

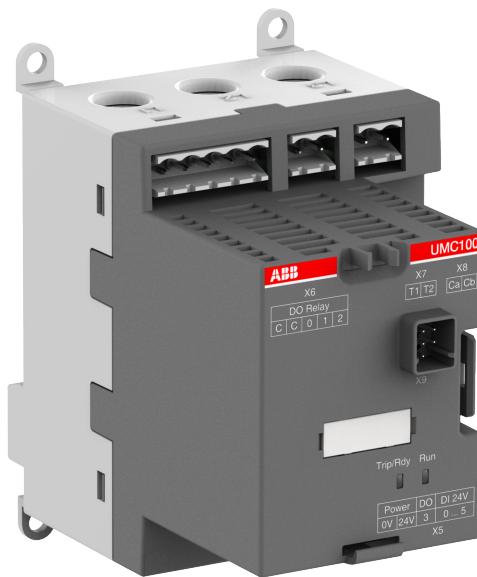

Mapping tables for acyclic access to the UMC100.3

How to access data acyclically

This document contains the acyclic mapping of the following communication protocols:

- EtherNet/IP™
- Modbus TCP
- Profibus
- Profinet

Purpose of this document

According to the UMC100.3 manual, several data, information and diagnostics can be transferred with the cyclic communication. Some information are not available in the cyclic data and since they are absolutely required, some can be read over the acyclic data.

Pre-information

In the following tables, please always read/write the complete 8 byte given in one line, even when you only need a part of it. Furthermore there are gray shaded areas in the tables. These bytes are reserved/unused, so please don't use them.

—
01—
01 EIU32.0—
02—
02 EIU32.0 on SMK3.0**EtherNet/IP™**

The EtherNet/IP™ module EIU32.0 can be mounted directly on the UMC100.3 or remotely on the single mounting kit SMK3.0.

The data access is defined by “Class”, “Instance” and “Attribute”. The class is defined by the data type. The instance defines a data area, like “acyclic data”. Inside each data area, the parameters are addressed with the attribute. Each attribute consists of 8 byte. You will find the table for EtherNet/IPTM on the pages 5 to 8.

—
03—
03 MTQ22.0**Modbus TCP**

The MTQ22.0 is our communication interface for Modbus TCP and has four communication ports to connect up to four UMC100.3 to one MTQ22.0.

The parameter and value storage of the MTQ22.0 is built up in registers which can be accessed with Modbus function codes 0x03 and 0x04 for reading and 0x10 for writing. The register addresses for each port can be found in the table Modbus TCP on the pages 9 to 12.

—
01—
02—
01 PDP32.0**Profibus**

For Profibus the PDP32.0 communication interface has to be used. This interface can be directly mounted on the UMC100.3 or remotely with a single mounting kit SMK3.0.

The access with Profibus works over so called "Slot" and "Index". The slot addresses a data area, so in the UMC100.3 one slot would be "acyclic data", another one is "parameter read/write unpacked". Inside each slot a specific data/dataset is addressed via the index. With the UMC100.3 each index contains 8 byte of data. You will find the table for Profibus on the pages 13 to 16.

—
03—
03 PNQ22.0**Profinet**

The PNQ22.0 and PNU32.0 modules are used for Profinet communication.

—
04

—
04 PNU32.0

Profinet

PNU32.0 also supports basic ModbusTCP functionality. The according indexes/registers for the PNU32.0 are those of PNQ22/MTQ22 Port 1.

The PNU32.0 allows for block read out of acyclic data. This massively frees up capacity of the DCS controller and therefore increases performance.

The data of the acyclic addresses 0x0431...0x047E can be read/write in blocks bigger than 8 byte per request. It is also possible to start at any other address and read out less than 624 bytes.

Example 1: Starting at address 0x0431 and reading out all 624 bytes at once. Therefore, getting all acyclic information in one read request.

Example 2: Starting at any other address within 0x0431...0x047E and read any number of bytes (dividable by 8). For example, the request starts at address 0x0467 and reads out 16 bytes. This will obtain the “UMC Measuring Data 1/2”.

Example 3: A request starting at either address 0x0436 and writing 16 bytes or on 0x046A writing 24 bytes, is also possible.

The same process is also applying for the acyclic communication with ModbusTCP (PNU32.0 only). The respective addresses are in the ModbusTCP table for port 1.

Mapping tables

Note

- The data length to read/write is always 8 byte.
- If you use the PDF-version of the application note, it is recommended to use the Adobe Acrobat Reader “Two Page View”, in order to see the tables in full width on your screen (Adobe Acrobat Reader setting: View > Page Display > Two Page View).

EtherNet/IP™

Class (hex)	Instance (hex)	Attribute (hex)	Length	Access	Title	Byte 0	Byte 1	Byte 2
