi Alarm 4: Hi Alarm 8: Lo Lo Alarm 16: Lo Alarm 32: PI Reserved 64: PI Reserved 128: Update Event 256: PI Reserved 512: PI Reserved 1024: PI Reserved 2048: PI Reserved 4096: PI Reserved 8192: PI Reserved 16384: PI Reserved 32768: PI Reserved	DS-42	8	D	r / C / a	None

Table 2.2 Slot 0 – Physical Block

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
24 / 8	SOFTWARE_REVISION Revision number of the device firmware.	VisibleString	16	Cst	r / C / a	'?' ,
25 / 9	HARDWARE_REVISION Revision number of the device hardware.	VisibleString	16	Cst	r / C / a	'?' ,
26 / 10	DEVICE_MAN_ID Unique identifier of the device manufacturer.	Unsigned 16	2	Cst	r / C / a	26
27 / 11	DEVICE_ID Manufacturer specific identification of the device.	VisibleString	16	Cst	r / C / a	'FEX100-DP'
28 / 12	DEVICE_SER_NUM Unique transmitter identification number.	VisibleString	16	Cst	r / C / a	1
29 / 13	DIAGNOSIS Standard diagnostic information for the device.	OctetString	4	D	r / C / a	0
30 / 14	DIAGNOSIS_EXTENSION Extended diagnostic information for the device.	OctetString	6	D	r / C / a	0
31 / 15	DIAGNOSIS_MASK Mask for Diagnostic information bytes.	OctetString	4	Cst	r / C / a	0
32 / 16	DIAGNOSIS_MASK_EXTENSION Mask for Extended Diagnostic information bytes.	OctetString	6	Cst	r / C / a	0xFF,0xBF,0x67,0xFF,0xBD,0x01
33 / 17	DEVICE_CERTIFICATION Available certifications for the device.	VisibleString	32	Cst	r / C / a	' , '
34 / 18	WRITE_LOCKING Software write locking for the PROFIBUS interface. 0: Write Locking Enabled 2457: Write Locking Disabled	Unsigned 16	2	N	r,w / C / a	Write Locking Disabled
35 / 19	FACTORY_RESET Reset functions to the device EEPROM Device and Bus Address Changes to this parameter cause the instrument to reboot. 1: Reset ROM Defaults 2506: Soft Reset 2712: Default Station Address	Unsigned 16	2	S	r,w / C / a	-
36 / 20	DESCRIPTOR Device descriptive text.	OctetString	32	S	r,w / C / a	' , '
37 / 21	DEVICE_MESSAGE Device message text.	OctetString	32	S	r,w / C / a	' , '

Table 2.2 Slot 0 – Physical Block (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
38 / 22	DEVICE_INSTAL_DATE Device installation date text.	OctetString	16	S	r,w / C / a	,
39 / 23	LOCAL_OP_ENA Blocks editing of values via the local device display, fixed to enabled. 1: Local Operation Enabled	Unsigned 8	1	N	r,w / C / a	Local Operation Enabled
40 / 24	IDENT_NUMBER_SELECTOR Profile ident currently in use by the device. Changes to this parameter cause the instrument to reboot. 0: Profile Specific – 0x9700 1: Manufacturer Specific – 0x3431 128: Manufacturer Specific – 0x9740 129: Manufacturer Specific – 0x9741	Unsigned 8	1	S	r,w / C / a	Manufacturer Specific – 0x3431
41 / 25	HW_WRITE_PROTECTION State of the hardware write protect switch. Enabling the switch disables writing from all user interfaces. 0: HW Write Protection Disabled 2: HW Write Protection Enabled	Unsigned 8	1	D	r / C / a	HW Write Protection Disabled
42 / 26	FEATURE Feature information for the device.	OctetString	8	N	r / C / a	0
43 / 27	COND_STATUS_DIAG Enables/disables condensed diagnosis. 0: Condensed Diagnosis Disabled 1: Condensed Diagnosis Enabled	Unsigned 8	1	S	r,w / C / a	Condensed Diagnosis Enabled
44 / 28	PI RESERVED Parameter reserved for future use.	–	–	–	–	–
45 / 29	PI RESERVED Parameter reserved for future use.	–	–	–	–	–
46 / 30	PI RESERVED Parameter reserved for future use.	–	–	–	–	–
47 / 31	PI RESERVED Parameter reserved for future use.	–	–	–	–	–
48 / 32	PI RESERVED Parameter reserved for future use.	–	–	–	–	–
49 / 33	DIAG_WORST_COND Worst case active diagnostic class.	Unsigned 16	2	D	r / C / a	0x3FFF
50 / 34	DIAG_EXT_HISTORY The device diagnostic history.	OctetString	6	D	r / C / a	0x0,0x0,0x0,0x0,0x0,0x0
51 / 35	UNUSED Unused parameter.	–	–	–	–	–

Table 2.2 Slot 0 – Physical Block (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
52 / 36	DIAG_SIMUL_STATUS Enables / Disables diagnosis simulation. 0: Disabled 1: Enabled	Unsigned 8	1	D	r,w / C / a	Disabled
53 / 37	DP_ENABLED_FEAT_PROT Extended PROFIBUS features to be supported. 1: ChkCfg 2: SetPrm	Unsigned 8	1	N	r,w / C / a	ChkCfg SetPrm
54 / 38	DIAG_CONDITION_IDX Index of the alarm history item to be read back via the DIAG_DETAILS item. 0: None 1: Logic simulation selected on OP1 2: Pulse simulation selected on OP1 3: Logic simulation selected on OP1 4: Pulse simulation selected on OP2 5: Logic simulation selected on OP3 6: Low flow alarm 7: High flow alarm 8: Q > 103% Qmax 9: Simulation mode on 10: Tx. simulator / calibrator mode 11: At Qmax, volume display overrun <1600hrs 12: Totalizer reset 13: Intermittent sensor comms 15: Tx. memory fault detected 16: Sensor memory not detected 17: Tx. measurement suspended 18: Empty pipe 21: Open circuit electrode 22: Short circuit electrode 24: Installation fault/condition 25: Open circuit coil/wiring 26: Short circuit coil/wiring 27: Check cable+coil resistance 28: Transmitter hardware fault 29: Bad flow data 30: Accuracy warning? 31: OIML self-check limits exceeded 32: Measurement starting 34: Sensor setup not complete 35: Incompatible sensor 36: Tx. code memory fault 37: Tx. data memory fault 39: Alarm simulation active 40: Non-volatile summary alarm	Unsigned 8	1	D	r,w / C / a	None
55 / 39	DIAG_DETAILS Alarm history of the alarm selected by the DIAG_CONDITION_IDX parameter.	Diagnosis Information	14	D	r / C / a	-

Table 2.2 Slot 0 – Physical Block (Continued)

Table 2.2 Slot 0 – Physical Block (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
63 / 47	MASK_OVERRANGE_103 Mask for the Overflow 103% alarm. 0: Disabled 1: Enabled	Unsigned 8	1	S	r,w / C / a	Enabled
64 / 48	UNUSED Unused parameter.	-	-	-	-	-
65 / 49	UNUSED Unused parameter.	-	-	-	-	-
66 / 50	FLOWRATE_LIMIT_MIN_ALARM Flowrate for min. flow alarm. Min: 0 Max: 130 Unit: %	Float	4	S	r,w / C / a	0
67 / 51	FLOWRATE_LIMIT_MAX_ALARM Flowrate for max. flow alarm. Min: 0 Max: 130 Unit: %	Float	4	S	r,w / C / a	110
68 / 52	DATA_EXCHANGE_ACTIVE Flag set when the device is cyclically exchanging data with a master. 0: Inactive 1: Active	Unsigned 8	1	D	r / C / a	Inactive

Table 2.2 Slot 0 – Physical Block (Continued)

2.2 Slot 1 – Analog Input 1 – Volume Flow

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT This object contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	–
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	,
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto 16: Manual 128: Out Of Service	DS-37	3	D	r / C / a	Actual: Out Of Service Permitted: Auto Manual Out Of Service Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained.	DS-42	8	D	r / C / a	–
24 / 8	BATCH The Batch parameter is necessary in a distributed Fieldbus system to identify used and available channels, in addition to identify the current batch in case of alerts.	DS-67	10	S	r,w / C / a	–

Table 2.3 Slot 1 – Analog Input 1 – Volume Flow

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
25 / 9	UNUSED Unused parameter.	-	-	-	-	-
26 / 10	OUT The Function Block parameter OUT contains the current measurement value in a vendor-specific or configuration-adjusted engineering unit and the belonging state in AUTO MODE. The Function Block parameter OUT contains the value and status set by an operator in MAN MODE.	101	5	D	r,w / O / cyc	0
27 / 11	PV_SCALE Conversion of the Process Variable into percent using the high and low scale values. The engineering unit of PV_SCALE high and low scale values are related directly to the PV_UNIT of the configured Transducer Block (configured via Channel parameter). The PV_SCALE high and low scale values follow the changes of the PV_UNIT of the related Transducer Block automatically – a change of the Transducer Block PV_Unit causes no bump at OUT from AI.	Float	8	S	r,w / C / a	-
28 / 12	OUT_SCALE Scale of the Process Variable. The Function Block parameter OUT_SCALE contains the values of the lower limit and upper limit effective range, the code number of the engineering unit of Process Variable and the number of digits on the right hand side of the decimal point.	DS-36	11	S	r,w / C / a	-
29 / 13	LIN_TYPE Linearization type (not used, fixed to NO_LINEARISATION). 0: No Linearization	Unsigned 8	1	S	r,w / C / a	No Linearization
30 / 14	CHANNEL Reference to the active Transducer Block that provides the measurement value to the Function Block. 0x0111: TB1.VOLUME_FLOW	Unsigned 16	2	S	r,w / C / a	TB1.VOLUME_FLOW
31 / 15	UNUSED Unused parameter.	-	-	-	-	-
32 / 16	PV_FTIME Filter time of the Process Variable. The Function Block parameter PV_FTIME contains the time constant for the rise time of the FB output up to a value of 63,21 % resulted from a jump on the input (PT1 filter). The engineering unit of the parameter is second.	Float	4	S	r,w / C / a	0
33 / 17	FSAFE_TYPE Defines the reaction of device, if a fault is detected. The calculated ACTUAL MODE remains in AUTO. For mode FSafe Value, the block parameter FSAFE_VALUE is used as OUT and the status is set to UNCERTAIN_Substitute Value, In mode Last Stored, the last stored valid OUT value is used as OUT and the status is set to UNCERTAIN_LastUsableValue. If there is no valid value available, the status is set to UNCERTAINInitial_Value and the OUT value is set to its initial value. In the mode Out Status Bad, OUT has the wrong calculated value and status is set to BAD_*(with * as calculated). 0: Fsafe Value 1: Last Stored 2: Out Status Bad	Unsigned 8	1	S	r,w / C / a	Last Stored

Table 2.3 Slot 1 – Analog Input 1 – Volume Flow (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
34 / 18	FSAFE_VALUE Default value for the OUT parameter, if a sensor or sensor electronic fault is detected. The unit of this parameter is the same as that for OUT.	Float	4	S	r,w / C / a	–
35 / 19	ALARM_HYS Hysteresis value applied to block parameters HI_HI_LIM, HI_LIM, LO_LIM and LO_LO_LIM. The hysteresis is expressed as value below high limit and above low limit in the engineering unit of xx_LIM.	Float	4	S	r,w / C / a	–
36 / 20	UNUSED Unused parameter.	–	–	–	–	–
37 / 21	HI_HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM change to 1.	Float	4	S	r,w / C / a	–
38 / 22	UNUSED Unused parameter.	–	–	–	–	–
39 / 23	HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
40 / 24	UNUSED Unused parameter.	–	–	–	–	–
41 / 25	LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
42 / 26	UNUSED Unused parameter.	–	–	–	–	–
43 / 27	LO_LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
44 / 28	UNUSED Unused parameter.	–	–	–	–	–
45 / 29	UNUSED Unused parameter.	–	–	–	–	–
46 / 30	HI_HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	–

Table 2.3 Slot 1 – Analog Input 1 – Volume Flow (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
47 / 31	HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	–
48 / 32	LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	–
49 / 33	LO_LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	–
50 / 34	SIMULATE For commissioning and test purposes the input value from the Transducer Block to the block can be simulated. Note that the Transducer block is disconnected from the block when the SIMULATE parameter is in use.	DS-50	6	S	r,w / C / a	–
51 / 35	OUT_UNIT_TEXT If the unit of the OUT parameter is not available in the list of PROFIBUS Unit Codes, the user can write the specific text in this parameter. The unit code is then set to 'textual unit definition'.	OctetString	16	S	r,w / C / a	–

Table 2.3 Slot 1 – Analog Input 1 – Volume Flow (Continued)

2.3 Slot 2 – Totalizer 1 – Volume Flow

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT Contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	-
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	' '
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto 16: Manual 128: Out Of Service	DS-37	3	D	r / C / a	Actual: Out Of Service Permitted: Auto Manual Out Of Service Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained.	DS-42	8	D	r / C / a	-
24 / 8	BATCH The Batch parameter is necessary in a distributed Fieldbus system to identify used and available channels, in addition to identify the current batch in case of alerts.	DS-67	10	S	r,w / C / a	-
25 / 9	UNUSED Unused parameter.	-	-	-	-	-
26 / 10	TOTAL The Function Block parameter TOTAL contains the integrated quantity of the rate parameter provided by CHANNEL and the associated status.	101	5	N	r,w / O / cyc	-
27 / 11	UNIT_TOT Unit of the totalized quantity.	Unsigned 16	2	S	r,w / C / a	-
28 / 12	CHANNEL Reference to the active Transducer Block that provides the measurement value to the Function Block. 0x0111: TB1.VOLUME_FLOW	Unsigned 16	2	S	r,w / C / a	TB1.VOLUME_FLOW

36 / 20	UNUSED Unused parameter.	-	-	-	-	-
37 / 21	HI_HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM change to 1.	Float	4	S	r,w / C / a	-
38 / 22	UNUSED Unused parameter.	-	-	-	-	-
39 / 23	HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	-

Table 2.7 Slot 5 – Analog Input 3 – Internal Volume Reverse Totalizer (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
40 / 24	UNUSED Unused parameter.	-	-	-	-	-
41 / 25	LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	-
42 / 26	UNUSED Unused parameter.	-	-	-	-	-
43 / 27	LO_LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	-
44 / 28	UNUSED Unused parameter.	-	-	-	-	-
45 / 29	UNUSED Unused parameter.	-	-	-	-	-
46 / 30	HI_HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	-
47 / 31	HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	-
48 / 32	LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	-
49 / 33	LO_LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	-
50 / 34	SIMULATE For commissioning and test purposes the input value from the Transducer Block to the block can be simulated. Note that the Transducer block is disconnected from the block when the SIMULATE parameter is in use.	DS-50	6	S	r,w / C / a	-
51 / 35	OUT_UNIT_TEXT If the unit of the OUT parameter is not available in the list of PROFIBUS Unit Codes, the user can write the specific text in this parameter. The unit code is then set to 'textual unit definition'.	OctetString	16	S	r,w / C / a	-

Table 2.7 Slot 5 – Analog Input 3 – Internal Volume Reverse Totalizer (Continued)

2.7 Slot 6 – Analog Input 4 – Diagnostic Signal

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT This object contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	–
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	‘ ’
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto 16: Manual 128: Out Of Service	DS-37	3	D	r / C / a	Actual: Out Of Service Permitted: Auto Manual Out Of Service Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained.	DS-42	8	D	r / C / a	–
24 / 8	BATCH The Batch parameter is necessary in a distributed Fieldbus system to identify used and available channels, in addition to identify the current batch in case of alerts.	DS-67	10	S	r,w / C / a	–
25 / 9	UNUSED Unused parameter.	–	–	–	–	–
26 / 10	OUT The Function Block parameter OUT contains the current measurement value in a vendor-specific or configuration-adjusted engineering unit and the belonging state in AUTO MODE. The Function Block parameter OUT contains the value and status set by an operator in MAN MODE.	101	5	D	r,w / O / cyc	–
27 / 11	PV_SCALE Conversion of the Process Variable into percent using the high and low scale values. The engineering unit of PV_SCALE high and low scale values are related directly to the PV_UNIT of the configured Transducer Block (configured via Channel parameter). The PV_SCALE high and low scale values follow the changes of the PV_UNIT of the related Transducer Block automatically – a change of the Transducer Block PV_Unit causes no bump at OUT from AI.	Float	8	S	r,w / C / a	–

Table 2.8 Slot 6 – Analog Input 4 – Diagnostic Signal

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
28 / 12	OUT_SCALE Scale of the Process Variable. The Function Block parameter OUT_SCALE contains the values of the lower limit and upper limit effective range, the code number of the engineering unit of Process Variable and the number of digits on the right hand side of the decimal point.	DS-36	11	S	r,w / C / a	-
29 / 13	LIN_TYPE Unused, fixed to NO_LINEARISATION. 0: No Linearization	Unsigned 8	1	S	r,w / C / a	No Linearization
30 / 14	CHANNEL Reference to the active Transducer Block that provides the measurement value to the Function Block. 0x0521: TB5.ELECTRODE_1_RESISTANCE 0x0539: TB5.ELECTRODE_2_RESISTANCE 0x053A: TB5.BACK_OFF_VOLTAGE 0x053B: TB5.COIL_AND_CABLE_RESISTANCE 0x053C: TB5.COIL_INDUCTANCE 0x053D: TB5.SENSOR_INDUCTANCE_SHIFT 0x053E: TB5.TRANSMITTER_AVERAGE_GAIN_SHIFT	Unsigned 16	2	S	r,w / C / a	TB5.ELECTRODE_1_RESISTANCE
31 / 15	UNUSED Unused parameter.	-	-	-	-	-
32 / 16	PV_FTIME Filter time of the Process Variable. The Function Block parameter PV_FTIME contains the time constant for the rise time of the FB output up to a value of 63.21 % resulted from a jump on the input (PT1 filter). The engineering unit of the parameter is second.	Float	4	S	r,w / C / a	0
33 / 17	FSAFE_TYPE Defines the reaction of device, if a fault is detected. The calculated ACTUAL MODE remains in AUTO. For mode FSafe Value, the block parameter FSAFE_VALUE is used as OUT and the status is set to UNCERTAIN_Substitute Value, In mode Last Stored, the last stored valid OUT value is used as OUT and the status is set to UNCERTAIN_LastUsableValue. If there is no valid value available, the status is set to UNCERTAINInitial_Value and the OUT value is set to its initial value. In the mode Out Status Bad, OUT has the wrong calculated value and status is set to BAD_* (with * as calculated). 0: Fsafe Value 1: Last Stored 2: Out Status Bad	Unsigned 8	1	S	r,w / C / a	Last Stored
34 / 18	FSAFE_VALUE Default value for the OUT parameter, if a sensor or sensor electronic fault is detected. The unit of this parameter is the same as that for OUT.	Float	4	S	r,w / C / a	-
35 / 19	ALARM_HYS Hysteresis value applied to block parameters HI_HI_LIM, HI_LIM, LO_LIM and LO_LO_LIM. The hysteresis is expressed as value below high limit and above low limit in the engineering unit of xx_LIM.	Float	4	S	r,w / C / a	-
36 / 20	UNUSED Unused parameter.	-	-	-	-	-
37 / 21	HI_HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM change to 1.	Float	4	S	r,w / C / a	-
38 / 22	UNUSED Unused parameter.	-	-	-	-	-

Table 2.8 Slot 6 – Analog Input 4 – Diagnostic Signal (Continued)

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
39 / 23	HI_LIM Upper limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or higher than the upper limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
40 / 24	UNUSED Unused parameter.	–	–	–	–	–
41 / 25	LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
42 / 26	UNUSED Unused parameter.	–	–	–	–	–
43 / 27	LO_LO_LIM Lower limit value for alarms with the same engineering unit as that of the OUT parameter. If the measured variable is equal to or lower than the lower limit value, the State Bits in the Status Byte of OUT and in the FB parameter ALARM_SUM are set to 1.	Float	4	S	r,w / C / a	–
44 / 28	UNUSED Unused parameter.	–	–	–	–	–
45 / 29	UNUSED Unused parameter	–	–	–	–	–
46 / 30	HI_HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	–
47 / 31	HI_ALM The state of the upper limit of an alarm and the related time stamp. The time stamp expresses the time the measured variable has been equal or higher than the upper limit of the alarm.	DS-39	16	D	r / C / a	–
48 / 32	LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	–
49 / 33	LO_LO_ALM The state of the lower limit of an alarm and the related time stamp. The time stamp expresses the time at which the measured variable has been equal to or lower than the lower limit of the alarm.	DS-39	16	D	r / C / a	–
50 / 34	SIMULATE For commissioning and test purposes the input value from the Transducer Block to the block can be simulated. Note that the Transducer block is disconnected from the block when the SIMULATE parameter is in use.	DS-50	6	S	r,w / C / a	–
51 / 35	OUT_UNIT_TEXT If the unit of the OUT parameter is not available in the list of PROFIBUS Unit Codes, the user can write the specific text in this parameter. The unit code is then set to 'textual unit definition'.	OctetString	16	S	r,w / C / a	–

2.10 Slot 9 – Transducer Block 2 – Device Info

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT This object contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	–
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	' '
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto	DS-37	3	D	r / C / a	Actual: Auto Permitted: Auto Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained.	DS-42	8	D	r / C / a	0
24 / 8	MANUFACTURER Manufacturer name.	VisibleString	20	D	r / C / a	?
25 / 9	MANUFACTURER_ADDRESS_1 Manufacturer address line 1.	VisibleString	20	D	r / C / a	?
26 / 10	MANUFACTURER_ADDRESS_2 Manufacturer address line 2.	VisibleString	20	D	r / C / a	?
27 / 11	MANUFACTURER_CONTACT Manufacturer contact details.	VisibleString	20	D	r / C / a	?

Table 2.12 Slot 10 – Transducer Block 3 – Special Function (Continued)

2.12 Slot 11 – Transducer Block 4 – Display

Abs. Idx / Rel. Idx	Variable Name / Brief Description	Data Type	Size	Store	Access / Usage / Transport	Default
16 / 0	BLOCK_OBJECT This object contains the characteristics of the blocks.	DS-32	20	Cst	r / C / a	-
17 / 1	ST_REV Revision counter for static variables. If a static variable changes its value, this counter is incremented by one.	Unsigned 16	2	N	r / C / a	0
18 / 2	TAG_DESC Every block can be assigned a textual TAG description. The TAG_DESC must be unambiguous and unique in the Fieldbus system.	OctetString	32	S	r,w / C / a	' '
19 / 3	STRATEGY The STRATEGY parameter has a user-specified value. This assigned value can be used in configuration or diagnostics as a key in sorting block information.	Unsigned 16	2	S	r,w / C / a	0
20 / 4	ALERT_KEY The ALERT_KEY parameter has a user-assigned value that can be used for sorting alarms or events generated by a block.	Unsigned 8	1	S	r,w / C / a	0
21 / 5	TARGET_MODE The TARGET_MODE indicates what mode of operation is required for the block. It is normally set by a control application or by an operator through a human interface application. The input parameters are used by the algorithm in conjunction with the state of the Function Block application containing the block to determine if the algorithm can achieve the target mode of operation established for it. See parameter 'MODE_BLK', 'Permitted' element for possible values.	Unsigned 8	1	S	r,w / C / a	Auto
22 / 6	MODE_BLK The MODE_BLK is a structured parameter composed of the actual mode, the normal mode and the permitted mode of the block. The actual mode is set (calculated) by the block during its execution to reflect the mode used during execution. Normal mode is the required operating mode of the block. The permitted mode shows which changes of the target mode are valid for the specific block to the remote user of the MODE_BLK parameter. 8: Auto	DS-37	3	D	r / C / a	Actual: Auto Permitted: Auto Normal: Auto
23 / 7	ALARM_SUM The ALARM_SUM parameter summarizes the status of up to 16 block alarms. For each alarm, the current states, unacknowledged states, unreported states and disabled states are maintained.	DS-42	8	D	r / C / a	0
