If the target system supports network functionality, you can convert the variables of a GVL into network variables and thus use them for data exchange with other devices in the network. To do this you must define corresponding properties for the GVL in the "Network Variables" tab of the "Properties" dialog.

## Object 'GVL' - Global Variable List (task-local)

## Symbol: 徐

A global variable list (task-local) is used for the declaration, editing and display of global variables. For this special global variable list, the declared variables in the list can be written by one task only. All other tasks have only read-only access. This makes sure that the values of these variables are always consistent, even for multicore projects.

The object is available for compiler version 3.5.13.0 with the corresponding device description.
"Task with write access" $\quad$ Task that has exclusive write access to the variables.

Object: IEC Symbol Publishing

The" IEC Symbol Publishing" object contains an editor for configuring variables and IEC data types from the project for publishing via an OPC UA Server. A group of symbols can be compiled and configured for each created object.
The editor is a newer alternative to the already known editor for the Symbol Configuration.
Use the Add Object dialog to attach one or more IEC Symbol Publishing objects below an OPC UA Server object below the Communication Manager. You can change the object name, for example to webvisu, if the symbols are to be used for exchange with a web visualization.

Editor: IEC Function: Configuration of a symbol set for exchange via OPC UA Symbol Publishing

Call: Double click or [Edit Object] command on the desired "<name of IEC symbol publishing>" object in the device tree.
The editor consists of two tabs: On the" IEC Symbol Editor" tab, you configure the symbol set to be published from individual variables from the project. On the "Symbol Type Editor" tab, you work with whole data types, such as GVL and FB.

Note that the editor works with variables and types from the precompile state of the project. If changes are made to variables or types in the project, then it can create inconsistencies with the current configuration in the symbol publishing editor. They are indicated at the relevant places in the editor by icons of the $\$$ error, $\$$ warning, or information. A tooltip on the icon provides more information about the inconsistency and a possible fix. The tooltip contains at least the message text, which also appears in the message window in the "IEC Symbol Publishing" category.

| $\$$ "Refresh" | Refreshes the display in the editor according to the current <br> situation in the project |
| :--- | :--- |
| "Use access rights defined in <br> the user management" | 目: The access rights to the symbol set are taken from the <br> current settings in the user management of the controller. |

Editor: IEC On this tab of the editor, you configure individual variables from the application as symbols to be Symbol Publishing, Tab: IEC Symbol Editor published. You do this by dragging the desired variables from the "Precompile Sets" from the left part of the tab to the right part, where the symbols can then be configured.

| "Precompile Sets" | The tree structure shows all variables which are already available for publication in the project before compilation. To do this, the project scans the following: <br> - "<device>.<application>": Project POUs below the device application <br> - "Libraries": Integrated libraries <br> - "Pool": Project POUs in the "POUs" view <br> A list of excluded types can be found in the tooltip after the Warum erscheint meine Variable nicht icon. |
| :---: | :---: |
| D Sync | This button is operable as long as there are inconsistencies between the current symbol configuration and the project. In this case you will see icons of the type $\$, \oplus$, or 9 information. After correcting the inconsistencies, synchronize the editor with the project again. |
| 7 | The display of information about the configured symbols can be filtered. In the list after $\gamma$, you select which table columns are to be displayed. When you enter a string in the search field, the search hits are highlighted in yellow in the table. |
| Table of configured symbols | Information about the individual symbols, depending on the set filter: <br> - Symbol: Variable name (example: iVar) <br> - Path: Variable path (example: PLC_PRG.iVar, PLC_PRG.fb1_inst) <br> - IEC type: IEC data type of the variable (example: INT, FB1) <br> - Symbol Type (Exported Type Name): Name of the symbol under which it will appear after export. In the case of structured types, the instance can be selected here. <br> - Access Rights: Permissions to the symbol. Example: Read/Write <br> - Comment: Comment stored in the application code |

Editor: IEC Symbol Publishing, Tab: Symbol Type Editor

On this tab of the editor, you configure entire "symbol types" for publishing. To do this, you drag the desired "IEC Data Types" from the left part of the window to the right side into the configuration table. Then there you can configure for each symbol type in detail which of its components should be exported with which access rights and with which name.

You can also filter the display in this table via $\gamma$ and search for strings.

| Symbol Type (Exported Type <br> Name) | The name of the symbol type dragged from IEC data types <br> can be edited. It is used after export as defined here. |
| :--- | :--- |
| Members | The $\ldots$ button opens the Data type members of <symbol <br> type> dialog (see above). |
| IEC Type | IEC data type as defined in the project (example: $\because$ Color) |

Dialog: Data type members of <symbol type>.
Call: ... button on the" IEC Symbol Type Editor" tab in the "Members"
In this dialog, you select which members of the symbol type in question should be exported as symbols. You can define a name for each member under which it will be exported, including the access rights.

| Export | $\checkmark:$ The member is exported as a symbol. |
| :--- | :--- |
| Exported Name | Default: Member name (IEC Name) from the project; can be <br> edited |
| IEC Name | Member name from the project |
| IEC Type | IEC data type of the member (example: INT) |
| Symbol Type (Exported Type <br> Name) | Name of the data type to which the member belongs <br> (example: |
| Access Rights | Access right to the symbol (Read, Write, Read/Write) |

Above the table, there are filter and search options, just like on the editor tabs described above.

## Object 'Image Pool'

The "Image Pool" object contains a table with image ID assignments.

| "ID" | ID of the image; you reference this ID, for example in the visualization of the <br> image. |
| :--- | :--- |
| "File name" | File path of the image; if you click for more settings (...), the "Select Image" <br> dialog box opens. |
| "Image" | Show a thumbnail of the image. |
| "Link type" | Opens the "Select Image" dialog box, where you define the link type. |

Dialog box 'Se-
lect Image'

| "Image file" | Name and directory of the image file (example: "C:IPro- <br> grammelimagesllogo.bmp") CODESYS supports the following image formats: <br>  <br> BMP, EMF, GIF, ICO, JPG, PNG, SVG, and TIFF. Please note that a controller <br> may not support all formats. <br>  <br>  <br>  <br>  <br> Whether or not you can use images formatted as scalable vector graphics (*.svg) <br> depends on the operating system. Any necessary information is located in the <br> device description of the hardware vendor. |
| :--- | :--- |

Table 433: "File Handling"

| "Remember the link" | CODESYS saves only the link. CODESYS automatically updates any changes to <br> an image file in the image pool. You must ensure that the path of the image file <br> does not change. <br> When saving the project as an archive, CODESYS embeds the image file in the <br> project archive. |
| :--- | :--- |
| "Remember the link and |  |
| embed into project" | CODESYS copies the image to the image pool and the link information is <br> retained. In this way, CODESYS recognizes any changes to the image file and <br> then update the image pool can as needed. This behavior is controlled with the <br> options in the next table. <br> Embedded image files increase the memory requirement of the project. |
| "Embed into project" | CODESYS copies the image to the image pool. If the image file is changed <br> again afterwards, then it is not updated in the project. For libraries, you must <br> embed the image in the project. <br> Embedded image files increase the memory requirement of the project. |

Table 434: "Change Tracking"
These options are available only if you have selected the "Remember the link and embed into project" check box as described above.

| "Reload the file automatically" | CODESYS automatically updates the image file in the project without prompting. |
| :--- | :--- |
| "Prompt whether to reload the <br> file" | If the image file has changed, you may be prompted whether or not the image <br> file should be updated. |
| "Do nothing" | CODESYS does not update the image file in the image pool. |

## Object 'Library Manager'

## Symbol:

The Library Manager lists all libraries that were integrated in the project for creating applications. It provides information about the type of library, its properties, and its contents.
You can expand or collapse the list of integrated libraries, as well as edit library properties for non-dependent libraries.
The Library Manager consists of three views:

- Upper view: List of integrated libraries
- Lower left view: Tree structure with all modules of the library selected in the upper view
- Lower right view: Documentation for the module selected in the tree

The user should delete this variable } \\ \text { because in this case it is almost always an OPC UA feature which is not sup- } \\ \text { ported yet. OPC UA features which are not supported yet are grayed out in the } \\ \text { left area. }\end{array} \\ \hline \text { Right area: Object types and data types of the OPC UA information model which are mapped to IEC types }\end{array}\right\}$

| "Name" | Name of the IEC POU or data type in the project <br> By default, the name of the type is displayed in the OPC UA information <br> model. OPC UA also supports names which are invalid in IEC. In these cases, <br> CODESYS automatically generates a valid IEC name. <br> You can change the name. |
| :--- | :--- |
| "IEC Type" | IEC type to which the OPC UA type was mapped (example: BOOL, "Method"). |
| "OPC UA Type" | Corresponds to the "Element Type" displayed in the left area |

## OPC UA pub-

 lishing editorSymbol:
In the editor, the instances (OPC UA objects) of the OPC UA types are configured which should be available to the OPC UA Clients via the controller

| "Search for Mapped Instances" | Searches in GVLs and PRGs below the current application for instances of the mapped OPC UA types which have already been declared. The search result is displayed in the list. <br> Note: Instances in the "POUs" view and in libraries are not taken into consideration. |
| :---: | :---: |
| "Create New Instance" | Opens the "Create New Instance" dialog to select the IEC type for which a new instance should be generated. <br> Instances can be generated for the POUs which have been created in the OPC UA information model editor from OPC UA types. These instances can be used in POUs in the application. <br> Requirement: In the OPC UA information model editor, the "Generate IEC declarations" command has been executed after mapping the OPC UA types to the IEC types. |
| "Root Node" | Selection of directories or the object instance of the server which is displayed on the OPC UA Client for publishing the instances. The list box depends on the applied OPC UA companion specification. |
| Tabular list of generated instances: |  |
| "OPC UA Variable" | Variable which has been generated as an instance of an OPC UA type. This variable can be published in an OPC UA Client. <br> You can edit the displayed name. |
| "OPC UA Type" | OPC UA type of the "OPC UA Variable" |
| "Map or Generate" | - ": The "OPC UA Variable" has been mapped to an existing variable. <br> - : The "OPC UA Variable" has been generated as a new instance. |
| "IEC Variable" | Full variable name |
| "IEC Type" | IEC type of the IEC variable |

| "Access Rights" | Note that an OPC UA Client may have read/write access the OPC UA variable. <br> In the function blocks, the access rights to the variables can be changed by <br> attributes which can also be read from the XML file if necessary. <br> Reading and writing |
| :--- | :--- |
| "Maximal" | Maximum possible permissions for the OPC UA variable |

See also - « Chapter 6.4.1.21.3.9.12 "Command 'OPC UA Information Model Repository"' on page 2665

## Object 'Network Variable List (Sender)'

Symbol:
A network variable list (sender) is used for declaring and listing global variables that should be sent to network variable lists (receiver) of other devices or network projects.
You add the object to the device tree by clicking "Add Object $\rightarrow$ Network Variable List (Sender)" of an application.
You can configure the protocol and transfer parameters in the "Add Network Variable List
(Sender)" dialog box or "Properties" dialog box of the object in the "Network Variables" tab.

Dialog Box 'Add Function: This dialog box defines the network properties for the sender NVL. When you close Network Vari- the dialog box, CODESYS adds the sender NVL of the application to the device tree.

Call: Main menu "Project $\rightarrow$ Add Object $\rightarrow$ Network Variable List (Sender)" while the application is selected in the device tree.

This dialog box corresponds to the "Network Variables" tab in the "Properties" of the network variable list object.
See also

- $\Rightarrow$ Chapter 6.4.1.21.4.11.12 "Dialog 'Properties' - 'Network Variables'" on page 2760
- $\quad$ • Chapter 6.4.1.21.2.19 "Object 'Network Variable List (Receiver)"' on page 2475
- 

## Object 'Network Variable List (Receiver)'

Symbol:
The object is used for listing the received network variables and displaying the information: network and transmit information and sender.
You add the object to an application by clicking "Add Object
$\rightarrow$ Network Variable List (Receiver)".
The network variable list (receiver) shows the received network variables, which were declared in network variable list (sender) of another device or project. You cannot change the network variables in the object editor.

The object editor consists of two parts:

- Information about the sender and transfer log of the list
- List of declarations of network variables

Dialog Box 'Add Function: This dialog box defines the receiver NVL to a sender NVL and adds the receiver NVL Network Variable List
(Receiver)' to the application object in the device tree.

Call: Main menu "Project $\rightarrow$ Add Object $\rightarrow$ Network Variable List (Receiver)" (when the application object is selected).

| "Task" | Task of the current application that controls the variables to be <br> received. |
| :--- | :--- |
| "Sender" | Drop-down list <br> - Available sender NVLs of another device in the project <br> - <br> "Import from file": Required if the necessary sender NVL is <br> defined in another project. For this, the necessary sender NVL <br> must have been generated in another project as "GVL export file <br> ".gvl" in the properties dialog of the NVL in the "Link To File" tab. |
| "Import from file" | File name in "GVL export file *.gvl" format if you have selected <br> "Import from file" for "Sender ". |

## Object 'Persistent variable list'

## Symbol: T

The object contains the declaration of global persistent variables in the declaration section VAR GLOBAL PERSISTENT RETAIN . . END VAR. The variables are stored in special nonvolatile memory.

The persistence editor shows the variables as a list in the usual way. The displayed list does not influence the persistence behavior of the variables, but only the list stored internally in the process image. The list there contains all variables ever declared in chronological order. Variables that you have removed are marked with a placeholder and continue to exist as a gap.
The declaration section can also contain instance paths, which refer to locally declared persistent variables and were created with the command "Declarations $\rightarrow$ Add All Instance Paths".

## NOTICE!

Before you decide how to set up persistence for an application, it would be helpful for you to be familiar with the use cases described in the "Data Persistence" section. Moreover, it is helpful if you can differentiate between the mechanisms of persistent variables, retain variables, variables of the Persistence Manager, and recipe variables.

Commands The following commands are provided in the persistence editor:

- Command "Declarations $\rightarrow$ Add All Instance Paths"
- Command "Declarations $\rightarrow$ Reorder List and Clear Gaps"

## Object 'POU'

## General

Symbol: | \# |
| :---: |

An object of the type "POU" is a Program Organization Unit in a CODESYS project. You write source code for your controller program in POUs.
There are the following types of POUs:

- Program
- Function
- Function block

A "POU" object is inserted by using the command "Project $\rightarrow$ Add Object" in the Device tree or in the "POUs" view. When adding a POU you define the POU type and the implementation language.
You can also add other programming objects (method, action, etc.) to these objects.

## Calling POUs

Certain POUs can call other POUs. Recursions are not permitted.
When calling POUs via the namespace, CODESYS browses the project for the POU to be called in accordance with the following order:

1. Current application
2. "Library Manager" of the current application
3. "POUs" view
4. "Library Manager" in the "POUs" view

If you want to call a POU that exists with the same name in a library used in the application and as an object in the "POUs" view, note the following: There is no syntax that allows you to call the POU in the "POUs" view only by its name. In this case you must shift the library from the application's library manager to the project's library manager (in the "POUs" view). After that you can call the POU object in the "POUs" view purely by its name. If you add the namespace to the library, you can call the POU of the library.

The term "POU" is also used in CODESYS for the "POUs" view in which CODESYS manages the global objects in the project.

Dialog 'Add Function: The dialog is used to configure a new POU according to the IEC 61131-3 standard. POU' This means that a POU can be a program, a function, or a function block.
Call: "Project $\rightarrow$ Add Object" menu; context menu in the "Devices" view when an application is selected; context menu in the "POUs" view

| "Name" | Name of POU |
| :--- | :--- |

Table 436: "Type"

| "Program" |  |
| :---: | :---: |
| "Function Block" | "Extends": Specification or selection of a base function module in the sense of object-oriented programming. Specified with the EXTENDS keyword in the function block declaration <br> "Implements": Specification or selection of an interface in the sense of object-oriented programming. Specified with the IMPLEMENTS keyword in the function block declaration. When the POU is created, all methods are created which are defined via the interface. <br> "Final": Derived access is not allowed. This means that you cannot extend the function block with another function block. This allows for optimized code generation. <br> "Abstract": Identifies that the function block has a missing or incomplete implementation and cannot be instantiated. Abstract FBs are used exclusively as base function blocks and the implementation typically occurs in a derived FB. If a non-abstract function block is created, which in turn extends an abstract function block, then all abstract methods of the abstract basic function block are added to the new function block as (non-abstract) methods. <br> "Access specifier" <br> - "PUBLIC": Corresponds to the specification of no access specifier. <br> - "INTERNAL": Access to the function block is restricted to the namespace (library). <br> - "Method implementation language": When you select the "Implements" option, you can select an implementation language here for all method objects that CODESYS generates by means of the implementation of the interface. <br> The "Method implementation language" does not depend on the implementation language of the function block. |
| "Function" | Note: Not available when "Sequential Function Chart (SFC)" is selected as the "Implementation language". <br> "Return type:": Data type of the return value |
| "Implementation language" | Implementation language of the POU |

## Object 'Program'

A program is a POU that supplies one or more values during execution. After execution of the program, all values are retained until the next execution. The order of calling the programs within an application is defined in task objects.
A program is added to the application or the project using the command "Project $\rightarrow$ Add Object $\rightarrow P O U$ ". In the Device tree and in the "POUs" view the program POUs have the suffix " $(P R G)$ ".

The editor of a program consists of the declaration part and the implementation part.
The uppermost line of the declaration part contains the following declaration:
PROGRAM <program>

See also

- $\quad 4$ Chapter 6.4.1.21.2.21 "Object 'POU"' on page 2477
- $\boldsymbol{y y}^{2}$ Chapter 6.4.1.9.17 "Task Configuration" on page 1914

## Object 'Function Block'

A function block is a POU that yields one or more values when executed.
The object is added to the application or the project by clicking "Project $\rightarrow$ Add Object $\rightarrow$ POU". In the device tree or in the "POUs" view, function block POUs have the "(FB)" suffix.
It always calls a function block by means of an instance that is a copy of the function block.

The editor of a function block consists of the declaration part and the implementation part.
The values of the output variables and the internal variables remain unchanged after execution until the next execution. This means that the function block does not necessarily return the same output values for multiple calls with the same input variables.
In addition to the functionality described in IEC 61131-3, you can also use function blocks in CODESYS for the following functionalities of object-oriented programming:

- Extension of a function block
- Implementation of interfaces
- Methods
- Properties

The top line of the declaration part contains the following declaration:

```
FUNCTION_BLOCK <access specifier> <function block> | EXTENDS <function
block> | IMPLEMENTS <comma-separated list of interfaces>
```

| Calling a func- <br> tion block | The call is always made by means of an instance of the function block. When a function block is <br> called, only the values of the respective instance change. |
| :--- | :--- |
|  | Declaration of the instance: |
|  | <instance> : <function block>; |

<instance> : <function block>;

You access a variable of the function block in the implementation part as follows:
<instance> . <variable>

## NOTICE!

## Note the following:

- You can access only input and output variables of a function block from outside the function block instance, not the internal variables.
- Access to a function block instance is restricted to the POU in which the instance is declared, unless you have declared the instance globally.
- You can assign the desired values to the function block variables when you call the instance.

## Assigning variable values when calling:

In the textual languages IL and ST, you can assign values directly to input and/or output variables when you call the function block.

A value is assigned to an input variable with := .
A value is assigned to an output variable with $=>$.
Example $\quad$ The instance CMD_TMR of the timer function block is called with assignments for the input
variables IN and PT. Then the output variable $Q$ of the timer is assigned to the variable A.

```
PROGRAM PLC_PRG
VAR
    CMD_TMR : TOF;
END_VAR
CMD_TMR(IN := %IX5.1, PT := T#100MS);
A := CMD_TMR.Q;
```

When you insert a function block instance by means of the "Input Assistant" and select the "Insert with arguments" option in the "Input Assistant" dialog, CODESYS inserts the call with all input and output variables. Then you only have to insert the desired value assignment. In the example above, CODESYS inserts the call as follows: CMD_TMR (IN:=, PT:=, $Q=>$ ).

You can use the attribute 'is_connected' and a local variable to determine at the time of the call in the function block instance whether or not a specific input receives an external assignment.

- $\Rightarrow$ Chapter 6.4.1.21.2.21.9 "Object 'Property"' on page 2493
- ${ }^{\omega}$ Chapter 6.4.1.20.6.3.24 "Attribute 'is_connected"' on page 2293

## Object 'Function'

A function is a POU that supplies precisely one data element when executed and whose call in textual languages can occur as an operator in expressions. The data element can also be an array or a structure.
The object is added to the application or the project by clicking "Project $\rightarrow$ Add Object $\rightarrow$ POU". In the device tree or in the "POUs" view, function POUs have the "(FUN)" suffix.

## NOTICE!

Functions have no internal status information, which means that functions do not save the values of their variables until the next call. Calls of a function with the same input variable values always supply the same output value. Therefore, functions must not use global variables and addresses!

The editor of a function consists of the declaration part and the implementation part.
The top line of the declaration part contains the following declaration:
FUNCTION <function> : <data type>
Below that, you declare the input and function variables.
The output variable of a function is the function name.

## NOTICE!

If you declare a local variable in a function as RETAIN, this has no effect. In this case, CODESYS issues a compiler error.

## NOTICE!

You cannot mix explicit and implicit parameter assignments in function calls in CODESYS V3. This means that you have to use either only explicit or only implicit parameter assignments in function calls. The order of the parameter assignments when calling a function is arbitrary.

[^37]

Functions with additional outputs

According to the IEC 61131-3 standard, functions can have additional outputs. You declare the additional outputs in the function between the keywords VAR_OUTPUT and END_VAR. The function is called according to the following syntax:

```
<function> (<function output variable1> => <output variable 1>,
<function output variable n> => <output variable n>)
```

Example The fun function is defined with two input variables in1 and in2. The output variable of the fun function is written to the locally declared output variables loc1 and loc2.

```
    fun(in1 := 1, in2 := 2, out1 => loc1, out2 => loc2);
```

See also

- $\quad \Leftrightarrow$ Chapter 6.4.1.21.2.21 "Object 'POU"' on page 2477

## Object 'Interface'

Symbol: $\simeq$
Keyword: InTERFACE
An interface is a means of object-oriented programming. The object ITF describes a set of method and property prototypes. In this context, prototype means that the methods and properties contain only declarations and no implementation.
This allows different function blocks having common properties to be used in the same way. An object "ITF" is added to the application or the project with the command "Project $\rightarrow$ Add Object $\rightarrow$ Interface".

Table 437: "Adding an interface"

| "Inheritance" |  |
| :--- | :--- |
| "Name" | Interface name |
| "Extends" | $\checkmark:$ Extends the interface that you enter in the input field or via the input assistant <br> $\ldots$. <br> are also available in the new interface. |

You can add the objects "Interface property" and "Interface Method" to the object "ITF". Interface methods may contain only the declarations of input, output and input/output variables, but no implementation.
So that you can also use an interface in the program, there must be a function block that implements this interface.

This means:

- the function block contains the interface in its IMPLEMENTS list in its declaration part
- the function block contains an implementation for all methods and property prototypes of the interface

A function block can implement one or more interfaces. You can use the same method with identical parameters, but different implementation code in different function blocks.

Please note the following:

- You may not define variables within an interface. An interface has no implementation part and no actions. Only a collection of methods is defined, in which you may define only input, output and input/output variables.
- CODESYS always treats variables declared with the type of an interface as references.
- A function block that implements an interface must contain implementation code for the methods of the interface. You have named the methods exactly as in the interface and the methods contain the same input, output and input/output variables as in the interface.

## NOTICE!

## Interface references and online change

The following can happen with a compiler version < 3.4.1.0: if a function block changes its data because variables are added or deleted, or because the type of variables changes, then CODESYS copies all instances of the function block to a new memory location. In this case, however, an interface reference refers not to the new memory location, but still to the old one.

In case of compiler versions >= 3.4.1.0, CODESYS automatically re-addresses the interface references so that CODESYS also references the correct interface in case of an online change. CODESYS requires additional code and more time for this, so that jitter problems can occur depending on the number of objects concerned. Therefore, CODESYS displays the number of variables and interface references concerned before the execution of the online change and you can then decide whether the online change should be executed or aborted.

- ${ }^{*}$ Chapter 6.4.1.9.22.3 "Implementing interfaces" on page 1931
- \& Chapter 6.4.1.9.22.4 "Extending interfaces" on page 1933

## Object 'Method'

Symbol: IM $_{\text {m }}$
Keyword: METHOD

Methods are an extension of the IEC 61131-3 standard and a tool for object-oriented programming which is used for data encapsulation. A method contains a declaration and an implementation. However, unlike a function, a method is not an independent POU, and it is subordinated to a function block or program. A method can access all valid variables of the superordinate POU.

You can use interfaces for the organization of methods.
You can add a method below a program or a function block. Click "Project $\rightarrow$ Add Object $\rightarrow$ Method" to open the "Add Method" dialog.

Declaration - The variables of a method contain temporary data that are valid only during the execution of the method (stack variables). All variables that are declared and implemented in a method are reinitialized each time the method is called.

- Like functions, methods can have additional outputs. You have to assign these additional outputs in the method call.
- Depending on the declared access specifier, a method can be called only within its own namespace (INTERNAL), only within its own POU and its derivatives (PROTECTED), or only within its own POU (PRIVATE). For PUBLIC, the method can be called from anywhere.
Interface methods can have declared input, output, and VAR_IN_OUT variables, but do not contain an implementation.
See also
- \& Chapter 6.4.1.21.2.21.7 "Object 'Interface Method"" on page 2490

Implementation - Access to function block instances or program variables is allowed in the implementation of the method.

- The THIS pointer allows for access to its own function block instance. Therefore, the pointer is allowed only in methods that are assigned to a function block.
- A method cannot access VAR_TEMP variables of the function block.
- A method can call itself recursively.

## NOTICE!

When you copy a method below a POU and add it below an interface, or move the method there, the contained implementation is removed automatically.

## Calling a method

Syntax for calls:

```
<return value variable> := <POU name> . <method name> ( <method input
name> := <variable name> (, <further method input name> := <variable
name> )* );
```

For the method call, you assign transfer parameters to the input variables of the method.
Respect the declaration when doing this. It is enough to specify the names of the input variables without paying attention to their order in the declaration.

## Example

Declaration

```
METHOD PUBLIC DoIt : BOOL
VAR_INPUT
    iInput_1 : DWORD;
    iInput-}2 : DWORD
    sInput_3 : STRING(12);
END_VAR
```

Call
bFinishedMethod := fbInstance.DoIt(sInput_3 := 'Hello World ', iInput_2 := 16\#FFFF, iInput_1 := 16);
When the method is called, the return value of the method is assigned, for example, to variables declared locally. When you omit the names of the input variables, you have to pay attention to the declaration order.

## Example

## Declaration

```
METHOD PUBLIC DoIt : BOOL
VAR_INPUT
        iInput_1 : DWORD;
        iInput_2 : DWORD;
        sInput_3 : STRING(12);
END_VAR
```

Call

```
bFinishedMethod := fbInstance.DoIt( 16, 16#FFFF,'Hello World ');
```

## Recursive method call

Within the implementation, a method can call itself, either directly by means of the THIS pointer, or by means of a local variable for the assigned function block.

- THIS^. <method name> ( <parameter transfer of all input and output variables> )
Direct call of the relevant function block instance with the THIS pointer
- VAR fb_Temp : <function block name>; END_VAR

Call by means of a local variable of the method that temporarily instantiates the relevant function block
A compiler warning is issued for a recursive call. If the method is provided with the pragma \{attribute 'estimated-stack-usage' :=
'<sstimated_stack_size_in_bytes>'\}, then the compiler warning is suppressed. For an implementation example, see the "Attribute 'estimated-stack-usage'" chapter.
To call methods recursively, it is not enough to specify only the method name. If only the method name is specified, then a compiler error is issued: "Program name, function or function block instance expected instead of"

| "Abstract" | The object is marked as (internal) in the POU or device view. The <br> declaration contains the keyword INTERNAL. |
| "Add" | V: Identifies that the method does not have an implementation and the imple- <br> mentation is provided by the derived FB |
| Adds a new method below the selected object. |  |

Input support when generating inheriting POUs

When you doing object-oriented programming and using the inheritance (keyword EXTENDS) of POUs, you can get support as follows:
When you insert an action, a property, a method, or a transition below a POU derived from a base POU, the "Add ..." dialog opens. Then the input field for the name extends to a list box. The list box contains a valid selection from the actions, properties, methods, or transitions available in the base POU. Now you can, for example, easily accept a method of the base POU and then adapt it to the derived function of the POU.

Methods and properties with the access modifier PRIVATE are not listed here because they are also not inherited. Methods and properties with the access modifier PUBLIC automatically get a blank access modifier field when accepting into the derived POU, which means the same thing functionally.
Example

## Object 'Interface Method'

Symbol: $\Phi_{\mathrm{m}}$
This object is used for object-oriented programming.
The object "Interface Method" is added to an interface via the command "Project $\rightarrow$ Add Object".
If a method is inserted underneath an interface, you can add and instance only variable declarations (input, output and input/output variables) in this method.
You can only add program code to the method if a function block 'implements' the interface to which the method belongs. CODESYS then inserts the method underneath the function block.

See also

- ${ }^{*}$, Chapter 6.4.1.21.2.21.5 "Object 'Interface'" on page 2484
- ${ }^{4}$ Chapter 6.4.1.21.2.21.6 "Object 'Method"' on page 2485
- ${ }^{4}$ Chapter 6.4.1.9.22.3 "Implementing interfaces" on page 1931

## Object 'Interface Property'

Symbol: 野
Interface properties are an extension of the IEC 61131-3 standard and a tool for object-oriented programming. An interface property declares the accessor methods Get and Set (no implementation code). Therefore, a function block that implements an interface also inherits their interface properties.
You can add an interface property to the device tree for an interface. Then an interface is extended with the accessor methods Get and Set. The Get accessor is for read access. The Set accessor is for write access. You can delete an unneeded accessor. Click "Project $\rightarrow$ Add Object $\rightarrow$ Interface Property" to add an accessor. The "Add Interface Property" dialog opens.

See also

- ${ }^{2} \gg$ Chapter 6.4.1.21.2.21.5 "Object 'Interface"' on page 2484
- ⓨ Chapter 6.4.1.21.2.21.9 "Object 'Property'" on page 2493

## Example

| Declaration and implementation of the interface property Literal_A |  |
| :---: | :---: |
|  | This interface itf_A has the property Literal_A with the accessor methods Get and Set. <br> The function blocks $f b \_A 1$ and $f b \_A 2$ implement the interface it $_{f} \_A$ and therefore inherit its interface property. Each FB has its own implementation. |
| Interface itf_A | ```INTERFACE itf_A VAR END VAR PROPEERTY Literal_A : STRING``` |
| FB fb_A1 | ```FUNCTION_BLOCK fb_A1 IMPLEMENTS itf_A VAR str_1 : STRING; str_2 : STRING; iCn̄ : INT; END_VAR iCnt := iCnt + 1; str_1 := 'Function block A1';``` |

```
Accessor
```

```
Accessor
fb_A1.Litera VAR
1_\overline{A}.Set END_VAR
    str_2 := Literal_A;
FB fb_A2
    FUNCTION_BLOCK fb_A2 IMPLEMENTS itf_A
    VAR
        str 1 : STRING;
        str_2 : STRING;
            iCnt : INT;
        END_VAR
    iCnt := iCnt + 1;
    str_1 := 'Function block A2';
```

## Accessor

```
fb A2.Litera VAR
1_\overline{A}.Get END_VAR
    Litēral_A := str_1;
Accessor
fb A2.Litera VAR
l_A.Set END_VAR
    str_2 := Literal_A;
Program
PLC_PRG PROGRAM PLC_PRG
    VAR
        iCnt : INT;
        my_1 : fb_A1;
        my_2 : fb_A2;
        str
        strName_2: STRING;
        END_VAR
        iCnt := iCnt + 1;
        my_1();
        my_2();
        strName_1:= my_1.Literal_A;
        strName_2:= my_2.Literal_A;
        my_1.Literal_A':= 'Hello-1';
        my_2.Literal_A := 'World 2';
```

This leads to the following monitoring of PLC_PRG when the application is in runtime mode:

## Object 'Property'

Symbol: 㩆

## Keyword: PROPERTY

Properties are an extension of the IEC 61131-3 standard and a tool for object-oriented programming.
Properties are used for data encapsulation because they allow for external access to data and act as filters at the same time. For this purpose, a property provides the accessor methods Get and Set which allows for read and write access to the data of the instance below the property.

You can add a property with accessor methods below a program, a function block, or a global variable list. Click "Project $\rightarrow$ Add Object $\rightarrow$ Property" to open the "Add Property" dialog.

## You can add an interface property below an interface.

When you copy a property that is inserted below a POU and add it below an interface, or if you move the property there, the included implementations are removed automatically.

See also

- « Chapter 6.4.1.21.2.21.8 "Object 'Interface Property"' on page 2490

Dialog 'Add Property'

Function: Creates a new property below the selected POU when the dialog is closed.
Call: Menu bar: "Project $\rightarrow$ Add Object $\rightarrow$ Property"; context menu
Requirement: A program (PRG), a function block (FUNCTION_BLOCK), or a global variable list (GVL) is selected in the "POUs" view or the "Devices" view.

| "Name" | Name (identifier) of the property <br> Example: prop_iA |
| :--- | :--- |
| "Return type" | Default type or structured type of return value <br> Example: INT |
| "Implementation language" | Example: "Structured Text (ST)" |

|  |  |
| :--- | :--- |
| "Access specifier" | Controls access to data |
| "PUBLIC" or unspecified | Access is not restricted. |
| "PRIVATE" | Access is restricted to the program, function block, or GVL. <br> The object is marked as (private) in the POU or device view. The declaration <br> contains the keyword PRIVATE. |
| "PROTECTED" | Access is restricted to the program, function block, or GVL with its derivations. <br> The object is marked as (protected) in the POU or device view. The declara- <br> tion contains the keyword PROTECTED. |
| "INTERNAL" | Access is restricted to the namespace (library). <br> The object is marked as (internal) in the POU or device view. The declara- <br> tion contains the keyword INTERNAL. |
| "Abstract" | V: Identifies that the property does not have an implementation and the imple- <br> mentation is provided by the derived FB |
| "Add" | Adds a new property be low the selected object and below that the accessor <br> methods Get and Set <br> Note: When you select a property, you can also add a previously removed <br> accessor explicitly by clicking "Add Object". |

Editor 'Property' You can program the data access in the editor. The code can contain additional local variables. However, it must not contain any additional input variables or (as opposed to a function or method) output variables.

```
Example
Function block
FB_A
    FUNCTION_BLOCK FB_A
    VAR_INPUT
    END_VAR
    VAR_OUTPUT
    END - VAR
    VAR
            iA : INT;
    END_VAR
    iA := iA + 1;
Property
prop_iA
Accessor
method
FB_A.prop_iA.
Get
Accessor iA := prop_iA;
method
FB_A.prop_iA.
Set
PROGRAM PLC_PRG
VAR
        fbA : FB A;
        iVar: INT;
END_VAR
fbA();
IF fbA.prop_iA > 500 THEN
        fbA.prop_iA := 0;
END_IF
iVar := fbA.prop_iA;
```

Get and Set accessors

The call of the Set accessor is written to the property. Then it is used in the same way as an input parameter. When the Get accessor is called, the property is read. It is used in the same way as an output parameter. Access is restricted in each case by means of access modifiers (qualifiers). As a result, the objects are identified accordingly.
When a property is accessed as read only or write only, you can delete the unneeded accessors.
You can add accessors explicitly by selecting a property and clicking "Add Object". A dialog opens, either "Add Get accessor" or "Add Set accessor". There you can set the implementation language and the access.

Table 438: Dialog "Add Get (Set) Accessor"

| "Implementation language" | Example: "Structured Text (ST)" |
| :--- | :--- |
|  |  |

| "Access specifier" | Qualifier for the declaration part |
| :--- | :--- |
| PUBLIC or unspecified | Access is not restricted. |
| PRIVATE | Access is restricted to the program, function block, or GVL. <br> The object is marked as (private) in the POU or device view. The declaration <br> contains the keyword. |
| PROTECTED | Access to the property is restricted to the program, function block, or GVL and its <br> derivations. The declaration contains the keyword. <br> The object is marked as (protected) in the POU or device view. |
| INTERNAL | Access to the method is restricted to the namespace (the library). <br> The object is marked as (internal) in the POU or device view. The declara- <br> tion contains the keyword. |
|  | "Add" |

Monitoring of properties in online mode

Input support when generating inheriting POUs

The following pragmas are provided for the monitoring of properties in online mode. You insert them at the top position of the property definition:

- \{attribute 'monitoring' := 'variable'\}

Each time the property is accessed, CODESYS saves the actual value to a variable and displays the value of this variable. This value can become outdated if no more access to the property takes place in the code.

- \{attribute 'monitoring' := 'call'\}

Each time the value is displayed, CODESYS calls the code of the Get accessor. If this code contains a side effect, then the monitoring executes the side effect.

You can monitor a property with the help of the following functions.

- Inline monitoring

Requirement: The "Enable inline monitoring" option is selected in the "Text Editor" category of the "Options" dialog.

- Watch List

See also

- ${ }^{\wedge}$ ) Chapter 6.4.1.20.6.3.26 "Attribute 'monitoring'" on page 2295

When you doing object-oriented programming and using the inheritance (keyword EXTENDS) of POUs, you can get support as follows:

When you insert an action, a property, a method, or a transition below a POU derived from a base POU, the "Add ..." dialog opens. Then the input field for the name extends to a list box. The list box contains a valid selection from the actions, properties, methods, or transitions available in the base POU. Now you can, for example, easily accept a method of the base POU and then adapt it to the derived function of the POU.

Methods and properties with the access modifier PRIVATE are not listed here because they are also not inherited. Methods and properties with the access modifier PUBLIC automatically get a blank access modifier field when accepting into the derived POU, which means the same thing functionally.

## Object 'Action'

Symbol: 略
Implement more program code in an action. You can implement this program code as the base implementation in another language. The base implementation is a function block or a program where you inserted the action.
An action does not have its own declaration and it works with the data from the base implementation. This means that the action uses the input and output variables and the local variables from its base implementation.
Add an "Action" to a function block or program by clicking "Project $\boldsymbol{\rightarrow}$ Add Object $\boldsymbol{\rightarrow}$ Action".

Table 439: "Add Action"

| "Name" | Name of the action |
| :--- | :--- |
| "Implementation language" | List box of implementation language |

Input support When you doing object-oriented programming and using the inheritance (keyword EXTENDS) of when generating inheriting POUs POUs, you can get support as follows:
When you insert an action, a property, a method, or a transition below a POU derived from a base POU, the "Add ..." dialog opens. Then the input field for the name extends to a list box. The list box contains a valid selection from the actions, properties, methods, or transitions available in the base POU. Now you can, for example, easily accept a method of the base POU and then adapt it to the derived function of the POU.
Methods and properties with the access modifier PRIVATE are not listed here because they are also not inherited. Methods and properties with the access modifier PUBLIC automatically get a blank access modifier field when accepting into the derived POU, which means the same thing functionally.

Calling an | Syntax: |
| :--- |
| action |
|  | <program>. <action> or <FB instance>. <action>

To call an action from only within the base implementation, you only have to provide the action name.
Examples Calling a "Reset" action from another POU The call is not executed from the base implementa-
tion.
Declaration:
PROGRAM PLC_PRG
PROGRAM PLC_PRG
VAR
VAR
Inst : Counter;
Inst : Counter;
END VAR
END VAR
Calling a "Reset" action from an IL POU
CAL Inst.Reset(In := FALSE)
LD Inst.Out
ST ERG
Calling a "Reset" action from an ST POU
Inst.Reset(In := FALSE);
Inst.Reset(In := FALSE);
Erg := Inst.out;
Calling a "Reset" action from an FBD POU

Actions are used frequently in the SFC implementation language.

## Object 'POUs for Implicit Checks'

## General

You can add these special POUs to an application to equip them with implicit monitoring functions. At runtime, these functions check the limits of arrays or subrange types, the validity of pointer addresses, and division by zero. Please note: This option can be disabled for devices that are already equipped with these kinds of monitoring blocks by a special implicit library.
The command "Add Object $\rightarrow$ POU for Implicit Checks" is used for adding to the application. The command opens the "Add POU for Implicit Checks" dialog where you can select a monitoring function type (see table below). Depending on the monitoring function, you have to adapt the implementation code or create it yourself from scratch.

To prevent multiple inclusions, monitoring functions that have already been inserted are disabled in the "Add POU for Implicit Checks" dialog.

## NOTICE!

To get the feature for monitoring functions, do not edit their declaration part.
However, you are permitted to add local variables.
After removing an implicit monitoring function (example: Check Bounds) from the project, only a download is possible, not an online change. A corresponding message is issued.

By default, CODESYS does not run implicit checks for function blocks from libraries used in the application. However, you can extend the check to the libraries by opening the "Properties" dialog of the application and specifying the compiler definition checks_in_libs in the "Compiler-Defines" field in the "Build" tab. This definition affects implementation libraries (*. library) only, not protected libraries (*. compiled-library).

You can use the "no_check" attribute to deactivate the check for special POUs in the project.

Table 440: "Available Functions"

| Monitoring function | Type |
| :---: | :---: |
| "Check Bounds" | "Bound Checks" <br> Appropriate handling of bound violations; such handling includes setting flags or changing field indices. |
| "CheckDivDInt" | "Division checks": <br> Monitors the divisor value to avoid division by zero. |
| "CheckDivLInt" |  |
| "CheckDivReal" |  |
| "CheckDivLReal" |  |
| "CheckRangeSigned" | "Range checks": <br> Monitors the range limit of a subrange type in runtime mode. Valid for data types DINT/UDINT. |
| "CheckRangeUnsigned" |  |
| "CheckLRangeSigned" | "L-range checks": <br> Monitors the range limit of a subrange type in runtime mode. Valid for data types LINT/ULINT. |
| "CheckLRangeUnsigned" |  |
| "CheckPointer" | "Pointer checks" |
|  | You are responsible for filling in this function completely with implementation code. Refer to the help page for "POU 'CheckPointer'". The function should monitor whether the passed pointer reference a valid memory address, and whether the orientation of the referenced memory area matches the variable type to which the pointer refers. If both conditions are fulfilled, then the pointer is returned. If not, then CheckPointer should complete an appropriate error handling. CheckPointer monitors the same way as variables of type REFERENCE TO. |

## POU 'CheckBounds'

Functions for The task of this monitoring function is to handle bound violations appropriately. Examples of Bound Checks: reactions to violations include setting error flags and changing the value of the array index. The CheckBounds check is performed only for one variable array index. An incorrect constant array index causes a compiler error. CODESYS calls the function implicitly when values are assigned to an ARRAY variable.

After inserting the function, you receive automatically generated code in the declaration and implementation parts. See below.

## CAUTION!

To obtain the feature for monitoring functions, do not edit the declaration part. However, you are permitted to add local variables.

Declaration part // Automatically generated code: DO NOT EDIT FUNCTION CheckBounds : DINT VAR_INPUT
index, lower, upper: DINT;
END_VAR
Implementation // This automatically generated code is a suggested implementation.
IF index < lower THEN CheckBounds := lower;
ELSIF index > upper THEN
CheckBounds := upper;
ELSE
CheckBounds := index;
END_IF
(* It is also possible to set a breakpoint, log messages or e.g. to halt on an exception:
Add CmpApp.library, SysExcept.library and SysTypes2_Itf as newest. Declaration:
VAR
_pApp : POINTER TO CmpApp.APPLICATION; _result : SysTypes.RTS_IEC_RESULT;
END_V̄AR
Implementation:
_pApp := AppGetCurrent(pResult:=_result);
$\overline{\mathrm{I}} \mathrm{F}$ index < lower THEN
CheckBounds := lower;
IF _pApp <> 0 THEN
AppGenerateException(pApp:=_pApp,
ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
END_IF
ELSIF index $>$ upper THEN
CheckBounds := upper;
IF _pApp <> 0 THEN
AppGenerateException(pApp:=_pApp,

```
ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
    END_IF
ELSE
    CheckBounds := index;
END_IF
*)
```

When the "CheckBounds" function is called, it receives the following input parameters:

- index: Index of the array element
- lower: Lower limit of the array range
- upper: Upper limit of the array range

The return value is the index of the array element, as long as it is within a valid range. If not, then the CODESYS returns either the upper or lower limit, depending on which threshold was violated.

```
Example: Cor- In the sample program below, the index falls short of the defined lower limit of the a array.
rection of the
access to an
array outside
the defined
array bounds
```

```
PROGRAM PLC_PRG
```

PROGRAM PLC_PRG
VAR
VAR
a: ARRAY[0..7] OF BOOL;
a: ARRAY[0..7] OF BOOL;
b: INT:=10;
b: INT:=10;
END_VAR
END_VAR
a [b]:=TRUE;

```
    a [b]:=TRUE;
```

In this example, the CheckBounds function causes a to change the upper limit of the array range index to 10 . The value TRUE is assigned then to the element a [7]. In this way, the function corrects array access outside of the valid array range.

```
Example:
exception
when array
limits are vio-
lated.
Declaration
part
Implementa-
tion part
Add the following libraries in the library manager of the application:
- CmpApp.library and SysExcept.library as placeholder libraries
- SysTypes2_Itfs.library with "Newest version always"
Add a "CheckBounds" object below the application and modify the specified code as shown below.
```

```
FUNCTION CheckBounds : DINT
```

FUNCTION CheckBounds : DINT

pApp : POINTER TO CmpApp.APPLICATION;
Result : ISystypes2.RTS_IEC_RESULT;
Result : ISystypes2.RTS_IEC_RESULT;
END_\overline{V}AR
END_\overline{V}AR
// This automatically generated code is a suggested implementation.
// This automatically generated code is a suggested implementation.
_pApp := AppGetCurrent(pResult := _Result);
_pApp := AppGetCurrent(pResult := _Result);
IF index < lower THEN
IF index < lower THEN
CheckBounds := lower;
CheckBounds := lower;
IF _pApp <> 0 THEN
IF _pApp <> 0 THEN
AppGenerateException(pApp := _pApp, ulException :=
AppGenerateException(pApp := _pApp, ulException :=
RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
END_IF
END_IF
ELSIF index > upper THEN
ELSIF index > upper THEN
CheckBounds := upper;
CheckBounds := upper;
IF _pApp <> 0 THEN
IF _pApp <> 0 THEN
AppGenerateException(pApp:=_pApp,
AppGenerateException(pApp:=_pApp,
ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
ulException:=RtsExceptions.RTSEXCPT_ARRAYBOUNDS);
END_IF
END_IF
ELSE
ELSE
CheckBounds := index;
CheckBounds := index;
END_IF
END_IF
Program a "MAIN_PRG" object below the application with the contents shown below.

```
```

PROGRAM MAIN_PRG

```
PROGRAM MAIN_PRG
VAR
VAR
    xInit : BOOL;
    xInit : BOOL;
    arData : ARRAY[0..7] OF BYTE;
    arData : ARRAY[0..7] OF BYTE;
    i : INT;
    i : INT;
    dwAdr : DWORD;
    dwAdr : DWORD;
END_VAR
END_VAR
IF NOT xInit THEN
IF NOT xInit THEN
    // Required for CheckBounds
    // Required for CheckBounds
    xInit := TRUE;
    xInit := TRUE;
END_IF
END_IF
// Set i to a value > 7 or < 0
// Set i to a value > 7 or < 0
// Generates an exception in CheckBounds, user-defined
// Generates an exception in CheckBounds, user-defined
arData[i] := 11;
```

arData[i] := 11;

```

When you load and start this application, an exception will be thrown when array bounds are violated. Processing stops in "CheckBounds" so that the type of error can be detected.

\section*{POU 'CheckDivInt'}

Functions for To prevent division by zero, you can use the functions CheckDivInt, CheckDivLint, preventing division by zero:
CheckDivInt,
CheckDivLint,
CheckDivReal,
and
CheckDivLReal CheckDivReal, and CheckDivLReal. If you include these functions in the application, then they are called before each division operation in the code.

\section*{CAUTION!}

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

\section*{The default implementation of CheckDivReal:} Declaration section:
```

// This is automatically generated code: DO NOT EDIT
FUNCTION CheckDivReal : REAL
VAR_INPUT
divisor:REAL;
END_VAR

```

Implementation section:
```

// This automatically generated code is a suggested implementation.
IF divisor = O THEN
CheckDivReal:=1;
ELSE
CheckDivReal:=divisor;
END_IF;

```

The DIV operator uses the output of the CheckDivReal function as a divisor. In the sample program below, CheckDivReal prevents division by 0 by changing the implicit value of the divisor a from " 0 " to 1 before the division operation is executed. Therefore, the division result is 799.
```

PROGRAM PLC_PRG
VAR
erg:REAL;
v1:REAL:=799;
d:REAL:=0;
END VAR
erg:= v1 / d;

```

\section*{See also}
- « Chapter 6.4.1.9.21 "Using POUs for implicit checks" on page 1928

\section*{POU 'CheckRangeSigned'}

Function for monitoring the range limits of a subrange type of type DINT.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

\section*{CAUTION!}

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:
- value: Value that should be assigned to the subrange type variables
- lower: Lower range limit
- upper: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.
For example, the assignment \(\mathrm{i}:=10{ }^{\mathrm{y}} \mathrm{y}\) is replaced implicitly by \(\mathrm{i}:=\) CheckRangeSigned (10*y, -4095, 4095);

If \(y\) is " 1000 ", then " \(10 * 1000=10000\) " is not assigned to \(i\) like in the original code. Instead, the upper range limit of "4095" is assigned.

The same is true for CheckRangeUnsigned function.

\section*{NOTICE!}

If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295 ) to a variable of subrange type DINT/UDINT. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type LINT/ULINT.

\section*{CAUTION!}

Linking area monitoring functions can lead to endless loops. For example, an endless loop can occur if the counter variable of a FOR loop is a subrange type and the counting range for the loop exits the defined subrange.

\section*{Example of an endless loop:}
```

VAR
ui : UINT (0..10000);
END_VAR
FOR ui:=0 TO 10000 DO
END_FOR

```

The program never exits the FOR loop because the CheckRangeSigned monitoring function prevents ui from being set to a value greater than 10000.
```

Example for The assignment of a value to a DINT variable of a signed subrange type is a condition for
CheckRangeSi automatically calling the CheckRangeSigned. This function restricts the assignment value
gned to the subrange as defined in the variables declaration. The default implementation of the function in ST is as follows:
Declaration section:

```
Implementation:
```

```
// This is automatically generated code: DO NOT EDIT
```

// This is automatically generated code: DO NOT EDIT
FUNCTION CheckRangeSigned : DINT
FUNCTION CheckRangeSigned : DINT
VAR_INPUT
VAR_INPUT
value, lower, upper: DINT;
value, lower, upper: DINT;
END_VAR

```
END_VAR
```

```
// This automatically generated code is a suggested implementation.
```

// This automatically generated code is a suggested implementation.
IF (value < lower) THEN
IF (value < lower) THEN
CheckRangeSigned := lower;
CheckRangeSigned := lower;
ELSEIF(value > upper) THEN
ELSEIF(value > upper) THEN
CheckRangeSigned := upper;
CheckRangeSigned := upper;
ELSE
ELSE
CheckRangeSigned := value;
CheckRangeSigned := value;
END_VAR

```
END_VAR
```

## POU 'CheckLRangeSigned'

Function for monitoring the range limits of a subrange type of type LINT.
For an implementation example of range monitoring, refer to the help page for the CheckRangeSigned function.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

## CAUTION!

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:

- value: Value that should be assigned to the subrange type variables
- lower: Lower range limit
- upper: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.
For example, the assignment $i \quad:=10 * y$ is replaced implicitly by $i \quad:=$ CheckRangeSigned (10*y, -4095, 4095);
If $y$ is " 1000 ", then " $10 * 1000=10000$ " is not assigned to $i$ like in the original code. Instead, the upper range limit of "4095" is assigned.
The same is true for CheckRangeUnsigned function.

## NOTICE!

If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295 ) to a variable of subrange type DINT/UDINT. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type LINT/ULINT.

## CAUTION!

Linking area monitoring functions can lead to endless loops. For example, an endless loop can occur if the counter variable of a FOR loop is a subrange type and the counting range for the loop exits the defined subrange.

```
Example of an
endless loop:
```

```
VAR
```

VAR
ui : UINT (0..10000);
ui : UINT (0..10000);
END_VAR
END_VAR
FOR ui:=0 TO 10000 DO
FOR ui:=0 TO 10000 DO
END_FOR

```
        END_FOR
```

The program never exits the FOR loop because the CheckRangeSigned monitoring function prevents ui from being set to a value greater than 10000.

## POU 'CheckRangeUnsigned'

Function for monitoring the range limits of a subrange type of type UDINT.
For an implementation example of range monitoring, refer to the help page for the CheckRangeSigned function.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

## CAUTION!

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:

- value: Value that should be assigned to the subrange type variables
- lower: Lower range limit
- upper: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.

For example, the assignment i $:=10 * y$ is replaced implicitly by i $:=$
CheckRangeSigned(10*y, -4095, 4095);
If $y$ is " 1000 ", then " $10 * 1000=10000$ " is not assigned to $i$ like in the original code. Instead, the upper range limit of "4095" is assigned.

The same is true for CheckRangeUnsigned function.

## NOTICE!

If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295 ) to a variable of subrange type DINT/UDINT. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type LINT/ULINT.

```
Example of an
endless loop:
```

```
VAR
```

VAR
ui : UINT (0..10000);
ui : UINT (0..10000);
END_VAR
END_VAR
FOR ui:=0 TO 10000 DO
FOR ui:=0 TO 10000 DO
END_FOR

```
        END_FOR
```

The program never exits the FOR loop because the CheckRangeSigned monitoring function prevents ui from being set to a value greater than 10000.

- ${ }^{*}>$ Chapter 6.4.1.21.2.22.7 "POU 'CheckRangeSigned'" on page 2508

## POU 'CheckLRangeUnsigned'

Function for monitoring the range limits of a subrange type of type ULINT.
For an implementation example of range monitoring, refer to the help page for the CheckRangeSigned function.

This monitoring function is responsible for the appropriate handling violations to range limits. Examples of reactions to violations include setting error flags and changing values. The functions are called implicitly when a value is assigned to a subrange type variable.

## CAUTION!

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

When the function is called, it receives the following input parameters:

- value: Value that should be assigned to the subrange type variables
- lower: Lower range limit
- upper: Upper range limit

The return value is the assignment value as long as it is within the valid range. If not, then either the upper or lower limit is returned, depending on which threshold was violated.
For example, the assignment i $:=10 * y$ is replaced implicitly by i $:=$
CheckRangeSigned(10*y, -4095, 4095);
If $y$ is " 1000 ", then " $10 * 1000=10000$ " is not assigned to i like in the original code. Instead, the upper range limit of "4095" is assigned.

The same is true for CheckRangeUnsigned function.

## NOTICE!

If functions are not available, then the subrange is not checked for the respective variables at runtime. In this case, you can assign any value between -2147483648 and +2147483648 (or between 0 and 4294967295 ) to a variable of subrange type DINT/UDINT. You can assign any value between -9223372036854775808 and +9223372036854775807 (or between 0 and 18446744073709551615) to a variable of a subrange type LINT/ULINT.

## CAUTION!

Linking area monitoring functions can lead to endless loops. For example, an endless loop can occur if the counter variable of a FOR loop is a subrange type and the counting range for the loop exits the defined subrange.

```
Example of an
endless loop:
```

```
VAR
```

VAR
ui : UINT (0..10000);
ui : UINT (0..10000);
END_VAR
END_VAR
FOR ui:=0 TO 10000 DO
FOR ui:=0 TO 10000 DO
END FOR

```
    END FOR
```

The program never exits the FOR loop because the CheckRangeSigned monitoring function prevents ui from being set to a value greater than 10000 .

## POU 'CheckPointer'

## Monitoring function for pointers (Checkpointer)

Use this function to monitor the memory access of pointers in runtime mode. As opposed to other monitoring functions, a standard suggestion does not exist for the implementation of CheckPointer. You must define an implementation according to your own requirements.

The CheckPointer function should check whether the returned pointer references a valid memory address; monitors whether the orientation of the referenced memory range matches the variable type that the pointer refers to. If both conditions are fulfilled, then the pointer is returned. If not, then the function should complete an appropriate error handling.

## CAUTION!

To obtain the feature for monitoring functions, do not edit the declaration section. However, you are permitted to add local variables.

[^39]
## NOTICE!

For complier version 3.5.7.40 and later, the implicit check function "Checkpointer" also acts on REFERENCE variables in the same way as on pointer variables.

## Model

Declaration:

```
// Automatically generated code: DO NOT EDIT
FUNCTION CheckPointer : POINTER TO BYTE
VAR_INPUT
        ptToTest : POINTER TO BYTE;
        iSize : DINT;
        iGran : DINT;
        bWrite: BOOL;
END_VAR
// Not a standard implementation. Please add your own code here.
CheckPointer := ptToTest;
```

Implementa-
tion: (incom-
plete)

When the function is called, CODESYS provides the following input parameters:

- ptToTest: Target address of the pointer
- iSize: Size of the referenced variable; the data type of iSize must be compatible with INT and cover the dimensional scope of the variables.
- iGran: Granularity of the referenced size; this is the largest non-structured data type contained in the referenced variables; the data type of iGran must be compatible with INT
- bWrite: Access type (TRUE = write access, FALSE = read access); the data type of bWrite must be BOOL

When the result of the check is positive, the unchanged pointer is returned (ptToTest).

## Object 'Project Settings'

Symbol:
Function: This object contains the configuration of the project.

## Call:

- "Project $\rightarrow$ Project Settings"
- Double-click on the object in the device tree

CODESYS saves the project settings directly in the project. If, for example, you transfer a project to another system, the "Project Settings" object is also transferred with it without a project archive being required.
The project settings are valid project-wide and offer setting possibilities for various categories such as "AS" or "Users and Groups". The available categories vary, depending on which software packages you have installed via the package manager.

## Object 'Project Information'

Symbol: i
Function: The object contains the properties, meta-information, and project information. With this, you can check the authorship and integrity of the project.

## Call

- Double-click the object in the device tree
- Menu bar: "Project $\rightarrow$ Project Information"

Requirement: CODESYS creates the object when you click "Project $\rightarrow$ Project Information", and the dialog opens.

CODESYS saves the project information directly in the project. For example, if you transfer a project to another system, then the "Project Information" object is also transferred. You do not need a project archive.

Tab 'File' The tab displays the properties of the project file and their attributes. You cannot edit these attributes. They correspond to the file properties of Windows Explorer.

Tab 'Summary' The tab contains general information and meta-information of the project file. CODESYS uses this information to create keys on the "Properties" tab. For example, if the name Company_A is specified in "Company", then the Company key with the value Company_A is provided on the "Properties" tab.

## NOTICE!

If you save your project as a library project, then you should pay attention to the guidelines for library developers (Library Development Summary).

| For a library project, a "Company", a "Title", and a "Version" must be specified to install the library. |  |
| :--- | :--- |
| "Company" | Name of the company (example: Company_A). |
| "Title" | Title of the project (example Automation_A). |
| "Version" | Version of the project (example: 0.0 .0 .1 ). |
| "Released" | V: Activates protection from modification. <br> Result: If you edit the project now, then a dialog prompt opens to confirm <br> whether you really want to change the project. If you reply to this prompt <br> one time by clicking "Yes", then no additional prompts appear for more editing <br> actions. |

| "Categories" | Categories of the library project, according to which you can sort in the "Library <br> Repository" dialog. If no category is specified, then the category "Other" is <br> assigned to the library. <br> The categories originate from one or more external description files in XML <br> format. However, they can also originate from a library project that has already <br> been created. <br> Requirement: The project is a library project. <br> (...: The "Library Categories" dialog opens where you can add library categories. |
| :--- | :--- |
| "Default namespace" | If you do not define a standard namespace here, then the name of the library file <br> is applied automatically as the namespace. |
| "Author" | Author of the project (example: Arnold Best). |
| "Description" | Example: For internal use only |

- $乡$ Chapter 6.4.4.2 "Guidelines for creating libraries" on page 2852
- $\triangleq$ Chapter 6.4.1.21.3.9.5 "Command 'Library Repository"' on page 2657

Tab 'Properties' On this tab, you can define keys that you can control externally from user-specific programs.

| "Key" | Name of the key. Specify any string of text for the new key, or select an existing <br> key from the "Properties" table. |
| :--- | :--- |
| "Type" | Data type of the key. Possible types: "Text", "Date", "Number", "Boolean", <br> "Version". |

| "Value" | Value of the key in permitted format <br> - "Text": Any character string <br> - "Date": Example: Friday, January 1, 2016 00:00:00. Minimum entry for the date: 1.1 <br> - "Number": Integer in Integer32 format with or without a sign (example: -32500). <br> - "Boolean": True or False, capitalization irrelevant. <br> - "Version": Examples: 1.1,1.0.1.0, maximum four figures. |
| :---: | :---: |
| "Add" | Adds the new defined key to the "Properties" table. |
| "Modify" | Saves the change made for the key selected in the "Properties" table. |
| "Remove" | Removes the key selected in the "Properties" table. |

| "Properties" | List of the properties that are defined as keys. CODESYS creates keys automati- <br> cally for the information in the "Summary" tab. <br> Click a key to edit it in the input fields above the list. |
| :--- | :--- |

Tab 'Signing' This tab is displayed only for existing libraries whose signing has been created with this tab. This tab is no longer visible for newly generated libraries.
When a certificate-signed library is created (possible as of CODESYS V3 SP15) and library compatibility with CODESYS < V3 SP15 is not set, the settings on this tab are disabled. In this case, the signing is done by means of a certificate that has to be assigned to the user profile in the security screen.

One method, which is not recommended but may be necessary in some case for compatibility with versions < V3 SP15, is the less secure signing of a library by means of a vendor-specific, one-time key in this dialog. Requirement: This key is available as a private key file (*. libpk) with an associated token. The user of the library also has to obtain this key in order to be able to check whether the last signing was actually performed by the library vendor.

| "Activate signing" | 局: CODESYS signs the library project with a single-use, manufacturer-specific <br> key. |
| :--- | :--- |
| "Private key file" | Location of the private key file *. libpk (example: D: $\backslash$ for lib developers <br> only $\backslash$ mycomp_libkey. libpk). |
| "Public key token" | Example: 427A5701DA3CF3CF <br> Requirement: A private key file is specified, and CODESYS has read and <br> entered the token. |
| "Create Private Key File" | CODESYS creates a new private key file. |

## Object 'Recipe Manager'

Tab 'Storage' The recipe manager provides functions for maintaining user-defined variable lists, known as recipe definitions. The recipe definitions can be stored in recipe files on the PLC.

| "Storage Type" | "Textual": CODESYS saves the recipe in a readable Format with the configured columns and delimiters. <br> "Binary": CODESYS saves the recipe in a non-readable binary format. This format requires less storage space. <br> Note: You can read binary recipes again only if you have not changed the variable lists. |
| :---: | :---: |
| "File path" | <directory name>\} <br> Example: AllRecipes $\backslash$ <br> Path on the runtime system <br> Notes: <br> - The path has to end with a backslash ("l"). <br> - The path is usually a relative path on the target system in the directory of the runtime files (PlcLogic). <br> - Access to paths outside of the directory PlcLogic is not permitted on every controller. An absolute path for Windows systems can be selected by pressing the... button. <br> Example of the file path in the runtime system: PlcLogic/AllRecipes <br> CODESYS saves a file in this directory for each recipe when downloading to the PLC. The requirement is that you select the "Recipe management in the PLC" option. <br> The files are loaded to the recipe manager each time the application is restarted. |
| "File extension" | File extension for the recipe file in the format .<file extension> <br> The resulting default name for recipe files is in the form <recipe>.<recipe definition>.<file extension>. |
| "Separator" | Delimiters between the individual values in the saved file |
| "Available Columns" <br> "Selected Columns" | Defines the information that is saved and in which order in the recipe file |
| "Save as Default" | CODESYS uses the settings on the tab throughout the entire project for all other recipe managers. |

Tab 'General'

```
"Recipe management in the
PLC"
```

$\checkmark$ : Has to be selected for the user program or visualization elements to load recipes at runtime. If you transfer recipes to the PLC exclusively via the CODESYS program interface, then you can clear this option.

Table 443: "Save Recipe"
"Save recipe changes to recipe files automatically"

When "Recipe management in the PLC" is selected, there is the following option for saving the recipe:
$\checkmark$ : We recommend this option because it helps the recipe manager operate "normally". The recipe files on the PLC are updated automatically at runtime whenever a recipe is changed.

Table 444: "Load Recipe"
When "Recipe management in the PLC" is selected, there are the following two options for downloading from the PLC:
"Download only for exact match of the variable list"

Download variables with matching names"

The recipe is only downloaded if the file on the PLC contains all variables from the variable list of the recipe definition of the application and these are sorted in the same order. Additional entries at the end are ignored. If the required match does not exist, then the error status ERR_RECIPE_MISMATCH is set (RecipeManCommands.GetLastError).
: The recipe values are downloaded only for those variables that have the same name in the recipe definition of the application as in the recipe file on the PLC. If the variable lists differ in composition and sorting, then no error status is set.

In this way, recipe files can also be downloaded if variables in the file or in the recipe definition have been deleted.
"Overwrite existing recipes on download"
$\checkmark$ : If recipe files with the same name exist on the controller, then they are overwritten with the configured values from the project when the application is started. If the values from the existing recipe files should be loaded instead, then this option has to be disabled.
Requirement: The "Storage Type" is "Textual" and the "Save recipe changes to recipe files automatically" option is selected.

Table 445: "Write Recipe"
The following options are available for writing recipe values to the variables on the PLC:
"Limit the variable to $\mathrm{min} / \mathrm{max}$ when recipe value is out of the range"
"Do not write to a variable when the recipe value is out of the min/max range"

O: If the recipe contains a value that is outside of the range of values specified in the definition, then the defined minimum or maximum value is written to the PLC variable instead of this value.
: If the recipe contains a value that is outside of the range of values specified in the definition, then no value is written to the PLC variable. It retains its current value.

Table 446: "Read Recipe"
The following option is available for reading recipe values from the PLC into the recipe in the project:
"Check recipe for changes"

Always use the function block RecipeManCommands from RecipeManagement. library to read recipes. Never call the method cyclically. This is because each call can be written to the file system, which is time-intensive and burdens the controller. For example, a Raspberry protocol interpreter has a limited number of write cycles.
$\checkmark$ : With each method call, the current PLC variable values are first read into the recipe. Then the system checks whether the values have changed. Only if the values have changed is the recipe saved. This means that the recipe file is overwritten with the current recipes.
The option can be used in order to update the recipe file in the local file system only if recipe values have changed on the PLC. However, it affects performance because it generates additional code for checking.
. With each method call, the current PLC variable values are first read into the recipe. Then the recipe is written to the recipe file in the local file system.
Note: As the file system is written to each call, the controller can be very burdened.

Recipes during online mode

Table 447: Option "Save recipe changes to recipe files automatically" is selected.

| Menu commands | Behavior of the recipes <br> defined in the project | Behavior of the defined rec- <br> ipes at runtime |
| :--- | :--- | :--- |
| "Online $\rightarrow$ Reset Warm" | The recipes of all recipe def- <br> initions are downloaded with <br> "Online $\rightarrow$ Reset Cold" <br> "Onejects. | Dynamically generated rec- <br> ipes remain unchanged. |
| "Online $\rightarrow$ Download" $\rightarrow$ Reset Origin" | The application is removed from the PLC. If a download is <br> done again afterwards, then the recipes are restored as for an <br> online reset warm. |  |
| Shutdown and restart of the <br> PLC | After a restart, the recipes are downloaded again from the <br> automatically created files. This will restore the same state as <br> before shutdown. |  |
| "Online $\rightarrow$ Online Change" | The recipe values remain unchanged. In runtime mode, a <br> recipe can be changed only via the function block command <br> RecipeManCommands. |  |
| "Debug $\rightarrow$ Stop" | The recipes remain unchanged when the PLC is stopped or <br> started. |  |
| "Debug $\rightarrow$ Start" |  |  |

Table 448: Option "Save recipe changes to recipe files automatically" is not selected.

| Actions | Recipes defined in the <br> project | Recipes defined at runtime |
| :--- | :--- | :--- |
| "Online $\rightarrow$ Reset Warm" | The recipes of all recipe def- <br> initions are downloaded with <br> the values from the current <br> projects. However, these are <br> set in the memory only. To <br> save recipes to a file, you <br> have to run the "Save Recipe" <br> command explicitly. | Dynamically generated rec- <br> ipes are lost. |
| "Online $\rightarrow$ Reset Cold" |  |  |$\quad$ Download" $\quad$| The application is removed |
| :--- |
| from the PLC. When a down- |
| load is performed afterwards, |
| the recipes are restored. |$\quad$| Dynamically generated rec- |
| :--- |
| ipes are lost. |

| Actions | Recipes defined in the <br> project | Recipes defined at runtime |
| :--- | :--- | :--- |
| Shutdown and restart of the <br> PLC | After the restart, the recipes are downloaded again from the <br> automatically created files. This will restore the same state as <br> before shutdown. |  |
| "Online $\rightarrow$ Online Change" | The recipe values remain unchanged. In runtime mode, a <br> recipe can be changed only via the function block command <br> RecipeManCommands. |  |
| "Debug $\rightarrow$ Stop" <br> "Debug $\rightarrow$ Start" | The recipes remain unchanged when the PLC is stopped or <br> started. |  |

## Object 'Recipe Definition'

In the recipe definition (1), you define different data sets for the variables, which are termed recipes (2).
You can toggle the display of the recipe definition between the flat list view (3) and the structured view (4). In the structured view, CODESYS groups variables according to structure.

| "Type" | Entered automatically |
| :--- | :--- |
| "Name" | Optional |
| "Minimal Value" <br> "Maximal Value" | If the variable value is less than the "Minimal Value" or greater than the "Maximal <br> Value", then CODESYS sets the value to the "Minimal Value" or "Maximal <br> Value". |
| "Comment" | Additional information, for example the unit of the value. |
| "Current Value" | Current variable value; not shown in online mode |

Table 449: "Additional commands in the context menu in the structured view"

| "Add Sibling" | Adds a sibling variable to the recipe definition. |
| :--- | :--- |
| "Add Child" | Adds a child variable to the recipe definition. |

## Object 'Symbol Configuration'

You can use the symbol configuration for creating symbol descriptions for project variables. Click "Project $\rightarrow$ Add Object" to add a symbol configuration object to the device tree. Then define specific presets. See dialog below: "Add Symbol Configuration".

Double-click the "Symbol Configuration" object to open the symbol configuration editor.

Dialog 'Add Function: This dialog is used to define the defaults for a "Symbol Configuration" object. Symbol Configuration'

Call: "Project $\rightarrow$ Add Object $\rightarrow$ Symbol Configuration" menu; context menu of the application object.

| "Include comments in XML" | Exports the symbol file with the comments assigned to the variables. |
| :--- | :--- |
| "Support OPC UA features" | Note: Availability and editability of this option depend on the device. |
|  | W: When downloading the symbol configuration, additional information is also <br> downloaded to the controller. The information below is necessary for operating <br> the OPC UA server. |
|  | - Base types of inherited function blocks |
|  | $\bullet \quad$ Contents of attributes that were assigned via compiler pragmas |
|  | $\bullet \quad$ Scopes (example: VAR_INPUT, VAR_OUTPUT, VAR_IN_OUT) |

Table 450: "Client-Side Data Layout"

| For detailed information and examples of layout options, see the next section "Symbol Configuration Editor". |  |
| :--- | :--- |
| "Compatibility layout" | This setting is used for the compatibility of old projects. The data layout created <br> for the client is matched as much as possible to the layout created internally by <br> the compiler. |
| "Optimized layout" | Recommended for new projects. Calculates the output layout in optimized form <br> detached from the internal compiler layout. Does not generate any gaps for <br> unpublished elements and strictly fulfills the requirements for memory alignment <br> of the data types. Requires compiler version 3.5.7.0 or higher. |

Symbol configu- The editor includes a table with selected variables and a menu bar for editing. ration editor

Table 451: Menu bar

| ® "View" | You can use this button for activating and deactivating the following categories of variables used in the configuration editor: <br> - 圆 "Unconfigured from Project": Variables that have not been added to the symbol configuration, but are provided in the project. <br> - 追 "Unconfigured from Libraries": Variables that have not been added to the symbol configuration, but are provided in the project. <br> - \{\} "Symbols Exported via Attribute": This filter also lists the variables that have already been marked for export in the symbol file by means of the \{attribute 'symbol' := 'read'\} pragma. These symbols are displayed in gray. The "Attribute" column shows which access rights are set by the pragma. |
| :---: | :---: |
| \#3 "Build" | Compiles the project. Requirement for current preparation of variables in the configuration editor. |

- "Support OPC UA features":

Note: Availability and editability of this option depend on the device.
$\square$ : When downloading the symbol configuration, additional information is also downloaded to the controller. The information below is necessary for operating the OPC UA server. This currently includes the following information:

- Base types of inherited function blocks
- Contents of attributes that were assigned via compiler pragmas
- Scopes (example: VAR_INPUT, VAR_OUTPUT, VAR_IN_OUT)
- <!> "Include comments in XML"
$\square$ : Exports the symbol file with the comments assigned to the variables.
- "Include Node Flags in XML"

V: The namespace node flags provide additional information about the origin of a node in the namespace. The node flags always in the symbol table when OPC UA is activated. However, its inclusion in the XML file can be deactivated as some defective parsers have problems with it.

- "Configure Comments and Attributes"

Opens the "Comments and Attributes" dialog. Here you configure the details of what should be included in the symbol configuration and XML file with respect to comments and attributes.

- "Configure synchronization with IEC tasks":

Opens the "Properties - <device name>" dialog, "Options" tab.
This setting allows for the symbolic clients (e.g. visualizations or database links based on the PLCHandler) to have consistent read/write access synchronized with the IEC tasks. For a detailed description of this setting, see the "Setting: Configure synchronization with IEC tasks" section below.
Note: Variable access which is synchronous with the IEC tasks can increase the jitter for all IEC applications on this device. Synchronized consistent access can interrupt the real-time capability.

- List box for defining the data layout type for the client of the symbol configuration:
Note: See the "Example of data layout types" section at the end of this help page.
- "Optimized layout": Recommend for new projects. Calculates the output layout in optimized form detached from the internal compiler layout. Does not generate any gaps for unpublished elements and strictly fulfills the requirements for memory alignment of the data types. Requires compiler version 3.5.7.0 or higher.
- "Compatibility layout": This setting is used for the compatibility of old projects. The data layout created for the client is matched as much as possible to the layout created internally by the compiler.
Due to the configuration possibilities of the symbol configuration which have grown over time, problematic offsets can still result. Causes of offsets
Memory gaps due to internal pointers or references in function blocks and structure components that are not released for symbol configuration. Memory gaps that occur differently in 32 -bit and 64 -bit systems depending on the data type, such as $\qquad$ XINT/ $\qquad$ XWORD.
Fields that are at uneven addresses. Some clients are not set up for this. Unintentional memory misalignment, which occurs when using the attributes 'pack_mode' or 'relative_offset'.
- "Use Empty Namespaces by Default (V2 Compatibility)": Required when using a CODESYS V2-compatible OPC server configuration.
V: Behavior same as in CODESYS V2.3.
- Program variables are exported without an application name (Application. PLC_PRG.MyVar --> PLC_PRG.MyVar
- Global variables are exported additionally without the GVL name (Application.GVL.MyGlobVar --> .MyGlobVar

|  | "Enable Direct I/O Access": This feature is potentially dangerous and not intended for operation in production. Activate only for error checking and tests, or when commissioning the machinery (for example, for checking cables connections). : In the symbol configuration, you can also use access to direct I/O addresses that correspond to IEC syntax (for example, "\%IX0.0"). Access to input addresses (I) is read-only*. Access to output addresses (Q) and memory addresses (M) can be read-write. <br> *Information: In simulation mode, write access to symbols is also possible for input addresses. <br> Because external clients for protocols such as OPC or OPC UA do not always support IEC syntax for direct addresses, access is also provided using an array syntax in the namespace $\qquad$ MIO of the implicit code. For example, you can also access $\qquad$ MIO.MIO _IX[2].x3 instead of \%IX2.3. However, the symbols for array access are hidden in browsers because some clients cannot handle the large number of nodes (several thousand depending on the size of the I/O ranges). <br> - "Support Calls of Functions, FBs, Methods, and Programs": <br> Note: Availability and editability of this option depend on the device. : The access rights "execute" can be set in the symbol table for symbols of POUs of type function, function block, method, or program. The "Support OPC UA features" option also has to be selected in the "Settings". <br> - "Include Call information in XML": : The information about called functions, function blocks, methods, or programs is also listed in the XML file of the symbol configuration. The option is enabled only if the "Support calls of functions, FBs, methods, and programs" option is supported by the device. <br> - "Enable Symbol Sets": : A toolbar with buttons and a list box is displayed above the symbol table. You can use this to configure symbol sets for client-specific assignment of access rights to the controller. See "Toolbar for symbol set configuration" below. |
| :---: | :---: |
| "Download" | If you use a device that supports its own application file for the symbol configuration, then this button is also available in the toolbar. If you change the symbol configuration in online mode, then you can load the new <application name>. symbols file immediately to the PLC. |
| "Tools" | "Save XSD Scheme File": This command opens the standard dialog for saving a file in the file system. With this command, you can prepare the XSD format of the symbol file, for example for use in external programs. |

Table 452: Symbol table

| "Access Rights" | You can change the access rights for a symbol by clicking the symbol in the "Access Rights" column. <br> Icons for access rights (in ascending order) <br> - Read only <br> - Write only <br> - Read and write <br> - 3: Execute <br> This permission allow for execute access to functions, function blocks, methods, and programs. <br> Requirements for the assignment: The device provides the "Support calls of functions, FBs, methods, and programs" and "Support OPC UA features" options. Both options are activated in the "Settings". <br> Note: In case the controller has a user management, you can use symbol sets to define client-specific access rights to the same symbols. |
| :---: | :---: |
| "Maximal" | Maximum access rights for this symbol |

| "Attribute" | If the access right was assigned by attribute, then a corresponding icon is dis- <br> played here. |
| :--- | :--- |
| "Type" | Alias data types are also displayed In CODESYS V3.5 SP6 and higher. <br> Example: MY_INT : INT for a variable declared with the data type MY_INT <br> (type INT). |
| "Members" | You can add variables of a structured data type also by selecting a check box <br> for symbol configuration in the "Symbols" column. This causes CODESYS to <br> export all member variable symbols. However, in the "Members" column, you <br> can click the ellipsis button (...) to select only specific structural components. <br> Note: This selection applies to all instances of this data type for which symbols <br> are exported. If a member of a structured type cannot be selected, then an <br> asterisk (*) is displayed in the check boxes of the members to indicate that all <br> exportable members of that type are exported. |

Table 453: Toolbar for symbol set configuration

| "List box" | Already defined symbol sets |
| :---: | :---: |
| $\pm$ "Add New Symbol Set" | Opens the "Add New Symbol Set" dialog for specifying a name for this set |
| ㅁ. "Add Duplicate from Selected Symbol Set" | Opens the "Add Duplicate from Selected Symbol Set" dialog. A copy is created for the set selected in the list box. You can change the default name (<group name>_duplicate). |
| "Rename Selected Symbol Set" | Opens the "Rename Selected Symbol Set" dialog for specifying another name for the set selected in list box. |
| "Delete selected Symbol Set" | Opens a dialog prompting whether or not the symbol set selected in the list box should be deleted. |
| "Configure Symbol Rights" | Opens the "Symbol Rights" tab of the device editor. When logged in there, you can assign different access rights for each user group (client) to the symbol set selected in the list box. |

## Dialog 'Com- <br> ments and <br> Attributes'

Table 454: "Symbol Table Contents"

| "Enable extended OPC UA <br> information" | Note: Availability and editability of this option depend on the device. <br> V: Additional information that can be evaluated by OPC UA servers is included <br> in the symbol table. This includes inheritance information of user-defined data <br> types and the namespace node flags. Additional information, such as comments <br> and attributes, can also be included if the OPC UA setting is active. <br> When the OPC UA setting is enabled, attributes are included in the symbol table <br> according to the following rule: |
| :--- | :--- |
|  | - In compiler versions V3.5.5.0 to V3.5.7.X, all attributes are included <br> according to the "Match simple identifiers" setting. <br> In compiler version V3.5.8.X, all attributes are included according to the <br> setting "Include all attributes". <br> In compiler version V3.5.9.0 and higher, you can customize the attributes <br> that are included. |
| "Include comments" | Requirement: "Enable extended OPC UA information" is activated. <br> V: Comments and attributes are also saved in the symbol table. |

| "Include attributes" |  |
| :--- | :--- |
| "Also include comments and | Requirement: "Include comments" is activated. |
| attributes for type nodes" | : The information for type nodes is also included (user-defined types, such as <br> STRUCT and ENUM elements). |
|  | $\square:$ Only directly exported variables have comments and attributes. |

Table 455: "XML symbol file contents"

| "Include namespace node flags" | The namespace node flags provide additional information about the origin of a node in the namespace. The node flags always in the symbol table when OPC UA is activated. However, its inclusion in the XML file can be deactivated as some defective parsers have problems with it. |
| :---: | :---: |
| "Include comments" | Comments can also be saved in the XML file. <br> In compiler versions V3.5.5.x to V3.5.8.0, this includes the setting "Prefer docucomments". |
| "Include attributes" | $\checkmark$ : Attributes can also be saved in the symbol file. |
| "Also include comments and attributes for type nodes" | Requirement: "Include comments" is activated. The information for type nodes is also included (user-defined types, such as STRUCT and ENUM elements). : Only directly exported variables have comments and attributes. |

Table 456: "Select Comments"
Requirement: "Include comments" is activated.
"Include docu comments"
"Include normal comments"
"Always include both types of
comments"
"Prefer docu comments, fallback to normal ones"
"Prefer normal comments, fallback to docu comments"

The options determines the comments that are saved in the symbol configuration.

Table 457: "Filter Attributes (Case-Insensitive)"

| Requirement: "Include attributes" is activated. |  |
| :--- | :--- |
| "Include all attributes" | Defines the attributes that are saved in the symbol configuration. |
| "Include attributes starting with" |  |
| "Filter attributes with regular |  |
| expression" |  |$\quad$| "Match simple identifiers" |
| :--- | | Exists primarily due to the backward compatibility to older versions in order to |
| :--- |
| emulate the old behavior. |

Setting: Configure synchronization with IEC tasks

For synchronously consistent access, the symbolic client waits in the runtime when processing a read or write request until a time is found when no IEC task is executed. When this gap is detected, restarting the IEC tasks is prevented until all values of the variable list have been copied. Then the IEC tasks are planned again as usual. Synchronized access can cause a delayed starting of IEC tasks, which is shown as increased jitter. As all applications in the runtime are managed by a common scheduler, this potential impairment of the real-time behavior
affects all applications on the device. All applications of the device are affected, regardless of whether or not they include a symbol configuration or they have been downloaded to the controller from one or more CODESYS projects. Therefore, the runtime permits synchronized consist access only if this it allows all applications that are downloaded to the controller at the time of access.

The setting is located in the editor of the symbol configuration of the "Settings" menu. In addition, the setting is also located in the context menu of the controller when you click the "Properties" command and then select the "Options" tab in the opened dialog.
For applications without symbol configuration, the setting can only be found in the properties dialog.

## NOTICE!

After changing the setting, all applications downloaded to the device by means of a download or online change have to be reloaded and all boot applications updated.

## In which cases is synchronized consistent access necessary?

As a rule, there is no need for consistent values for displayed values because it is mostly irrelevant from which IEC task cycle the changed values originate. It is completely irrelevant for seldom changed values. Even when writing there are almost no hard consistency demands because typically the machine must be in a kind of standby mode (for example when writing recipes) in which there is no direct access to the values written as recipes.
In contrast, consistent values are particularly necessary for database links to save production data. For clocked machines, however, these values must be synchronous with the production timing (one value set per produced product) and not consistent with reference to one or more IEC tasks. With reference to the machine clocking, the consistency must be already ensured by the IEC application. For this purpose, the values that arise during a production cycle are typically collected in a global variable list. At the end of the cycle, the symbolic client is notified by means of an additional variable (BOOL or counter) that the machine cycle has ended and the values are valid. Now the client has the chance to archive the values from the production cycle. Depending on necessity, the successful reading can also be displayed in the opposite direction by means of a released variable, so that the production can also be halted in case the production data cannot be archived. Synchronized consistent access is not necessary and helpful for this use case because the synchronization takes place at the application level.
In contrast, synchronized consistent access by symbolic clients is typically applied in the process industry with continuously running systems without production clocking when, for example when process values are written consistently and cyclically in a fixed time frame of 60s. This can take place either by synchronization on the application level similar to clocked machines (see above) or by synchronization of the synchronized consistent symbolic access. The advantage of the latter is that no logic has to be implemented in the IEC program and access is controlled entirely by the client.

## CAUTION!

Due to the increased jitter, the synchronized consistent monitoring is not suitable for motion or real-time critical applications. For these reasons, synchronized consistent access should be released and used only if it is absolutely necessary.

If a client uses synchronous consistent access released by this setting, then it has and effect on the client. Depending on the scheduler of the runtime, the response time can jitter more here for read/write access because the system might still have to wait for an execution gap of the IEC tasks. Read and/or write access can still fail when IEC tasks run for a long time (in the range of several 100 ms ) or the CPU load is close to $100 \%$ for an extended period of time with one or more IEC tasks (in the range of several 100 ms ). Therefore, the availability of the values also depends on the load of the controller by the IEC application.

Moreover, the client can minimize the effects on itself and on the runtime if it observes the following in the definition of the variable lists to be read or written:

- Synchronized consistent access only to those variables that are absolutely and consistently required.
- Separate variable lists for variables that have to be consistent and for variables that could be inconsistent.
- Divide variable lists with several consistent variables into several smaller lists.
- Select read intervals for cyclic reading of values as large as possible.

> Support for the current configuration and possible corrective actions

Entries marked in red in the symbol table show variables that they are configured for export to the symbol file but are currently invalid in the application. The cause for this can be that the declaration has been removed from the block.

In version 3.5.8.0 and higher, a warning appears in the editor if variables that have configured symbols are not used in the IEC code or are not mapped in the case of I/O variables. In addition, the compiler indicates variables that are referenced from outdated library versions $n$ the symbol configuration.

## NOTICE!

Object variables that are not used in the program code remain uncompiled by default and are therefore not available in the symbol configuration.

However, CODESYS provides variables from uncompiled objects in the symbol configuration when one of the following conditions is met:

- The "Link always" POU property is selected.
- The \{attribute 'linkalways'\} pragma is used.

## Example for the data layout types

| Examples for the layout types | The following examples from an IEC application will show how gaps can result in the clientside memory layout caused by unpublished symbols, internal "invisible" pointers, or a "pack mode" definition in the device description. With the "Optimized layout" setting, the gaps are avoided. The symbol file contains different information about the size and offset of memory locations, depending on the selected layout setting. |
| :---: | :---: |
| Example: <br> Large structure | // Example of a big structure, where not all members get published STRUCT <br> \{attribute 'symbol':='readwrite'\} |
|  | PublicNumber : INT; |
|  | \{attribute 'symbol':='none'\} <br> InternalData : ARRAY[0..100] OF BYTE; |
|  | ```{attribute 'symbol':='readwrite'} SecondNumber : INT;``` |
|  | \{attribute 'symbol':='none'\} |
|  | MoreData : ARRAY[0..100] OF BYTE; |
|  | END_STRUCT |
|  | END_TYPE |
|  | Resulting entries in the symbol file; pay attention to "size" and "byteoffset": |
| Symbol file, large structure, compatibility layout option | <TypeUserDef name="T_LargeStructure" size="208" nativesize="208" typeclass="Userdef" pouclass="STRUCTURE" iecname="LargeStructure"> |
|  | <UserDefElement iecname="PublicNumber" type="T_INT" byteoffset="0" vartype="VAR" /> |
|  | <UserDefElement iecname="SecondNumber" type="T_INT" byteoffset="104" vartype="VAR" /> |
|  | </TypeUserDef> |
| Symbol file, large structure, optimized layout option | <TypeUserDef name="T_LargeStructure" size="4" nativesize="208" <br> typeclass="Userdef" pouclass="STRUCTURE" iecname="LargeStructure"> |

## Object 'Text List'

Symbol:
This object is used to create, manage, and translate texts. It contains a table with texts where you can add new texts. You can select a text which you have composed here can be selected in a visualization in the "Dynamic texts" property of an element. In runtime mode, the visualization displays this text dynamically in the selected language.
When the object is assigned to an alarm group and is located below the "Alarm Configuration" object, CODESYS adds the texts of the alarm group to the table. You can also add texts.

| "ID" | Unique identifier of the text |
| :--- | :--- |
| "Standard": | Source text as character string (example: Information A: \% i options). <br> Use the keyboard shortcut [Ctrl]+[Enter] to add a line break. <br> Double-click in the field to edit the text. |
| The table contains as many language columns as you want to add. A language column is named with a language <br> code that you specified when you created the column by means of the "Insert Language" command. |  |
| "<language code>" | Name of the language as a language code. Example: en-US. This column con- <br> tains the translation of the text which is composed under "Standard". Under the <br> condition that the language code is selected as the language in the visualization <br> manager, a visualization displays the translated text in runtime mode. If a trans- <br> lation has not been composed, then CODESYS uses the text under "Standard" <br> A visualization in runtime mode can also change the language if requested by a <br> user. |
| Blank line | Edit the line to add your own text. |

## Object 'Task Configuration'

## General

Symbol:
The object is used to define and display the basic settings for the task configuration.
The "Task Configuration" object must be included exactly one time in each application.
"Task Configuration" tabs and functions

- "Properties": Display of the basic settings
- "System Events": Linking of POU calls with system events
- "Monitor": Display of the status and current statistics for the cycles times in online mode
- "Variable Usage": Overview of the tasks that access the variables and how they do it
- "Task Groups": Definitions of the tasks groups and their assignment to CPUs
- "CPU Load": Graphical representation of the CPU load in online mode

## Tab 'Properties'

## Object: "Task Configuration"

In this tab, you define the basic settings of the task configuration as predefined by the target system, such as the maximum values for tasks and watchdog parameters.

## Tab 'System Events'

Object: "Task Configuration"
On the "System Events" tab, you define which event calls which function and whether or not the configuration is currently activated. You use this tab when a system event (instead of a task) should call a project function.

| "Add Event Handler" | Opens the "Add Event Handler" dialog |
| :--- | :--- |
| "Remove Event Handler" | Deletes the selected list assignment |
| "Event Info" | Shows information from the corresponding event library |

| "Open Event Function" | Opens the editor of the new function for the selected assignment You have <br> selected the implementation language of the new function in the "Add Event <br> Handler" dialog. |
| :--- | :--- |
| Ans |  |

Assignment of functions to call for events with: "Name", "Description", "Function to call", and "Active" (activate/deactivate configuration).

Table 458: "Add Event Handler"

| Adds a new assignment "Event - Function to call" to the list |  |
| :--- | :--- |
| "Event" | The possible selection depends on the target device. CODESYS marks unavail- <br> able events with a red symbol in front of the name. <br> A list of all possible system events is located at the end of this section. |
| "Function to call" | Function name ("POU", type "FUNCTION") <br> You have to specify the name of the new function. CODESYS inserts the func- <br> tion to the device tree after you confirm the dialog. |
| "Scope" | - "Application": The function is available to the application. <br> - "POUs": The function is available to the entire project. |
| "Implementation language" | Implementation language for the new function |
| "Description" | Short description of the selected event |

Features in The list of assignments from called functions to events also includes the following information:
"Online Mode" "Event Status", "Call Count", and the "Online Reset" button.

| "Event Status" | 0 : No error has occurred. |
| :--- | :--- |
| Does not equal 0: Error. You need to consult the respective runtime system |  |
| documentation. |  |

| Possible system <br> events | Event | Description | Task |
| :--- | :--- | :--- | :--- |
|  | PrepareStart | Call before starting the <br> application | Communication task |
|  | StartDone | Call after starting the <br> application | Communication task |
| PrepareStop | Call before stopping <br> the application | Communication task | No |
| StopDone | Call after stopping the <br> application | Communication task | No |
| PrepareReset | Call before resetting <br> the application | Communication task | No |
| ResetDone | Call after resetting the <br> application | Communication task | No |
| PrepareOnline- <br> Change | Call before online <br> change of the applica- <br> tion | Communication task | No |

| Event | Description | Task | Debugging |
| :---: | :---: | :---: | :---: |
| OnlineChangeDone | Call after online change of the application | Communication task | No |
| PrepareDownload | Call before downloading the application | Communication task | No |
| DownloadDone | Call after downloading the application | Communication task | No |
| PrepareDelete | Call before deleting the application | Communication task | No |
| DeleteDone | Call after deleting the application | Communication task | No |
| PrepareExit | Call before exiting the application | Communication task | No |
| ExitDone | Call after exiting the application | Communication task | No |
| CodelnitDone | Event is sent after Code Init. Called within the task safe section and only for an online change change (for example, the copy code for online change is executed here). | Communication task | No |
| Exception | The event is sent if an exception has occurred in the context of an application. | Exception handling task of the runtime, or the task itself if the runtime does not support exception handling | Depends on the task |
| Login | Login of a client to this application | Communication task | No |
| Logout | Logout of a client from this application | Communication task | No |
| BeforeReadinglnputs | Call before reading the inputs | IEC task | Yes |
| AfterReadingInputs | Call after reading the inputs | IEC task | Yes |
| BeforeWritingOutputs | Call before writing the outputs | IEC task | Yes |
| AfterWritingOutputs | Call after writing the outputs | IEC task | Yes |
| DebugLoop | Event is sent in cycles to the debug loop if the IEC task stops at a breakpoint. | Communication task | No |
| PrepareShutdown | Event is sent immediately before the runtime system is downloaded. | Runtime main loop | No |

| Event | Description | Task | Debugging |
| :--- | :--- | :--- | :--- |
| PrepareExitComm | Event is sent during <br> download before <br> exiting the communica- <br> tion server. | Runtime main loop | No |
| PrepareExitTasks | Event is sent during <br> download before <br> exiting all tasks. | Runtime main loop | No |

## Tab 'Monitor'

## Object: "Task Configuration"

In online mode, the tab shows the status of the tasks of the task configuration, as well as some current measurements of the cycles and cycle times. CODESYS updates the values in the same time interval as for the monitoring of values from the PLC.
The displayed values can be reset to 0 by means of the "Reset" context menu command.

| "Task" | Task name (as defined in the task configuration) |
| :--- | :--- |
| "Status" | - "Not created": The task has not been started since the last update (especially for <br> event tasks). <br> "Generated": The task is recognized in the runtime system, but not yet in opera- <br> tion. <br> "Valid": The task is operating normally. <br> - "Exception": The task has produced an exception status. |
| "IEC-Cycle Count" | Number of cycles executed since starting the application where the IEC code was <br> executed (0 if the target system does not support the counter function) |
| "Cycle Count" | Number of executed cycles since logging in to the PLC <br> It depends on the target system whether cycles are also counted where the appli- <br> cation is not running. In these cases, the "Cycle Count" may be greater than the <br> "IEC-Cycle Count". |
| "Last Cycle Time $(\mu s) "$ | Last measured cycle time [ $\mu \mathrm{s}$ ] |

## Tab 'Variable Usage'

Object: "Task Configuration"
The "Variable Usage" tab provides an overview of all variables and their usage. There you can see the tasks where variables are accessed.
When using multicore, write access (w) to a variable should take place only in a task because otherwise it can cause inconsistencies.

In the context menu, you can hide individual tasks and show the cross-reference list to variables.

| "Variables" | Name of the variable |
| :--- | :--- |
| "Type" | Data type |
| "Number" | Number of tasks that access these variables. |
| "<task name>" | Access to the variable (r: read, w: write, rw: read/write) |

See also

- $\quad$ ② Chapter 6.4.1.9.17 "Task Configuration" on page 1914

## Tab 'Task Groups'

## Object: "Task Configuration"

You define task groups on the "Task Groups" tab. Task groups can be distributed over the individual processor cores in multicore systems. The tasks of a task group are bound to the processor cores according to the strategy defined in the "Core" field.

| "Add Group" | The button adds a new task group named NewGroup_<no>. |
| :--- | :--- |
| "Remove Group" | Deletes the selected task group. |
| "Group Name" | The name can be changed by double-clicking in the field. |
| "Core" | Determines the processor core for process the tasks of this group. <br> - "Free floating": All tasks are bound dynamically to different processor cores. <br> The user does not have any influence over this. The operating system is <br> responsible for the distribution. |
|  | "Sequentially pinned": All tasks are bound and fixed to different processor <br> cores. The user does not have any influence over this. <br> "Fixed pinned": All tasks are bound to one processor core. By default, the <br> runtime system determines the processor core. |
| "<core number>": Fixed defined processor core. If the processor core is not |  |
| available, then an error message is issued. |  |

## Tab 'CPU Load'

## Object: "Task Configuration"

The "CPU Load" tab is available in online mode for multicore devices only. The load of the individual CPUs is presented in the trace editor.
You open the trace configuration by double-clicking the legend in the window on the right side. Adding more variables is not possible here.

See also

- $乡$ "Displaying the CPU load with DeviceTrace objects in the CODESYS project (example)" on page 2015

## Mapping of Task Priorities on a Linux System

Dependencies When the target system is running in Linux, specific priorities of the IEC tasks are mapped between IEC task priorities to specific priorities and scheduling policies. Depending on the priority, the scheduling policy SCHED_FIFO or SCHED_OTHER is displayed as in the table. and Linux priorities

| IEC Task Priority | Linux Priority Linux (Default) |
| :--- | :--- |
| 0 (highest real-time priority) | 56 (SCHED_FIFO) |
| 15 (lowest real-time priority) | 41 (SCHED_OTHER) |
| 16 (no real-time priority) | 0 (SCHED_OTHER) |
| 31 (no real-time priority) | 0 (SCHED_OTHER) |

## Object 'Task'

## General

Symbol:
In this object, you define the conditions for starting and calling the task.
You insert the object below "Task Configuration" in the device tree.

## Tab 'Configuration'

Object: "Task"

| "Priority" | Possible values: $0 . .31$, where 0 is the highest priority |
| :--- | :--- |
| "Task group" | Assigned task groups which can be assigned to specific processor cores in <br> multicore <br> Example: <br>  <br>  <br> IEC Tasks Note: The task group is shown in brackets after the task in the device <br> tree. |

When using a runtime system in Linux, there exist fixed dependencies between task groups and priorities. For more information, see: $\Rightarrow$ Chapter 6.4.1.21.2.29.8 "Mapping of Task Priorities on a Linux System" on page 2538

Table 459: "Type"

| Type "Cyclic" | Processing of the task is done cyclically. |
| :--- | :--- |
| Input field Interval | Required <br> Time span after which the task is restarted (task cycle time) <br> - As a time definition in the format TIME <br> Example: t\#200ms |
|  | As a number <br> Example: 200 Hint: the number is displayed automatically in the format TIME <br> when the input field is in focus again. <br> Note: Deviations of the task from this desired task cycle time are displayed at <br> runtime as periodic jitter on the Watchdog tab. |
| Time unit of the interval | If only a number and not a time definition is specified in the Interval input field, <br> then the unit selected here determines the time dimensions. <br> Example: ms <br> Note: A task cycle time in $\mu$ s is always displayed as a number. |
| Type "Event" | Processing of the task starts event-controlled on the rising edge of the event <br> variable. |
| Input field "Event" | Global variable (Boolean type) <br> The task starts as soon as the variable value switches from 0 to 1. |
| Type "External" | Processing of the task starts event-controlled on the rising edge of the event <br> variable. |
| List box "Event" | List with target system-dependent events (Boolean type) <br> Note: The target system determines which events are supported and offered in <br> the list box. <br> Hint: Not to be confused with system events |
| "Interval" | Time definition in TIME format or as a number with a time unit Note: Only <br> available when the event requires a time definition |
| Input field "Event" | Processing of the task starts automatically in a continuous loop at program start <br> and at the end of a complete pass <br> Note: A cycle time is not defined. |
| Processing of the task starts state-triggered by the event variables |  |
| Global variable (Boolean type) When the variable has the state TRUE hat, the |  |
| task starts. |  |

## NOTICE!

For fieldbuses, a fixed cycle matrix is necessary to assure a determined behavior. Therefore, you should not use TypeFreewheeling for a bus cycle task.

## NOTICE!

Note the following difference between the processing types Status and Event. If the given event yields TRUE, then the start condition of a task of type Status is fulfilled. In contrast, the start of a task of type Event requires a switch of the event from FALSE to TRUE. If the sampling rate of the task scheduler is too low, then the rising edge of the event can remain unnoticed.

## NOTICE!

When setting the task cycle time, you have to identify which bus system is currently being used. For example, the task cycle time in a CAN bus system must match the currently set baud rate and the number of frames used in the bus. In addition, the times set for heartbeat, node guarding, and sync should always be a multiple of the task cycle time. If not, then CAN frames can be lost.

Table 460: "Watchdog"
Defines the time monitoring for a task. If the target system supports an advanced watchdog configuration, then the following settings may be predefined in the device description.

- Upper and lower limit
- Default watchdog time
- Time specified as percentage

The default watchdog settings depend on the device.

| "Enable" | The watchdog is active. <br> If the task exceeds the currently set "Time" of the watchdog, then the task is <br> halted with an error status (exception). The application in whose task the error <br> occurred and its child applications are also halted. In this way, all tasks of the <br> affected applications are also halted. Then the currently defined "Sensititity" is <br> also taken into account. If you activate the option "Update I/Os" in the "PLC <br> Settings" of the PLC, then CODESYS resets the outputs to the defined default <br> values. <br> Possible cases: <br> - Multiple consecutive timeouts: <br> Sensitivity: 0, 1 - exception in cycle 1 <br> Sensitivity: 2 - exception in cycle 2 <br> Sensitivity: n - exception in cycle n <br> Single timeout: Exception if the cycle time of the current cycle is longer than <br> (time *sensitivity). Example: Time=t\#10ms, Sensitivity=5 (i.e., exception as <br> soon as the one-time task runs longer than 50 ms) |
| :--- | :--- |
| "Time (e.g. t\#200ms)" | Watchdog time <br> Defines (together with "Sensitivity") the watchdog for a task; description as for |
| "Enable". |  |
| Depending on the target system, the monitoring time span is given as a per- |  |
| centage of the task interval if possible. In this case, the list box for the unit is |  |
| disabled and displays "\%". |  |

Using the functions from the library CmpIecTask. Iibrary, you can deactivate a watchdog for specific PLC cycles. This is useful for cycles that demand more time due to initialization.

```
Example Deactivating/reactivating the watchdog:
    hIecTask := RTS_IEC_HANDLE //Declaration of the variable hIecTask
    hIecTask := IecTask\overline{GetCurrent(0);}
    IecTaskDisableWatchdog(hIecTask); // Watchdog disabled
    IecTaskEnableWatchdog(hIecTask); Watchdog enabled
```

List of "POU"s that the task calls
The calling order corresponds to the POU order in the list (from top to bottom).

| "Add Call" | Defines a new program call |
| :--- | :--- |
| "Open POU" | Opens the selected POU |
| "Move Up" | Changes the calling order |
| "Move Down" |  |

The normal watchdog of an IEC task is triggered when the execution time of the IEC task exceeds the watchdog time. The "Omitted Cycle" watchdog is triggered when the task does not start at all. This is the case when the task does not execute any cycle at all within the maximum of <Time * Sensitivity> or $<2$ * Interval>. The cause could be crowding by other tasks or a failure in the scheduler, which no longer enables the task.

## Object 'Trace'

## Symbol: a

An object of type "Trace" is used for configuring and displaying application-specific trace data in one or more charts. At application runtime, value curves of trace variables, which you can monitor in the trace editor in CODESYS, are recorded on the controller. Requirements are that a trace configuration has been configured transferred to the controller, and the trace recording has been started. The recorded data is transferred to the development system and displayed in diagrams according to the configuration. You can navigate through the data when tracing.

If the controller supports a Trace Manager, then you can use the 'DeviceTrace' object type in the Trace Manager to access all traces that are running on the controller.

Double clicking the trace object opens the trace editor. The corresponding toolbar contains the most important trace commands. The trace variable list shows the variable whose value curve is recorded.

## Trace editor

At application runtime，the runtime system buffer of the trace component is filled with the recorded samples．The data is transferred to the development system and stored in its trace editor buffer．The trace editor accesses this data and displays it in diagrams as a graph over time．When you close the trace editor，the trace editor buffer will be freed．
Use menu commands for controlling the trace．In addition，you can use menu commands， keyboard shortcuts，and mouse input for navigating through the data．

## Object 'Trend Recording Manager'

Symbol
A "Trend Recording Manager" object makes it possible to save data at runtime in a database for a long period of time. This data is recorded with the "CmpTraceMgr" runtime system component. In the device tree, this object is used as a node for trend recordings that are created below an application. It is available below an application only one time.
See also

- \& Chapter 6.4.1.13.4 "Data Recording with Trend" on page 2016
- $\#$ Chapter 6.4.1.21.3.5.1 "Command 'Add Object"' on page 2598
- $\Leftrightarrow$ Chapter 6.4.1.21.2.33 "Object 'Trend Recording'" on page 2545

## Object 'Trend Recording'

Symbol:
A "Trend Recording" object is always located below a "Trend Recording Manager" and enables editing of the trace configuration. At runtime, CODESYS transfers the configuration that is available to the runtime system component CmpTraceMgr. You can configure an application with any number of trend recordings.

## NOTICE!

## Timeout for trend recording

During a trend recording, it can happen that the application task triggers a timeout that is caught with an exception when transitioning from "Running" to "Stop". Causes can be that file operations with the SQLite database are taking too long or that too many variables are being recorded. This usually happens on a target device with weak performance.
You can avoid the occurrence of an exception:

- Configure the trend recording with less memory demand so that the amount of data that is stored is adapted to the target system.
- Reduce the number of variables.

The editor includes the configuration for trend recording. The tree view shows the trend configuration and enables navigation there.

The top entry contains the trend name. When this entry is selected, the "Record Settings" are displayed next to it. An entry is located here for each variable whose data was recorded continuously. When a variable is selected, the "Variable Settings" are displayed next to it.

| "Add Variable" | When you click the link, a new entry is displayed in the trend configuration with <br> its blank configuration below the "Variable Settings" group. |
| :--- | :--- |
| "Delete Variable" | The selected variable is removed. Requirement: A variable is selected. |

See also

- Command 'Edit Trend Recording'
'Recording Set- The data is recorded in the runtime system component by means of the functionality which is tings' also used for the trace. The settings that appear here are the same. The options that are not required here are deactivated.

| The settings that affect the trigger are deactivated. Only a trace configuration for a trace editor can configure triggering. |  |
| :---: | :---: |
| "Task" | Task where data was recorded. Click $\geqslant$ to open a list box with all tasks available in the project. In general, the trend recording runs in the same task as the main program. For example: MainTask |
| "Recording condition" | Condition under which the application records data: <br> - IEC variable of type INT. The condition is fulfilled for TRUE. <br> - Bit access to an integer variable. The condition is fulfilled for 1 . <br> As read access to a property. <br> The contents of a pointer are not permitted. <br> Note: If no condition is defined, then the recording starts automatically. |
| "Comment" | Comment (example: Data recording of sensor A) |
| "Resolution" | Resolution that the application saves the time stamp <br> Note: If the task where the trend object is executed has a cycle time of 1 ms or less, then you should set the resolution of the time stamp to " $1 \mu \mathrm{~s}$ ". |
| "Trend Storage" | The "Trend Storage" dialog opens. |
| "Advanced" | The "Advanced Trend Settings" dialog opens. |

- $\sum^{*}$ Chapter 6.4.1.21.4.17 "Dialog Box 'Trend storage"" on page 2809
- «y Chapter 6.4.1.21.4.18 "Dialog Box 'Advanced Trend Settings'" on page 2810
'Variable Settings'

| "Variable" | Variable for recorded value. <br> - IEC variable with valid data type <br> - Property <br> - Reference <br> - Contents of the pointer <br> - Array element of a valid data type <br> - Enumeration of a valid data type <br> Valid data types are all standard types, except STRING, WSTRING, and ARRAY. |
| :---: | :---: |
| "Parameter" | Parameter for the recorded value <br> The "Input Assistant" dialog lists all valid system parameters in the "Parameters" category of the "Categories" tab. |
| - | Click the symbol to toggle between "Variable" and "Parameter". |
| "Recording condition" | Condition under which the application records the data of these "Variables": <br> - IEC variable of type Int. The condition is fulfilled for TRUE. <br> - Bit access to an integer variable. The condition is fulfilled for 1 . <br> As read access to a property <br> The contents of a pointer are not permitted. <br> Note: If no condition is defined, then the recording starts automatically. |
| "Attached y axis" | Y -axis of the trend diagram that displays the "Variable". The list box provides the standard Y -axis and the configured Y -axes. <br> Requirement: This option is visible only when the "Trend" visualization element has configured additional Y-axes in the "Edit Display Settings" dialog. |
| "Display variable name" | The visualization shows the name of the IEC variable in the trend diagram at runtime. Either alone or in parentheses after the "Description" $\square$ The name of the IEC variable is shown and does not appear in parentheses after the "Description". <br> Requirement: If any text is typed in "Description", then you can disable the option. |
| "Description" | Text for the tooltip (example: Sensor A): When a visualization user focuses on the variable in the trend diagram, the visualization shows the text as a tooltip. The text is typed into the "GlobalTextList" object and can be localized there. <br> When the "Display Variable Name" property is activated, then the text is supplemented with the variable name in parentheses. Example: Sensor A (PLC_PRG.iSensor_A) <br> If "Description" does not contain any text, then "Display Variable Name" is enabled. The name is then alone without parentheses (for example, PLC_PRG.iSensor_A). <br> If a legend is assigned to the trend, then the trend variable is labeled in the legend and shown like the trend is configured here. |
| "Curve type" | - "Line" <br> - "Area": |
| "Graph color" | Color of the curve in the trend diagram |
| "Line type" | - "Line": Values are linked to form a line. <br> - "Step": Values are linked in the form of steps. <br> - "None": Values are not linked. <br> Requirement: The "Curve type" is "Line". |

| "Filling type" | - "No filling" <br> - "Plain color": <br> - "Gradient" <br> Requirement: The "Curve type" is "Area". |
| :---: | :---: |
| "Filling color" | The area is filled with the selected color. Requirement: The "Curve type" is "Area". |
| "Transparency" | Value (0 to 255) for defining the transparency of the selected color <br> Example 255: The color is opaque. 0 : The color is completely transparent <br> Requirement: The "Curve type" is "Area". |
| "Line width" | Value (in pixels) <br> Example: 1 |
| "Line style" | The display of the line is solid, dash, dot, dash-dot, or dash-dot-dot. |
| "Point type" | Display as scatter chart <br> - "Dot": Value as a dot. <br> - "Cross": Value as a cross. <br> - "None": No dot display <br> Hint: Select "None" for larger size data. |
| "Activate minimum warning" | $\square$ : Warning when below the lower limit. |
| "Critical lower limit" | If the variable value is below the limit, then the variables are displayed with the alert color in the trend diagram. |
| "Color" | Warning color on falling below the limit |
| "Activate maximum warning" | $\square$ : A warning is issued if the upper limit is exceeded. |
| "Critical upper limit" | If the variable value exceeds the limit, then the variables are displayed with the alert color in the trend diagram. |
| "Color" | Warning color on exceeding the limit |

## Object 'Unit Conversion'

Symbol 寇
A "Unit Conversion" object is used to define a conversion rule. The following table lists all defined conversion rules. You can edit a conversion rule in the input fields listed below the table.

Table of conver-
sion rules

| "Name" | <name> : <name> Impl is the name of the conversion rule. CODESYS automatically implements the entry as a function block <name> Impl and instances it as <name>. |
| :---: | :---: |
| "Type" | Type of conversion rule <br> - "Single scaling (offset)": adds an offset to the input variable. Result := Input + Offset <br> - "Single scaling (factor)": multiplies the input variable by a factor. Result := Input * Factor <br> - "Linear scaling 1 (factor and offset)": converts the input variable with a factor and offset. Result := Input * Factor + Offset <br> - "Linear scaling 2 (Base and target range)": converts the input variable for the output value to be within a target range. CODESYS calculates the functional linear equation internally. <br> - "User defined conversion": configures a user-defined conversion rule with IEC operators. The input variable is rValue. <br> - "Switchable conversion": defines a conversion rule that CODESYS executes independent of any specified language or variable. |
| "Setting" | Displays the configured conversion rule. |
| "Condition" | - "TRUE": CODESYS always executes the conversion. <br> - "Language" If the language in the visualization is the language defined here, then CODESYS executes the conversion. The current visualization language is located in the VisuElems. CurrentLanguage variable. <br> - "Variable": If the comparison is TRUE, then CODESYS executes the conversion rule. CODESYS can pass the comparison for a constant, variable, or IEC expression. <br> You can edit the comparison below the table in the "Condition Setting". |
| "Condition Setting" | If you select "TRUE" as the "Condition", then the field is hidden. <br> If you configure "Language" as the "Condition", then the field shows the current configuration, for example en, de. <br> If you select "Variable" as the "Condition", then the field shows the current configuration, for example PLC_PRG.bActual=PLC_PRG.bSet. <br> You can edit the current condition setting below the table in the input fields for "Condition Setting". |

Input field The input variable is added with an offset. 'Single scaling (offset)'

| "Offset" | $\bullet$ <br> $\bullet$ <br>  <br> $\bullet$ <br> as a a n IEC variable |
| :--- | :--- |

[^40]| "Factor" | $\bullet \quad$ as a number, including REAL |
| :--- | :--- |
|  | $\bullet \quad$ as an IEC variable |

Input field 'Li- The input variable is converted with the linear equation defined below. near scaling 1 (factor and offset)'

| "Factor" | $\bullet$ <br>  <br> $\bullet$ <br> •as a number, including REAL <br> "Offset"$\|$$\bullet$ as a number, including REAL <br>  <br> $\bullet$ <br> as an IEC variable |
| :--- | :--- |

Input field 'Li- The input variable is converted to be within a target range. CODESYS internally creates a linear near scaling 2 equation from the following input values.
(Base and target range)'

| "Base start value" | Lowest possible value for the input variable. <br> - as a number, including REAL <br> - as an IEC variable |
| :---: | :---: |
| "Base end value" | Highest possible value for the input variable. <br> - as a number, including REAL <br> - as an IEC variable |
| "Target start value" | Lowest possible value for the output variable. <br> - as a number, including REAL <br> - as an IEC variable |
| "Target end value" | Highest possible value for the output variable. <br> - as a number, including REAL <br> - as an IEC variable |

Example Conversion of electric current from a 10-bit input signal to an amperage range of 4-20 mA

| "Base start value" | 0 |
| :--- | :--- |
| "Base end value" | 1024 |
| "Target start value" | 4.0 |
| "Target end value" | 20.0 |

Input field 'User defined conversion'

| "Convert :=" | Conversion rule as mathematical function of $r$ Value The input variable is <br> rValue. |
| :--- | :--- |
| "Reverse :=" | Reverse function of the function defined in "Convert" |

Input field Use this conversion rule when you want to apply a conversion that is language-specific or 'Switchable con- variable-dependent. version'

| "Switchable conversion name" | Selected from a list of predefined conversion rules. Double-click directly into the <br> field for editing. |
| :--- | :--- |
| "Condition setting""" | Configured condition. Click into the input fields in "Condition setting" to edit the <br> condition. |

Example The Conv_A_LanguageDependent conversion rule that defines which conversion rule is executed for the English or German language.

| "Name" | "Type" | "Setting" | "Condition" | "Condition <br> setting" |

### 6.4.1.21.3 Menu Commands

## Genera

By default the most important commands are already provided in the CODESYS user interface. If you want to customize the menu configuration individually, choose command "Tools $\rightarrow$ Customize $\rightarrow$ Menu".

When you have installed any packages or add-ons, additional menus and commands might be available.

## Menu 'File'

6.4.1.21.3.2.1 Command 'New Project' ..... 2552
6.4.1.21.3.2.2 Command 'Open Project' ..... 2553
6.4.1.21.3.2.3 Command 'Close Project' ..... 2554
6.4.1.21.3.2.4 Command 'Save project'. ..... 2554
6.4.1.21.3.2.5 Command 'Save Project as'. ..... 2555
6.4.1.21.3.2.6 Command 'Save Project and Install into Library Repository'. ..... 2556
6.4.1.21.3.2.7 Command 'Save Project as Compiled Library'.. ..... 2556
6.4.1.21.3.2.8 Command 'Save/Send Archive' ..... 2557
6.4.1.21.3.2.9 Command 'Extract Archive'. ..... 2558
6.4.1.21.3.2.10 Command 'Source Upload', ..... 2559
6.4.1.21.3.2.11 Command 'Source Download'. ..... 2560
6.4.1.21.3.2.12 Command 'Print' ..... 2560
6.4.1.21.3.2.13 Command 'Print Preview'. ..... 2560
6.4.1.21.3.2.14 Command 'Page Setup'. ..... 2560
6.4.1.21.3.2.15 Command 'Recent Projects' ..... 2561
6.4.1.21.3.2.16 Command 'Exit'. ..... 2561

## Command 'New Project'

Symbol: 徨, Shortcut: [Ctrl] + [N]
Function: This command opens the "New Project" dialog box for the creation of a new project file.
Call: "File" menu
'New Project' Function: Selection of a project category and a project template. dialog box

## Call: "File $\rightarrow$ New Project"

Depending on the template, you obtain a project that is automatically equipped with a certain range of objects.

Table 465: "Categories"

| "Libraries" |  |
| :--- | :--- |
| "Projects" |  |

Table 466: "Templates"

| "Projects" category:: |  |
| :--- | :--- |
| "Empty project" | Contains only the "Project Settings" object |
| "Standard project" | Contains a basic range of objects and libraries. A wizard assists with the creation <br> -see below. |
| "Standard project with |  |
| Application Composer" | Contains a basic range of objects and libraries for working with the Application <br> Composer. A wizard assists with the creation. |
| "Libraries" category: |  |
| "CODESYS container library" | Library that contains only further libraries, but no function blocks of its own. |
| "CODESYS interface library" | Library only for the definition of the interface of a software component. Thus <br> contains only objects that do not generate any code (constants, structures, inter- <br> faces, etc.). |
| "Empty library" | Contains only the "Project Settings" object |

| "External CODESYS library" | Target-system-specific library which is implemented as part of the runtime <br> system (in ANSI C or C++). |
| :--- | :--- |
| "Name" | Name of the project to be created. Depending on the template, a standard name <br> appears. The numerical suffix ensures the uniqueness of the name in the file <br> system. <br> You can change the file name, taking into consideration the file path conventions <br> of the operating system. Periods are not permitted in names. <br> CODESYS automatically adds the appropriate file extension to the selected <br> template. |
| "Location" | Location for the new project file. <br> ". opens a dialog box for browsing the file system. <br> - displays the history of previously entered paths |
| "OK" | CODESYS opens a new project. An error symbol $\mathbf{e}$ next to the input field draws <br> attention to missing specifications. If you place the mouse pointer on it, a tooltip <br> appears, informing you what to do. |

"Standard
Project" dialog
box

Function: Wizard for the creation of a standard project.
Project" dialog box

Call: Command "File $\rightarrow$ New Project"; in the "New Project" dialog box, select the "Projects" category and the "Standard project" template and click on "OK".

| "Device" | Selection list with PLC devices. The selected device is inserted as an object in <br> the Devices view below the root node |
| :--- | :--- |
| "PLC_PRG in" | Selection list with the programming languages. The automatically inserted pro- <br> gram PLC_PRG is created in the selected language. |

## Command 'Open Project'

Symbol: ※̋; shortcut: [Ctrl]+[O]
Function: The command opens the default dialog for loading a project. You can search for a CODESYS project in the file system and open it in the development system.
Call: Menu bar: "File"

## Dialog 'Open <br> Project'

| "File type" | Type of the CODESYS project to be loaded to the development system |
| :--- | :--- |
| "All supported files" | Filters by all projects which CODESYS can load <br> Hint: For example, you can select pro projects which have been created with <br> CoDeSys V2.3. These kinds of projects are also converted. |
| File extension project | Filters by projects which have been created with CODESYS V3 |
| File extension <br> projectarchive | Filters by project archives which have been created with CODESYS V3 |

| File extension library | Filters by library projects which have been created with CODESYS V3 |
| :--- | :--- |
| "Open" | Loads the project you selected to CODESYS <br> Note: Depending on the state of your CODESYS installation, it may be neces- <br> sary to update or supplement the installation. If this is the case, then first open <br> another "Open Project" dialog with options for installation management. |

- „y Chapter 6.4.1.3.3 "Opening a V2.3 project" on page 1809

## Command 'Close Project'

Function: This command closes the currently opened project. CODESYS remains opened.
Call: "File" menu. In addition implicitly when opening a new/other project, while another project is still open.
If the project contains unsaved changes, a query appears, asking whether the project should be saved.
If you have not yet explicitly saved the project, a query appears asking whether you wish to delete the project files.

## Command 'Save project'

Symbol: ${ }^{[ }$, shortcut [Ctrl] + [S]
Function: this command saves the project file.
Call: "File" menu
This command saves the project file with the current project name, which appears in the title bar of the main window. If the project has been changed since it was last saved, the project name is given an asterisk.

The command is not available if the project is read-only.
Write protection exists if

- the project is identified in the project information (summary) as 'Released'
- the option "Open read-only" was selected in the dialog box "Open Project" when opening the project
Write protection is indicated by a line in the top right corner of the main window. A mouse-click on this line brings up a menu with commands for the possible actions:
- "Save project under a different file name on the disk": a mouse-click on this option leads to 'Save file as...'
- "Exit read-only mode": appears only if the option "Open read-only" was selected when opening the project.
- "Remove read-only attribute from the project on the disk": appears only if the project file had been provided with the property 'Read-only' on the disk at the time of opening.
- "Remove identification 'Released' in the project information": appears only if this attribute is currently set.

## Backup copy

Optionally a backup copy of the project file can be created. If the option "Create backup copy" is activated in the option dialog box 'Load and Save', the project is additionally copied to a file <projectname.backup> each time the project is saved.

## See also

- « Chapter 6.4.1.21.3.2.5 "Command 'Save Project as"' on page 2555
- \& Chapter 6.4.1.6.9 "Saving the Project" on page 1831
- \& Chapter 6.4.1.21.4.14.17 "Dialog 'Options' - 'Load and Save"' on page 2791

## Command 'Save Project as'

This command opens the standard Windows dialog box for saving a file. The project can be stored with the desired location and file type.

| "File type" | For both normal projects and library projects, this drop-down list contains the respective versions of the development system for which the project can be saved. If the current project contains add-ons that are not available in the selected memory format (profile), then the "Extend Profile" dialog box opens. <br> - "Project files (CODESYS v<version>) (*.project)": The project is saved as a CODESYS project file "<project name>.project " for the currently used or selected version of the development system. <br> - "Library files (CODESYS v<version>) (*.library)": The project is saved as a CODESYS library file "<project name>.library" for the currently used or selected version of the development system. <br> If the project should be opened later in an older version, then it makes sense to save for precisely this version, as you will then be informed immediately about possible data loss. |
| :---: | :---: |

Before saving a project as a library:

- Make sure that the rules for creating libraries have been followed.
- If it is to be possible to configure global constants provided by the library at a later time in an application, then you must define them in a parameter list. A parameter list is a special type of global variable list.
- When saving the project, no automatic check for errors is performed.
- Unlike CoDeSys V2.3, there is no distinction between 'external' and 'internal' libraries. Now you can define in the properties of each individual project object whether or not it should be treated as 'external'.
- Consider whether the library created is to be installed in the system library repository immediately. If so, then use the command 'Save project and install in the library repository'.
- If you want to protect the library project from later changes, then set the "Released" attribute in the "Project Information" dialog box. At the next attempt to save the project, a corresponding message will be displayed and the user must respond to the write protection with deliberate actions.
- If you save the project as a version of the development system other than the one currently in use, then you will be informed first about possible data loss.

Dialog box 'Extend Profile'

In this dialog box, the selected profile (memory format) can be extended by the add-ons that are contained in the current project. The profile is saved temporarily and then deleted after being saved or exported.

| "Add to profile" | Ø: The current profile is extended by the add-on so that the add-on data of the <br> current project is also saved. |
| :--- | :--- |
| "Add-on" | The add-on of the current project that is not contained in the selected memory <br> format. |
| "Version" | Version of the "Add-on" included in the current profile. <br> If several versions are installed, then the version can be selected. |

| "Save profile" | Opens the "Enter Profile Name" dialog box. In this dialog box, specify the name <br> for the new profile. The new profile is saved permanently at \$ProgramData\$/ <br> \$PRODUCT\$/CustomInformationalProfiles. |
| :--- | :--- |
| "Use saved profile" | The profile which was permanently saved in "Save profile" is used for saving or <br> exporting the current project. |

## Command 'Save Project and Install into Library Repository'

Function: this command saves the project as a library in the 'system' library repository.
Call: Main menu "File".
With this command CODESYS saves the project as a library in the 'system' library repository. This is an extension to the saving of a project as a library file using the "Save Project as" command. The library is installed on the local system and is immediately available for insertion into a project.
See also

- ${ }^{\circ}>$ Chapter 6.4.1.21.3.2.5 "Command 'Save Project as'" on page 2555

## Command 'Save Project as Compiled Library'

Function: The command saves a library project in encrypted form.
Call: Menu bar: "File"
The command opens the default dialog for saving a file in the file system. The "Compiled CODESYS Libraries" file type is already preset. The file extension is . compiled-library-v3 or . compiled-library (CODESYS < SP15). In this format, then source code of the library POU is not visible when the library is used in a project.

If the "Enforce signing of compiled libraries" option is selected in the "Security Screen" view on the "User" tab, then a library project has to be provided with a digital certificate-based signature when being saved. When a suitable certificate is available, it is provided in the "Security Screen" on the "User" tab in the "Digital Signature" section. In the "Project Information", on the "Summary" tab, a "Library compatibility" with a CODESYS version >= V3 SP15 is set by default. In this case, the project file is stored with the file extension . compiled-library-v3 when being saved as a compiled and signed library. If you still have not specified a suitable valid certificate for your user profile in the "Security Screen", then a dialog prompt opens next for you to do this. Afterwards, you can execute the save command again.

In all other respects, compiled library files behave just like *.library files, and therefore they can be installed and referenced with the same steps.
We recommend the use of compiled libraries signed with certificates. Besides the protection of the source code and the unauthorized use of a library, less memory is also used which therefore results in shorter loading times.

If you have the corresponding help files with translations, then as of CODESYS V3 SP15 you can extend the library documentation with the translation into other languages. This is done as follows:
Place the files created for the new languages __lmd_<language>. aux in a directory <library name>. Imd parallel to the library project <library name>. compiled-library-v3. If the files are correct, then they are included in the compiled library file when saving the library project by means of the "Save Project as Compiled Library" command.

Example: The directory standard. Imd is exists parallel to the library file standard. compiled-library-v3 and contains the file__lmd_fr.aux with the French translation of the library documentation. After the compiled library is saved, the French version of the documentation is also available in the Library Manager.

## Command 'Save/Send Archive'

Function: This command opens the dialog "Project Archive" for the configuration of project archives.

## Call: Menu bar: "File $\rightarrow$ Project Archive"

An archive file (*.projectarchive) contains all files contained and referenced in the currently opened project. It can either be saved or dispatched as an e-mail attachment. The dispatch by email is very helpful for providing an employee with all project-relevant files. The file can be simply unpacked again with the command "Extract Archive".

## NOTICE!

The archiving function is not intended for the storage of a project, but rather for the simple summarizing of all project-relevant files.

See also

- $\boldsymbol{y y}^{4}$ Chapter 6.4.1.6.10 "Saving/Sending the project archive" on page 1832
- $\sum^{*}$ Chapter 6.4.1.21.3.2.9 "Command 'Extract Archive"' on page 2558

Dialog 'Project The dialog displays all the categories that can be added to the project archive. In this dialog, Archive' complete categories or individual objects from the categories can be added to the project archive by setting a check mark ( $\square$ ).

Entries that are display as red in the list require your attention. Move the mouse pointer over this library for more information.

| "Additional Files" | Opens the dialog "Additional Files". Here, further files can be added to the <br> archive with the "Add" button. |
| :--- | :--- |
| "Comment" | Opens the "Comment" dialog. Here, comments can be added to the archive. |
| "Save" | Creates the archive file and saves it. The storage location and the archive name <br> are specified in the subsequent dialog |
| "Send" | Creates a temporary archive file that is attached to an empty e-mail. A cor- <br> rect installation of the MAPI (Messaging Application Programming Interface) is <br> required for the successful execution of this operation. Failure is documented <br> by the display of a corresponding error message. The temporary archive is <br> automatically deleted after sending the e-mail. |

## Command 'Extract Archive'

Function: The command extracts a project archive, that was created with the command "Save/ Send Archive". You have to configure which objects of the archive CODESYS shall extract and in which directory of the file system they will be copied.

Call: Main menu "File $\rightarrow$ Project Archive"
The file extension of an archive is . projectarchive.
After the archive is selected, the dialog "Extract Project Archive" opens to configure the extract parameters.

Dialog Box 'Ex- This dialog box shows the contents of the project archive. You can exclude complete categories tract Project or single objects from categories by clearing the check boxes ( $\boxed{\square}$ ) from the extraction.
Archive'

Table 467: "Locations"

| "Extract into the same folder <br> where the archive is located" | The archive is extracted to the same directory. |
| :--- | :--- |
| "Extract into the following <br> folder" | The contents of the archive are extracted to the given path. |
| "Advanced" | Opens the "Advanced" dialog box for you to define where special and additional <br> files from the archive are extracted. |

Table 468: "Contents"

| "Items" | Shows the contents of the archive structured in object categories. <br> $\square:$ The object is extracted. <br> $\square$ |
| :--- | :--- |
| "Come object is not extracted. |  |

| "Extract" | If an extracted file has the same name as an existing file in the target directory, <br> then a dialog box opens, prompting whether the local file should be replaced. <br> The decision can be applied automatically to any additional conflicting names. In <br> this case, you have to select the $\square$ "Apply to all objects and files" check box. |
| :--- | :--- |

## Dialog 'Advan- <br> ced'

Table 469: "Repositories"

| "Install devices into" | Drop-down list with currently available repositories. Select the repositories, in <br> which CODESYS shall install the devices and the libraries of the archive. |
| :--- | :--- |
| "Install libraries into" |  |

Table 470: "Additional Files"

| By default the "additional files" are set to "Do not extract". Select the entries in the table and chose one of the <br> following options: |  |
| :--- | :--- |
| "Extract into project folder" | Folder of the project file |
| "Extract into folder" | User defined folder |
| "Do not extract" | Default |

## Command 'Source Upload'

Function: This command loads the project source code (as project archive) from the controller.
Call: Main menu "File".
Requirement: The network path for the controller must be configured.
After you execute the command, an overview opens with all devices in the network. Select a controller from this overview. The dialog box "Extract Project Archive" then opens with export settings.
See also

- ${ }^{4}$ Chapter 6.4.1.21.3.2.11 "Command 'Source Download'" on page 2560

Dialog Box 'Ex- This dialog box shows the contents of the project archive. You can exclude complete categories tract Project or single objects from categories by clearing the check boxes ( $\square$ ) from the extraction. Archive'

Table 471: "Locations"

| "Extract into the same folder <br> where the archive is located" | The archive is extracted to the same directory. |
| :--- | :--- |
| "Extract into the following <br> folder" | The contents of the archive are extracted to the given path. |
| "Advanced" | Opens the "Advanced" dialog box for you to define where special and additional <br> files from the archive are extracted. |

Table 472: "Contents"

| "Items" | Shows the contents of the archive structured in object categories. <br> $\square:$ The object is extracted. |
| :--- | :--- |
|  | $\square:$ The object is not extracted. |

| "Extract" | If an extracted file has the same name as an existing file in the target directory, <br> then a dialog box opens, prompting whether the local file should be replaced. <br> The decision can be applied automatically to any additional conflicting names. In <br> this case, you have to select the <br> $\square$ |
| :--- | :--- |
| "Apply to all objects and files" check box. |  |

## Command 'Source Download'

Function: This command loads the project source code (as project archive) to the controller.
Call: Main menu "File".
Requirement: The network path for the controller must be configured.
After you execute the command, an overview opens with all devices in the network. Select a controller from this overview. Then the Archiv.prj project archive is downloaded to this controller. You can click "Source Upload" to upload the complete source code to the CODESYS development system at a later time.
If you are already connected to a controller (in online mode), then the "Source Download to Connected Device" command is also available for this process.

## Standard Commands

CODESYS provides the following standard commands:
－Undo：$\curvearrowleft$ ，shortcut：［Ctrl］＋［Z］
－Redo：$c »$ ，shortcut：［Ctrl］＋［Y］

- Cut：品，shortcut：［Ctrl］＋［X］
- Copy：踃，shortcut：［Ctrl］＋［C］
- Paste：賭，shortcut：［Ctrl］＋［V］
－Delete：$\times$ ，shortcut：［Ctrl］
－Select all：shortcut：［Ctrl］＋［Ctrl］
Not all editors support the＂Insert＂command．In some editors it can be used with limitations． Graphical editors only support the command if the pasted elements will create a valid construct．

In object trees like POUs or device view the command refers to the currently selected object． Multi selection is possible．

## Command＇Find＇，＇Find in Project＇

Symbol 略，keyboard shortcut［Ctrl］＋［Shift］＋［F］
Function：These commands scan the project or parts of it for a specified character string．
Call：Menu bar：＂Edit $\rightarrow$ Find Replace＂
This command opens the＂Find＂dialog where the searched character string is specified and the search options are defined．

Dialog＇Find＇

| ＂Search for＂ | Character string to be searched． |
| :---: | :---: |
| ＂Match case＂： | $\square$ ：The search considers uppercase and lowercase． |
| ＂Match whole word＂： | V：Only character strings are found that exact matches． |
| ＂Search up＂： | The specified search range runs upwards． <br> ］：The specified search range runs downwards． |
| ＂Use regular expressions＂： | Use the $\geqslant$ button to receive support when specifying regular expressions． |
| ＂Search in＂ | $\checkmark$ ：Drop－down list with the areas of the project to be searched： <br> －＂Active editor＂ <br> －＂All open editors＂ <br> －＂Selected objects \＆Subobjects＂ <br> －＂Entire project＂ <br> －＂Entire project \＆Uncompiled libraries＂ <br> －＂Selection only＂ <br> ．．．．：Opens a dialog where you set the areas of the project to be searched（see below） |
| ＂Find next＂ | Start the search |
| ＂Find all＂ | All search results are listed in the message view with their object path，project name，object name，and object position．Possible additional information for posi－ tion：＂（Decl）＂＝Declaration part of the object；＂$(\mathrm{mpl})$＂＝Implementation part of the object <br> Double－clicking the entry in the list opens the match position in the respective object editor． |
| ＂Replace＂ | Switches to the＂Replace＂dialog |

## Dialog for setting the objects to be searched

| "Entire project" | All editable positions in all objects of the project are searched. |
| :---: | :---: |
| "Entire project and all uncompiled libraries" | All editable positions in all objects of the project, including integrated uncompiled libraries, are searched. |
| "Within the following objects" | Only the editable positions within the objects defined here are searched: |
|  | - "Scheme": The "Save" command saves the current search configuration by the specified name. All saved schemes are available in the drop-down list ( $\vee$ ). <br> - "Object types": $\checkmark$ : The object is searched. <br> - "Name filter": Name filter for the searched objects. The placeholder "*" can be used. <br> Example: Filter "*CAN*": All objects are searched that have "CAN" in the name. |
| "All open editors" | All editors are searched that are currently open in a window. |
| "Active editor" | Only the editor is searched where the cursor currently is. |
| "Selection only" | Only the text is searched that is currently selected in an object. |

## Command 'Replace', 'Replace in Project'

Symbol ${ }^{A}$ ? ; keyboard shortcut: $[\mathrm{Ctrl}]+[H]$
Symbol ${ }^{A}$, keyboard shortcut [Ctrl]+[Shift] $+[H]$
Function: These commands scan the project or parts of it for a specified character string and replaces it.
Call: Menu bar: "Edit $\rightarrow$ Find Replace"
Requirement: The application is in online mode.
This command opens the "Replace" dialog where the search and replace character strings are specified and the search options are defined.

Table 473: In addition to the options of the "Search" dialog, the following settings are still possible:

| "Replace with" | Input field for the new character string. |
| :--- | :--- |
| "Replace" | Each next found string is highlighted in the editor and replaced (step-by-step <br> replace). |

| "Replace all" | All found strings are replaced at one time without them being displayed in the <br> editors. |
| :--- | :--- |
| "Leave changed objects open <br> after "Replace all"" | The editors of the found objects remain open. |

Replacement in referenced libraries is not possible.

## Command 'Find Next'

Symbol ${\underset{n}{n}, \text {, keyboard shortcut [F3] }}^{2}$
Function: During the search for a certain string within the project, this command selects the next match at its position in the respective editor.
Call: Menu "Edit $\rightarrow$ Search Replace"
Requirement: You have already started searching the project for a certain string by using the commands "Find" or "Replace".

See also

- $\sum^{\wedge}$ Chapter 6.4.1.21.3.3.2 "Command 'Find', 'Find in Project"" on page 2563

- $\Longleftrightarrow$ Chapter 6.4.1.9.15 "Searching and replacing in the entire project" on page 1910

## Command 'Find Next (Selection)'

Keyboard shortcut [Ctrl] + [F3]
Function: The command searches the project for the next string matching the string which is currently selected or in which you have currently placed the cursor.
Call: Menu "Edit $\rightarrow$ Find Replace"
Requirement: You have the cursor placed in an editable string in your project, or you have selected an editable string.
See also

- ${ }^{*}$ Chapter 6.4.1.21.3.3.2 "Command 'Find', 'Find in Project"" on page 2563

- ${ }^{*}$ Chapter 6.4.1.9.15 "Searching and replacing in the entire project" on page 1910

## Command 'Find Previous (Selection)'

Keyboard shortcut [Ctrl] + [Shift] + [F3]
Function:The command searches the project for the previous string matching the string which is currently selected or in which you have currently placed the cursor.

## Call: Menu "Edit $\rightarrow$ Find Replace"

Requirement: You have the cursor placed in an editable string in your project, or you have selected an editable string.
See also

## Command 'Insert File as Text'

Function: This command copies the contents of a text file to the active editor as the current cursor position.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from "Tools $\rightarrow$ Customize" (command category "Text Editor").

Requirement: The file must have the extension .txt. The command is available in a text editor only.
Many development environments and text processing applications provide the option of exporting code and text as a plain text file. This command can copy the contents of this file to the editor.
See also

- $\quad \Leftrightarrow$ Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor"' on page 2798

## Command 'Overwrite Mode'

Shortcut: [Insert]
Function: This command activates the overwrite mode.
Call: Menu "Edit $\rightarrow$ Advanced"
Requirement: A text editor is opened.
If the overwrite mode is activated, characters in front of the cursor are overwritten when entering new characters. If the overwrite mode is deactivated, characters are inserted and existing characters in front of the cursor are retained.

See also

- 出 Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor'" on page 2798

## Command 'View Whitespace'

Symbol: a.b

Function: This command causes control characters for spaces and tabs to be shown.
Call: Menu "Edit $\rightarrow$ Advanced"
Requirement: A text editor is opened.
CODESYS visualizes spaces by a period and tabs by an arrow.
See also

- ⓨ Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor"' on page 2798

## Command 'View Indentation Guides'

Function: This command activates the indentation help lines.
Call: Menu "Edit $\rightarrow$ Extended"
Requirement: A text editor is opened.
If the indentation help lines are activated, a broken line is inserted for each manual indentation in the code. This facilitates the overview of the different levels in the code. You can insert manual indentations with the [Tab] key.
See also

- ② Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor'" on page 2798

## Command 'Go to Line'

Function: With this command the cursor jumps to a defined line in the code.
Call: Menu "Edit $\rightarrow$ Extended"
Requirement: A text editor is opened.
This command opens a dialog box with an input field "Line number".
See also

- $\sum^{\circledR}$ Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor'" on page 2798

## Command 'Make Uppercase'

Shortcut: [Ctrl]+[Shift]+[U]
Function: This command converts all lowercase letters in the selected code into uppercase letters.
Call: Menu "Edit $\rightarrow$ Advanced"
Requirement: A text editor is opened and code is selected, or the declaration editor is opened and variable declarations are selected.

See also

- ${ }^{〔}$, Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor'" on page 2798

## Command 'Make Lowercase'

Shortcut: [Ctrl]+[U]
Function: This command converts all uppercase letters in the selected code into lowercase letters.
Call: Menu "Edit $\rightarrow$ Advanced"

Requirement: a text editor is opened and code is selected, or the declaration editor is opened and variable declarations are selected.
See also

- $\quad \Leftrightarrow$ Chapter 6.4.1.21.4.14.26 "Dialog 'Options' - 'Text Editor"' on page 2798

## Command 'Go to Matching Bracket'

Function: This command makes the cursor jump to the other part of the selected code parenthesis.
Call: Menu "Edit $\rightarrow$ Advanced"
Requirement: A text editor is opened and the cursor is positioned at an opening or closing code parenthesis. If you position the cursor at a code parenthesis, CODESYS displays the corresponding parenthesis in color, provided you have activated the option "Associated parentheses" in the CODESYS options in the "Text Editor" category, "Text Area" tab.
See also

- \& "Tab 'Text Area'" on page 2799

## Command 'Select to Matching Bracket'

Function: This command selects the entire code section within the currently selected code parentheses.

Call: Menu "Edit $\rightarrow$ Extended"
Requirement: A text editor is opened and the cursor is positioned at an opening or closing code parenthesis. If you position the cursor at a code parenthesis, CODESYS displays the corresponding parenthesis in color, provided you have activated the option "Associated parentheses" in the project options in the "Text Editor" category, "Text Area" tab.

- ㄹy "Right-click commands in the cross-reference list" on page 2589

## Command 'Collapse All Folds'

Function: This command collapses all expanded code segments in the textual editor or result locations in the cross-reference list. In this way, only the uppermost level of code and only the root node of the result locations displayed.

Requirement: A textual editor is active and indentation is activated in the "Options" ("Text Editor" category); or the cross-reference list is active.
Call: In textual editors: main menu "Edit $\rightarrow$ Advanced", or right-click. In the cross-reference list: right-click.

- ㄹy "Right-click commands in the cross-reference list" on page 2589

## Command 'Comment Out Selected Lines'

Symbol //c; keyboard shortcut: [Ctrl]+[O]
Function: The command inserts comment marks ('//') at the beginning of the selected lines.
Call: Menu bar: "Edit $\rightarrow$ Advanced"; context menu
Requirement: In the ST editor, either the cursor is located in a line of the implementation or multiple lines are selected.

See also

- ${ }^{\wedge}$ Chapter 6.4.1.21.3.3.20 "Command 'Uncomment Selected Lines'" on page 2569

## Command 'Uncomment Selected Lines'

Symbol //c; keyboard shortcut: [Ctrl]+[I]
Function: The command removes any comment marks ('//') at the beginning of the selected lines.
Call: Menu bar: "Edit $\rightarrow$ Advanced"; context menu
Requirement: In the ST editor, either the cursor is located in a line of the implementation or multiple lines are selected.

See also

- $\quad$ \& Chapter 6.4.1.21.3.3.19 "Command 'Comment Out Selected Lines'" on page 2569

## Command 'Enable Inline Monitoring'

Function: This command enables or disables the inline monitoring function. This works the same way as the check box with the same name in the CODESYS options ("Text Editor" category).
Requirement: A text editor is active.
Call: Context menu of the text editor in the "Advanced" submenu.
See also

- « "Tab 'Monitoring'" on page 2800

## Command 'Toggle Bookmark'

Symbol ח, keyboard shortcut [Ctrl]+[F12]
Function: The command sets or removes a bookmark at the current position.
Call: Menu bar: "Edit $\rightarrow$ Bookmarks"

Requirement: A POU is open in the editor and the cursor is at a program line.
See also

- $\xi^{4}$ Chapter 6.4.1.9.14.3 "Setting and using bookmarks" on page 1908

## Command 'Next Bookmark (Active Editor)'

Symbol: 께; keyboard shortcut: [F12]
Function: The command jumps to the next bookmark in the active editor.
Call: Menu bar: "Edit $\rightarrow$ Bookmarks"
Requirement: A POU is open in the editor and the cursor is positioned in the POU.
See also

- $\Rightarrow$ Chapter 6.4.1.21.3.3.24 "Command 'Next Bookmark'" on page 2570
- ${ }^{\text {• }} \boldsymbol{y}$ Chapter 6.4.1.9.14.3 "Setting and using bookmarks" on page 1908

## Command 'Next Bookmark'

## Symbol: \#\#

Function: The command jumps to the next bookmark in the "Bookmarks" view and in the project, and opens the respective POU. The order of jumping to bookmarks corresponds to the order of bookmarks in the table of the "Bookmarks" view.
Call:

- $\rightarrow$ "Next Bookmark" button in the "Bookmarks" view
- The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools $\rightarrow$ Customize" (command category "Bookmarks").

## Requirement:

- A project is open.
- The "Bookmarks" view is open.

See also

- ${ }^{\wedge}$ Chapter 6.4.1.21.3.3.23 "Command 'Next Bookmark (Active Editor)"' on page 2570

## Command 'Previous Bookmark (Active Editor)'

Symbol: *; keyboard shortcut: [Shift]+[F12]
Function: The command jumps to the previous bookmark in the active editor.
Call: Menu bar: "Edit $\rightarrow$ Bookmarks"
A POU is open in the editor and the cursor is positioned in the POU.
See also

- ${ }^{*}$ Chapter 6.4.1.21.3.3.26 "Command 'Previous Bookmark'" on page 2570
- \#y Chapter 6.4.1.9.14.3 "Setting and using bookmarks" on page 1908

## Command 'Previous Bookmark'

Symbol: *t
Function: The command jumps to the previous bookmark in the "Bookmarks" view and in the project, and opens the respective POU. The order of jumping to bookmarks corresponds to the order of bookmarks in the table of the "Bookmarks" view.

## Call：

－$\Rightarrow$＂Next Bookmark＂button in the＂Bookmarks＂view
－The command is not in any menu by default．You can add it to a menu by using the dialog from＂Tools $\rightarrow$ Customize＂（command category＂Bookmarks＂）．
Requirement：
－A project is open．
－The＂Bookmarks＂view is open．
See also

## Command＇Browse Cross References＇

Symbol：
Function：The command shows all occurrences of a variable in the＂Cross Reference List＂view．
Call：Menu bar：＂Edit $\rightarrow$ Browse＂；cross reference view：toolbar
Requirement：A POU is open in the editor and the cursor is set at a variable．Or the＂Cross Reference List＂view is open and a variable is specified in the＂Name＂field．
See also
－${ }^{\circledR}$ ，Chapter 6．4．1．21．3．3．30＂Command＇Browse Global Cross References＇＂on page 2571

## Command＇Browse Global Cross References＇

Symbol：

Function: The command shows all occurrences of all variables with the same name in the "Cross Reference List" view. In contrast to the "Browse Cross References" command, these can be different variables.
Call: Menu bar: "Edit $\rightarrow$ Browse"; cross reference view: toolbar
Requirement: A POU is open in the editor and the cursor is set at a variable. Or the "Cross Reference List" view is open and a variable is specified in the "Name" field.

See also

- ${ }^{*}>$ Chapter 6.4.1.9.14.1 "Using the cross-reference list to find occurrences" on page 1906
- $\quad>$ Chapter 6.4.1.21.3.3.29 "Command 'Browse Cross References'" on page 2571

## Command 'Browse Call Tree'

## Symbol: $=$

Function: The command opens the view "Call Tree", which displays the calls of a module and also its callers.

## Call:

- Menu "Edit $\rightarrow$ Browse"
- Context menu, see below: Requirement

Requirement: A module is opened in the editor and the cursor is placed in a variable, or a module is selected in the "Devices" view or in the "POUs" view.
See also

- $\Leftrightarrow$ Chapter 6.4.1.21.3.4.16 "Command 'Call tree"" on page 2590

## Command 'Auto Declare'

Keyboard shortcut: [Shift]+[F2]
Function: The command opens the "Auto Declare" dialog, which supports the declaration of a variable.

Call: Menu bar: "Edit"
Requirement: An object or a device of the project is opened in the editor.
With the auto-declaration function, the "Auto Declare" dialog also appears when the cursor is located in the implementation part of a POU in a line containing the name of an undeclared variable. The requirement for this is that you must have clicked "Tools $\rightarrow$ Options" and enabled the "Declare unknown variables automatically (AutoDeclare)" option in the "SmartCoding" category.
With the smart tag function, the "Auto Declare" command also appears when you place the cursor over an undeclared variable in the implementation part of the ST editor and then click $\quad$.

Dialog 'Auto
Declare'

| "Scope" | Scope of the variable that is not declared yet. <br> Example: VAR (default setting for local variables) |
| :--- | :--- |
| "Name" | Variable name not declared yet <br> Example: bIsValid |

| "Type" | Example: BOOL <br> - $\quad$ : Lists the standard data types. $\square$ <br> - "Input Assistant": Opens the "Input Assistant" dialog <br> - "Array Assistant": Opens the "Array" dialog |
| :---: | :---: |
| "Object" | Object where the new variable is declared. By default, the object that you are editing now. <br> Example: fbA <br> : Lists that objects where the variable can be declared. <br> If no objects are available for the selected "Scope", the entry "<create object>" appears. When you select the "<create object>" entry, the "Add Object" dialog opens for generating a suitable object. |
| "Initialization" | Example: FALSE <br> If you do not specify an initialization value, then the variable is initialized automatically. <br> ...: Opens the "Initialization Value" dialog. This procedure is helpful for the initialization of structured variables. |
| "Address" | Memory address of the application for the variable that is not declared yet. <br> Example: \%IX1.0 <br> Note: <br> Possible only for the following scopes: <br> - Local variable (VAR) <br> - Global variable (VAR_GLOBAL) <br> - Or for a persistent variable (PERSISTENT). |
| "Flags" | Atribute keywords <br> - COnstant: Keyword for a constant. <br> - RETAIN: Keyword for a remanent variable. <br> - persistent: Keyword for a persistent variable (stricter than Retain). <br> The selected attribute keyword is added to the variable declaration. |
| "Comment" | Example: New input In1 <br> In the tabular declaration editor, the comment entered is displayed in the "Comment" column, while in the textual declaration editor it is displayed above the variable declaration. |
| "Apply changes using refactoring" | When you exit the dialog, the variable is not declared yet, but then it opens the "Refactoring" dialog. You can continue editing your changes here. <br> The option appears for the following scopes: <br> - Input variable (VAR_INPUT) <br> - Output variable (VAR_OUTPUT) <br> - VAR_IN_OUT variables (input variable and output variable) |
| "OK" | The variable is declared and appears in the declaration. Example: ```VAR RETAIN // New input In1 xIn1 AT %IX1.0: BOOL := FALSE; END VAR``` |

## Dialog 'Array'

| "Ranks and base type <br> specification" | Definition of the field sizes ("Dimension") by entering the lower and upper limits <br> and the "Base type" of the array. You can enter the basic type directly or with the <br> help of the "Input Assistant" or "Array" dialogs when you click the $>$ button. |
| :--- | :--- |
| "Result" | Display of the defined array |

## NOTICE! <br> CODESYS reinitializes variables only if you have modified the initialization values of the variables.

## Dialog 'Initializa-

tion Value'

| List of the variables with name ("Expression"), "Initialization Value" and "Data Type". <br> Modified initialization values are displayed in bold fonts. |  |
| :--- | :--- |
| Input field below the list | Input of an initialization value for the selected variable(s) |
| "Apply value to selected lines" | Change of the initialization value of the selected line(s) according to the value of <br> the input field |
| "Reset selected lines to default <br> values" | Resets the default initialization values |
| "OK" | CODESYS applies the initialization values in the "Auto Declare" dialog. |

In the case that the variable to be initialized by means of this dialog is a function block instance with an extended FB_Init method, an additional table is displayed above the "Initialization Value" table. The additional FB_Init parameters are listed in this table. The meaning and operation essentially correspond to the lower table with the following differences:

- All variables have to be assigned with initialization values. Otherwise "OK" remains disabled.
- For complex data types (structures, arrays), no components contained within are displayed (type cannot be expanded). In this case, the complex type has to be initialized with a corresponding variable.
For FB_Init parameters configure this way, a corresponding symbol is displayed after the initialization value in the "Auto Declare" dialog.

## Command 'Input Assistant'

Symbol: 주; keyboard shortcut: [F2]
Function: This command opens the "Input Assistant" dialog which helps you to select one of the possible programming elements at the current cursor position.

Call: Menu bar: "Edit"; context menu.
Requirement: A POU is open in the editor and the cursor is at a program line.

Dialog 'Input The input assistant provides all program elements that you can insert at the current cursor

Assistant' - Tab
'Categories'
position in the editor.
The elements are sorted by "Categories". In the category "Variables", you can also set a "Filter" for the scope, for example "Local variables", "Global variables", or "Constants".

| "Structured view" | The elements are displayed in a structure tree. You can show/hide the columns "Type", "Address", and "Origin" by right-clicking the column title and selecting/clearing the column name in the dropdown list. $\square$ : The elements are displayed in a flat structure. |
| :---: | :---: |
| "Show documentation" | $\checkmark$ : The dialog is extended with the "Documentation" field. |
| "Insert with arguments" | Elements that include arguments (for example, functions) also insert with these arguments at the cursor position. <br> Example: If you insert the function block fb1, which contains an input variable fb1_in and an output variable fb1_out, "with arguments", then this appears in the editor as follows: $f$ b1 ( $\mathrm{fb} 1 \mathrm{in}:=$, fb1 out=> ). |
| "Insert with namespace prefix" | Inserts the selected element with the appended namespace. In the case of library modules, the check box remains disabled if the requirement for a namespace has been defined in the library properties. |

If you create objects with the same name in the same category, whether globally ("POUs" view) or assigned to an application ("Devices" view), then only one entry appears in the input assistant. The usage conforms to the usual call priority (application assigned before global).

Dialog 'Input
Assistant' - Tab
'Text Search'

This tab allows you to search for specific objects. When you begin typing a search string into the search field, the names of all objects are listed whose names include the search string. Double-click an object to insert it at the current cursor position in the editor.

| "Filters" | Limits the search to a specific variable category |
| :--- | :--- |

## Command 'Go to Source Position'

Function: The command sets the cursor to the position in the source code that causes the message.
Call: Main menu "Edit", context menu of the message in the message view.
Requirements: A message is selected in the message view.
Use the command "Next Message" or "Previous Message" to display the source code position of the next or previous message.
See also

- $y^{\prime}>$ Chapter 6.4.1.21.3.3.35 "Command 'Next Message'" on page 2576

- $\Leftrightarrow$ Chapter 6.4.1.21.3.4.5 "Command 'Messages'" on page 2583

## Command 'Next Message'

Keyboard shortcut: [F4]
Function: This command selects the next message in the messages view.
Call: Main menu "Edit".
If the last message in the list has been reached, then the marking jumps to the beginning.
See also

- \# Chapter 6.4.1.21.3.3.36 "Command 'Previous Message"' on page 2576

## Command 'Previous Message'

Keyboard shortcut: [Shift] + [F4]
Function: This command selects the previous message in the messages view.
Call: Main menu "Edit"
If the first message in the list has been reached, then the marking jumps to the end.
See also

- © Chapter 6.4.1.21.3.3.35 "Command 'Next Message"' on page 2576

## Command 'Go to Definition'

Symbol: $\qquad$
Function: This command shows the definition locations of a variable or function.
Call: Main menu "Edit $\rightarrow$ Browse"
Requirement: A POU is open in the editor and the cursor is at a variable or function.
See also

- ※ Chapter 6.4.1.9.14.2 "Finding declarations" on page 1908

## Command 'Go To Reference'

Symbol:
Function: The command opens the declaration location of the variable that is referenced by the pointer currently in focus in online mode.
Call:

- Context menu in the declaration part or implementation code
- Menu bar: "Edit $\rightarrow$ Browse"

Requirement: Online mode. A POU is open in the editor and the cursor is at a pointer. The referenced variable is stored in static memory.

If the pointer does not point exactly to the beginning of the variable, then a corresponding message is displayed when you switch to the variable declaration.

See also

-     * Chapter 6.4.1.20.5.13 "Pointers" on page 2243

## Command 'Go to Instance'

Symbol: $\rightarrow$
Function: This command opens the instance of a function block in a new window.
Call: Menu bar: "Edit $\rightarrow$ Browse for Symbol"
Requirement: The application is in online mode. A POU is open in the editor and the cursor is at an instance of a function block.

The command is not available for temporary instances or instances from compiled libraries.
See also

- \& Chapter 6.4.1.9.14.2 "Finding declarations" on page 1908

## Command 'Refactoring' - 'Rename <...>'

Function: This command opens a dialog box for renaming an object or variable across the project.

Call: Main menu "Edit $\rightarrow$ Refactoring" or right-click.
Requirement: An object is selected in the device tree or in the "POUs" view, or the cursor is placed before or on a variable identifier in the declaration section of a programming object.

You can rename the following:

- Variables
- POUs
- GVLs
- Methods
- Properties
- Devices
- Variables and unit conversions in the unit conversion edit

Dialog box 'Re-
name'

| "Current name" | Name of the object or variable |
| :--- | :--- |
| "New name" | Input field for a new name. <br> If the name already exists, then CODESYS reports this directly below this input <br> field. |
| "OK" | Can be activated if you have typed a valid name in "New name". <br> Opens the "Refactoring" dialog box. |
|  | The affected objects and occurrences are highlighted in both views. <br> You can determine how to handle the occurrences in each view by right-clicking <br> the occurrences and clicking the available commands. |

## Dialog box 'Refactoring'

This dialog box displays all occurrences in the project.
The affected objects and occurrences are highlighted in both views.

| Right view | Displays the occurrence within an object where "Current name" occurs. |
| :--- | :--- |
| Left view | Device tree of the project with the object. |

You can determine how to handle the occurrences in each view by right-clicking the occurrences and clicking the available commands.

| "Reject this change" | Reject the single change in view on the right. |
| :--- | :--- |
| "Accept this object" | Accept all changes in the affected object. |
| "Reject this object" | Reject all changes in the affected object. |
| "Accept whole project" | Accept all changes in the project. |
| "Reject whole project" | Reject all changes in the project. |
| CODESYS highlights the accepted changes in yellow and the rejected changes in gray. |  |

## Command 'Refactoring' - 'Update Referenced Pins'

## NOTICE!

Currently, this command applies only to the CFC, FBD, LD, and IL editors. It is a combination of the "Reset Pins" and "Update Parameters" commands.

Function: This command modifies the pins according to the latest block declaration in all affected occurrences of the block.

Call: Main menu "Edit $\rightarrow$ Refactoring" or right-click.
Requirement: The cursor is placed in the name of the block in the first line of the block declaration or in the device tree.

See also

- $y^{*}$ Chapter 6.4.1.9.16 "Refactoring" on page 1910
- H Chapter 6.4.1.21.3.13.24 "Command 'Reset Pins'" on page 2694
- ${ }^{*}$, Chapter 6.4.1.21.3.14.38 "Command 'Update Parameters'" on page 2710

## Command 'Refactoring' - 'Add Variable'

## Symbol:

Function: This command enables the declaration of variables in a POU, as well as the automatic update to the occurrence of the POU.
Call: Main menu "Edit $\rightarrow$ Refactoring", or right-click.
Requirements: The declaration part is in focus.
The command opens the default dialog box for declaring variables.
See also

- ② "Dialog 'Auto Declare'" on page 2572

Dialog box 'Re- After clicking "OK" to close the declaration dialog, the "Refactoring" dialog box opens with two factoring' frames.

| "Right dialog frame"" | Declaration part and implementation of the POU where the variable is added. <br> Colored highlighting of changed locations: New added declarations have a blue <br> font and are highlighted in yellow (1). |
| :--- | :--- |
| "Left dialog frame" | Device tree or POUs tree of the project. <br> Colored highlighting of blocks where the POU is used: red font and yellow <br> highlight (2). <br> After you double-click the POU object, the detail view opens. |

Before you decide which changes to accept at which locations, select the required option from the drop-down list (3) at the upper right part of the window:

| "Add inputs with placeholder <br> text" | Default placeholder text:_REFACTOR_; editable <br> The placeholder text defined here is used at the occurrence locations of the new <br> added variables in the implementation code. This is used for searching for the <br> affected locations. |
| :--- | :--- |
| "Add inputs with the following |  |
| value" | Initialization value for the new variable. |

You can accept or reject changes by right-clicking the changed locations or by executing commands in the left or right area of the dialog box. Refer to the description of the "Refactoring $\rightarrow$ Rename" command.

```
Examples 1. By refactoring, the fun block receives a new input variable input3 with the initialization
        value 1. The change has the following effect:
Before:
fun(a + b, 3, TRUE);
fun(input1:= a + b , input2 :=3 , inputx := TRUE);
After:
fun(a + b, 3, 1, TRUE);
fun(input1:= a + b , input2 :=3 , _REFACTOR_, inputx := TRUE);
2. By refactoring, the "fun" block receives a new input variable input 3 with the placeholder text "_REFACTOR_":
```

## Before:

```
inst(input1 := a + b, input2 := 3, inputx := TRUE);
```

inst(input1 := a + b, input2 := 3, inputx := TRUE);
fun(a + b, 3, TRUE);
fun(a + b, 3, TRUE);
After:

```
```

inst(input1 := a + b, input2 := 3, input3 := _REFACTOR_, inputx

```
inst(input1 := a + b, input2 := 3, input3 := _REFACTOR_, inputx
:= TRUE);
:= TRUE);
fun(a + b, 3, _REFACTOR_, TRUE);
```

fun(a + b, 3, _REFACTOR_, TRUE);

```

\section*{See also}

- 公 Chapter 6.4.1.21.3.3.40 "Command 'Refactoring' - 'Rename <...>"' on page 2577

\section*{Command 'Refactoring' - 'Remove <variable>'}

Symbol: 厚
Function: This command removes an input or output variable from the POU and all occurrences of the POU.
Call: Main menu "Edit \(\rightarrow\) Refactoring", or right-click.
Requirements: In the declaration part of the POU, the cursor is located in the identifier of the variable to be removed.
Then, the command opens a dialog box with information about the removal. After you confirm this, the "Refactoring" dialog box opens. For a description of the "Refactoring" dialog box, refer to the "Edit \(\rightarrow\) Refactoring \(\rightarrow\) Rename" help page.
When you accept the changes in the "Refactoring" dialog box, the respective input and output parameters are deleted at the occurrence locations of the affected POU.

In CFC, only the connection is removed between the removed input or output to the block. The input or output itself remains in the chart.

Example in ST In a POU, refactoring removes the input4 input variable. The occurrences are updated automatically:
Before removal:
```

inst(input1 := a + b, input2 := 3, input4 := 1, input5 := TRUE);
fun(a + b, 3, 1, TRUE);

```

After removal:
```

inst(input1 := a + b, input2 := 3, input5 := TRUE);
fun(a + b, 3, TRUE);

```

\section*{Command 'Refactoring' - 'Reorder Variables'}

Function: This command allows changing the order of variables in the declaration editor for the selected scope: VAR_INPUT, VAR_OUTPUT, or VAR_IN_OUT.
Call: "Edit \(\rightarrow\) Refactoring"; context menu of the focused scope in the declaration editor.
Requirement: One of the above scopes is selected in the declaration, and more than one variable is declared in it.
The command opens the "Reorder" dialog box with a list of all declarations of the selected scope. You can drag a selected declaration up or down to another position.

- 出 Chapter 6.4.1.9.16 "Refactoring" on page 1910

\section*{Command 'Advanced' - 'Format Document'}

Symbol:
Function: The command starts an automatic formatting of the code in the open ST editor.
Call: Menu bar: "Edit \(\rightarrow\) Advanced"; context menu of the window in focus in the ST editor
Requirement: The focus is in the ST editor. The syntax of the ST code does not contain any errors.

The following formatting is performed automatically:
- Keywords are converted to uppercase letters.
- Spacing is standardized.
- Indentations are changed according to syntax.
- Long lines are wrapped in sensible places.

\section*{Standard Menu in View 'Devices', 'POUs', 'Modules'}

The views "Devices", "POUs" and "Modules" provide the button \(\square\) in the top right corner to open a menu with the following commands:
- \(\quad\) "Open in editor": Opens the selected object in the corresponding editor.
- .Find object": Opens the dialog "Find Object" for the object tree. Starting to enter a search string all matching objects will be displayed with their path. Use the button "Open" to open the selected search result in the editor.
- "Sort by type": Sorts the objects in the view alphabetic by type.
- "Sort by name": Sorts the objects in the view alphabetic by name.
- "Sort ascending": Displays the chosen sorting in ascending order.
- "Sort descending": Displays the chosen sorting in descending order.
- "Track active editor": CODESYS selects the object, that is opened in the active editor, in the device tree of the view.

- «y Chapter 6.4.1.21.3.4.4 "Command 'Modules'" on page 2583

\section*{Command 'Devices'}

Symbol: view: [AIt] + [0]
Function: The command opens the view "Devices" in the CODESYS main window. The view contains the project's "device tree", where you configure your applications

Button opens the standard menu for navigating in the tree view.
Call: Menu "View"

See also
- \& Chapter 6.4.1.21.3.4.3 "Command 'POUs'" on page 2583
- © Chapter 6.4.1.21.3.4.1 "Standard Menu in View 'Devices', 'POUs', 'Modules"' on page 2582

\section*{Command 'POUs'}

Symbol: [], Shortcut: [Alt] + [1]
Function: This command opens the "POUs" view in the CODESYS main window. POUs located here are available in the entire project.
Call: Menu "View"
See also
- \& Chapter 6.4.1.21.3.4.1 "Standard Menu in View 'Devices', 'POUs', 'Modules"' on page 2582

\section*{Command 'Modules'}

Symbol:
Function: This command opens the "Modules" view and shows the modules of the application composer in a tree structure.
Call: Main menu "View"
See also
- * Chapter 6.4.1.21.3.4.1 "Standard Menu in View 'Devices', 'POUs', 'Modules"' on page 2582

\section*{Command 'Messages'}

Symbol:
Function: This command opens the "Messages" view.
Call: Menu bar: "View".

View 'Messages'
\begin{tabular}{|c|c|}
\hline Message category & The messages are categorized by component or functionality for selection from a drop-down list. Filter the message display by selecting a category. \\
\hline Message type & \begin{tabular}{l}
Click the symbol of the message type to show or hide messages. CODESYS displays the number of messages next to each symbol. \\
- ©: Error \\
- ©: Warning \\
- © : Message
\end{tabular} \\
\hline 区 & Deletes all messages in the selected message category. \\
\hline 圈 & Deletes all messages in all message categories. \\
\hline "Description" & \multirow{4}{*}{Message text with the reported object and the location in the object. Double-click a message in the table to jump to the source text location.} \\
\hline "Project" & \\
\hline "Object" & \\
\hline "Position" & \\
\hline
\end{tabular}

Table 474: "Commands in the context menu"
\begin{tabular}{|l|l|}
\hline "Next Message" & The source text position of the next message is displayed. \\
\hline "Previous Message" & The source text position of the previous message is displayed. \\
\hline "Go to Source Position" & The source position of the selected message is displayed. \\
\hline
\end{tabular}

\section*{Command 'Element properties'}

Symbol:
Function: This command opens the "Element Properties" view.
Call: Main menu "View"
This command opens the properties view for the open object. This view is available only for a few objects, for example visualization and POU (SFC).

The properties are displayed in a structured table. You change the property values by clicking into the value fields. You can filter or sort the properties view.

\section*{Command 'ToolBox'}

Symbol:
Function: This command opens the "ToolBox" view.
Call: Main menu "View"
This command opens the toolbox view for the open object. By default, this view is available for graphical editors and visualizations. It includes the graphical programming elements that you can drag into the editor.

\section*{Command 'Watch' - 'Watch <n>'}

Symbol: 展
Function: This command opens the "Watch <n>" view. You can populate a watchlist with variables from your project in order to monitor, force, or write these variable values in an individual view in online mode. The value " \(n\) " can be 1, 2, 3, or 4 for a total of up to four watchlists.

Call: Main menu "View"
See also
- ② Chapter 6.4.1.13.2.3 "Using watch lists" on page 2002

\section*{Command 'Watch' - 'Watch All Forces'}

Symbol: 原
Function: The command opens the "Watch All Forces" view, which is a special kind of watch list.

\section*{Call: Menu bar: "View \(\rightarrow\) Watch \(\rightarrow\) Watch All Forces"}

Requirement: A project is in offline mode or online mode.
The view contains all variables currently prepared for forcing, and all forced variables of the application in one list. Actions are possible in the list which are also possible in other watch lists. Moreover, the following commands are available in the "Unforce" list box of the view:

Table 475: "Watch All Forces"
Tabular view of all forced variables of the application, including variables prepared for forcing
\begin{tabular}{|l|l|}
\hline "Expression" & Variable name \\
\hline "Data Type" & Data type of the variable \\
\hline "Value" & Currently forced value of the variable \\
\hline "Prepared Value" & Value prepared for forcing \\
\hline \begin{tabular}{l} 
"Overwritten value at start of \\
cycle"
\end{tabular} & \begin{tabular}{l} 
For inputs, the actual value is already overwritten by the force value before the \\
application code is executed. As a result, this is the forced value. \\
For outputs, this is the forced value.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Overwritten value at end of \\
cycle"
\end{tabular} & \begin{tabular}{l} 
For outputs, this is the value which is calculated in the cycle. However, this value \\
is overwritten by the force value at the end of the cycle. \\
For inputs, this is the forced value.
\end{tabular} \\
\hline
\end{tabular}
- "Unforce and Keep All Selected Values": For all selected entries in the list, the variables will be set to the forced value and the forcing will be lifted
- "Unforce and Restore All Selected Values": For all selected entries in the list, the variables will be reset to the values they had before they were forced, and the forcing will be lifted.

See also
- \# Chapter 6.4.1.12.5 "Forcing and Writing of Variables" on page 1987
- 出 Chapter 6.4.1.13.2.3 "Using watch lists" on page 2002

\section*{Command 'Add All Forces to Watchlist'}

Function: The command adds all variables of the active application, which are currently prepared for forcing, or which are already forced, to the watchlist. Please regard, that this works only for docked watch list views.

Call: Context menu of view "Watch"
Requirement: Online mode, a watch list view is active.

There is a special watch list: "Watch All Forces". This view shows automatically all variables currently prepared for forcing or already being forced. It provides additional commands for releasing any forces.

See also

\section*{Command 'Breakpoints'}

Symbol: 四
Function: This command opens the "Breakpoints" view.
Call: Menu bar: "View".
This view shows an overview of all defined breakpoints for an application. You have access to all breakpoint commands within this view.

Table 476: Table of current breakpoints
\begin{tabular}{|l|l|}
\hline "Application" & Select the required application from the list. \\
\hline "POU" & Name of the function block that will receive the breakpoint \\
\hline "Location" & \begin{tabular}{l} 
Location of the breakpoint in the POU \\
\(\bullet \quad\) Text editor: Line number and column number \\
\(\bullet \quad\) Graphical editor: Network number or element number \\
For function blocks, "(Impl)" indicates that the breakpoint is located in the imple- \\
mentation of the function block, not in an instance.
\end{tabular} \\
\hline "Instance Path" & Complete object path of the breakpoint location. \\
\hline "Tasks" & \begin{tabular}{l} 
Names of tasks that will be effective when the breakpoint is executed. If there \\
are no restrictions, then "(all)" is displayed here.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline ＂Condition＂ & \begin{tabular}{l}
－＂Break always＂：No additional enable condition defined；the breakpoint is \\
always enabled． \\
Boolean expression．The expression must yield TRUE for the breakpoint to \\
be enabled．
\end{tabular} \\
\hline ＂Hit Count Condition＂ & When the breakpoint should be in effect（depending on the hit count） \\
\hline ＂Current Hit Count＂ & \begin{tabular}{l} 
How often the breakpoint has already been reached up to now during the execu－ \\
tion
\end{tabular} \\
\hline
\end{tabular}

Table 477：Toolbar
\begin{tabular}{|c|c|c|}
\hline \multirow[t]{2}{*}{景} & ＂New Breakpoint＂ & This command opens the＂Breakpoint Properties＂dialog． \\
\hline & －＂New Data Breakpoint＂ & This command opens the＂New Breakpoint＂dialog． \\
\hline \(X\) & ＂Clear Breakpoint＂ & Removes the breakpoint（not the same as disable） \\
\hline 煓 & ＂Enable／Disable Breakpoint＂ & \begin{tabular}{l}
Toggles the status of the breakpoint or execution point between＂enabled＂and ＂disabled＂ \\
－Breakpoint enabled \\
－O Breakpoint disabled \\
－Execution point enabled \\
－Execution point disabled \\
－Data breakpoint enabled \\
－Data breakpoint disabled \\
－Data execution point enabled \\
－Data execution point disabled \\
As opposed to＂Clear breakpoint＂，a disabled breakpoint remains in the list and can be enabled again．
\end{tabular} \\
\hline 嘓 & ＂Properties＂ & The＂Breakpoint Properties＂dialog opens for editing the breakpoint parameters． This dialog is the same as＂New Breakpoint＂．In online mode，you can change the breakpoint into an execution point． \\
\hline 里 & ＂Go to Source Position＂ & Opens the online view of the affected block．The cursor is set at the breakpoint location． \\
\hline 8930］ & ＂Clear All Breakpoints＂ & Deletes all breakpoints and execution points in the application．The list is cleared． Not to be confused with＂deactivate＂． \\
\hline 阶而 & ＂Enable All Breakpoints＂ & Enables all currently disabled breakpoints and execution points． \\
\hline 所的 & ＂Disable All Breakpoints＂ & Disables all currently enabled breakpoints and execution points．The points remain in the list and can be enabled again． \\
\hline
\end{tabular}

\section*{Command＇Cross Reference List＇}

Symbol：
Function：This command opens the＂Cross Reference List＂view．

\section*{Call: Menu bar: "View", or "Edit \(\boldsymbol{\rightarrow}\) Browse \(\boldsymbol{\rightarrow}\) Browse Cross References".}

This view shows a list of cross-references for a symbol in the project. The symbol can be a variable, a POU (program, function block, function), or a user-specific data type (DUT). The cross-reference list offer two basic types of searches:
- Text search: By specifying a symbol name, the cross-references of all symbols in the project are displayed with their names. If multiple symbols with the same are found, then the display can be limited to individual declarations by means of the context menu.
- Declaration search: The symbol can be selected by means of the input assistant or by specifying a qualified path (for example, Device.Application.PLC_PRG.i or POOL.POU.a). Then only the occurrence locations of this symbol are displayed, even if there exist other symbols with the same name.
\begin{tabular}{|c|c|}
\hline Input field & \begin{tabular}{l}
Symbol name (variable name, POU name, DUT name). Input options: \\
- Selection of a declared symbol by means of the input assistant ( \(Q\) button). Manual input of the symbol name. Triggering of the search by pressing the \(\Rightarrow\) button or the [Enter] key. \\
For the text search, you can use the placeholders " "*" (any number of characters) or "?" (exactly any one character) in combination with a partial string of a variable identifier. \\
Use the percent sign "ஃ" to search for IEC addresses. Examples: " \(\% \mathrm{MW} 8\) ", "ьм" \\
More options outside of cross-reference list view: \\
- Use the command "Browse for Symbol \(\rightarrow\) Browse Cross References" if the name of a declared symbol is selected in an editor, or if the cursor is in the name field. A search is also possible if the object is selected in the device tree or POU pool. \\
- Automatic if the name of a declared symbol is selected in an editor, or if the cursor is in the name field. A automatic search is also possible if the object is selected in the device tree or POU pool. \\
Requirement: CODESYS option "Automatically list selection in cross reference view" is activated (category "SmartCoding". \\
The following input is valid: \\
- Variable name, simple or qualified. Examples: "iVar", "PLC_PRG.iVar". \\
- POU name: Examples: "PLC_PRG", "myFB". \\
- DUT name: Example: "mystruct". \\
- Strings combined with placeholders: asterisk (*) for any character or question mark (?) for exactly one characters). \\
Example: "iVar*" applies to iVar1, iVar_glob2, iVar45, etc. \\
"iVar?" refers to iVar1, iVar2, iVarx, and so on, but not \\
iVar_glob2, iVar45 and so on... \\
- "\%<IEC address>": CODESYS searches for variables that are assigned to this address and direct memory access. Example: " \(\circ Q \mathrm{QB} 0\) ", \(\%\) \(\Omega 0:=2\).
\end{tabular} \\
\hline Q & Open input assistant for selecting a symbol \\
\hline \(\Rightarrow\) & Perform a search \\
\hline 8 & Define columns to search for the string. \\
\hline Input field & String that is searched for in the selected columns. The result locations are marked in yellow. Cross references without this string are hidden. \\
\hline - & Show source position of previous cross-reference, [Shift]+[F4] \\
\hline 4 & Show source position of next cross-reference, [F4] \\
\hline E- & Limit results to current declaration: Available if multiple declarations are found for a symbol. Limits the display to the declaration that you have selected in the list. \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline \(\pm\) & Show source position of selected cross-reference: The focus jumps to the occurrence location of the symbol. \\
\hline 즐 & Print cross-reference list: The default dialog opens for setting up a print job. \\
\hline \multicolumn{2}{|l|}{The cross references are displayed with the following information:} \\
\hline "Symbol" & \begin{tabular}{l}
The result locations for the symbols (variables, POUs, or DUTs) are grouped by declaration. The declaration occurrence comprises the root node and the occurrence locations in the project are indented below. The precise expression is displayed that has the symbol at the occurrence location. \\
Example: If there is a global variable \(i\) in the project and a local declared variable \(i\) in a POU, then two root node entries will be listed after a text search for cross-references with the occurrences of the variable i below each.
\end{tabular} \\
\hline "POU" & Block name; also a task name if a block call in the task configuration. \\
\hline "Variable" & Only the variable name (for example, iVar) \\
\hline "Access" & \begin{tabular}{l}
Type of access to the variable at the occurrence location: "Declaration"/ "Read"/ "Write"/ "Call". \\
Special case for pointers: An assignment type p := ADR (var1) is displayed as write | address when searching for var1. The reason for this: Any write access to p is not displayed when searching for var1. Write access is also possible by means of pointer variables.
\end{tabular} \\
\hline "Type" & Data type of the variable \\
\hline "Address" & IEC address if variables are assigned Example: "AT \%QB0". \\
\hline "Position" & Location of the occurrence in the POU editor, for example line number, network number, declaration part, or implementation part. Example: "line 1, column 1 (Impl)". \\
\hline "Object" & POU name plus complete path of the occurrence location in brackets (if this is found in the "Devices" view). Example: "PLC_PRG [Device:Plc Logic:Application]" \\
\hline "Comment" & Comments if available in the declaration of the variable \\
\hline
\end{tabular}

The search yields all result locations in the project and in included, uncompiled libraries.

Right-click com- "Show source position": Opens the respective POU and marks the occurrence: for root entries, mands in the cross-reference list the declaration, and for subordinate entries, the respective occurrence location. As an alternative, you can double-click a line.
"Limit Results to Selected Declaration": Limits the display of results to the selected symbol declaration if multiple declarations are found.
"Expand All": In the list, every single result location is shown.
"Collapse All": In the list, only the root nodes of the result locations are shown.

\section*{Command 'Browse Cross References in Classic View'}

Symbol

Function: This command opens the "Classic Cross Reference List" view.
Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from "Tools \(\rightarrow\) Customize" (command category "Browse Project").

The view corresponds to the "Cross Reference List" view before CODESYS V3.5 SP6.

\section*{Command 'Call Stack'}

\section*{Symbol: 路}

Function: This command opens the "Call Stack" view.
Call: Main menu "Debug".
This view is very useful when you want to step into programs. It shows the current location with the complete call path.
\begin{tabular}{|l|l|}
\hline "Application" & Name of the active application that controls the current POU \\
\hline "Task" & Name of the task that controls the current POU \\
\hline \multicolumn{1}{|l|}{} & \begin{tabular}{l} 
Name of the POU where program execution has halted \\
The first line in the list describes the current execution location (marked with a \\
yellow arrow). If this location is in a block that is called by another block, then \\
the call location is described in the second line. In turn, if the caller is called by \\
yet another block, then that call location is described in the third line, and so \\
on.
\end{tabular} \\
\hline "Location" & \begin{tabular}{l} 
Position within the POU where program execution has halted \\
\(\bullet\) \\
\(\bullet\) \\
- Line and column numbers for textual editors
\end{tabular} \\
\hline "Instance & Instance where program execution has halted \\
path"
\end{tabular}

The call stack is also available in offline mode and normal online mode when you are not currently using any debugging functions). In this case, it receives the last displayed location during a stepped execution, but it is displayed in gray.

The "Call Tree" view, in contrast to the "Call Stack", at any time provides information on the calls of a POU.

(2) Chapter 6.4.1.21.3.4.16 "Command 'Call tree'" on page 2590

\section*{Command 'Call tree'}

Symbol: \(=5\)
Function: This command opens the "Call Tree" view.
Call:
- "View" menu
- Context menu of a callable block in the "Devices" or "POUs" view.

View 'Call tree' The call tree is available at all times, even before compiling the application. It is a static representation of the caller and the calls of the block that you specify explicitly. Therefore, the tree always contains two root nodes above the respective call order is displayed as successive indented entries. Recursive calls are detected quickly in this tree representation.

Example of a call tree (1) for the (2) PLC_PRG block:

- (3) Node "<block name> is called by:"
- (4) Node "<block name> calls:"
\begin{tabular}{|c|c|}
\hline "Block name" & \begin{tabular}{l}
Name of the program block; specified manually, by dragging from another view, or by means of the button \\
The drop-down list includes the last specified block names.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{Toolbar and keyboard usage} \\
\hline ¢ : Find block \(^{\text {a }}\) & CODESYS searches for the block specified in "Block name" and displays its caller and calls. \\
\hline B: Use block from the input assistant & The "Input Assistant" dialog box opens for selecting a block call or instance call. The call tree is refreshed automatically after the selection. \\
\hline Show source code position of the selected block & CODESYS jumps to the occurrence location of the block in the source code of the program. \\
\hline \begin{tabular}{l}
[F4]: Show source code position of the next block \\
[Shift]+[F4]: Show source code position of the previous block
\end{tabular} & \begin{tabular}{l}
The selection in the call tree jumps to the next or previous block in the call structure. At the same time, the associated source code position is opened in the respective editor. \\
Note: Double-clicking an entry in the call tree also opens the associated source code position.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{Display of the call tree:} \\
\hline "Symbol" & \begin{tabular}{l}
"<block name> is called by": The call order is displayed for below this node. The bottom entry in this tree structure shows the start of the calls. \\
"<block name> calls": The calls from this block are displayed below this node. The bottom entry in this tree structure shows the end of the call chain.
\end{tabular} \\
\hline "Position" & \begin{tabular}{l}
For the root node in the call tree: Line numbers of the declaration ("Decl") of the block. \\
For the caller or calls below the root node: Line number, column number, and network number of the position, depending on the implementation language.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{Context menu for the entry selected in the tree:} \\
\hline "Collapse All" & The expanded entries in the call tree are collapsed, except for the two root nodes. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Show Source Position" & \begin{tabular}{l} 
CODESYS jumps to the occurrence location of the block in the source code of \\
the program.
\end{tabular} \\
\hline "Set as New Root Node" & \begin{tabular}{l} 
The entry selected in the call tree is displayed in "Block name". The tree is \\
refreshed automatically for the new root nodes.
\end{tabular} \\
\hline
\end{tabular}

The "Call list" view is provided for immediate information when stepping through a program, as opposed to the static call tree that provides call information about a block. The call list always shows the full call path of the current position that is reached.

\section*{Command 'Memory'}

Symbol:
Function: In CODESYS V3.5 version earlier than SP11, the command opens the "Memory" view.
Call: Menu bar: "View \(\rightarrow\) Memory".
As of SP11, the command provides the notice that you must install the CODESYS Memory Tools package (available in the CODESYS Store) in order to use the memory view. After installation, you can open the "Memory" view by clicking "View \(\rightarrow\) Show Memory View".

\section*{Command 'Security Screen'}

Symbol:
Function: The command opens the "Security Screen" view.
Call:
- "View" menu
- (3) icon or 3 in the status bar

The icon is displayed in blue when a valid certificate is specified for the digital signature. When only one client certificate is specified for the encrypted communication, the icon remains gray, resulting in the client certificate providing no increased security for the user.

The following security features of CODESYS are configured and displayed in the view:
- Personal user certificate
- Encrypted communication
- Encryption and signatures of IEC projects
- Encryption and signature of download, online change, and boot application
- Security level

\section*{NOTICE!}

When the "Security Screen" is opened and closed, the current settings are applied in the user options, even when no active changes have been made.

If the CODESYS Security Agent add-on product is installed, then the "Security Screen" view provides an additional "Devices" tab. This allows for the configuration of certificates for the encrypted communication with controllers.

\begin{abstract}
Tab 'User' On this tab, certificates are configured that are required for the encrypted communication and the digital signature of the user. Only certificates with private keys can be specified here. The user profile is saved as an XML file in the user options.
\end{abstract}
\begin{tabular}{|c|c|}
\hline "User Profile and Certificate Selection" & By default, the login name for Windows is specified as the user profile. \\
\hline List box with existing user profiles & \begin{tabular}{l}
Opens the "User Profiles" dialog. Here you specify the name for a new user profile. \\
Deletes the selected user profile. This user profile is no longer displayed in the list box.
\end{tabular} \\
\hline "Digital Signature" & \begin{tabular}{l}
Opens the "Certificate Selection" dialog for selecting the certificate for the digital signature. \\
One certificate can be selected. The certificate has to have a private key. \\
Deletes the displayed certificate. \\
One certificate can be selected. The certificate has to have a private key.
\end{tabular} \\
\hline "Project File Decryption" & \begin{tabular}{l}
Opens the "Certificate Selection" dialog for selecting the certificate for decrypting project files. \\
One certificate can be selected. The certificate has to have a private key. \\
Deletes the displayed certificate.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Start Page'}

Symbol: 包
Function: This command opens the "Start Page" view.
Call: Main menu "View"
The view includes some basic commands and a list of recently opened projects. In addition, the CODESYS homepage is displayed.

If you access the Internet through a proxy, then you can save the authentication data in the project options ("Proxy Settings") so you do not have to provide this data every time you use this command.

By moving the mouse pointer over the list of recently opened projects, you can remove or pin individual projects in the list. Pinned projects remain in this list until you remove the pin.

In the project options ("Load and Save"), you can configure whether this start page should open automatically when you start CODESYS.

See also
- \(\quad>\) Chapter 6.4.1.21.4.14.17 "Dialog 'Options' - 'Load and Save'" on page 2791

\section*{Command 'Add Object'}

Symbol: 蒀
Function: This command opens a submenu with objects that contain all objects that can be inserted, depending on the current position in the "Devices" or "POUs" view.

Call: "Project" menu, context menu in the "Devices" or "POUs" view.

Requirement: If CODESYS is to insert the object in the device tree, select an already existing object under which the new one is can be inserted indented. If CODESYS is to insert the object in the POUs tree, set the focus in any free place in the CODESYS window.

\section*{Command 'Add Folder'}

Symbol:
Function: This command opens a dialog box for defining a new folder in the Devices or POUs view.

Call: "Project" menu, context menu in the Devices or POUs view

You cannot structure the arrangement of device nodes and device objects through folders that you have created yourself.

This command inserts the folder below the object that has just been selected in the tree. If no object is selected, CODESYS inserts the folder right at the top in the tree directly under the root node.

\section*{Command 'Insert Device'}

Function: this command opens the dialog box "Add Device" for the selection of a device object that is to be inserted in the device tree below the currently selected object.
Call: Context menu of a device object in the device tree.
Requirement: An object is selected in the device tree below which a device object can be inserted.

See also
- \({ }^{\text {² }}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835

Dialog box 'Add Function: Depending on the currently selected position in the device tree, the dialog box device' offers a selection of the devices that can be inserted at this point. In addition, it contains the commands also available in the context menu: "Insert Device", "Add Device", "Plug Device", "Update Device".
Requirement: The devices are installed in the device repository on the local system.

If you have opened the dialog box, it always displays the selection to suit the object currently selected in the device tree until you click "Close".
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Name with which the device is to appear in the device tree. Must be a valid IEC \\
identifier.
\end{tabular}
\end{tabular}

Table 483: "action"
\begin{tabular}{|l|l|}
\hline "Add device" & \begin{tabular}{l} 
CODESYS inserts the selected device indented below the selected object in the \\
device tree.
\end{tabular} \\
\hline "Insert device" & \begin{tabular}{l} 
CODESYS inserts the selected device at the same level as the selected object \\
below it in the device tree.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Plug device" & \begin{tabular}{l} 
CODESYS inserts the selected device in the selected slot. If the slot is already \\
occupied, the existing module is replaced by the new one.
\end{tabular} \\
\hline "Update device" & \begin{tabular}{l} 
CODESYS replaces the device selected in the device tree by the one selected. \\
Please note: Depending on the device, this may cause the configuration already \\
done in the device editor to be overwritten with the default values!
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "String for the full text search" & \begin{tabular}{l} 
This field is editable after clicking in it. For any character string entered, only \\
those devices that include the character string are displayed in the lower view. \\
The matched string is highlighted in yellow for these devices.
\end{tabular} \\
\hline "Vendor:" & Drop-down list with manufacturers whose available devices are displayed. \\
\hline "Group by category" & \begin{tabular}{l}
\(\square:\) The available devices (newest version) are sorted by category. The category \\
is defined in the device description file. \\
\(\square\)
\end{tabular} \\
\hline \begin{tabular}{l} 
"Display all versions (for \\
experts only)" available devices appear flat and alphabetically sorted.
\end{tabular} \\
\hline "Display outdated versions" & \begin{tabular}{l}
\(\square\) \\
\(\square\)
\end{tabular} \\
\hline\(\square:\) In addition, all other available versions of the devices can also be selected. \\
\(\square\) & \begin{tabular}{l}
\(\square\) \\
versions result, for example, from the update of plug-ins. \\
\(\square\)
\end{tabular} \\
\hline
\end{tabular}

The information provided by the device description file is displayed:
device name, vendor, categories, version, order number and a short description, device-specific bitmap.

- \({ }^{4}\) Chapter 6.4.1.21.3.5.4 "Command 'Plug Device"' on page 2600
- \({ }^{\Perp}\) Chapter 6.4.1.21.3.5.6 "Command 'Update Device"' on page 2602

\section*{Command 'Plug Device'}

Function: Like the command "Add Device", this command opens the dialog box "Add Device" for the selection of a device object that is to be inserted in the device tree in the currently selected slot.

Call: Context menu of the slot of a device object in the device tree.
Requirement: The slot of a device object is selected in the device tree.
An empty slot is identified by the symbol k and the entry "<empty> (<empty>)". An occupied slot is given the symbol and the name of the device.
In the case of an occupied slot, this command replaces the existing module with the new one.

- \(\Leftrightarrow\) Chapter 6.4.1.21.3.5.3 "Command 'Insert Device'" on page 2599
- \(y_{y}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835

\section*{Command 'Scan for Devices'}

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.
Call: Menu bar: "Project"; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.
The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.
After performing the scan operation, the "Scan Devices" dialog opens and displays the found devices.

\section*{Dialog 'Scan \\ Devices'}

Table 484: "Scanned Devices"
\(\left.\begin{array}{|l|l|}\hline \text { "Device name, Device type, } \\ \text { Address, Station name, etc." } & \begin{array}{l}\text { Data about the scanned device depending on network type. } \\ \text { When you change a value in the list of scanned devices, the value is shown } \\ \text { in italics. This indicates that the new value has been changed in the editor in } \\ \text { CODESYS, but not in the device. When you download the value to the device, it } \\ \text { is shown normally. } \\ \text { Value that indicate differences between the project and the scanned device are } \\ \text { shown in orange. } \\ \text { If multiple device descriptions are available for the scanned device, then the }\end{array} \\ \text { name is displayed in bold. The selection of the matching device description is } \\ \text { resolved differently for different fieldbuses. For more detailed information, see } \\ \text { the corresponding fieldbus chapters. } \\ \text { If a device description cannot be found, then the following message is shown: } \\ \text { "Attention! The device was not found in the repository." Depending on the bus } \\ \text { system, additional information is displayed, such as manufacturer number and } \\ \text { product number. The device cannot be inserted into the project without the } \\ \text { installed device description. }\end{array}\right\}\)

NOTICE!
If you insert devices, which are available in the device tree, to the device tree with "Copy All Devices to Project", then the following should be noted. The data of the "Process Data" and "<...> I/O Mapping" tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 485: "Configured Devices"
This part of the dialog is visible only when you select the "Show differences to project" option.
Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.
\begin{tabular}{|l|l|}
\hline & \begin{tabular}{l} 
If you have selected a device in both views, then the scanned devices are \\
inserted above the selected configured device.
\end{tabular} \\
\hline If you have selected a device in both views, then the scanned devices are \\
inserted below the selected configured device. \\
\hline & \begin{tabular}{l} 
If you have selected a device in both views, then the configured devices are \\
replaced by the selected scanned device.
\end{tabular} \\
\hline
\end{tabular}

The dialogs for the scan differ depending on the type of device. See the help pages for the respective device editor.

\section*{Command 'Update Device'}

Function: Like the command "Add Device", this command opens the dialog box "Add Device" for the selection of a device object. This object is inserted in the device tree in place of the currently selected object.
Call: Context menu of a device object in the device tree.
Requirement: An object is selected in the device tree below which a device object can be inserted.

With this command you can insert either a different version of a device or a different type of device in place of the previous one.
The symbolic device name used in the device tree is retained, but the device type specified in parentheses behind it changes if a different type has been selected. Thus if only the device version is changed, the object entry appears unchanged.
If the device type does not change, the configuration tree indented below the device entry concerned is retained. In this case the configuration settings also remain the same. Inconsistencies in the configuration resulting from the device update are reported by CODESYS at the next compilation of the application. This also concerns implicitly inserted libraries, which CODESYS does not remove accordingly during a device update.
See also
- \({ }^{4}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835
- \(\sum^{*}\) Chapter 6.4.1.21.3.5.3 "Command 'Insert Device"' on page 2599

\section*{Command 'Acknowledge Diagnosis', 'Acknowledge Diagnosis for Subtree'}

Function: The command acknowledges a diagnosis message.
Call: Context menu of a device object in the device tree
Requirement: The project is in online mode.

The "Acknowledge diagnosis" command acknowledges the diagnosis messages of an individual device. The "Acknowledge Diagnosis for Subtree" command also acknowledges the diagnosis messages of all subordinate devices. The diagnosis message of a pending malfunction is indicated by a red exclamation mark at the device object. The diagnosis message of a corrected malfunction is indicated by a gray exclamation mark.

\section*{Command 'Edit Object'}

Function: This command opens the object in its editor.
Call: Main menu "Project", context menu.
Requirement: An object is selected in the device tree or in the "POUs" view.

\section*{Command 'Edit Object with'}

Function: When multiple objects are available for an object, this command opens a dialog box for selecting an editor.

If only one editor is available for an object, then this command opens the object in that editor.
Call: Main menu "Project" or shortcut menu (right-click)
Requirement: An object is selected in the device tree or in the "POUs" view.
In the standard installation of CODESYS, there is no object that has multiple available editors.

\section*{Command 'Check integrity'}

Function: Automation Builder checks the project integrity for the complete project ("Project integrity" checks if all devices in the device tree are installed in the device repository).
Call: Main menu "Project", Context menu.
Requirement: A project is open.

\section*{Command 'Edit Object (Offline)'}

Function: The command opens the object offline in the editor.
Call: Main menu "Project", Context menu
Requirement: The application is in online mode. An object is selected in the device tree or in the "POUs" view.

The command allows you to edit objects in online mode. After editing you transfer the changes to the controller by use of the command "Online \(\rightarrow\) Online Change" or "Online \(\rightarrow\) Load".
See also
- \({ }^{〔}\) Chapter 6.4.1.21.3.7.6 "Command 'Online Change'" on page 2629
- \(\quad\) Chapter 6.4.1.21.3.7.5 "Command 'Load'" on page 2628

\section*{Command 'Set Active Application'}

Function: This command sets the selected application as the active application.
Call: Main menu "Project", or right-click the "Application" object.
Requirement: The project has at least two applications. The selected application is not active.
Online actions apply only to the active application. The name of an active application is displayed in bold typeface in the device tree.

\section*{Command 'Project information'}

Symbol:
Function: This command opens the dialog box "Project Information".
Call: Main menu"Project"
When you execute the command in the project for the first time, CODESYS creates the "Project Information" object.

- \& Chapter 6.4.1.21.2.24 "Object 'Project Information'" on page 2515

\section*{Command 'Project Settings'}

Symbol:
Function: This command opens the "Project Settings" dialog box.
Call: "Project" menu or double-click on the object "Project Settings" in the "POUs" view
Requirement: A project is open.
See also
- \(\sum^{*}\) Chapter 6.4.1.3.4.3 "Making project settings" on page 1814

- \(\sum^{*}\) Chapter 6.4.1.21.2.23 "Object 'Project Settings'" on page 2514

\section*{Command 'Project Environment'}

Function: This command opens the "Project Environment" dialog box.
Call: "Project" menu
Requirement: A project is open.
this command is for checking the currentness of software and files integrated in the project and enables them to be updated.

\section*{Command 'Project Localization' - 'Create Localization Template'}

Function: This command opens the "Create Localization Template" dialog. Define here which information should be exported from the project to a translation template (*.pot file).
Call: Menu bar: "Project \(\rightarrow\) Project Localization".
Requirement: A project is open.

Dialog 'Create
This dialog is used for selecting the textual information that should be used in the localization
Localization
template'
Table 486: "Include the Following Information"
\begin{tabular}{|c|c|}
\hline "Names" & Texts, such as dialog captions and object names in the device tree \\
\hline "Identifier" & Variable identifier (example: Counter) \\
\hline " Strings" & Example: 'count' in the following declaration: strVar: STRING := 'count'; \\
\hline "Comments" & Comment texts in the POUs \\
\hline "Position information" & \begin{tabular}{l}
Selection of which positions of the selected text categories in the project should be included in the translation file. The position information is located in the first line(s) of a segment for a translation. Example:
```

\#: D:\Proj1.project\Project_Settings:1
msgid "Project settings"
msgstr ""

``` \\
- "All": All detected positions of the text are listed. \\
- "First appearance": In the translation file, the position is included in the project where the text to be translated appears for the first time. \\
- "None"
\end{tabular} \\
\hline "Generate" & This button opens the dialog for saving a file. The translation template is created in a text file of type *.pot (portable object template). Each further generation creates a completely new template file. \\
\hline
\end{tabular}

\section*{Command 'Project Localization' - 'Manage Localizations'}

Function: This command opens the "Manage localizations" dialog. Select the desired localization language in the dialog or the original version of the project. You can still accept the localization files *.<language>.po into the project or remove them.

Call: Menu bar: "Project \(\boldsymbol{\rightarrow}\) Project localization".
Requirement: A project is open.

Dialog 'Manage localizations'
\begin{tabular}{|l|l|}
\hline "Available Localizations" & \begin{tabular}{l} 
List of the localization files available in the project. Example: \\
proj1-de.po \\
proj1-en.po \\
<original version> \\
The original version is always available. The project can be edited only in the \\
original version.
\end{tabular} \\
\hline "Add" & \begin{tabular}{l} 
This button opens the dialog for selecting an additional po file from the file \\
system.
\end{tabular} \\
\hline "Remove" & \begin{tabular}{l} 
This button removes the po file, which is selected on the left side, from the \\
project.
\end{tabular} \\
\hline "Default localization" & \begin{tabular}{l} 
■: The selected localization is for the default localization. The entry is display in \\
bold.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Switch Localization" & Use this button to switch to the selected localization. \\
\hline "OK" & \begin{tabular}{l} 
The project is displayed in the language that is provided by the file selected \\
below the files. If you select "<original version>", then the project appears in the \\
editable non-localized version.
\end{tabular} \\

\hline\(\ominus\) & Switch back to the project compare view. \\
\hline\(\downarrow\) & Selects the next line below in the code where differences were detected. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline 令 & Selects the next line above in the code where differences were detected. \\
\hline \multirow{4}{*}{ "Accept Block"2 } & \begin{tabular}{l} 
The block (with all subordinate lines) is selected for acceptance of the reference \\
blocks into the current project. \\
A block in the detailed compare view consists of the unit where the cursor is \\
located and all corresponding units that have the same difference markers. A \\
unit is a line, network, or element. Subsequent lines of a line are examples of \\
corresponding units. \\
Repeated clicking of \(\approx\) "Accept Block" undoes the effects of its last change.
\end{tabular} \\
\hline\(\checkmark\) "Accept Single" & The line is selected in the current object for acceptance of the reference line.
\end{tabular}\(|\)\begin{tabular}{l} 
Switches between the default display where different units (lines, networks, ele- \\
ments) are displayed in red and another display: The units are displayed as \\
recently added in the open project. In the reference project, they are displayed \\
as deleted. \\
Available within the detailed compare view only. \\
Note: Depending on the display, detected differences in the statistics are \\
counted as changed, inserted, or deleted.
\end{tabular}

Table 493: Display of differences with colors, and symbols
\begin{tabular}{|l|l|}
\hline Black font & Objects are identical. \\
\hline \begin{tabular}{|l|l|}
\hline Gray highlight + bold blue font & Code is only in the reference project. \\
\hline \begin{tabular}{l} 
Gray highlight + bold green \\
font
\end{tabular} & Code is only in the current project (not in reference project). \\
\hline
\end{tabular}
\end{tabular}
\begin{tabular}{|l|l|}
\hline Yellow highlight & The object is activated for acceptance. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline\(\times\) & \begin{tabular}{l} 
The dialog prompt opens: "Do you want to commit the changes which you made \\
in the diff view?"
\end{tabular} \\
"Yes": The code highlighted in yellow is accepted into the project. The code \\
corresponds to the reference project. Then the detailed view is closed and the \\
project view is displayed. You can continue working with project compare.
\end{tabular}

\section*{Dialog 'Accept'}

Table 494: "Which meta data should be accepted?"
\begin{tabular}{|l|l|}
\hline "Access rights" & \(\boxed{ } \quad\) : Access rights that are selected for acceptance.
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Accepted groups" & \begin{tabular}{l} 
Grouping with access rights accepted by the reference project. A group is \\
accepted if it is present in both projects with different access rights. \\
Example: Group_A
\end{tabular} \\
\hline \begin{tabular}{l} 
"Unaccepted groups (missing \\
in a project)"
\end{tabular} & The group is not accepted if it is not present in one of the two projects. \\
\hline
\end{tabular}

\section*{"Properties"}
\(\square\) : Properties activated for accept
Requirement: The properties of the reference object and object are different.
"OK" \(\quad\) Settings are accepted.

\section*{Command 'Commit Accepted Changes'}

Symbol: 제
Function: This command commits the accepted differences from the project comparison to the current project.

Call: "Project \(\boldsymbol{\rightarrow}\) Commit Accepted Changes".
Requirement: Changes from the project comparison have been accepted.

See also
- « \({ }^{\circ}\) Chapter 6.4.1.5.3 "Opening the detailed compare view" on page 1818

\section*{Command 'Map pool devices'}

Symbol: [
Function: Maps imported devices from the device pool to already configured devices below a PLC.
Call: Main menu "Project", Context menu.
Requirement: A project is open.
* Chapter 6.6.1.1.8 "Arrange or map devices imported to the device pool" on page 4194

\section*{Command 'Export'}

Function: This command opens a dialog box for exporting objects from a project to an XML file. Call: Menu bar: "Project".

Dialog 'Export' This dialog box lists all objects from the device tree, POU tree, and module tree that CODESYS can export.
\begin{tabular}{|l|l|}
\hline One file per subtree & \begin{tabular}{l} 
V: CODESYS generates a separate export file for each subtree that is located \\
directly under the root node and includes selected files. \\
\(\square\)
\end{tabular} \\
\hline : CODESYS generates one export file for all selected objects.
\end{tabular}

- « Chapter 6.4.1.4.2 "Exporting and importing projects" on page 1815

\section*{Command 'Import'}

Function: This command opens a dialog box for importing objects from an XML file.
Call: Menu "Project"
Requirement: A project is open.

Dialog box 'Im- The dialog box lists all objects from the export file that CODESYS can import at this point. port'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Currently selected target \\
objects"
\end{tabular} & Object that is selected in the Device tree \\
\hline "Insertable items" & \begin{tabular}{l} 
Displays all objects of the export file that CODESYS can insert below the \\
selected object.
\end{tabular} \\
\hline "Show contents" & Displays the contents of the export file in a tree structure \\
\hline
\end{tabular}

\section*{Command 'Export PLCopenXML'}

Function: This command opens a dialog box for exporting objects from a project into an XML file in the PLCopen format.
Call: Menu "Project"

Dialog box 'Ex- The dialog box lists all objects from the Device tree that CODESYS can export into an XML file port PLCo- in accordance with the PLCopen format. penXML'

The PLCopenXML scheme does not permit VAR_GLOBAL and VAR_GLOBAL CONSTANT POUs to be in the same variable list. Therefore, if you wish to export both, you must first divide the variables into two separate variable lists.

See also
- \({ }^{\wedge}\), Chapter 6.4.1.21.3.5.27 "Command 'Import PLCopenXML"' on page 2612

\section*{Command 'Import PLCopenXML'}

Function: This command opens a dialog box for importing objects from an XML file in PLCopen format.
Call: Menu "Project"
Requirement: A project is open.

Dialog box 'Im- The dialog box lists all objects from the PLCopen export file that CODESYS can import at this port PLCo- point. penXML'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Currently selected target \\
object"
\end{tabular} & Object that is selected in the Device tree \\
\hline "Insertable items" & \begin{tabular}{l} 
Displays all objects of the export file that CODESYS can insert below the \\
selected object.
\end{tabular} \\
\hline
\end{tabular}

The PLCopenXML scheme does not permit VAR_GLOBAL and VAR_GLOBAL CONSTANT POUs to be in the same variable list. Therefore, if you wish to export both, the variables must first be divided into two separate variable lists.

\section*{Command 'User management' - 'Log in User'}

\section*{Symbol: 9}

This command opens the dialog box "Login". Here you specify the project that you wish to edit and enter the login data for a user account with the corresponding rights. In addition, you can open the password manager from this dialog box.
The command is available in the menu "Project \(\rightarrow\) User Management".
See also
- ⓨ Chapter 6.4.1.6.7 "Logging in via User Account and Password Manager" on page 1827

\section*{Command 'User management' - 'Log out User'}

Symbol:
The user currently logged in to the project is logged out again with this command. This takes place without a dialog box or message, unless no user is currently logged in.

The command is available in the menu "Project \(\rightarrow\) User Management".
If the user is currently logged in to several projects or to libraries integrated in them (it does not have to be the same user account), then the dialog box "Logout" opens, in which the specific project or library project can be selected from which the current user is to be logged out.
The status bar always displays the user who is currently logged into the project.

A double-click on the field "Current user" in the status bar enables quick access to the "Login" or "Logout" dialog box.
See also
- \& Chapter 6.4.1.6.7 "Logging in via User Account and Password Manager" on page 1827
- \({ }^{*}>\) Chapter 6.4.1.21.3.5.28 "Command 'User management' - 'Log in User'"' on page 2613

\section*{Command 'User management' - 'Rights...'}

This command opens the dialog box "Rights", in which you define the actions that may be carried out, the user groups that may carry them out and the project objects on which they may be carried out.

The command is available in the menu "Project \(\rightarrow\) User Management".
See also
- \({ }^{\wedge}\) Chapter 6.4.1.6.6 "Protecting Objects in the Project by Access Rights" on page 1826

\section*{Command 'Insert Device'}

Function: Like the command "Add Device", this command opens a dialog box "Insert Device" for the selection of a device object. This object is inserted in the device tree at the same level as the currently selected object.

Call: Context menu of a device object in the device tree.
Requirement: An object is selected in the device tree below which a device object can be inserted at the same level.
See also
- \({ }^{4}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835
- \(\sum^{*}\) Chapter 6.4.1.21.3.5.3 "Command 'Insert Device"' on page 2599

\section*{Command 'Generate EtherCAT XML'}

Function: This command opens the standard dialog box for saving a file in the local file system. You can define a name and a storage location for an xml file, in which CODESYS is to store the EtherCAT configuration of the EtherCAT master currently selected in the device tree. This may be necessary in order to operate an external EtherCAT stack.
Call: Context menu of an EtherCAT master device object in the device tree.
See also
- \({ }^{4}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835

\section*{Command 'Generate Sercos SCI XML'}

The command is not integrated in the standard menu. You can add it via the dialog box "Tools \(\rightarrow\) Customize" from the category "Devices".

Function: This command opens the standard dialog box for saving a file in the local file system. You can define a name and a location for an xml file in which CODESYS then stores the configuration data of the sercos master currently selected in the device tree. This may be necessary in order to operate an external sercos stack.
Call: Context menu of a sercos master device object in the device tree.
See also
- \(\boldsymbol{y}^{*}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835
- \(\Leftrightarrow\) Chapter 6.4.1.2.2.2 "Customizing menus" on page 1802

\section*{Command 'Disable Device' - 'Enable Device'}

Function: This command switches back and forth between the enabled (activated) and disabled (deactivated) states of a device in the bus system.
Call: Context menu of a device object in the device tree.
Requirement: The project is in offline mode. The bus driver must support the function.

A disabled device is not taken into account and is not addressed. Note that with some bus systems the deactivation of a node can lead to the master stopping.
The entry of a disabled device in the tree appears in light-gray lettering.
② Chapter 6.4.1.8 "Configuring I/O Links" on page 1835

\section*{Command 'Edit I/O Mapping'}

Function: This command opens the "Edit I/O Mapping" dialog box. This displays all I/O mappings of the currently selected device object, including I/O mappings of all additional device objects that are inserted in the device tree below this object.

Call: Context menu of a device object in the device tree.

Dialog box 'Edit You can edit the I/O mapping in this dialog box in exactly the same way as in the dialog box "//O I/O mapping' mapping" of the individual device editors. The respective other dialog boxes are directly updated accordingly.
\begin{tabular}{|l|l|}
\hline "Search" & \begin{tabular}{l} 
Input field for a search string for the mapping table. The search results are \\
marked in yellow.
\end{tabular} \\
\hline "Filter" & Drop-down list for filtering I/O assignments displayed listed in the mapping table: \\
& \(\bullet\) "Show all" \\
& \(\bullet\) "Show outputs only" \\
& \(\bullet\) "Show inputs only" \\
& - "Show unmapped variables only" \\
& - "Show mapped variables only" \\
& \(\bullet\) "Show mappings to existing variables only" \\
& \(\bullet\) "Show mappings to new variables only" \\
\hline
\end{tabular}

In the context menu you will find among other things the following commands:
"Export Mappings to CSV": Stores the mappings of a device and its sub-devices in an external file. To do this you select the device in the device tree or in the mapping list.
"Import Mappings from CSV": Inserts mappings from a file created beforehand by export.
See also
- \({ }^{4}\) Chapter 6.4.1.8 "Configuring I/O Links" on page 1835
- « \({ }^{*}\) Chapter 6.4.1.21.3.5.35 "Command 'Edit I/O Mapping'" on page 2615
- \({ }^{\star}\) Chapter 6.4.1.21.3.5.37 "Command 'Export Mappings to CSV'" on page 2616
- \({ }^{\bullet}\) Chapter 6.4.1.21.3.5.36 "Command 'Import Mappings from CSV'" on page 2615

\section*{Command 'Import Mappings from CSV'}

Function: The command opens the default dialog for opening a file in the local file system. The filter is set to the file format CSV in order to import the I/O mapping configuration of a device from the file which was exported previously by means of the "Export Mappings to CSV" command. CODESYS writes the configuration to the selected device.

Call: Context menu of a device object in the "Devices" view.
Requirement: A project is open with a device and an I/O mapping configuration. The device matches the exported CSV file.

\section*{NOTICE!}

I/O mapping configurations are stored in CSV files with the semicolon separator.
These files can be edited manually. If the files are edited manually, then it is imperative that this format is retained in order to import successfully. Note: The entries of the file to the I/O mapping of the device are assigned by the device name and the parameter name. Parameter names that are not unique are numbered sequentially in this file ( \(@<n>\) ).
Fields without contents in the CSV file are ignored at import. To remove an existing entry in the I/O mapping by importing, you have to add a space in the respective field in the CSV file.

See also
- \& Chapter 6.4.1.21.3.5.37 "Command 'Export Mappings to CSV"' on page 2616
- Ehapter 6.4.1.8.2 "Configuring Devices and I/O Mapping" on page 1836

\section*{Command 'Export Mappings to CSV'}

Function: The command opens the default dialog for saving a file to the local file system. The filter is set to file format CSV. After specifying a name and a location, CODESYS stores the I/O mapping configuration in a CSV file with the semicolon separator.

Call: Context menu of a device object in the "Devices" view.
Requirement: A device object with an I/O mapping configuration is selected in the device tree.

See also
- Ela Chapter 6.4.1.21.3.5.36 "Command 'Import Mappings from CSV"' on page 2615
- © Chapter 6.4.1.8.2 "Configuring Devices and I/O Mapping" on page 1836

\section*{Command 'Read PLC Parameter File to Configuration'}

Function: This command reads the configuration file IoConfig.par of the PLC and stores the values in the project. Such a file is created if the parameters of the PLC have been changed by another device, for example via a visualization. Then these parameters are changed only in the memory of the PLC, but not in the configuration of the project.
Call: Context menu of the PLC device object
Requirement: You have made the command available using the dialog in "Tools \(\boldsymbol{\rightarrow}\) Customize".

\section*{Command 'Online Config Mode'}

Function: This command is for switching the online configuration mode on and off. At switch-on it establishes a connection to the PLC and loads an implicitly created application "HiddenOnlineConfigModeApp" to the PLC. Depending on the device, CODESYS goes into simple online configuration mode or a dialog box appears for selecting between simple and advanced online configuration mode.
Call: Context menu of the PLC object in the device tree
Requirement: The communication settings for the PLC device are correctly set.

Simple online configuration mode:
This command creates the implicit application HiddenOnlineConfigModeApp and loads it to the controller. The application automatically initializes all inputs and outputs of the controller once. After that you can access the I/Os as follows:
- Read I/Os
- Write outputs
- Diagnosis (in the device tree and on the "Status" tab of the device editor)
- Scan (of the current hardware)
- Interactive online functions, if supported (for example, writing asynchronous messages)

Advanced online configuration mode (parameter mode):
If there are already applications on the PLC and the controller supports it, the command first opens the dialog box "Devices", which displays the applications existing on the controller. From this dialog you can connect via the button "Parameter mode" to the PLC and then access the values of the device parameters without having to log in with a real application.

\section*{Writing and forcing in the I/O mapping}

In online configuration mode the writing and forcing of values on the "//O
Mapping" tab works differently to the way it works in real online mode. The outputs are written immediately after insertion into the table. There is no "Prepared Value" column; instead, the initial values can be changed directly after a doubleclick on the column "Current Value".

Dialog box This dialog box appears after the command "Online Config Mode" if the device supports the 'Config applica- advanced online configuration mode and there are already real applications on the controller. tion mode'
\begin{tabular}{|l|l|}
\hline "Parameter mode" & \begin{tabular}{l} 
The controller configuration in the project is compared with that on the device. \\
If they correspond, CODESYS establishes a connection to the PLC. Unlike the \\
simple online configuration mode it permits the reading and - if supported by the \\
driver - the writing of parameters in the generic device editor. The applications \\
already loaded to the device remain unchanged in this case!
\end{tabular} \\
\hline "Config application mode" & CODESYS switches to the 'simple online configuration mode'. \\
\hline
\end{tabular}

\section*{Command 'Runtime licensing'}

\section*{Symbol: \([\)}

Function: Management of runtime licenses on the PLC. The use of some libraries and devices require the PLC to have a runtime license.
Call: Main menu "Project", Context menu. Displayed only offline.
Requirement: A project is open. Log-in required for managing runtime licenses without need for memory card.
The license status of a PLC can be displayed at any time \({ }^{\Perp}\) Chapter 6.3.2.2.2.6 "View license information" on page 1453.

\section*{Command 'Generate Code'}

Symbol (\#; shortcut: [F11]
Function: The command starts the code generation for the active application.
Call: Menu bar: "Build"
When generating code with this command, code is generated as when downloading the application to the PLC, but the code is not transferred to the PLC. At this time, other source code tests are performed As a result, you can check the code for bugs that were not detected by the compiler and for fixing any bugs before the code is used in online mode.
See also
- ※y Chapter 6.4.1.11.5 "Generating Application Code" on page 1976

\section*{Command 'Clean'}

Function: This command deletes the build information for the active application.
Call: Main menu "Build".
During the last download, the build information was created and saved to a file (*.compileinfo).
After a cleaning process, an online change is no longer possible for the affected application. The application must be fully downloaded to the controller again.

See also
- \({ }^{4}\) Chapter 6.4.1.21.3.6.3 "Command 'Clean All"' on page 2618

\section*{Command 'Clean All'}

Function: This command deletes the build information for all applications in the project.
Call: Main menu "Build".
During the last download, the build information was created in the local file system and saved to a file ( \({ }^{*}\).compileinfo).
This command requires a download before another login An online change is no longer possible. As compared to the "Clean" command (only the active application), CODESYS regenerates the language model for all objects, which is very time-consuming.

\section*{NOTICE!}

Reconsider carefully whether or not executing this command is really necessary. If you only want to rebuild and download the active application, then execute the "Clean" command.

See also
- * \({ }^{*}\) Chapter 6.4.1.21.3.6.2 "Command 'Clean'" on page 2618

\section*{Command 'Build'}

Function: The command starts the build operation for the active application.
Call: The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools \(\rightarrow\) Customize" (command category "Build").
During the build operation, CODESYS performs a syntactic validation of all objects in the application. However, code is not generated like at log in to the target system or download of the application. The build operation is always performed automatically when you log in with a changed program.

When the check is complete, CODESYS displays any error messages or warnings in the message view ("Build" category).
If the program has not been changed since it was compiled without errors the last time, then it is not recompiled. The message "The application is current" appears. If the syntactic validation is repeated, then you must execute the "Rebuild" command.
See also
- \(\quad\) \& Chapter 6.4.1.21.3.6.5 "Command 'Rebuild'" on page 2619

\section*{Command 'Rebuild'}

Function: The command starts the build operation for the active application, even if the last build contained errors.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools \(\rightarrow\) Customize" (command category "Build").

See also
- \(\quad \Leftrightarrow\) Chapter 6.4.1.21.3.6.4 "Command 'Build'" on page 2619

\section*{Command 'Generate Runtime System Files'}

Function: The command generates a C stub file and an M4 interface file from the current library project. These files are used as the basis for creating an external library file.
Call: Menu bar: "Build"
Requirement: A library project is open.
The command opens the "Generate Files for Runtime System" dialog.
\begin{tabular}{|l|l|}
\hline "Output directory" & \begin{tabular}{l} 
Directory where CODESYS creates the runtime system files. Click the ... button \\
to open the default dialog for browsing the file system.
\end{tabular} \\
\hline "Component names" & Name of the library project \\
\hline \multicolumn{2}{|l|}{ "Which files do you want to create?" } \\
\hline
\end{tabular}

\section*{Command 'Check all Pool Objects'}

Symbol i*; shortcut: [F11]
Function: The command starts a build operation (a syntax check) for all pool objects that are managed in the POU view and as a result are available throughout the project. First and foremost, this is useful when creating libraries.
Call: Menu bar: "Build"
Requirement: A library project is open.

\section*{NOTICE!}

The command does not result in code generation. In addition, no file is created in the project directory with information about the build operation.

See also
- \# Chapter 6.4.1.21.4.15.2 "Dialog 'Customize' - 'Menu"' on page 2801
- \(\xi^{*}\) Chapter 6.4.1.17.3 "Information for Library Developers" on page 2035

\section*{Command 'Generate Code for Active Application'}

Function: The command generates the code for the application of a library project.
Call: Menu bar: "Build"
Requirement: The project contains an application.
- A library project is open.
- The library project contains an application.

When generating code with this command, code is generated as when downloading the application to the PLC, but the code is not transferred to the PLC. At this time, other source code tests are performed As a result, you can check the code for bugs that were not detected by the compiler and for fixing any bugs before the code is used in online mode.
See also
- Chapter 6.4.1.21.3.6.6 "Command 'Generate Runtime System Files'" on page 2619

\section*{Command 'Check All Application Objects'}

Function: This command starts a build operation for all objects of the active application, even for the POUs that are not used by the application. After the build operation, the errors that were found in the unused objects are also displayed in the message window.
Call: The command is not in any menu by default. You can add it to a menu by using the dialog from "Tools \(\boldsymbol{\rightarrow}\) Customize" (command category "Build").
Requirement: An application of the open project is active.

\section*{NOTICE!}

The command does not result in code generation. In addition, no file is created in the project directory with information about the build operation.

See also
- © Chapter 6.4.1.21.4.15.2 "Dialog 'Customize' - 'Menu"' on page 2801

\section*{Command 'Check Library Compatibility'}

Function: The command triggers a check whether the currently opened library project is compatible with the last installed version of this library (next lower version number).

Call: By default the command is not available in any menu. You can add it to a menu by using the "Tools \(\rightarrow\) Customize" dialog, command category "Build".
Requirement: A library project is opened.
The check regards differences in the implemented interfaces of a method. So, after the check you will get displayed error messages in the messages window in the following cases:
- Adding or removing inputs or outputs of function blocks, functions or methods
- Changing the data type of inputs or outputs
- Modifying the implemented interfaces of a method

\section*{Command 'Choose Active Application'}

Symbol: \(\qquad\)
The command is implemented as a list box from which you can set an application active. By default, the list box is located on the toolbar.

Function: The list box displays the currently active application with its device path.
Call: The list box contains all applications that are organized in the "Devices" view. By clicking an entry in the list box, you activate the selected application.
Requirement: The project has multiple applications.
\begin{tabular}{|c|c|c|}
\hline \multirow[t]{5}{*}{Example} &  & \\
\hline & App [Device: PLC Logic] & - \(\square 4\) \\
\hline & App [Device: PLC Logic] & \\
\hline & App [Device2: PLC Logic] & \\
\hline & SubApp [Device: PLC Logic: App] SubSubApp [Device: PLC Logic: App: SubApp] & \\
\hline
\end{tabular}

When you call commands in the "Build" oder "Online" menus, these commands are applied to the active application. This is displayed in the list box, and also displayed in bold in the device tree. In particular, this applies to the "Build
\(\rightarrow\) Build" and "Online \(\rightarrow\) Login" commands.
You can also access these commands using the command icons on the toolbar where the list box is located. When the command icons are called, they are also applied to the active application.
However, if you call a command from the context menu of a device object in the device tree, then the command is applied to the corresponding object. For example, by calling you can establish a connection to an application on the device which is not active.

See also
- \& Chapter 6.4.1.21.3.5.12 "Command 'Set Active Application'" on page 2603
- \(\xi^{\sharp}\) Chapter 6.4.1.21.3.6.4 "Command 'Build'" on page 2619
- \({ }^{\circ}\) Chapter 6.4.1.21.3.7.2 "Command 'Login'" on page 2624

\section*{Command 'Login'}

Symbol: ©s; shortcut: [AIt]+[F8].
Function: The command connects the application to the target system (PLC to simulated device) and starts the online mode.

\section*{Call: Menu bar: "Online"; context menu of an "Application" object}

Requirement: The application contains no errors and the communication settings are configured.

A dialog prompt opens if the communication settings are incorrect. You can then switch directly to the "Communication Settings" of the PLC.
If you click "Login" from the online menu, then the currently active application is connected to the target system. If you choose this command from the context menu (right-click) while an application is selected in the device tree, then that application is logged in, even if it is not set as the active application.

If an online user management is configured on the target device, then you are prompted for user data when you log in. The "Device User Login" dialog opens for this.

\section*{CAUTION!}

\section*{Check controller accessibility}

For security reasons, controllers should not be accessible from the Internet or untrusted Networks under any circumstances! In particular, the TCP/IP programming ports (usually UDP-Ports 1740.. 1743 and TCP-Ports \(1217+11740\) or the controller specific ports) should not be accessible from the internet without protection. In case Internet access to the controller is needed, using a a safe mechanism is absolutely mandatory, such as VPN and password protection of the controller.
«̌ Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.
For more information, see the "Subordinate Safety Controllers" chapter.

Possible situations when logging in:
- A later version of the device description (than in the project) is on the PLC. A warning prompt is displayed with the option to cancel the process.
- The application does not exist on the PLC: You are prompted to confirm the download.
- The application is already on the PLC and has not been changed since the last download. The login continues without any more prompts.
- The application exists on the PLC, but it has been changed since the last download. You are prompted to select one of the following options:
- Login with online change (Note the information about online changes in the help page "Command 'Online Change' ".)
- Login with download
- Login without any change

The position also provides the option of updating the boot application on the PLC.
- An unknown version of the application exists on the PLC. CODESYS prompts you to replace it.
- A version of the application exists on the PLC and is running. CODESYS prompts you to log in anyway and overwrite the currently running application.
- The application on the PLC is currently halted at a breakpoint. You are logged out and the program has been changed: CODESYS prompts you with a warning that the PLC will be stopped completely if an online change or download occurs. This happens also if several tasks exist and the breakpoint affects only one of them.

Click "Details" in the dialogs above to open the "Application Information" dialog.

In CODESYS V3.5 SP17 and higher, only exactly one CODESYS instance can ever be logged in to an application of a controller. If a second CODESYS instance wants to log in to the same application of the same controller, then an error message is displayed.

See also
- « \({ }^{*}\) Chapter 6.4.1.21.3.7.6 "Command 'Online Change"' on page 2629
- \& Chapter 6.4.1.10.7 "Subordinate safety controller" on page 1964

Dialog 'Applica- The dialog provides two tabs with comparative information about the application changed in the tion Information' development system and its previous version currently located on the PLC. There are two tabs: (Details)
- "Application information": The application properties of the "Application in the IDE" (Integrated Development Environment) are compared with those of the "Application in the PLC": Project name, Last modification, IDE version, Author, Description. In addition, CODESYS shows the objects that have changed since the last download.
- "Application contents": When the "Download application info" is selected, the contents of the applications on both the (1) development system and (2) PLC can be compared. The "Download application info" option is located on the "Application Build Options" tab of the application properties.
If the code in the development system is not current, then (3) "Application not up to date. Generate code now?" appears at the bottom left of the dialog. Execute this command to update the application source code.
This detailed information can help you to better assess the effects of login in the current situation and to make a decision about downloading the new application.

See also
- \& Chapter 6.4.1.21.2.8.5 "Tab 'Applications"' on page 2434
- \& Chapter 6.4.1.5 "Comparing projects" on page 1817

Unknown appli- If one or more applications are already on the PLC, but are not in the project, then CODESYS

\section*{cations on the}

PLC opens a dialog with a list of these applications. You can then define whether an application should be deleted before loading the current application from the PLC. This also applies to child applications that are on the PLC, but have been deleted from the project in the meantime.

\section*{Compiling the project before login}

If an application program has not been compiled since the last change, then CODESYS compiles the project before login. This operation is the same as the "Generate Code" command when logged out.
If compile errors occur, then a dialog prompt opens. The errors are displayed in the message view in the "Build" category. You can then decide whether or not you log in without downloading the program to the PLC.
See also
- \(\boldsymbol{y}^{\text {® }}\) Chapter 6.4.1.21.3.6.4 "Command 'Build"' on page 2619

Error at login If an error occurs when logging in to the PLC, then CODESYS cancels the loading operation with an error message. The error dialog gives you the options of showing the error details. If an exception was thrown and the text *SOURCEPOSITION* is included in the log, then you can display the affected function in the editor by clicking "Show in Editor". The cursor jumps to the line containing the error.

Messages during the download operation

If CODESYS downloads the project to the PLC at login, then the following information is printed to the message view:
- Generated code size
- Size of the global data
- Resulting memory requirement on the PLC
- List of the affected blocks (for online change)

In online mode, you cannot change the settings of the devices or modules. You have to logout of the application for changing device parameters. Depending on the bus system, there may be some special parameters that you can also change in online mode.

CODESYS saves the view configuration separately in online and offline mode. In addition, views are closed that cannot be used in any operating mode. For this reason, the view can change automatically at login.

\section*{Command 'Logout'}

Symbol: keyboard shortcut: [Ctrl]+[F8].
Function: This command disconnects the application from the target system (controller or simulated device) and returns to offline mode.

Call: Main menu "Online", or context menu of the "Application" object.

\section*{Command 'Create Boot Application'}

Function: This command generates a boot application.
Call: Main menu "Online".

A boot application is the application that is started automatically when the controller is switched on or started.
In offline mode, you can save the boot application in any directory. In online mode, CODESYS save the boot application to the target device. The file name is <application name>.app.

See also
- ⓨ Chapter 6.4.1.11.7 "Generating boot applications" on page 1978
- \({ }^{4}\) Chapter 6.4.1.21.2.2 "Object 'Application'" on page 2410

\section*{Command 'Load'}

Function: This command causes a compilation of the active application with subsequent download to the controller.
Call: Menu bar: "Online".
Requirement: The application is in online mode.
When you execute this command, CODESYS performs a syntax check and generates the application code. This code is downloaded to the PLC. Furthermore, CODESYS generates the build log <project name>.<device name>.<application ID>.compile info in the project directory.

\section*{NOTICE!}

During loading all variables are re-initialized with the exception of persistent variables.

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.
For more information, see the "Subordinate Safety Controllers" chapter.

The description of the "Login" command describes the possible situations when logging in and loading.
If you attempt to download an application when the same version of the application is already on the PLC, then you get the message: "Program is unchanged. Application was not downloaded". CODESYS downloads the application to the PLC.
During loading a record of the actions being executed (generation of code, execution of initialization, etc.) appears in the Message window in the message category "Compile". Furthermore, information is displayed regarding the memory ranges, the size of the code, the global data and the allocated memory. For the purpose of clarity, as opposed to the online change, the modified function blocks are no longer listed.
See also
- \({ }^{〔}\) Chapter 6.4.1.21.3.7.2 "Command 'Login'" on page 2624
- «y Chapter 6.4.1.10.7 "Subordinate safety controller" on page 1964

\section*{Command 'Online Change'}

Function: The command is used for initiating an online change on the current application. When this is done, CODESYS re-downloads only the changed parts of an application that is already running on the PLC.

Call: Menu bar: "Online"; context menu of an "Application" object
Requirement: The application is in online mode.
The command is available in the context menu if an application is selected in the device tree. In this way, you can perform an online change just for one application, even if that application is not currently active.

\section*{CAUTION!}

An online change modifies the running application program and does not cause a restart.
Make sure that the new application code still has the required effect on the controlled system.
Depending on the controlled plant, the plant and workpieces may be damaged or the health and life of persons could be endangered.

\section*{NOTICE!}
1. When an online change is performed, the application-specific initializations (example: homing) are not executed because the machine retains its status. For this reason, the new program code may not have the intended effect.
2. Pointer variables retain their value from the last cycle. When a pointer refers to a variable whose value was changed in an online change, the variable no longer yields the correct value. Make sure that the pointers are re-assigned in each cycle.
3. After the parent application has been changed, a child application is removed from the controller when an online change is performed.

\section*{NOTICE!}

For compiler version >=3.5.0.0, a fast online change is performed for minor changes. In this case, only the modified blocks are compiled and downloaded. In particular, no initialization code is generated. This means that also no code is generated when variables with the init_on_onlchange attribute are initialized. As a rule, this has no effect because the attribute is used primarily for initializing variables with addresses. However, it cannot happen that a variable changes its address during an online change.
To secure the effect of the init_on_onlchange attribute in the entire application code, you must deactivate the fast online change in general for the application by using the compiler definition no_fast_online_change. To do this, insert the definition in the application "Properties" ("Build" \(\overline{\text { tab }}\) ).

At the time of download, CODESYS also lists the changed interfaces, affected variables, and all blocks with new generated code in the "Build" category of the message view. If memory locations change, a dialog will inform you of possible problems in conjunction with pointers.

In the "Online Change Memory Reserve" view, memory reserves can be configured for the online change so that instance variables do not have to be moved in the memory when changing a function block in an online change.

\section*{What prevents an online change?}

There are actions in CODESYS after which an online change on a controller is no longer possible. Afterwards, the application always has to be completely recompiled. A typical case is the "Clean All" action which deletes the compile information stored at the last download. However, these kind of actions typically generate a warning which you have to acknowledge.

But there are also "normal" editing actions that result in an online change not being possible at the next login. Therefore, pay attention to the following symbol in the status bar when editing in the program POUs: 包. When this symbol turns red in color ( 0 the controller can be performed. Double-clicking the symbol opens the "Application Information" dialog with a list of differences to the last download. In the dialog, you also find information about which of the changes prevent an online change.

Actions and changes in different areas of an application that prevent an online change:
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
Check func- \\
tions
\end{tabular} & \begin{tabular}{l} 
Activation or removal of a check function (CheckBounds, CheckRange, \\
CheckDiv, etc.) \\
Change in an interface of a check function (also the insertion and deletion of \\
local variables)
\end{tabular} \\
\hline \begin{tabular}{l} 
Task configu- \\
ration
\end{tabular} & Change in the configuration settings \\
\hline \begin{tabular}{l} 
Project set- \\
tings
\end{tabular} & \begin{tabular}{l} 
Change of the "Compile Options" in the "Settings" section (Unicode, replace \\
constants, logging in, breakpoints) \\
Change in the "Compiler defines"
\end{tabular} \\
\hline \begin{tabular}{l} 
Application \\
properties
\end{tabular} & Change of the "Target system memory settings" ("Build" tab) \\
\hline \begin{tabular}{l} 
POU proper- \\
ties
\end{tabular} & Change of the "External implementation" option ("Build" tab) \\
\hline \begin{tabular}{l} 
Task-local \\
global vari- \\
able list
\end{tabular} & \begin{tabular}{l} 
All changes \\
\hline \begin{tabular}{l} 
Function \\
block
\end{tabular} \\
\begin{tabular}{l} 
Change of the base POU of a function block (EXTENDS FBbase), also the \\
insertion or deletion of such a base POU \\
Change in the interface list (IMPLEMENTS ITF). Exception: Adding a new \\
interface at the end of a list
\end{tabular} \\
\hline Data type \\
\begin{tabular}{l} 
Change of the data type of a variable from a user-defined data type to another \\
user-defined data type (for example, from TON to TOF) \\
Change of the data type from a user-defined data type to a base type (for \\
example, from TON to TIME) \\
Note: As a workaround, you should always change the name of the variable \\
together with the data type. Then the variable is initialized as a new variable \\
and the old one is removed. Then an online change is possible.
\end{tabular} \\
\hline \begin{tabular}{ll} 
Alarm config- \\
uration
\end{tabular} \\
\begin{tabular}{l} 
Change in the alarm database configuration \\
Change of the number of latch variables (also has an effect on the memory \\
format in the database) \\
Change to the configuration of the distributed alarms
\end{tabular} \\
\hline Data source
\end{tabular} \begin{tabular}{l} 
All changes in the configuration \\
\hline Device config- \\
uration
\end{tabular} \\
\begin{tabular}{l} 
Change in the device tree (also by the "Update Device" command) \\
Change in a device configuration: By default, changes to device parameters \\
are not capable of online change. However, exceptions can be configured in \\
the device description. \\
Note: I/O mapping to variables is possible by online change.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Visualization & \begin{tabular}{l} 
Toggling of the overlay function \\
Before V3.5 SP6: Change in the configuration of the trace element \\
Note: In V3.5 SP6 and higher, the following applies: For online changes \\
that affect visualizations or affect the data of the application (for example, \\
a new variable is inserted), the visualization is completely reinitialized. For \\
TargetVisu, for example, this means that the visualization closes and reopens \\
with the start page. For WebVisu, the visualization also restarts with the start \\
visualization after a short waiting period.
\end{tabular} \\
\hline \begin{tabular}{l} 
Unit conver- \\
sion
\end{tabular} & \begin{tabular}{l} 
Insertion or removal of objects for unit conversion
\end{tabular} \\
\hline Trend & \begin{tabular}{l} 
Change of the number of variables or maximum number of variables. Change \\
of the number of variables with a description or special line settings
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Source Download to Connected Device'}

Function: This command loads the project source code (as project archive) to the controller currently connected.
Call: Main menu "Online".
Requirement: The application is in online mode.
See also
- \(\quad\) \& Chapter 6.4.1.21.3.2.10 "Command 'Source Upload'" on page 2559
- \({ }^{\bullet}\), Chapter 6.4.1.21.3.2.11 "Command 'Source Download'" on page 2560

\section*{Command 'Download Manager'}

Symbol: 匋
Function: Download or create a boot project from the project devices or update the firmware oft he device.
Call: Main menu "Online", Context menu.
Requirement: A project is open.

\section*{Command 'Multiple Download'}

Function: The command causes the code generation of the applications contained in the project as well as the loading of the applications to the corresponding controllers.

Call: Menu bar: "Online"

The command opens a dialog with a list of the applications. In this dialog, select the applications that are to be loaded. Then, CODESYS performs the syntax check of these applications and generates the respective code. The code is then downloaded to the respective PLC. For each selected application, CODESYS generates a build log with the name <project name>.<device name>.<application ID>.compileinfo in the project directory.

For more information, see the "Subordinate Safety Controllers" chapter.

Dialog 'Multiple
Download'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Please select the items to be \\
downloaded"
\end{tabular} & \begin{tabular}{l}
\(\boxed{\swarrow}\) : Selection of the applications. The applications are thereby also loaded to \\
different controllers.
\end{tabular} \\
\hline "Move Up", "Move Down" & \begin{tabular}{l} 
Change of the order of download of the applications. \\
The applications are downloaded to the PLCs in the order of this list. By default, \\
this list is alphabetically sorted. Parent-child relationships of applications are \\
thereby taken into account.
\end{tabular} \\
\hline "OK" & \begin{tabular}{l} 
Checks the syntax of all selected applications. Afterwards, the communication \\
with the associated controller is verified for each application before the download \\
takes place.
\end{tabular} \\
\hline
\end{tabular}

Table 495: "Online Change Options"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
If an earlier version already exists on the PLC and is different from the current version, then the following options \\
are provided:
\end{tabular} \\
\hline \begin{tabular}{l} 
"Try to perform an online \\
change. If this is not possible, \\
perform a full download."
\end{tabular} & \begin{tabular}{l} 
Activated by default. If an online change cannot be executed for one of the \\
applications, then a download is performed.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Force an online change. If \\
this is not possible, cancel the \\
operation."
\end{tabular} & \begin{tabular}{l} 
If an online change cannot be performed for (at least) one of the applica- \\
tions, then no download is performed and the online change is terminated (for \\
example, if you have executed the command "Clean All" beforehand).
\end{tabular} \\
\hline \begin{tabular}{l} 
"Always perform a full \\
download."
\end{tabular} & \begin{tabular}{l} 
Downloads all parts of the applications to the PLC, regardless of any existing \\
versions.
\end{tabular} \\
\hline
\end{tabular}

For selected applications that do not exist on the PLC yet, CODESYS performs a download automatically to the PLC.

Table 496: "Other Options"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Delete all applications on the \\
PLC which are not part of the \\
project."
\end{tabular} & \(\boxed{\square}\) : Corresponding applications are deleted \\
\hline \begin{tabular}{l} 
"Start all applications after \\
download or online change"
\end{tabular} & \(\boxed{\square}\) : The applications are started after the download or online change. \\
\hline \begin{tabular}{l} 
"Do not release forced \\
variables"
\end{tabular} & \begin{tabular}{l} 
implementation of this application has been changed, then no download is per- \\
formed for this application. \\
The message "Error: Skipped because one or more variables have been forced" \\
appears for this application in the window "Multiple Download - Result".
\end{tabular} \\
\hline
\end{tabular}

Note that variables with the key attribute PERSISTENT RETAIN are not generally initialized. If you change the data layout, however, the persistent variables are automatically re-initialized.

After completion of the download a listing of all selected applications appears in the download order that you configured. In addition, you are shown information on the success of the download for each application in the "Multiple Download - Result" dialog:
- "Created": A new application has been created and downloaded to the controller.
- "Not changed": The application which exists on the controller has not been changed.
- "Online changed": The application which exists on the controller has been modified by an online change.
- "Downloaded": The application which exists on the controller has been replaced by a new created application.
- "Skipped due to impossible online change": An online change could not be performed for the application. The application was not changed.
- "Error": An error has occurred for this application during download. More details may be displayed.
- "Cancelled by user": The operation has been aborted by the user.

\section*{Command 'Reset Cold'}

Function: The command results in a cold start of the active application on the controller.
Call: Menu bar: "Online"
Requirement: The application is in online mode.

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Cold", the following happens:
- Application code is retained on the controller.
- Variables are initialized (with the initialization value or the default initialization value 0 ), and the previous values are lost.
- Retain variables are initialized, and the previous values are lost.
- Persistent variables are retained with values.
- Breakpoints that were set in the code are retained with their status (for example, activated or deactivated).
- The application goes into the "STOP" state.

You can also select the command while debugging the application when it halts at a breakpoint in the "HALT ON BP" state. Then either the warm start is executed immediately, or the remaining statements of the current cycle are processed. Therefore, a message window opens for you to select the next action. However, the message window opens only if the runtime system is capable of restarting the cycle without terminating it first.

After the reset, you can run the application as usual and, for example, start the execution by clicking "Debug \(\rightarrow\) Start".

\section*{Command 'Reset Warm'}

Function: The command results in a warm start of the active application on the controller.
Call: Menu bar: "Online"
Requirement: The application is in online mode.

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections temporarily.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Warm", the following happens:
- Application code remains loaded on the controller.
- Variables are initialized (with the initialization value or the default initialization value 0 ).
- Retain variables are retained with values.
- Persistent variables are retained with values.
- Breakpoints that were set in the code are retained with their status (for example, activated or deactivated).
- The application goes into the "STOP" state.

You can also select the command while debugging the application when it halts at a breakpoint in the "HALT ON BP" state. Then either the warm start is executed immediately, or the remaining statements of the current cycle are processed. Therefore, a message window opens for you to select the next action. However, the message window opens only if the runtime system is capable of restarting the cycle without terminating it first.
After the reset, you can run the application as usual and, for example, start the execution by clicking "Debug \(\rightarrow\) Start".

- \(\Leftrightarrow\) Chapter 6.4.1.21.3.7.12 "Command 'Reset Origin"" on page 2635

\section*{Command 'Reset Origin'}

Function: The command results in a reset origin of the active application on the controller.
Call: Menu bar: "Online"
Requirement: The application is in online mode.

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections permanently.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.

For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Origin", the following happens:
- The application code is deleted, and as a result the application has no state.
- Variables are deleted, and the values are lost.
- Retain variables are deleted, and the values are lost.
- Persistent variables are deleted, and the values are lost.
- Breakpoints that were set in the code are lost.

\section*{Command 'Reset Origin Device'}

Function: The command opens a dialog to reset the device to its factory settings. All applications, boot applications, and remanent variables will be deleted from the device. Depending on the version of the device, a selection of the elements to be deleted can be made in this dialog. When these elements are unselected in the dialog, they are not deleted during the reset and remain on the controller. By default, all elements are selected and everything is deleted. Elements that are not available for selection are generally also deleted.
Call: Right-click a programmable device in the device tree.

\section*{NOTICE!}

If a safety controller is inserted below a controller, then this command can interrupt the communication connections permanently.
Connections of the safety controller to other safety controllers (via safety network variables), to field devices, and to the development system are affected. The safe field devices or other safety controller can enter the safe state as a reaction. The connection to the development system is affected only when a safety controller that is connected to the main controller via a fieldbus.
For more information, see the "Subordinate Safety Controllers" chapter.

After restarting with "Reset Origin Device", the following happens:
- All applications are reset as with the "Reset Origin" command.
- All files, which are not deleted by the "Reset Origin" command, are deleted (for example, files from visualization, alarms, and recipes).
- The user management is deleted.
- All certificates which are currently managed by the runtime system are deleted.

Note: When resetting the device, the objects selected in this dialog are also deleted. If not all displayed objects are selected in this dialog, then possibly other objects can no longer be used or they are also deleted. .
\begin{tabular}{|c|c|}
\hline "Delete" & \(\checkmark\) : The object is deleted when the "Reset Origin Device" command is executed. \\
\hline "Object" & \begin{tabular}{l}
Objects that can be excluded from "Delete". \\
The listed objects depend on the version of the controller. In version 3.5.16.20 and higher, the following objects can be excluded from the delete operation. \\
- "User Management" \\
- "PLC Logic" \\
- "Certificates"
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Logoff Current Device User'}

Symbol: ©
Function: This command logs out the user currently logged in to the controller (device). If CODESYS still has a connection to the controller, then it will be disconnected.

Call: Main menu "Online".
Requirement: The application is in online mode.

You can manage the device user management in the "Users and Groups"
tab and "Access control" of the device editor. The commands in the "Online
\(\rightarrow\) Security" menu provide another simple option for protecting access to the target device.

See also
- ② Chapter 6.4.1.21.2.8.14 "Tab 'Users and Groups'" on page 2450
- \({ }^{*}\) Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971

\section*{Command 'Download'}

Function: This command loads the compiled project in the PLC.
Call: Main menu "Online", Context menu.
Requirement: A project is open. Log-in required for download.

\section*{Command 'Add Device User'}

Symbol:
Function: This command configures a new device user and adds this user to the administrator group.

\section*{Call: Menu bar: "Online \(\rightarrow\) Security"}

Requirement: The device supports a device user management. You are logged in to the device as a user.

You can manage the device user management in the "Users and Groups" tab and "Access control" of the device editor. The commands in the "Online \(\rightarrow\) Security" menu provide another simple option for protecting access to the target device.

See also
- \({ }^{*} \Rightarrow\) Chapter 6.4.1.21.2.8.14 "Tab 'Users and Groups'" on page 2450
- \(\quad 4\) Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971

This command opens the "Add Device User" dialog. Here you define the access data of the new user.
The dialog corresponds to the dialog in the "Users and Groups" tab of the device editor for adding a new user.

Please use a strong password as follows:
- Password length >= 8 characters (best >=12)
- Use uppercase and lowercase
- Include numbers
- Use special characters
- Do not use existing names or sequence of characters that are easy to guess (for example, "123", "abc", "qwerty")

\section*{CAUTION!}

After performing this action, you can no longer use a blank username and password to log in. You must remember your password.

See also
- \({ }^{\circ} \gg\) Chapter 6.4.1.21.3.7.17 "Command 'Remove Device User"' on page 2638
- \#y Chapter 6.4.1.21.3.7.18 "Command 'Change Password Device User'" on page 2639

\section*{Command 'Remove Device User'}

Symbol:
Function: This command removes a user from the user management on the target system (device).
Call: Menu bar: "Online \(\rightarrow\) Security"
Requirement: You are logged in to the device as a user.

You can manage the device user management in the "Users and Groups"
tab and "Access control" of the device editor. The commands in the "Online \(\rightarrow\) Security" menu provide another simple option for protecting access to the target device.

See also
- \({ }^{4}\), Chapter 6.4.1.21.2.8.14 "Tab 'Users and Groups'" on page 2450
- \(\Rightarrow\) Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971

This command opens the "Remove Device User" dialog. Specify the user name and password of the user to be removed and click "OK" to confirm.

\section*{CAUTION!}

After performing this action, you can no longer use this removed user account to log in. If this user is the only one on the target system, then a dialog prompt notifies you that this user cannot be removed.

See also
- \(\sum^{\wedge}\) Chapter 6.4.1.21.3.7.16 "Command 'Add Device User'" on page 2637
- \(\boldsymbol{y y}^{2}\) Chapter 6.4.1.21.3.7.18 "Command 'Change Password Device User'" on page 2639

\section*{Command 'Change Password Device User'}

Symbol:
Function: The command changes the password for the user who is currently logged on the PLC.

Call: "Online \(\rightarrow\) Security" menu
Requirement: You are logged in to the device as a user.
The command opens the "Change Password for Device User" dialog for defining a new password. You have to specify the old password again.

\section*{NOTICE!}

After performing this action, you can no longer use the previous password to log in.

Make sure that you use a strong password. Note the following:
- Password length >= 8 characters (best >=12)
- Use uppercase and lowercase
- Include numbers
- Use special characters
- Do not use existing names or sequence of characters that are easy to guess (for example, "123", "abc", "qwerty")

- \(\Leftrightarrow\) Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971

\section*{Command 'Stop Execution on Handled Exceptions'}

Function: This command halts the application where the error is located despite a programmed exception handling.
Call: This command is not available by default, but it can be configured from the "Tools
\(\rightarrow\) Customize", "Add Command" dialog box ("Online" category).

Requirement: The application is in online mode and contains a programmed exception handling with the __TRY and __CATCH operators.
If you have configured this command from the "Online" menu and you call it from there, then the currently active application is affected. Furthermore, this command can help you to detect errors.
See also
- \({ }^{\#} \boldsymbol{y}\) Chapter 6.4.1.20.3.62 "Operators '__TRY', '__CATCH', '__FINALLY', '__ENDTRY"" on page 2206
- « "Adding commands" on page 1803
- \({ }^{\text {• }}\), Chapter 6.4.1.21.3.9.16 "Command 'Customize"' on page 2667

\section*{Command 'Connect to Device'}

Function: The command establishes a connection to the device currently selected in the device tree.
Call: Context menu of the device.
Requirements: A device is selected in the device tree. The communication settings are configured correctly.
See also
- « Chapter 6.4.1.21.3.7.21 "Command 'Disconnect from Device'" on page 2640

\section*{Command 'Disconnect from Device'}

Function: The command disconnects the connection from a device.
Call: Context menu of the device.
Requirements: A device is selected in the device tree.
See also
- \({ }^{*}\) Chapter 6.4.1.21.3.7.20 "Command 'Connect to Device"' on page 2640

\section*{Command 'Wink'}

Symbol:
Function: The command causes an LED of a connected controller to blink. As a result, the hardware can be identified clearly.

Call: The command is not in any menu by default. You can add it to a menu by means of the
"Tools \(\rightarrow\) Customize" dialog, in the "Online" command category.
Requirement: The controller supports this function and the connection parameters are configured correctly.

\section*{Command 'Simulation}

Function: The command switches the development system to simulation mode. Call: Menu bar: "Online"

In simulation mode, you can start and debug the active application an on a simulated target device. A physical target device is not necessary for testing the online behavior of an application. When logging in for the first time, you are prompted whether the application should be created or loaded. For a simulated device, you do not have to configure the communication settings. In CODESYS simulation mode, the entry of the controller in the device tree is displayed in italics.

\section*{NOTICE!}

\section*{No C code for simulation mode}

In simulation mode, C code is not generated and loaded to the runtime system. To simulate the code contained in the C modules anyway, you can implement it for this purpose in the respective IEC objects of the C code module.

After successful login, the red triangle symbol \((\boldsymbol{\Delta})\) in the device tree indicates simulation mode. You can use the corresponding online commands for testing the application.

To switch off simulation mode, log out of the controller and execute the "Simulation" command again.

The command affects the active application only.

Differences between simulation mode and operation with a physical controller
\begin{tabular}{|c|c|c|}
\hline & Simulation & Physical Controller \\
\hline Real-time behavior / multicore & \begin{tabular}{l}
- Runs in the CODESYS process with normal priority \\
- Single-core --> Worse real-time behavior
\end{tabular} & \begin{tabular}{l}
- Real-time operating system \\
- Single-core or multicore
\end{tabular} \\
\hline Architecture scope & - Simulation 64-bit (depends on the CODESYS installation): --> Possible compile error in the IEC application if the application has been previously run only as 32bit (for example, use of DWORD as POINTER) & - Controller 32-bit \\
\hline FPU (rounding error) & \begin{tabular}{l}
- Uses FPU of the PC \\
- Different configuration of the FPU exceptions
\end{tabular} & \begin{tabular}{l}
- Uses FPU of the controller or FPU emulation \\
- Different configuration of the FPU exceptions
\end{tabular} \\
\hline Handling of exceptions & - Exception handling of the Windows Runtime System & - Exception handling of the controller \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline & Simulation & Physical Controller \\
\hline External libraries (Cmp/Sys/CAA/O EM/...) & \begin{tabular}{l}
- Only a few external Cmp/ SysLibs are physically available. As compared to embedded, more SysLibs could also be available. \\
- Other implementation/behavior of the SysLibs (Windows in contrast to the OS of the controller) \\
- "Unresolved Reference error" on download is ignored. The application can still be downloaded to the controller and started. If the missing functions are actually called, they return nonsense values. \\
Therefore, an IEC implementation can also be specified for external POUs. This substitute IEC code is then executed in the simulation.
\end{tabular} & - "Unresolved Reference error" on download when external libraries do not exist in the controller \\
\hline I/O drivers & \begin{tabular}{l}
- I/O configuration is generated but not evaluated. \\
- Fieldbus stacks are not evaluated. \\
- I/O channels are not updated and no bus telegrams are sent.
\end{tabular} & - Mostly no restriction, but depends on the capabilities of the controller \\
\hline SoftMotion drivers & - All SoftMotion axes are set to virtual and therefore simulated. & - Mostly no restriction, but depends on the capabilities of the controller \\
\hline
\end{tabular}

See also
- \({ }^{4}\) Chapter 6.4.1.12.2 "Testing in simulation mode" on page 1980

\section*{Command 'Operating Mode'}

Function: The commands set the controller to a state which prevents accidental change to the project.
Call: Menu bar: "Online \(\rightarrow\) Operating Mode"
You can use these commands, for example, to lock the state of a controller in order to prevent the controller from switching to another state while you program another controller.

When programming is complete, the controller should then be switched to a defined and externally visible state that is set exactly the same way after restarting.
The \%, 日, and \(\mathbf{8}\) symbols in the status bar indicate the current operating mode. Doubleclicking one of these symbols opens a help window.

If it supports the controller, then you can switch the controller to the following operating modes:
- Z "Debug": No restrictions
- 日 "Locked": The current state of debugging is locked on the application. No additional breakpoints can be set and no additional variables can be forced. Writing variables is still possible and breakpoints which are already set remain active.
Only the "RUN" state of an application is preserved in \(\mathbf{6}\) "Locked" operating mode even if the controller is restarted.
With this operating mode, a developer can prevent himself or another developer from changing the application on the controller, for example by setting or deleting a breakpoint, by forcing, or by making changes to the file system. This operating mode is helpful to prevent a download to an incorrect controller when, for example, multiple controllers of a plant are programmed.
- 日 "Operational":

This operating mode makes sure that the controller reloads the same applications after a restart and that no debug features are active anymore. The operating mode is set when a controller is completely programmed and should be accepted or already is.
Conditions for activating the "Operational" mode
- A boot application for each application has to exist on the controller.
- There must not be any active breakpoints set.
- All applications have to be running.
- There must not exist any forced values.
- Furthermore, the device can define more of its own restrictions.

The "Locked" and "Operational" operating modes are different in the use cases and in the requirements for activating the operating mode. However, for both operating modes the runtime system prevents the following actions:
- Regarding the application
- Download of an application
- Online change
- Force variables
- Set breakpoints
- Stop application
- Reset application
- Start application
- Delete application
- Regarding the file transfer of the controller
- Download of a file to the controller
- Delete a file on the controller
- Rename a file on the controller
- Create a directory on the controller
- Delete a directory on the controller
- Rename a directory on the controller

You cannot switch the operating mode between "Locked" and "Operational".

\section*{Command 'Virtual mode'}

Function: "Virtual Mode" option enables virtual mode for Automation Builder.
Call: Main menu "Online", Context menue
Requirement: A project is open. Command is only available, if a license for advanced simulation support is acitvated.

\section*{Command 'Virtual system testing'}

Function: The "Virtual system testing" editor contains settings for the virtual devices and the simulation set-up and control.

Call: Main menu "Online", Context menu
Requirement: A project is open. Command is only available, if a license for advanced simulation support is acitvated.

\section*{Command 'Start'}

Symbol: ; keyboard shortcut: [F5]
Function: This command starts the application (status: "RUN").
Call: Menu bar: "Debug"; context menu of object: "Application"
Requirement: The application is in online mode and its status is "STOP".
Executing this command from the "Debug" menu will affect the application that is currently in focus.

\section*{See also}
- \(\Rightarrow\) Chapter 6.4.1.11.6 "Downloading the application code, logging in, and starting the PLC" on page 1977

\section*{Command＇Stop＇}

Symbol：■；keyboard shortcut：［Shift］＋［F8］
Function：This command stops the application（status：＂STOP＂）．
Call：Menu bar：＂Debug＂；context menu of object：＂Application＂
Requirement：The application is in offline mode and its status is＂RUN＂．
Executing this command from the＂Debug＂menu will affect the application that is currently in focus．

\section*{Command＇Single Cycle＇}

Keyboard shortcut［Ctrl］＋［F5］
Function：This command executes the active application for one cycle．
Call：Main menu＂Debug＂．
Requirement：The application is in online mode and the program is halted at a program step．

\section*{Command＇New Breakpoint＇}

Symbol：踢，keyboard shortcut［AIt］＋［F7］．
Function：This command opens the＂Breakpoint Properties＂dialog box．
Call：Main menu＂Debug＂．
Requirement：The application must be in online mode．

See also
－\({ }^{4}\) Chapter 6．4．1．12．3＂Using Breakpoints＂on page 1981

\section*{Command＇New Data Breakpoint＇}

Symbol：很
Function：The command opens the＂New breakpoint＂dialog．
Call：Menu bar：＂Debug＂

\section*{Requirement：}
－The application is in online mode．
－The device description file of the target device contains the entries for the＂data breakpoints＂ functionality．Currently，data breakpoints are possible only with the CODESYS Control Win V3．

See also
－\({ }^{\text {n }}\) Chapter 6．4．1．21．4．9＂Dialog＇New Breakpoint＂＇＂on page 2750
－\(\quad 4\) Chapter 6．4．1．12．3＂Using Breakpoints＂on page 1981

\section*{Command＇Edit Breakpoint＇}
```

Symbol: 覀

```

Function: This command opens the "Breakpoint Properties" dialog box.
Call: Main menu "Debug".
Requirement: The application is in online mode and the cursor is halted at a breakpoint.
See also
- \({ }^{4}\) Chapter 6.4.1.12.3 "Using Breakpoints" on page 1981

\section*{Command 'Enable Breakpoint'}

Function: This command enables a disabled breakpoint.
Call: Main menu "Debug".
Requirement: The application is in online mode and the cursor is halted at a disabled breakpoint.

See also
- \({ }^{4}\) Chapter 6.4.1.12.3 "Using Breakpoints" on page 1981

\section*{Command 'Disable Breakpoint'}

Function: This command disables an enabled breakpoint.
Call: Main menu "Debug".
Requirement: The application is in online mode and the cursor is halted at an enabled breakpoint.
See also
- ② Chapter 6.4.1.12.3 "Using Breakpoints" on page 1981

\section*{Command 'Toggle Breakpoint'}

Keyboard shortcut [F9]
Function: This command sets a breakpoint or clears an existing breakpoint.
Call: Main menu "Debug".
Requirement: The application is in online mode. The cursor is positioned at a breakpoint.
See also
- \({ }^{*}\) Chapter 6.4.1.12.3 "Using Breakpoints" on page 1981

\section*{Command 'Step Over'}

Symbol [注, shortcut [F10]
Function: The command executes the statement where the program is currently located and halts before the next statement in the POU.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode).

If the executed statement contains a call (from a program, function block instance, function, method, or action), then the subordinate POU is processed completely in one step and returned to the call. Then it halts before the next statement (in the next line of code).

Click "Step Into" to jump to a subordinate POU and process it in single steps.

See also
- \({ }^{\text {• }}\) Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985
- \(\quad \stackrel{y}{c}\) Chapter 6.4.1.21.3.8.11 "Command 'Step Into'" on page 2647

\section*{Command 'Step Into'}

Symbol \({ }^{\ddagger}\) 三, shortcut [F11]
Function: The command executes the statement where the program is currently located and halts before the next statement.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode).
If the executed statement contains a call (from a program, function block instance, function, method, or action), then the program execution jumps to this subordinate POU. Its code opens in a separate editor. The first statement there is executed and the program execution halts before the next statement. The new current breakpoint position is then in the called POU.

Click "Step Over" to remain in the currently active POU and execute the call in one step.

See also
- Es Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985
- \({ }^{4}\), Chapter 6.4.1.21.3.8.10 "Command 'Step Over"" on page 2646

\section*{Command 'Step Out'}

Symbol \({ }_{\text {E }}^{\text {三, }}\), shortcut [Ctrl]+[F11]
Function: The command executes the program until the next return and halts afterwards.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode).

If the current breakpoint position is in a subordinate POU, then this is run through to the end. Then the program execution jumps back to the calling point in the calling POU and halts there (in the line with the call).

If the current breakpoint position is in the main program, then the POU is run through to the end. Then the program execution jumps back to the beginning (to the program start at the first line of code in the POU) and halts there.

See also
- \({ }^{*}\) ) Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985

\section*{Command 'Run to Cursor'}

Symbol: \(+\overline{\text { ㅌ }}\)
Function: The command executes a program until a specified position as marked by the cursor.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode). Moreover, you have marked any line of code in any POU with the cursor.

The statements between the current breakpoint position and the cursor position are executed in one step. Then the execution halts at the cursor position, which then becomes the next breakpoint position. Remember that the line of code where you placed the cursor is reached but not executed.

See also
- \(\sum^{*}\) Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985

\section*{Command 'Set Next Statement'}

Symbol: \&
Function: The command determines which statement is executed next.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode). Moreover, you have marked any line of code in any POU with the cursor.

The line of code marked with the cursor becomes the current breakpoint position without executing the statements in between or the statement that jumped to it.

See also
- \(\sum^{4}\) Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985

\section*{Command 'Show Next Statement'}

Symbol: \(\Rightarrow\)
Function: The command displays the program statement that is processed in the next step.
Call: Menu bar: "Debug"
Requirement: The application is in online mode and the program is halted at the current break position (debug mode). The break position is in a line of code that you cannot see.
The command makes the window with the current breakpoint position active (in the code highlighted in yellow and marked with the \(\Rightarrow\) symbol) and makes the breakpoint position to become visible. This is useful if you have multiple editors open and the breakpoint position is hidden in an inactive editor.

See also
- \({ }^{*}\) ) Chapter 6.4.1.12.4 "Stepping Through a Program" on page 1985

\section*{Command 'Force Values'}

Keyboard shortcut: [F7]
Function: The command sets a permanent predefined value to a variable on the controller.
Call: Menu bar: "Debug"
Requirement: The application is in online mode.

\section*{CAUTION!}

Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery.
Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

With this command, CODESYS permanently sets one or more variables of the active application to defined values on the PLC.

A forced value is marked with the forced symbol ( \(\boldsymbol{E}\) ).
For more information about the functionality of forcing and the \(p\) of values, see the "Forcing and Writing of Variables" help page.

By default, the "Force Values [All Applications]" command, which applies to all application in the project, and is not included in a menu.

- \(\Leftrightarrow\) Chapter 6.4.1.21.3.8.18 "Command 'Unforce Values"' on page 2650

\section*{Command 'Write Values'}

Keyboard shortcut [Ctrl]-[F7]
Function: This command sets a predefined value to a variable on the controller one time.
Call: Main menu "Debug".
Requirement: The application is in online mode.

\section*{CAUTION!}

Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery.
Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

With this command, one or more variables of the active application are set to defined values on the controller one time. Writing is done one time at the beginning of the next cycle.

Values are prepared by
- Clicking in the field "Prepared value" in the declaration section
- Clicking in the inline monitoring field in the implementation section
- Clicking in the field "Prepared value" in the watch window

The command "Write Values [All Applications]" affects all application in the project and is not included in a menu by default.

See also
- \& Chapter 6.4.1.21.3.8.16 "Command 'Force Values"' on page 2649
- «y Chapter 6.4.1.12.5 "Forcing and Writing of Variables" on page 1987

\section*{Command 'Unforce Values'}

Keyboard shortcut [Alt]+[F7]
Function: This command resets the forcing of all variables. The variables receive their current values from the PLC.
Call: "Debug".
Requirement: The application is in online mode.
The "Remove Force List" command has the same functionality as this command with one difference. If the "Remove Force List" command cannot be executed for all forced values, then no message is displayed.

\section*{CAUTION!}

Unusual changes to variable values in an application currently running on the PLC can lead to undesired behavior of the controlled machinery.

Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled system, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

The command "Force Values [All Applications]" affects all application in the project and is not included in a menu by default.

See also

- « Chapter 6.4.1.12.5 "Forcing and Writing of Variables" on page 1987

\section*{Command 'Force All Values from <Device.Application>'}

Function: This command resets all values of variables from the selection <Device.Application> to predefined values permanently.

\section*{Call:}
- Context menu of the application in the device tree
- Context menu in the editor of a POU from the selected application

Requirement: The application is in online mode.

CAUTION!
Unusual changes to variable values in an application currently running on the controller can lead to undesired behavior of the controlled machinery.
Evaluate possible dangers before forcing variable values. Take the respective safety precautions. Depending on the controlled machinery, the result may lead to damage to machinery and equipment or injury to health and life of personnel.

With this command, CODESYS permanently sets one or more variables of the active application to defined values on the PLC. This is done at the beginning and end of a processing cycle. Order of processing: 1) read inputs, 2) force values, 3) process code, 4) force values, 5) write outputs.

You can prepare values as follows:
- Click in the "Prepared value" field in the declaration part and type in the value. For Boolean variables, you change the value by clicking the field.
- Click in the inline monitoring field in the implementation part of the FBD/LD/IL editor
- Click in the "Prepared value" field in the monitoring view and type in the value.

A forced value is marked with the forced symbol (E).
CODESYS forces the value until you explicitly lift it by
- Clicking "Unforce Values"
- Clicking "Unforce All Values from <Device.Application>"
- Lifting the force in the "Prepare Value" dialog
- Logging out of the application

The command "Force Values [All Applications]" affects all application in the project and is not included in a menu by default.

\section*{Command 'Flow Control'}

Function: This command activates and deactivates the flow control.
Call: Menu"Debug"
Requirement: The application is in online mode.

\section*{NOTICE!}

An active flow control extends application runtime.
When "Confirmed Online Mode" is activated in the communication settings, a dialog prompt appears when switching on the flow control to cancel the process.
When flow control is activated, it is not possible to use breakpoints or step through the program.

\section*{Menu 'Core Dump'}
6.4.1.21.3.8.23.1 Command 'Load Core Dump'. ..... 2653
6.4.1.21.3.8.23.2 Command 'Create Core Dump' ..... 2653
6.4.1.21.3.8.23.3 Command 'Close Core Dump'. ..... 2654
6.4.1.21.3.8.23.4 Command 'Load Device Log from Core Dump'. ..... 2654

\section*{Command 'Load Core Dump'}

Function: CODESYS scans the project directory for core dump files. When a new core dump is forced with the "Create Core Dump" command, the dump file is automatically loaded from the controller to the project directory. If multiple core dump files are available, then CODESYS prompts you to choose whether the latest file should be opened in the project. You can also select one of the other files.
When a file is loaded into the project, an online view of the application appears with state of the application at the time when the core dump was generated. You can then view the variable values afterwards. Finally, the call tree is also available.
Call: Main menu "Debug \(\rightarrow\) Core Dump".
Requirement: The application is in offline mode.

\section*{NOTICE!}

You can close the core dump view only by clicking "Close Core Dump". The
"Logout" command has no effect in this view.

See also
- \({ }^{4}\) Chapter 6.4.1.21.3.8.23.2 "Command 'Create Core Dump'" on page 2653
- \({ }^{4}\), Chapter 6.4.1.21.3.8.23.3 "Command 'Close Core Dump'" on page 2654

\section*{Command 'Create Core Dump'}

Function: This command causes CODESYS to check whether a core dump file is already available on the controller.
If a core dump file is available, then CODESYS prompts you to load this file to the project directory.
With the following requirements, CODESYS generates a new dump file with the current application data:
- A core dump file is still not available or CODESYS has rejected a core dump file from being loaded.
- The application is currently stopped at breakpoint or an exception has occurred.

The generated core dump file is saved directly to the project directory: <project name>.<device name>.<application name>.<application Guid>.core. You can cancel the file generation by clicking the button in the status bar.
The amount of detail in the dump depends on the support from the runtime system. Runtime systems that are appropriate for this purpose generate just one dump in the case of an exception error. The core dump output from clicking "Load Core Dump" can therefore be used for error analysis.

Call: Main menu "Debug \(\rightarrow\) Core Dump".
Requirement: The application is in online mode.
See also
- \({ }^{*}\) Chapter 6.4.1.21.3.8.23.1 "Command 'Load Core Dump'" on page 2653

\section*{Command 'Close Core Dump'}

Function: This command closes the core dump view of the application that is open in the project.
Call: Main menu "Debug \(\rightarrow\) Core Dump".
Requirement: The application is in offline mode and you have loaded a core dump file to the project from the controller.

\section*{Command 'Load Device Log from Core Dump'}

Function: This command imports the controller log list that was saved with the last generated core dump. The log list is displayed in the same view as in online mode in the "Log" tab of the device editor.

Call: Main menu "Debug \(\boldsymbol{\rightarrow}\) Core Dump".
Requirement: The application is in offline mode and a core dump is open in the project.

\section*{Command 'Display Mode' - 'Binary', 'Decimal', 'Hexadecimal'}

Function: These commands in the "Display Mode" submenu are used for setting the format of values in the display mode when monitoring in online mode.

Call: Main menu "Debug".
Requirement: The project is in either online or offline mode.

The "Binary" and "Hexadecimal" display modes are unsigned, and "Decimal" is signed.

Function: After a selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed and can migrated.
Call: Main menu "Tools", Context menu
Requirement: -
② Chapter 6.3.1.5 "Migration of third party devices" on page 1439

\section*{Command 'Package Manager'}

Symbol:
Function: The command opens the "Package Manager" dialog where you install, uninstall, and manage packages.

\section*{Call: Menu bar: "Tools"}

You can also call the Package Manager as a standalone application from the command line.

Table 497: "Currently Installed Packages"
List of installed packages with "Name", "Version","Installation date", "Update info", "License info"
If a package originates from the CODESYS Store, then CODESYS identifies it with the red package symbol instead of the yellow \({ }^{\text {Tl }}\) symbol.
When an update is available, CODESYS indicates this with an entry in the "Update info" column and with the symbol.
\begin{tabular}{|c|c|}
\hline "Refresh" & Refreshes the list \\
\hline "Install" & \begin{tabular}{l}
Opens the standard dialog for finding a file in the file system. By default, the file type is *.package. \\
You can also install two versions of a package. \\
After you select the package, the "Check package signatures" dialog opens. \\
- In the dialog, the package is displayed with the information about signing. Detailed information about signing is displayed in the tooltip and also in a dialog which opens when you double-click a package. \\
- "Allow unsigned and self-signed packages" \(\square\) : The package should be installed although it is unsigned or self-signed. \\
After the package is selected, the installation wizard opens with the dialogs: \\
- "Installation-License Agreement" \\
In this dialog, CODESYS also displays the "Checksum" of the package. \\
Displayed only when the package has a license agreement. \\
- "Choose Setup Type" \\
The options are package-dependent. \\
- "Complete setup": CODESYS installs all components \\
- "Typical setup": CODESYS installs a standard set of components as defined in the package \\
- "Custom setup": CODESYS installs those components which are selected in a dialog \\
- "Installation - Target Versions": You select which of the existing target versions should be updated by the package installation. You have to select at least one version profile. \\
When this dialog is successfully completed, the selected package is ready for installation. You have to close all CODESYS instances in order for the package installation to be automatically started and run.
\end{tabular} \\
\hline "Uninstall" & \begin{tabular}{l}
Uninstalls the selected package \\
- When the "Display versions" option is not selected, CODESYS uninstalls all versions of the selected package. \\
- When the "Display versions" option is selected and you have selected a package node on the top level, CODESYS uninstalls all versions of the selected package. \\
- When the "Display versions" option is selected and you have selected an individual package version, CODESYS uninstalls exactly this version. \\
When this dialog is closed, all CODESYS instances have to be closed in order for the package uninstallation to start.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Details" & \begin{tabular}{l}
Opens the "Details" dialog for the selected package with the following tabs: \\
- "Package Details" \\
- "Name": Package name \\
- "Version" \\
- "Checksum": SHA-1 checksum of the package \\
- "Vendor" \\
- "Copyright" \\
- "Description" \\
- "Installation date" \\
- "License Agreement" \\
- "Installations Log"
\end{tabular} \\
\hline "Search updates in background" & CODESYS automatically searches for updates every time the programming system is started and then one time every hour. \\
\hline "Display versions" & - Displays all versions of the installed package. \\
\hline
\end{tabular}

You can compare the "Checksum" with the package checksum from the package vendor. CODESYS displays this checksum in the "Details" dialog and in the "Installation - License Agreement" dialog of the installation wizard. You do this to make sure that you have installed an original package.

If you have installed a newer version of the programming system in the same installation directory as the previous version, the license information about the previously installed package remains unchanged and CODESYS displays the information in the "Package Manager" dialog.

Table 498: "Updates"
\begin{tabular}{|l|l|}
\hline "Search Updates" & \begin{tabular}{l} 
Searches for the selected package on your system and in the CODESYS Store \\
Updates. \\
CODESYS displays the found updates in the "Update Info" column of the \\
package list.
\end{tabular} \\
\hline "Download" & \begin{tabular}{l} 
Installs the update package from the "Download Package" dialog. In the \\
"Download Package" dialog, click the "Download and Installation" button for this.
\end{tabular} \\
\hline
\end{tabular}

Table 499: "CODESYS Store"
\begin{tabular}{|l|l|}
\hline "Rating" & Give an rating of the package \\
\hline "CODESYS Store" & Link to the homepage of the Store \\
\hline
\end{tabular}

\section*{Command 'Library Repository'}

Symbol: 血
Function: The command opens the "Library Repository" dialog. In this dialog you define which libraries are installed on the local system and are thus available for your application.
Call: Menu bar: "Tools"

\section*{Dialog 'Library \\ Repository'}

Table 500: "Location"
Display of the directory on the local system in which the library files are located. The libraries in this "Location" are listed in the "Installed libraries" area.
"Edit Locations" \(\quad\) Opens the "Edit Repository Locations" dialog.
\[
\begin{aligned}
& \text { 1. You can only use empty directories for new repositories. } \\
& \text { 2. You can also use existing repositories as locations. } \\
& \text { 3. The "System" repository is not editable; CODESYS indicates this by the italic } \\
& \text { lettering of the entry. }
\end{aligned}
\]

Table 501: Dialog "Edit Repository Locations"
\begin{tabular}{|l|l|}
\hline List of the repositories with "Location" and "Name" \\
\hline "Add" & \begin{tabular}{l} 
Creates a new repository. \\
Opens the "Repository Location" dialog. The selected directory ("Location" input \\
field) has to be either empty or an existing valid repository. "Name" is the input \\
field for a symbolic repository name.
\end{tabular} \\
\hline "Edit" & Opens the "Repository Location" dialog (see "Add") \\
\hline "Remove" " & \begin{tabular}{l} 
A dialog box open, asking whether only the entry should be removed from the \\
list of repositories, or whether the directory with the library files should be deleted \\
from the file system. If you want to delete the directory, you have to confirm this.
\end{tabular} \\
\hline
\end{tabular}

Table 502: "Installed libraries"
List of the libraries in a tree structure. Display of each library with category, name, company and version. The icon to the left of the name indicates whether the library is digitally signed or \(\square\) unsigned.
\begin{tabular}{|c|c|}
\hline "Company " & List box for filtering the displayed libraries. \\
\hline "Install" & \begin{tabular}{l}
Opens the "Select Library" dialog. Possible filters: \\
- "Compiled CODESYS library files (*.compiled-library)". \\
- "Compiled CODESYS library files (*.compiled-library-v3)" ab V3 SP15 \\
- "Library files (*.library)" for still uncompiled library projects \\
- "All files (*. *)"
\end{tabular} \\
\hline "Uninstall" & Uninstalls the selected library. \\
\hline "Export" & Opens the default dialog for saving the library project to the local file system. The file type is Library files (*.library), Compiled library files (*. compiled-library), or Compiled library files (*.compiled-library-v3). \\
\hline "Find" & \begin{tabular}{l}
Searches for libraries and function blocks. \\
Opens the "Find Library" dialog. When you enter a string in the input field, CODESYS displays the libraries that it finds with a corresponding string.
\end{tabular} \\
\hline "Details" & \begin{tabular}{l}
Opens the "Details" dialog with details from the project information of the library for the selected version of a library. You find the following information by clicking "More" in the "Details" dialog: \\
- "Size": Specified in bytes \\
- "Created": Creation date \\
- "Changed": Date of the last change \\
- "Last access": Date \\
- "Attributes" \\
- "Properties"
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Dependencies" & \begin{tabular}{l} 
For the selected library, the "Dependencies" dialog opens, showing the depend- \\
encies on other libraries. "Title", "Version" and "Company" are shown for \\
each library reference. References that function via placeholders are displayed \\
according to the syntax: \#<placeholder name>.
\end{tabular} \\
\hline "Group by category" & \(\bullet \square:\) Grouping by library category \\
& \begin{tabular}{l} 
- \(:\) Alphabetical sorting \\
The categories are defined by external description files '*.libcat.xml'.
\end{tabular} \\
\hline
\end{tabular}

Table 503: "Library Profiles"
A library profile defines the library version with which CODESYS resolves a library placeholder if a certain compiler version is set in the project.
\begin{tabular}{|l|l|}
\hline "Import" & \begin{tabular}{l} 
Imports a *. libraryprofile file. \\
If the import already contains existing placeholder entries, a query appears \\
asking whether CODESYS should overwrite it.
\end{tabular} \\
\hline "Export" & \begin{tabular}{l} 
Exports an xml file with the extension *. libraryprofile with the assign- \\
ments of the selected placeholder entries; you can only select a single entry of a \\
"Compiler version".
\end{tabular} \\
\hline
\end{tabular}

Placeholder resolutions can also be defined in the target device currently in use and even by a specific local specification in the Placeholders dialog in the Library Manager.

\section*{Command 'License Manager'}

Symbol:
Function: This command opens the wizard for configuring licenses for CODESYS add-on products. The wizard starts with the "License Manager - Select target" dialog.
Call: Menu bar: "Tools".
The License Manager can handle licenses for CODESYS add-on products on the local computer, as well as licenses for RTS add-on products on devices. It supports both the installation in a soft container and on a dongle.

Dialog 'License This is the start dialog of the License Manager wizard. Here you decide where the license will Manager be installed.
Select Target'
\begin{tabular}{|l|l|}
\hline "Workstation" & Local computer \\
\hline "Device" & \begin{tabular}{l} 
Controller. The connection to this device must be configured correctly in order to \\
license ("Communication Settings" tab of the device editor).
\end{tabular} \\
\hline
\end{tabular}

After clicking "Next", you decide the container where you want to manage the licenses.

Dialog 'License
Manager -
Select con-
tainer'
\begin{tabular}{|l|l|}
\hline "Dongle" & \begin{tabular}{l} 
A corresponding dongle must be connected to the computer or device. Not all \\
devices support dongles.
\end{tabular} \\
\hline "Soft container" & \begin{tabular}{l} 
"CODESYS Security Key. A corresponding soft container must be registered in \\
the CodeMeter Control Center. The CODESYS installation provides an existing \\
soft container.
\end{tabular} \\
\hline
\end{tabular}

If you are installing a product on your local computer ("Workstation"), then the "License Manager" opens immediately for the specific selection of the dongle or soft container, and the next actions. This happens after you choose the container type and click "Next >".

If you are licensing the add-on product for a controller, then first the dialog opens for selecting the device in the network after you click "Next >". This dialog corresponds to the classic view of the "Communication Settings" tab of the device editor.

Dialog 'License
Manager'
\begin{tabular}{|l|l|}
\hline "Container" & \begin{tabular}{l} 
Depending on whether "Dongle" or "Soft container" was selected: Drop-down list \\
of all CODESYS dongles or soft containers that were found on the computer or \\
device.
\end{tabular} \\
\hline "Products" & \begin{tabular}{l} 
List of all installed products that are subject to licensing. A prepended symbol \\
indicates the existence and validity of the license. \\
On the right side of the window, the following information is displayed for the \\
selected product and corresponding licenses: \\
"Name" \\
"Nampany" \\
"Compl \\
"Unit counter" \\
"License quantity"
\end{tabular} \\
& \begin{tabular}{l}

License" (see more below)
\end{tabular} \\
\hline "Additional Functions" \\
\\
\hline \begin{tabular}{l} 
Opens the menu with the following actions: \\
"Return license": Opens the "Return Licenses" (see more below) \\
"Restore license": This function is available in the case of device licensing \\
only. Opens the "Restore Licenses" dialog (see more below)
\end{tabular} \\
\hline
\end{tabular} \\
\hline
\end{tabular}

Table 504: "Install Licenses on <computer> - Activate License"
This is the recommended way to activate a license available via the License Server when you have an Internet connection. Requirement: The computer has an Internet connection.
\begin{tabular}{|l|l|}
\hline "Ticket ID" & \begin{tabular}{l} 
Input field for the ticket ID that you received from the software vendor. The \\
ticket ID consists of five sets of five alphanumerical characters (for example: \\
LYSQ3-ZU93K-24LWC-XGW J8-5AY7H).
\end{tabular} \\
\hline "License server" & \begin{tabular}{l} 
Drop-down list of the license server that provides the license for activating the \\
product. You receive the server URL from the software vendor.
\end{tabular} \\
\hline "Select Ticket from Repository" & Opens the "License Repository" dialog. \\
\hline "Next" & \begin{tabular}{l} 
CODESYS connects to the license server. \\
- If the specified ticket contains only one license, then a dialog opens to \\
confirm the successful activation after completion of the server action. \\
If the specified ticket contains multiple licenses, then the dialog "Install \\
licenses - Select Licenses" opens with a list of these licenses (see descrip- \\
tion below).
\end{tabular} \\
\hline
\end{tabular}

Table 505: "Install Licenses - Select Licenses"
Selection of the licenses to be activated for the ticket which you specified in the dialog "Install Licenses - Activate License".
\begin{tabular}{|l|l|}
\hline "Name" & Product name \\
\hline "Available" & Number of available licenses \\
\hline "Used" & Number of used licenses \\
\hline Total & Sum of all used and available licenses \\
\hline Next & \begin{tabular}{l} 
CODESYS connects to the license server. After successful completion of the \\
server action, a dialog opens with the confirmation of the activation.
\end{tabular} \\
\hline
\end{tabular}

Table 506: "Install Licenses on <computer> - Request License"
If the computer does not have an Internet connection, then you can generate a context file from this dialog. The file "WibuCmRaC" is then transmitted to the license server via an Internet-enabled computer. When activation is complete, a license update file "WibuCmRaU" is provided for download.
\begin{tabular}{|l|l|}
\hline "Software vendor" & \begin{tabular}{l} 
Input field for firm codes from the software vendor that provided the license for \\
activating the product. As an alternative, you can select the software vendor from \\
the drop-down list.
\end{tabular} \\
\hline "Context file" & Location and name \\
\hline
\end{tabular}

Table 507: "Install Licenses on <computer> - Install License"
If you downloaded a license update file from the Internet during software activation, then you can use this dialog to install the license on your dongle. To do this, specify the path of the license update file in the input field.

Table 508: "Return License"
\begin{tabular}{|l|l|}
\hline If the license permits, you can return it in order to reactivate it later on another computer. \\
\hline "Ticket ID" & Field for specifying the ticket ID that was used for licensing. \\
\hline "License server" & \begin{tabular}{l} 
Drop-down list for selecting the license server that provides the license for acti- \\
vating the product. You receive the server URL from the software vendor.
\end{tabular} \\
\hline "Load License(s)" & \begin{tabular}{l} 
Button for showing all current licenses installed for the given ticket ID on the \\
server in the "Licenses" window.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Licenses" & \begin{tabular}{l} 
List of licenses available on the server for the given ticket ID. The following \\
information for the selected license is displayed next to the window on the right: \\
\\
\\
\\
\\
\\
\\
- "Name" \\
\\
- "Number of activations" \\
- "Return allowed" \\
- "Activation type" \\
- "Activation date" \\
- "Firm code" \\
- "Comment"
\end{tabular} \\
\hline "Return License(s)" & \begin{tabular}{l} 
Button for returning the selected license(s). These can be reactivated later on \\
another system.
\end{tabular} \\
\hline
\end{tabular}

Table 509: "Install Licenses - Restore Licenses"
When activated, device licenses are saved to a file (*. WibuCmRau) on the local computer and in the "CODESYS Central License Server". If lost, they can be restored from this file to the identical device.
\begin{tabular}{|l|l|}
\hline "Ticket ID" & \begin{tabular}{l} 
Field for specifying the ticket ID that was used for licensing that has already \\
occurred.
\end{tabular} \\
\hline "Restore" & \begin{tabular}{l} 
If a corresponding license backup file is found, then the license is reactivated in \\
the device.
\end{tabular} \\
\hline
\end{tabular}

- Chapter 6.4.1.21.2.8.3 "Tab 'Communication Settings"' on page 2427
- \# Chapter 6.4.1.21.3.9.7 "Command 'License Repository"' on page 2662

\section*{Command 'License Repository’}

Symbol:
Function: This command opens the dialog box "License Repository" for viewing information about the individual licenses.
Call: Main menu "Tools"
Requirements: CODESYS is in offline or online mode.
In the license repository, after entering the ticket number, you can obtain information about the licenses concerned from the central license server.
To do this you can paste the ticket number(s) from the clipboard or import it/them from a text file.

Table 510: "Tickets"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
<List of the ticket IDs imported \\
into the repository for compo- \\
nents requiring licenses>
\end{tabular} & \\
\hline "Licenses" & \begin{tabular}{l} 
If you select an entry in the list of tickets, the name and the status of the licensed \\
component are displayed here. \\
च: License available and valid \\
I: License found, but invalid \\
X: License not found
\end{tabular} \\
& \begin{tabular}{l} 
In the right-hand part of the dialog box you will then receive then the following \\
information about this license:
\end{tabular} \\
\hline & \begin{tabular}{l} 
"Name": name of the product to be licensed \\
"Item number": item number in the license server. \\
"Return allowed": It is possible to have this license deactivated so that it can be \\
re-activated on another system. \\
"Can be activated": you can have the license activated via the license manager. \\
"Activation quantitiy": number of activations that have taken place so far. \\
"Activation date": date of the current activation \\
"Container serial" "
\end{tabular} \\
\hline "Firm codes" \\
"Comment"
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Import Tickets" & \begin{tabular}{l} 
The standard dialog box for browsing the local file system appears. If you open a \\
text file containing one or more "tickets", i.e. license numbers, these are imported \\
into the repository. Alternatively you can also insert the numbers from the clip- \\
board into the list.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Device Repository'}

Symbol:
Function: This command opens the "Device Repository" dialog. This dialog is used for managing the devices that are installed on the local system and can be integrated into CODESYS projects.
Call: Menu bar: "Tools".

\section*{CAUTION!}

Do not change the internal device repository manually. Do not copy any files to or from the repository. Always use the device repository dialog to install or uninstall devices.

Table 511
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|c|}{} \\
\hline "Location" & \begin{tabular}{l} 
Shows the device repository directory on the local system. The list box shows \\
the currently set save locations. By default, CODESYS creates the system repo- \\
sitory during installation. The devices of the selected location are listed in the \\
"Installed device descriptions" field.
\end{tabular} \\
\hline "Edit Locations" & Opens the "Edit Repository Locations" dialog. \\
\hline
\end{tabular}

Table 512: Dialog 'Edit Repository Locations'
\begin{tabular}{|l|l|}
\hline List of the repositories with "Location" and "Name". \\
\hline "Add" & \begin{tabular}{l} 
Creates a new repository. \\
Opens the "Repository Location" dialog. The selected directory ("Location" input \\
field) must be empty or it must be a valid repository.
\end{tabular} \\
\hline "Edit" & Opens the "Repository Location" dialog (see "Add"). \\
\hline "Remove" " & \begin{tabular}{l} 
A dialog prompt opens for you to decide whether the respective directory should \\
also be deleted from the hard disk.
\end{tabular} \\
\hline
\end{tabular}

Table 513: "Installed Device Descriptions"
\(\left.\begin{array}{|l|l|}\hline \begin{array}{l}\text { List of device descriptions in multilevel tree structure. Shows all device descriptions with "Name", "Vendor", and } \\ \text { "Version". The top nodes represent device categories, for example PLCs, fieldbuses, and logical devices. }\end{array} \\ \hline \begin{array}{l}\text { "String for full-text search in all } \\ \text { devices" }\end{array} & \begin{array}{l}\text { This field is editable after clicking in it. For any character string entered, only } \\ \text { those devices that include the character string are displayed in the lower view. } \\ \text { The matched string is highlighted in yellow for these devices. }\end{array} \\ \hline \text { "Vendor" } & \text { Drop-down list with manufacturers whose available devices are displayed. } \\ \hline \text { "Install" } & \begin{array}{l}\text { Opens the "Install Device Description" dialog. } \\ \text { For the default devices with file type "*.devdesc.xml". You can also select } \\ \text { manufacturer-specific description files, such as "*.gsd" files for PROFIBUS DP } \\ \text { modules, "*.eds" and "*.dcf" files for CAN devices. } \\ \text { When you click "OK" to confirm the selection, CODESYS inserts the new device }\end{array} \\ \text { into the device repository. If an error occurs during installation (for example, } \\ \text { missing files that are referenced by the device description), then CODESYS } \\ \text { reports the error to the lower part of the device repository dialog. }\end{array}\right\}\)

\section*{NOTICE!}

During installation, CODESYS copies the device description files and all additional reference files to an internal location. Therefore, any changes to the original files no longer influence the installed devices. You must reinstall the devices to make any changes effective. We recommended that you change the internal version number of a device description after a modification.

\section*{Command 'Create Device list CSV'}

Symbol: 圈
Function: MS Excel template of device list for device import is opened.
Call: Main menu "Tools", Context menu
Requirement: -
y Chapter 6.6.1.3.3 "Creating CSV device list" on page 4198

\section*{Command 'Multi Online Change'}

Function: The MultiOnlineChange tool/plug-in for Automation Builder enables firmware update, download and online change of the same project to several AC500 V2 PLCs.
Call: Main menu "Tools", Context menu
Requirement: -

\section*{Command 'Device ECAD data'}

Function: Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.

Call: Main menu "Tools", Context menu
Requirement: A project is open.
Chapter 6.6.1.1 "Exporting and importing ECAD data (PBF)" on page 4191

\section*{Command 'OPC UA Information Model Repository'}

Function: The command opens the "OPC UA Information Model" dialog. The OPC UA information models, which are installed on the local system and can be integrated in CODESYS projects, are managed in the dialog.

Call: Menu bar: "Tools"

Table 514: Dialog 'OPC UA Information Model'
\begin{tabular}{|c|c|}
\hline "Location" & Displays the OPC UA information model directories on the local system. The list box shows the currently set locations. By default, CODESYS creates the system repository during installation. The information models of the selected location are listed in the "Installed OPC UA information models" area. \\
\hline "Edit Locations" & Opens the "Edit Repository Locations" dialog. \\
\hline \multicolumn{2}{|l|}{"Installed OPC UA information models"} \\
\hline \multicolumn{2}{|l|}{List of installed information models. Double-click to open installed information model documentation. Note: The information models of this repository can also be added to project archives.} \\
\hline "Install" & \begin{tabular}{l}
Opens the "Select Installed OPC UA Information Model(s)" dialog. \\
- File type: OPC UA Information Models *NodeSet2 . xml (example: "Informationmodel.NodeSet2.xml". When you click "Open", the selected information model is inserted in the repository. \\
- File type: All files * . *: You can select an OPC UA documentation, for example, in PDF or Word format. When you click "Open", the "Assign Documentation OPC UA Information Models" opens. For a description of the dialog, see below.
\end{tabular} \\
\hline "Uninstall" & Uninstalls the selected OPC UA information model. When you delete the information model from the repository, it is no longer available in the development system for use in the CODESYS Development System. \\
\hline "Details" & \begin{tabular}{l}
Opens the "Details" dialog for the selected information model. The dialog includes additional information about the information model. In "Alias", you can specify an alias name for the URI. Moreover, information is displayed as to whether or not a documentation for the information model is available. \\
- "Model URI" \\
- "Publication date" \\
- "Publisher" \\
- "Repository" \\
- "Alias" \\
- "Documentation available": \\
- "Yes": The "Uninstall documentation" button is available. \\
- "No": The "Install documentation" button is available. \\
- "Install documentation": Opens the "Select OPC UA Information Model Documentation" dialog. The data type OPC UA Information Model Documentation (*.pdf) is set as default in the dialog.
\end{tabular} \\
\hline "Documentation" & Opens the installed documentation for the selected information model. If no documentation is installed for the selected information model, then the command is disabled. \\
\hline "Display all versions" & All installed versions of the information model are displayed in a tree structure. \\
\hline
\end{tabular}

See also • \(\begin{aligned} & \text {, } \\ & \text { Chapter 6.4.1.21.2.17 "Object 'OPC UA Information Model'" on page } 2472\end{aligned}\)

\section*{Command 'Scripting' - 'Execute Script File'}

Symbol: 匃
Function: This command opens a dialog for selecting and then executing the script file ( *.py). Call: Menu bar: "Tools \(\rightarrow\) Scripting".

\section*{Command 'Scripting' - 'Enable Script Tracing'}

Symbol:䁶
Function: This command makes CODESYS print all commands from the script file to the message view. Use this command for monitoring and debugging scripts. A blue frame around the symbol indicates that the option is active.
Call: Main menu "Tools \(\rightarrow\) Scripting".

\section*{Command 'Scripting' - 'Scripts'}

Function: This command executes a script that is stored in the ScriptDir folder.
Call: Menu bar: "Tools \(\rightarrow\) Scripting \(\rightarrow\) Scripts".
Requirement: The ScriptDir folder exists in the CODESYS installation directory. Python scripts are stored in this folder with the file extension .py.

All scripts that are contained in the ScriptDir folder are executable as menu commands and are sorted alphabetically by file name.

\section*{Command 'Customize'}

Function: This command opens the "Customize" dialog box, where you can customize the menus, toolbars, and keyboard shortcuts according to your individual requirements.
Call: Main menu "Tools"

\section*{Command 'Options'}

Function: The command opens the dialog box "Options" for the configuration of the CODESYS options. These options define the behavior and appearance of the CODESYS user interface. CODESYS saves the settings in your current user profile on your local system. The current profile specifies the standard settings.

Call: "Tools" menu

\section*{Command 'Import and Export Options'}

Function: This command opens the "Import and Export Options" dialog. Here you can configure the export and import of selected settings of the CODESYS options. The settings are saved to an XML file with the default extension (options.xml).

Call: Menu bar: "Tools".

Dialog 'Import
and Export
Options'
\begin{tabular}{|l|l|}
\hline "Export selected options" & \begin{tabular}{l} 
"Select options": In the table, you can select the categories of options, either \\
user-specific or machine-specific (computer), whose current settings are to be \\
exported to the XML file.
\end{tabular} \\
& \begin{tabular}{l} 
"File": Path of the export file in the local file system. Example: \\
D: \(\backslash\) system1. options. xml. \\
Button ....: Opens the default dialog to search for an existing file in the local file \\
system, or to create one. The "File type" option export (*. options. xml) \\
is preset.
\end{tabular} \\
\hline "Import selected options" & \begin{tabular}{l} 
"File": Path of the options export file whose contents are to be imported. \\
Button ...: Opens the default dialog to search for an existing file of type option \\
export (*. options. xml) in the local file system. \\
After you click "OK" to close the dialog, the settings described in the file are \\
applied to the project.
\end{tabular} \\
\hline
\end{tabular}

See also

\section*{Command 'Device Reader'}

Function: The command opens the standard "Select Device" dialog and reads the license and product information of the selected controller. This license and product information is displayed in the "Device Reader" dialog.
Call: Menu bar: "Tools"
Requirement: No applications exist on the controller.

If the command is selected although an application exists on the controller, then a dialog prompts the user whether or not all applications should be removed from the controller. When the user click "No" to this dialog, the "Device Reader" command is aborted.

Table 515: Dialog "Device Reader"
\begin{tabular}{|l|l|}

\section*{Command 'Next Editor'}

Keyboard shortcut: [Ctrl]+[F6]
Function: This command switches focus from the currently active view to the next view. The next view is identified by the tab to the right of the currently active tab.

Call: Main menu "Window"
Requirement: At least one object is open.
See also
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.10.2 "Command 'Previous Editor'" on page 2669

\section*{Command 'Previous Editor'}

Keyboard shortcut: [Shift]+[Ctrl]+[F6]
Function: This command switches focus from the currently active view to the previous view. The previous view is identified by the tab to the left of the currently active tab.
Call: Main menu "Window"
Requirement: At least one object is open.
See also
- ② Chapter 6.4.1.21.3.10.1 "Command 'Next Editor'" on page 2669

\section*{Command 'Close All Editors'}

\section*{Symbol:}

Function: This command closes all currently open editor views.
Call: Main menu "Window"
Requirement: At least one editor is open.

See also
- \({ }^{\circ} \Rightarrow\) Chapter 6.4.1.21.3.10.4 "Command 'Close All Editors of Inactive Applications'" on page 2670
- \(\quad \stackrel{y}{r}\) Chapter 6.4.1.21.3.10.16 "Command 'Close All Editors But This'" on page 2673

\section*{Command 'Close All Editors of Inactive Applications'}

Function: This command closes all editor views for objects that are located directly below a currently inactive application. Object editors in the POU view remain open.
Call: Main menu "Window"
Requirement: At least one object of an inactive application is open.
See also
- ③ Chapter 6.4.1.21.3.10.3 "Command 'Close All Editors'" on page 2669
- \({ }^{*}\), Chapter 6.4.1.21.3.10.16 "Command 'Close All Editors But This'" on page 2673

\section*{Command 'Reset Window Layout'}

Function: This command resets all currently open windows and views to their default positions. You are prompted for a confirmation before the command is executed.

Call: Main menu "Tools"

\section*{Command 'New Horizontal Tab Group'}

Symbol:
Function: This command moves the currently active view to a new, separate tab group below the existing one.
Call: Main menu "Window" or context menu of the tab
Requirement: Several editor views are open as tabs next to each other.
If you open another object in the editor, then this is automatically included in the tab group that is currently in focus.
See also
- « Chapter 6.4.1.21.3.10.7 "Command 'New Vertical Tab Group"' on page 2670

\section*{Command 'New Vertical Tab Group'}

Symbol:
Function: This command moves the currently active view to a new, separate tab group to the right of the existing one.
Call: Main menu "Window" or context menu of the tab
Requirement: Several editor views are open as tabs next to each other.
If you open another object in the editor, then this is automatically included in the tab group that is currently in focus.

See also
- \({ }^{*} \boldsymbol{y}\) Chapter 6.4.1.21.3.10.6 "Command 'New Horizontal Tab Group'" on page 2670

\section*{Command 'Float'}

Function: This command releases a docked view from its frame in the user interface and repositions it on the screen as a floating window.

Call: Main menu "Window"
Requirement: The application is in online mode.
This window can then be positioned outside of the user interface. Use the "Dock" command to return a floating window to the frame of the user interface.
See also
- ⓢ Chapter 6.4.1.21.3.10.9 "Command 'Dock"' on page 2671

\section*{Command 'Dock'}

Function: This command returns a floating window, which was released by the "Float" command, to the frame of the user interface.

Call: Main menu "Window"
See also
- \(y^{\prime 2}\) Chapter 6.4.1.21.3.10.8 "Command 'Float"' on page 2671

\section*{Command 'Auto Hide'}

Keyboard shortcut: [F7]
Function: This command shows or hides a view.
Call: Main menu "Window"
Hide simply means that CODESYS minimizes the view to a tab at the bottom of the user interface which is visible only when you move the mouse over the tab. The command functions like a check box. When a window is hidden, the check box is selected in the menu. When you click the command again, the checkbox is cleared and the window is shown.

\section*{Command 'Next Pane'}

Keyboard shortcut: [F6]
Function: This command sets the focus on the next pane.
Call: Main menu "Window"
Requirement: An object is open that contains two or more panes.
Example: If an object is open in the ST editor and the cursor is currently in the declaration section, then command sets the focus to implementation section.

See also
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.10.12 "Command 'Previous Pane"" on page 2671

\section*{Command 'Previous Pane'}

Keyboard shortcut: [Shift]+[F6]
Function: This command sets the focus on the previous pane.
Call: Main menu "Window"
Requirement: An object is open that contains two or more panes.

Example: If an object is open in the ST editor and the cursor is currently in the declaration section, then command sets the focus to implementation section.
See also
- \({ }^{4}\), Chapter 6.4.1.21.3.10.11 "Command 'Next Pane'" on page 2671

\section*{Command 'Toggle First Pane'}

Keyboard shortcut [Alt]+[F6]
Function: This command shows and hides the declaration view.
Call: "Window".
Requirement: The cursor is positioned in the editor of one of the following objects:
- POU
- Transition
- Method
- Get accessor method of a property
- Set accessor method of a property
- Visualization

You can also toggle the subviews by means of the buttons.

See also
- \(\sum^{4}\) Chapter 6.4.1.21.3.10.14 "Command 'Toggle Second Pane'" on page 2672

\section*{Command 'Toggle Second Pane'}

Function: This command shows and hides the implementation view.
Call: "Window".
Requirement: The cursor is positioned in the editor of one of the following objects:
- POU
- Transition
- Method
- Get accessor method of a property
- Set accessor method of a property
- visualization

See also
- ② Chapter 6.4.1.21.3.10.13 "Command 'Toggle First Pane"' on page 2672

\section*{Command 'Windows'}

Function: This command opens the "Windows" dialog box, which lists all open objects. You can then activate or close any of the listed views.

Call: Main menu "Window"

\section*{Command 'Close All Editors But This'}

Function: This command closes all editor views except the currently open one.
Call: Right-click the tab
Requirement: At least two objects are open.
See also
- \& Chapter 6.4.1.21.3.10.3 "Command 'Close All Editors"' on page 2669
- \& Chapter 6.4.1.21.3.10.4 "Command 'Close All Editors of Inactive Applications"' on page 2670

\section*{Command 'Select Object in Navigator'}

Function: This command selects the object of the active editor in the device tree.
Call: Right-click the tab
Requirement: At least one object is open.

This command is executed automatically when you select the "Track active editor" option for the device tree.

See also
- \({ }^{4}\) Chapter 6.4.1.21.3.10.18 "Command 'Select Parent Object in Navigator'" on page 2673

\section*{Command 'Select Parent Object in Navigator'}

- \({ }^{\text {© }}\) Chapter 6.4.1.21.3.10.17 "Command 'Select Object in Navigator"' on page 2673

\section*{Commands of the Submenu 'Window'}

Function: The command activates the selected window.
Call: Main menu "Window"
For each opened editor window the menu "Window" contains a command "<n><object name>". Choosing this command activates the corresponding window. In offline mode CODESYS adds the extension "(Offline)". To differentiate between the implementation or the instances of a function block the extension "(Impl)" or "<instance path>" is added.

\section*{Menu 'Help'}
6.4.1.21.3.11.1 Command 'Contents' ..... 2674
6.4.1.21.3.11.2 Command 'Index'. ..... 2674
6.4.1.21.3.11.3 Command 'Find'. ..... 2674
6.4.1.21.3.11.4 Command 'About'. ..... 2675

\section*{Command 'Contents'}

Symbol: k; keyboard shortcut: [Ctrl]+[Shift]+[F1]
Function: This command opens the CODESYS help.
Call: Menu bar: "Help".

\section*{Command 'Index'}

Symbol: ?]; keyboard shortcut: [Ctrl]+[Shift]+[F2]
Function: This command opens the CODESYS help.
Call: Menu bar: "Help".
An index search is not possible in the online help. The "Index" tab opens in the offline help.
All index entries of the help are listed alphabetically in the index view.
\begin{tabular}{|l|l|}
\hline "Look for" " & \begin{tabular}{l} 
As you type letters into the input field, CODESYS searches automatically for \\
matches in the index list.
\end{tabular} \\
\hline "Display" & \begin{tabular}{l} 
Opens the help page for the highlighted index entry in the list and displays the \\
title of the help page and location of the help file (*.chm) in the "Index results for \\
<index entry>" view. When several pages are found and then displayed in this \\
view, then you view a specific help page by clicking its entry in the list. \\
Clicking an entry in the index list achieves the same result.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Find'}

\section*{Symbol:}

Function: This command opens the CODESYS help.
Call: Menu bar: "Help".
In the online help, you can run a full-text search from the input field on the top right of the help page. The "Find" tab opens in the offline help.

Table 516: Tab 'Search'
\begin{tabular}{|l|l|}
\hline "Search for" & \begin{tabular}{l} 
Combo box for defining the search term or for selecting the 25 most recent \\
search terms.
\end{tabular} \\
\hline "Search in titles only" & The search is performed only in the titles of the help pages. \\
\hline "Display partial matches" & Displays terms also as search results that include the search term. \\
\hline "Limit to .... matches" & \begin{tabular}{l} 
Limits the number of search results. \\
Maximum value: 1000
\end{tabular} \\
\hline "Find" & Starts the full-text search. \\
\hline
\end{tabular}

\section*{Command 'About'}

Function: This command opens a splash screen with information about the CODESYS version and copyright. In addition, buttons are available for detailed information about the version, license, and acknowledgments.

Call: Main menu "Help".
\begin{tabular}{|l|l|}
\hline "Version Info" & \begin{tabular}{l} 
Opens the "Detailed Version Information" dialog box with a list of CODESYS \\
components and information about the operating system. \\
"Export": Exports the detailed version information as a *.txt file or in any other \\
format.
\end{tabular} \\
\hline "License Info" & \begin{tabular}{l} 
Opens the "License Information" dialog box. \\
- "Plug-in": Drop-down list for the plug-in to display the license information \\
- "Software License": License information about selected "Plug-in"
\end{tabular} \\
\hline "Acknowledgments" & \\
\hline
\end{tabular}

\section*{Command 'Init Step'}

Symbol: 追
Function: This command converts the selected step into an initial step.
Call: Main menu "SFC"

After you choose this command, the borders of the step element change to a double line. The previous initial step is automatically displayed as a normal step with a single-line border.
You can also activate and deactivate the property "Init step" in the properties dialog of a step. However, CODESYS does not automatically adjust the settings of other steps.

This command is useful if you want to convert a diagram. When you create a new SFC object, it automatically includes an initial step followed by a transition (TRUE) and a jump back to the initial step.

Please note: In online mode, it is possible to reset the diagram to the initial step using the SFCInit and SFCReset flags.

\section*{Command 'Insert Step'}

Symbol: \(\square \uparrow\)
Function: This command inserts a step before the selected point.
Call: Menu bar "SFC"; context menu in SFC editor
The new step is named \(S t e p<n>\) by default, where \(n\) is an incremental number starting at 0 for the first step that is inserted in addition to the initial step. The name can be edited by clicking on it.

See also

- \(\Downarrow\) Chapter 6.4.1.20.1.5.8.1 "SFC elements 'Step' and 'Transition"' on page 2073

\section*{Command 'Insert Transition After'}

Symbol: \(+\downarrow\)
Function: This command inserts a transition after the selected point.
Call: Menu bar "SFC"; context menu in SFC editor

The new transition is named Trans<n> by default, where n is an incremental number beginning at 0 for the first transition. The name can be edited by clicking on it.

See also
- \(\quad{ }^{\circ}\) Chapter 6.4.1.21.3.12.7 "Command 'Insert Step-Transition After"' on page 2677
- \({ }^{4}\), Chapter 6.4.1.20.1.5.8.1 "SFC elements 'Step' and 'Transition"' on page 2073

\section*{Command 'Insert Transition'}

Symbol: + \(\uparrow\)
Function: This command inserts a transition before the selected point.
Call: Menu bar "SFC"; context menu in SFC editor
The new transition is named Trans<n> by default, where \(n\) is an incremental number beginning at 0 for the first transition. The name can be edited by clicking on it.

See also
- \({ }^{\text {® }}\) Chapter 6.4.1.21.3.12.7 "Command 'Insert Step-Transition After"" on page 2677

\section*{Command 'Insert Step-Transition'}

Symbol: \(甲 \uparrow\)
Function: This command inserts a step and a transition before the selected point.
Call: Main menu "SFC"
If you have selected a step, then CODESYS inserts a new step-transition combination. If you have selected a transition, then a new transition-step combination is inserted.

The new step is named \(S t e p<n>\) by default, where \(n\) is an incremental number beginning at 0 for the first step that was inserted in addition to the initial step. The new transition is named Trans<n> by default. You can edit the default names directly by clicking the names.

See also

- \({ }^{*}\) Chapter 6.4.1.20.1.5.8.1 "SFC elements 'Step' and 'Transition"' on page 2073

\section*{Command 'Insert Step-Transition After'}

Symbol: \(+\downarrow\)
Function: This command inserts a step and a transition after the selected point.
Call: Main menu "SFC"
If you have selected a step, then CODESYS inserts a new transition-step combination. If you have selected a transition, then a new step-transition combination is inserted.
The new step is named \(S t e p<n>\) by default, where \(n\) is an incremental number beginning at 0 for the first step that was inserted in addition to the initial step. The new transition is named Trans<n> by default. You can edit the default names directly by clicking the names.
See also
- \({ }^{\wedge} \boldsymbol{y}\) Chapter 6.4.1.21.3.12.6 "Command 'Insert Step-Transition"" on page 2677

\section*{Command 'Add Entry Action'}

\section*{Symbol:}

Function: This command opens the "Add Entry Action" dialog box where you define a new entry action. Depending on the SFC options, a dialog prompt may open for selecting the duplication mode for the new step action.
Call: Menu bar: "SFC"; context menu of the selected step element.
Requirement: A step element in SFC is selected.
The entry action is opened automatically in the ST editor. The step element contains an E in the lower left corner.

\section*{Confirmation prompt for selecting the duplication mode}

\section*{Options:}
- "Copy reference: A new step will call the same actions": If the step is copied in SFC, the link to the step action(s) is also copied. The steps copied by each other will therefore call the same actions.
- "Copy implementation: New action objects are created for a new step.": This means that the step actions for a copied step are embedded. By default, the generated action objects appear below an SFC box in the device tree or "POUs" view. These objects contains a copy of the original implementation code of the respective action.
The display of the embedded objects can be activated and deactivated in the tree by means of the "Show Embedded Objects" and "Hide Embedded Objects" commands in the context menu of an SFC object.

\section*{Command 'Add Exit Action'}

Symbol:
Function: This command opens the "Add Exit Action" dialog box where you define a new exit action. Depending on the SFC options, a dialog prompt may open for selecting the duplication mode for the new step action. For more information, refer to the help page for the "Add Exit Action" command.

Call: Menu bar: "SFC"; context menu of the selected step element.
Requirement: A step element in SFC is selected.

\section*{See also}

- \(\boldsymbol{y y}^{\prime}\) Chapter 6.4.1.21.3.12.25 "Command 'Do Not Display Embedded Objects'" on page 2684

\section*{Command 'Parallel'}

Symbol: 照
Function: This command converts the selected alternative branch into a parallel branch.
Call: Main menu "SFC"
Requirement: The horizontal connecting line of a branch is selected.

Please note that after you convert a branch，you must check and modify the layout of the steps and transitions before and after the branch．
See also
－ⓨ Chapter 6．4．1．21．3．12．11＂Command＇Alternative＇＂on page 2679

\section*{Command＇Alternative＇}

Symbol：卢
Function：This command converts the selected parallel branch into an alternative branch．
Call：Main menu＂SFC＂
Requirement：The horizontal connecting line of a branch is selected．
Please note that after you convert a branch，you must check and modify the layout of the steps and transitions before and after the branch．
See also
－\({ }^{4}\) Chapter 6．4．1．21．3．12．10＂Command＇Parallel＂＇on page 2678

\section*{Command＇Insert Branch＇}

Symbol：昂
Function：This command inserts a branch to the left of the selected point．
Call：Main menu＂SFC＂
This command functions similar to the＂Insert Branch Right＂command．
See also
－\({ }^{4}\) Chapter 6．4．1．20．1．5．8．3＂SFC element＇Branch＂＇on page 2078
－ \(\boldsymbol{y}^{2}\) Chapter 6．4．1．21．3．12．13＂Command＇Insert Branch Right＂＇on page 2679

\section*{Command＇Insert Branch Right＇}

Symbol：悹
Function：This command inserts a branch to the right of the selected point．
Call：Main menu＂SFC＂
The type of inserted branch depends on the selected element．
－If the uppermost element of the selected elements is a transition or an alternative branch， then CODESYS inserts an alternative branch．
－If the uppermost element of the selected elements is a step，a macro，a jump，or a parallel branch，then CODESYS inserts a parallel branch with the Branch＜x＞jump marker，where \(x\) is an incremental number．You can edit the default name of the jump marker or define the jump marker as a jump destination．
－If a common element of an existing branch（horizontal line）is selected，then CODESYS inserts the new branch line as a branch line on the far right．If an entire branch line of an existing branch is selected，then CODESYS inserts the new branch line directly to the right as a new branch line．

Please note：You can convert a branch into another type with the＂Alternative＂ and＂Parallel＂commands．

Example of
alternative branch

The following image shows a new inserted alternative branch generated by the "Insert Branch Right" command while the \(t 4\) transition was selected. CODESYS automatically inserts a step (Step32 in the example), a preceding transition, and a subsequent transition ( \(\mathrm{t} 41, \mathrm{t} 42\) ).

Processing in online mode: If Step 3 is active, then CODESYS passes the subsequent transitions ( \(t 4, t 41\) ) from left to right. The first branch line of the main branch with the first transition yielding TRUE is passed. Therefore, only one branch line is processed as opposed to with a parallel branch.

\section*{Command 'Insert Action Association'}

Symbol: \(\mp\)
Function: This command assigns an IEC action to a step.
Call: Main menu "SFC"

Requirement: A step is selected.
CODESYS inserts the action element to the right of the selected step element.
If you have already assigned one or more actions to the step, they are displayed in an action list. The new action is then inserted as follows:
- If you selected the step element, the action is inserted as the first action of the step at first position of the action list.
- If you selected one of the available actions in the action list, then the action is inserted directly above the selected action.
The left section of the action element includes the qualifier ( N by default). You enter the action name in the right section. To set this value, click in the box to obtain an editing frame. You must have already created this action as a POU in the project.
You can also edit the qualifier. Valid qualifiers are described in the chapter "Qualifiers for Actions in SFC".

See also
- « Chapter 6.4.1.21.3.12.15 "Command 'Insert Action Association After"' on page 2681
- ② Chapter 6.4.1.20.1.5.4 "Qualifiers for Actions in SFC" on page 2065

\section*{Command 'Insert Action Association After'}

Symbol: \(\quad \downarrow\)
Function: This command assigns an IEC action to a step.
Call: Main menu "SFC"
Requirement: A step is selected.
This command functions similar to the "Insert Action Association" command. The difference between the two commands is that CODESYS inserts the new action in the last position of the action list, not the first position. If you select an action in the action list, then CODESYS inserts the new action at the bottom of the list, not at the top.

See also

- ⓨ Chapter 6.4.1.20.1.5.4 "Qualifiers for Actions in SFC" on page 2065

\section*{Command 'Insert Jump'}

Symbol: L \(\mathrm{L}_{\mathrm{L}} \uparrow\)
Function: This command inserts a jump element before the selected element.
Call: Main menu "SFC"
Requirement: A step is selected.
CODESYS automatically inserts the jump with the Step destination. Then, you still have to replace this jump destination with an actual destination by using the input assistant.

See also
- „y Chapter 6.4.1.20.1.5.8.4 "SFC element 'Jump"' on page 2079
- \(\quad\) Chapter 6.4.1.21.3.12.17 "Command 'Insert Jump After"' on page 2681

\section*{Command 'Insert Jump After'}

Symbol: Lo \(\downarrow\)
Function: This command inserts a jump element after the selected element.

Call: Main menu "SFC"
CODESYS automatically inserts the jump with the step destination. Then, you still have to replace this jump destination with an actual destination by using the input assistant.
See also
- „ Chapter 6.4.1.20.1.5.8.4 "SFC element 'Jump"" on page 2079
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.12.16 "Command 'Insert Jump"" on page 2681

\section*{Command 'Insert Macro'}

Symbol: 回 \(\uparrow\)
Function: This command inserts a macro element before the selected element.
Call: Main menu "SFC"
The new macro is named Macro \(\langle x\rangle\) by default, where \(x\) is an incremental number beginning at 0 for the first macro. You can edit the default name directly by clicking the name.

To edit the macro, click "Zoom Into Macro" in the macro editor.
See also
- \(\Leftarrow\) Chapter 6.4.1.21.3.12.20 "Command 'Zoom Into Macro'" on page 2682
- \(\quad \Rightarrow\) Chapter 6.4.1.21.3.12.19 "Command 'Insert Macro After'" on page 2682

\section*{Command 'Insert Macro After'}

\section*{Symbol: 审 \(\downarrow\)}

Function: This command inserts a macro element after the selected element.
Call: Main menu "SFC"
This command functions similar to the "Insert Macro" command.
See also
- \({ }^{\circledR}\) Chapter 6.4.1.21.3.12.20 "Command 'Zoom Into Macro'" on page 2682
- \(\quad>\) Chapter 6.4.1.21.3.12.18 "Command 'Insert Macro'" on page 2682

\section*{Command 'Zoom Into Macro'}

Symbol: \(\downarrow\)
Function: This command opens a macro for editing in the macro editor.
Call: Main menu "SFC"
Requirement: A macro is selected.
By choosing this command, CODESYS closes the main view of the SFC editor and opens the macro editor. This is also an SFC editor for editing the section of the SFC diagram that is displayed as a macro box in the main view.
Click "Zoom Out of Macro" to return to the main view.
See also
- \({ }^{\text {® }}\) Chapter 6.4.1.21.3.12.21 "Command 'Zoom Out of Macro'" on page 2682

\section*{Command 'Zoom Out of Macro'}

Symbol: \(\checkmark\)

Function: This command closes the macro editor and returns to the main view of the SFC editor.

Call: Main menu "SFC"
Requirement: A macro is open in the macro editor.

\section*{See also}
- \({ }^{4}\) ) Chapter 6.4.1.21.3.12.20 "Command 'Zoom Into Macro"' on page 2682

\section*{Command 'Paste After'}

Symbol: 圆 \(\downarrow\)
Function: This command pastes the elements from the clipboard after the selected position.
Call: Main menu "SFC".

\section*{Command 'Change Duplication' - 'Set'}

Function: This command embeds every step action or transition, which is called by a step or transition in the SFC box, with the caller. In this way, the action or transition object can be called only from exactly this caller (pseudo-embedding). The result is that copying step and transition elements that call cations or transitions automatically creates new action or transition objects. the implementation code is also copied.

Call: Menu bar: "SFC".
For more details about duplication mode, refer to the help page for the SFC element properties and the instructions for adding step actions.

Pseudo-embedded objects can be hidden in the "Devices" or "POUs" view by means of a command.

See also
- \& Chapter 6.4.1.20.1.5.8.6 "SFC element properties" on page 2080
- \({ }^{\bullet}>\) Chapter 6.4.1.9.5.5.2 "Programming in SFC" on page 1880

\section*{Command 'Change Duplication' - 'Remove'}

Function: This command removes the embedding of action, transition, and property objects by a step or transition that calls it for the entire SFC box. In this way, the pseudo-embedding of the action, transition, or property objects is removed. If step or transition elements are copied, which call actions, transitions, or properties, then the copying calls the same actions and transitions as the source.

Call: Menu bar: "SFC".
For more details about duplication mode, refer to the help page for the SFC element properties and the instructions for adding step actions.

Pseudo-embedded objects can be hidden in the "Devices" or "POUs" view by means of a command.

\section*{Command 'Edit Worksheet'}

Function: This command opens the "Edit Worksheet" dialog box in which you set the size of the worksheet.
Call: Main menu "CFC"
Requirements: A CFC editor is active.

\section*{Dialog box 'Edit worksheet'}
\begin{tabular}{|l|l|}
\hline "Use following dimensions" & \begin{tabular}{l} 
Here is where you set the size of the worksheet. Your change is only accepted if \\
the size is sufficient for the existing program.
\end{tabular} \\
\hline "Adapt the dimensions & Automatically adapts the size of the worksheet to the size of your program. \\
automatically" & \begin{tabular}{l} 
Shifts the worksheet along the x or y axis. The input of negative numbers is \\
permitted.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Move the working sheet origin \\
relatively"
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Edit Page Size'}

Function: This command opens the "Edit Page Size" dialog box, in which you change the size of the page-oriented CFC editor.
Call: Main menu "CFC"
Requirements: A page-oriented CFC editor is active.

\section*{Dialog box 'Edit \\ page size' \\ dialog box}
\begin{tabular}{|l|l|}
\hline "Width" & \begin{tabular}{l} 
Width of the page (minimum 24, maximum 1024). Elements outside of the \\
working area are marked red.
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Height of the page (minimum 24, maximum 1024). Elements outside of the \\
working area are marked red.
\end{tabular} \\
\hline "Margin width" & Width of the margin (minimum 6, maximum 25\% or page width). \\
\hline \begin{tabular}{l} 
"Set as standard for new CFC \\
objects"
\end{tabular} & \(\boxed{\square}\) : The current settings are selected as standard for new CFC objects. \\
\hline
\end{tabular}

See also
- \({ }^{4}\) Chapter 6.4.1.20.1.7.6.1 "CFC element 'Page'" on page 2109

\section*{Command 'Negate'}

Symbol: -d
Function: This command negates the selected function block input or function block output.
Call: Main menu "CFC", context menu
Requirements: A CFC editor is active. A function block input or function block output is selected.

\section*{Command 'EN/ENO'}

Symbol: \EM
Function: This command adds a boolean input "EN" (Enable) and a boolean output "ENO" (Enable Out) to the selected function block.

Call: Main menu "CFC", context menu
Requirements: A CFC editor is active. A function block is selected.
The added input "EN" activates the function block. The function block is executed only if the input is TRUE. The value of this signal is output at the "ENO" output.

\section*{Command 'None'}

Symbol: - - ; keyboard shortcut : [Ctrl]+[M] (to toggle between "S", "R", "REF", and None)
Function: The command removes a Reset (R), Set (S), or REF from the input of the "Output" element.

Call: Menu bar: "CFC \(\rightarrow\) Set/Reset"; context menu: "Set/Reset"
Requirement: A CFC editor is active. The input of an "Output" element is selected.

\section*{Command 'R (Reset)'}

Symbol: \(\mathbb{R}^{\text {; }}\); keyboard shortcut : [Ctrl]+[M] (to toggle between "S", "R", "REF", and None)
Function: The command adds a Reset to the input of a Boolean "Output" element.
Call: Menu bar: "CFC \(\rightarrow\) Set/Reset"; context menu: "Set/Reset"
Requirement: A CFC editor is active. The input of an "Output" element is selected.
If an "Output" element has a Reset input, then the Boolean output value is set to "FALSE" as soon as the value of the input is "TRUE". The "FALSE" value at the output is retained, even if the input value changes.
See also
- \(\left.\quad \begin{array}{l} \\ y\end{array}\right)\) Chapter 6.4.1.21.3.13.7 "Command 'S (Set)"' on page 2687

\section*{Command 'S (Set)'}

Symbol: si; keyboard shortcut : [Ctrl]+[M] (to toggle between "S", "R", "REF", and none)
Function: The command adds a Set (S) to the input of a Boolean "Output" element.
Call: Menu bar: "CFC \(\rightarrow\) Set/Reset"; context menu: "Set/Reset"
Requirement: A CFC editor is active. The input of an "Output" element is selected.
If an "Output" element has a Set input, then the Boolean output value is set to "TRUE" as soon as the value of the input is "TRUE". The "TRUE" value at the output is retained, even if the input value changes.

See also
- \(y^{\prime}>\) Chapter 6.4.1.21.3.13.6 "Command 'R (Reset)"' on page 2687

\section*{Command 'REF= (Reference Assignment)'}

Symbol: \({ }^{\text {REF }}\); keyboard shortcut : [Ctrl] \(]+[M]\) (to toggle between "S", " \(R\) ", "REF", and None)
Function: The command assigns a reference to an "Output" element.
Call: Menu bar: "CFC \(\rightarrow\) Set/Reset"; context menu: "Set/Reset"
Requirements: A CFC editor is active. The input of an "Output" element is selected.
```

Example: Declaration:
ref_int : REFERENCE TO INT;
a : INT;
CFC:

```

This corresponds to the ST code: ref_int REF= a;

For more information, see the description for the data type REFERENCE TO.

- \(\Leftrightarrow_{\text {® }}\) Chapter 6.4.1.20.5.14 "Reference" on page 2245

\section*{Command 'Display Execution Order'}

Function: The command temporarily shows a numbered tag for all CFC elements of the programming object.

\section*{Call}
- Menu bar: "CFC \(\rightarrow\) Execution Order"
- Context menu in the CFC editor

Requirement: A CFC editor is active and the "Auto Data Flow Mode" property is selected.
The numbers represent the automatically determined execution order. The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position in the editor.
The tags are hidden as soon as you click in the CFC editor.

See also
- \({ }^{*} \Rightarrow\) Chapter 6.4.1.9.5.3.2 "Automatic Execution Order by Data Flow" on page 1867
- \(\quad\) Chapter 6.4.1.21.3.13.10 "Command 'Set Start of Feedback"' on page 2688

\section*{Command 'Set Start of Feedback'}

Symbol:
Function: The command defines the selected element as the starting point within a feedback.
Call:
- Menu bar: "CFC \(\rightarrow\) Execution Order"
- Context menu: "Execution Order"

Requirement: A CFC editor is active and the "Auto Data Flow Mode" property is selected. Moreover, a network of the CFC POU contains a feedback, and an element within the feedback is selected.

In the CFC editor, the starting point within the feedbacks is decorated with the symbol. Then the element has the lowest number in the execution order within the feedbacks. At runtime, the processing of the feedback begins with this element.

- \(\quad\) Chapter 6.4.1.21.4.11.14 "Dialog 'Properties' - 'CFC Execution Order'" on page 2761

\section*{Command 'Send to Front'}

Symbol:

Function: The command numbers the elements so that the selected elements are located at the front of the execution order.

Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and the "Explicit Execution Order Mode" property is selected. At least one element is selected.

The selected elements get the lowest numbers beginning at 0 while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- *y Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology'" on page 2691

\section*{Command 'Send to Back'}

Symbol: 믈
Function: The command numbers the elements so that the selected elements are located at the end of the execution order.

Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and the "Explicit Execution Order Mode" property is selected. At least one element is selected.

The selected elements get the highest numbers while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- \({ }^{\Perp}\) Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology'" on page 2691

\section*{Command 'Move Up'}

Symbol: \(\square\)
Function: The command numbers the elements so that the selected elements are located one position forward.
Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and at least one element is selected. The "Explicit Execution Order Mode" property is selected.

The selected elements get a numbering decreased by one while keeping the previous order. The selected elements are processed one position earlier. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also
- \(y^{*}\) Chapter 6.4.1.9.5.3.2 "Automatic Execution Order by Data Flow" on page 1867

- \(\quad\) \& Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology'" on page 2691

\section*{Command 'Move Down'}

Symbol: -4
Function: The command numbers the elements so that the selected elements are located one position backward.

Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and at least one element is selected. The "Explicit Execution Order Mode" property is selected.

The selected elements get a numbering increased by one while keeping the previous order. The elements are processed one position later. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also

- \(\quad\) \& Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology"' on page 2691

\section*{Command 'Set Execution Order'}

Function: The command opens a dialog for setting the number of the selected element to any value.

Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and the "Explicit Execution Order Mode" property is selected. Exactly one element is selected.

The selected element gets the number specified in the dialog. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also
- \(\boldsymbol{y}^{*}\) Chapter 6.4.1.9.5.3.2 "Automatic Execution Order by Data Flow" on page 1867

- 祭 Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology'" on page 2691

\section*{Command 'Order by Data Flow'}

Function: The command numbers the elements in the program by data flow, or in the case of multiple networks by their topological position in the editor.

Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and the "Explicit Execution Order Mode" property is selected.
The command is also available when no element is selected.

The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position of the networks. All numbered elements of the POU are set accordingly. Afterwards, the execution order is identical to that in auto data flow mode. The topological positions of the elements are retained anyway.

- \(\quad\) © Chapter 6.4.1.21.3.13.17 "Command 'Order by Topology'" on page 2691

\section*{Command 'Order by Topology'}

Function: The command orders the execution order of the elements by their topological position from right to left and from top to bottom.
Call: Menu bar: "CFC \(\rightarrow\) Execution Order"; context menu: "Execution Order"
Requirements: A CFC editor is active and the "Explicit Execution Order Mode" property is selected. At least one element is selected.

The command applies to all elements in the program, even if not all elements are selected when the command is executed. The topological positions of the elements are retained anyway.

See also
- \#y Chapter 6.4.1.9.5.3.2 "Automatic Execution Order by Data Flow" on page 1867

\section*{Command 'Edit Parameters'}

Function: This command opens the "Edit Parameters" dialog box, where you change the constant input parameters of a function block.
Call: Main menu "CFC \(\rightarrow\) Edit Parameters", or "Right-Click \(\rightarrow\) Edit Parameters", click the "Parameter" function block.

Requirements: A CFC editor is active. An instantiated function block has VAR_INPUT CONSTANT variables in its declaration.

CODESYS displays blocks with VAR_INPUT CONSTANT variables by the word "Parameter" in the lower left corner of the block.

Dialog Box 'Edit
Parameters'
\begin{tabular}{|l|l|}
\hline "Parameters" & Name of the variable \\
\hline "Type" & Data type of the variables \\
\hline "Value" & Click into the field to type a value. \\
\hline "Initial Value" & Initialization Value \\
\hline "Category" & \begin{tabular}{l} 
Additional information about the parameters; these values are defined by attrib- \\
utes and cannot be changed in this dialog box.
\end{tabular} \\
\hline "Unit" & \begin{tabular}{l} 
- parameterCategory \\
"Min"
\end{tabular} \\
\hline "Max" & \begin{tabular}{l} 
- parameterUnit \\
\(\bullet\) \\
parameterMinValue
\end{tabular} \\
\hline "Delete Prepared Parameters" & \begin{tabular}{l} 
This command is active when you write a prepared value ("Debug \\
\(\rightarrow\) Write Value").
\end{tabular} \\
\hline
\end{tabular}

When you exit the field and the dialog box by clicking "OK", the value changes are applied to the project.
```

- \& Chapter 6.4.1.21.3.13.19 "Command 'Save Prepared Parameters to Project'" on page 2693

\section*{Command 'Save Prepared Parameters to Project'}

Function: This command saves the prepared parameter values to the project.
Call: Main menu "CFC".
Requirements: A CFC editor is active. Parameter values of function block instances are changed in online mode. You are in offline mode.
If the values of constants on the controller are different from the values in the application, then this is indicated by a red asterisk next to the parameter field. Clicking "Incur Prepared Parameters" saves the controller values to the application.

See also
- \(\mathrm{m}_{\text {" "Changing of constant input parameters of function block instances" on page } 2105}\)
- \({ }^{\text {• }}\) Chapter 6.4.1.21.3.13.18 "Command 'Edit Parameters"" on page 2692

\section*{Command 'Connect Selected Pins'}

Symbol: \(\sigma\)
Function: The command establishes a connection between the selected pins.
Call: Main menu "CFC", context menu
Requirements: A CFC editor is active. Precisely one output and several inputs are selected.
In order to select the pins you must keep the [CTRL] key pressed while clicking on the pins. Then you execute the command.

See also
- \({ }^{*}>\) Chapter 6.4.1.21.3.13.23 "Command 'Select Connected Pins'" on page 2694

\section*{Command 'Unlock Connection'}

Symbol:
Function: This command unlocks a disabled connection.
Call: Main menu "CFC \(\rightarrow\) Routing", context menu "Routing"
Requirements: A CFC editor is active. A connection or a connection mark is selected.
You obtain a disabled connection if you change the connections of the automatic routing. If you wish to carry out automatic routing again, you must first unlock a disabled connection.

See also
- \({ }^{4}\) Chapter 6.4.1.9.5.3.3 " Programming in the CFC editor" on page 1871
- 鼠 Chapter 6.4.1.20.1.7.6.12 "CFC element 'Connection Mark - Source/Sink"' on page 2112

\section*{Command 'Show Next Collision'}

Function: This command displays the next collision in the editor and marks the place concerned.

Call: Menu menu "CFC \(\rightarrow\) Routing", context menu "Routing"
Requirements: A CFC editor is active and at least one connection with a collision is present.
This function is very useful if you operate with large networks and see only one sub-area. A collision is additionally indicated to you by the red bordered symbol in the top right corner of the editor.

\section*{Command 'Select Connected Pins'}

Symbol: -E; shortcut: [Ctrl]+[Left Arrow], or [Ctrl]+[Right Arrow]
Function: The command selects all pins that are connected to the currently selected line, or connected to the currently selected connection mark in page-oriented CFC.
Call: "CFC" menu; context menu
Requirements: A CFC editor or a page-oriented CFC editor is active. One line and therefore exactly one connection or exactly one connection mark is selected.

See also
- \({ }^{4}\) Chapter 6.4.1.20.1.7.2 "CFC Editor" on page 2098

- \({ }^{\circ} \boldsymbol{y}\) Chapter 6.4.1.20.1.7.6.12 "CFC element 'Connection Mark - Source/Sink'" on page 2112

\section*{Command 'Reset Pins'}

Symbol: 汘, [Ctrl]+[U]
Function: The command restores the deleted pins of a box.
Call: "CFC \(\rightarrow\) Pins" menu; "Pins" in the context menu
Requirements: A CFC editor is active and a box is selected.
The command restores all inputs and outputs of the box as they are defined in their implementation.
See also
- \({ }^{\circledR}\), Chapter 6.4.1.21.3.13.25 "Command 'Remove Unused Pins'" on page 2694

\section*{Command 'Remove Unused Pins'}

Symbol:

Function: The command removes all unused pins of the selected element.
Call: Menu "CFC \(\rightarrow\) Pins", context menu "Pins"
Requirements: A CFC editor is active. An element is selected.
See also
- \({ }^{\circ} \boldsymbol{y}\) Chapter 6.4.1.21.3.13.24 "Command 'Reset Pins'" on page 2694

\section*{Command 'Add Input Pin'}

Symbol:
Function: The command adds a further input to the selected function block.
Call: Main menu "CFC \(\rightarrow\) Pins", context menu "Pins"
Requirements: A CFC editor is active. A function block is selected.
See also
- \(\sum^{\wedge}\) Chapter 6.4.1.21.3.13.27 "Command 'Add Output Pin'" on page 2695

\section*{Command 'Add Output Pin'}

Symbol: 洊
Function: The command adds a further output to the selected function block.
Call: Main menu "CFC \(\rightarrow\) Pins", context menu "Pins"
Requirements: A CFC editor is active. A suitable function block is selected.
See also
- \({ }^{\text {² }}\), Chapter 6.4.1.21.3.13.26 "Command 'Add Input Pin'" on page 2695

\section*{Command 'Route All Connections'}

Symbol: "
Function: This command cancels all manual changes to the connections in the program and re-establishes the original state.
Call: Main menu "CFC \(\rightarrow\) Routing", context menu "Routing"
Requirements: A CFC editor is active.
CODESYS cannot automatically route connections that are fixed by control points. You must remove the control points before executing the command. Use the "Remove Control Point" command to do this. Furthermore you must disconnect connections that have been changed manually and are marked by the \(\underline{\text {, icon. Use the "Disconnect Connection" command to do this. }}\)
See also
- \(\Rightarrow\) Chapter 6.4.1.21.3.13.29 "Command 'Remove Control Point'" on page 2695
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.13.21 "Command 'Unlock Connection'" on page 2693

\section*{Command 'Remove Control Point'}

Function: This command removes a control point.
Call: Context menu "Routing"
Requirements: A CFC editor is active. You have selected a connecting line.

If you move the mouse pointer over a selected connecting line, the existing control points are displayed with yellow circle symbols. Set the cursor on the control point to be deleted and execute the command from the context menu.

See also
- \(\quad 4\) Chapter 6.4.1.20.1.7.6.2 "CFC element 'Control Point"' on page 2109
- \({ }^{\bullet} \boldsymbol{y}\) Chapter 6.4.1.21.3.13.30 "Command 'Create Control Point"' on page 2696

\section*{Command 'Create Control Point'}

Symbol: +
Function: The command creates a control point on a connecting line.
Call: Context menu "Routing"
Requirements: A CFC editor is active. The cursor is over a connection.
The control point is created in the position on the connection at which the cursor is located when calling the command. The command corresponds to the "Control Point" element in the "Tools" window.

See also
- \({ }^{4} \boldsymbol{y}\) Chapter 6.4.1.20.1.7.6.2 "CFC element 'Control Point"" on page 2109

\section*{Command 'Connection Mark'}

Symbol:
Function: This command switches the display of the connection between two elements back and forth between a connecting line and the use of connection marks.

Call: Main menu "CFC", context menu
Requirements: A CFC editor is active. A connection or a connection mark is selected.
If you have selected a connecting line, the command removes this line and adds a "Connection Mark - Source" at the output of one element and a "Connection Mark - Sink" at the input of the other. Both are given the same name by default, " \(\mathrm{C}-<\mathrm{n}>\) ", where n is a sequential number.

If you select a pair of connection marks, the command converts these marks into a connecting line.

See also
- \(\boldsymbol{y y}^{\prime}\) Chapter 6.4.1.20.1.7.6.12 "CFC element 'Connection Mark - Source/Sink'" on page 2112

\section*{Command 'Create group'}

Symbol:向
Function: This command groups the selected elements.
Call: Main menu "CFC \(\rightarrow\) Group", context menu "Group"
Requirements: A CFC editor is active. Several elements are selected.

Grouped elements can only be moved together. The position of the elements is not affected by the grouping.

See also
- \({ }^{*}\), Chapter 6.4.1.21.3.13.33 "Command 'Ungroup'" on page 2697

\section*{Command 'Ungroup'}

Symbol: 面
Function: The command undoes a previous grouping.
Call: Main menu "CFC \(\rightarrow\) Group", context menu "Group"
Requirements: A CFC editor is active. A grouping is selected.
See also
- *y Chapter 6.4.1.21.3.13.32 "Command 'Create group'" on page 2696

\section*{Command 'Prepare Box for Forcing'}

This command is required when using compiler versions 3.5.11.x and 3.5.12.x.
The command is no longer required for compiler versions \(>=3.5 .13 .0\).

Function: The command activates and deactivates the forceability of the inputs for a function block element.

\section*{Call:}
- CFC
- Context menu

Requirements: The CFC editor is in offline mode and a function block element is selected.
After executing the command, the "Force Function Block Input" command is available in online mode to open a dialog for forcing the box input values.

See also
- \({ }^{4}\) Chapter 6.4.1.21.3.13.35 "Command 'Force Function Block Input'" on page 2697
- \(\Leftrightarrow\) Chapter 6.4.1.20.1.7.2 "CFC Editor" on page 2098
- \({ }^{4}\) Chapter 6.4.1.12.5 "Forcing and Writing of Variables" on page 1987

\section*{Command 'Force Function Block Input'}

\section*{NOTICE!}

This kind of forcing uses a data breakpoint internally and is therefore different from forcing with the "Force Values" command or [F7].
Values that were forced by the command "Force FB Input" do not respond to the commands "Show All Forces" or "Unforce Values".

Function: The command opens the "Force Value" dialog to force the selected input of a function block. Forcing can be canceled with the same command and dialog.
Call:
- CFC
- Context menu

\section*{Requirements:}
- The CFC editor is in online mode and the input of the function block is selected.
- For compiler versions 3.5.11.x and 3.5.12.x, the "forceability" of the function block is enabled by the "Prepare Box for Forcing" command.
In the "Force Value" dialog, you can either specify a value that the input of the function block should be forced, or remove the currently forced value.

After forcing, the input is highlighted in green again. Boolean inputs get a small monitoring view with the forced value. The forced value is displayed in the "Value" column of monitoring views (in the declaration part of the POU or in a watch list).

\section*{Dialog 'Force Value'}
\begin{tabular}{|l|l|}
\hline "Expression" & Name of the function block input. Example: TON_1. IN. \\
\hline "Type" & Data type of the input \\
\hline
\end{tabular}

Table 517: "What do you want to do?"
\begin{tabular}{|l|l|}
\hline "Set a new value to force" & \begin{tabular}{l} 
©: You can specify a new value in the input field. The format has to correspond \\
to the data type.
\end{tabular} \\
\hline "Remove value" & O: Forcing at the input is canceled. \\
\hline
\end{tabular}

- \(\Leftrightarrow\) Chapter 6.4.1.21.3.13.34 "Command 'Prepare Box for Forcing'" on page 2697

\section*{Command 'Use Attributed Member as Input'}

Symbol: \(\Downarrow\)
Function: This command allows for connecting a structure member to a scalar type input.
Call: Menu bar: "CFC \(\rightarrow\) Pins"; context menu: "Pins"
Requirements: A CFC editor is active and a function block input is selected.
The member of the structure that is connected to the input of the subsequent function block must be provided with the pragma \{attribute 'ProcessValue'\}. The data type of the structure member has to be compatible with the data type of the subsequent input. Inputs connected in this way are flagged with the " V " symbol.

If you do not execute the command "Use attributed member as input" for this link, then a compiler error is issued.

- \(\quad 4\) Chapter 6.4.1.21.3.14.2 "Command 'Insert Network (Below)"' on page 2701

\section*{Command 'Insert Network (Below)'}

Symbol: [通, shortcut: [Ctrl]+ [T]
Function: This command inserts a further network in the FBD/LD/IL editor below the selected network.

Call: Main menu "FBD, LD, IL", context menu
Requirements: The FBD, LD or IL editor is active. A network is selected. No box is selected.
See also
- \(\quad\) \& Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Toggle Network Comment State'}

Symbol: \((\times x)^{\prime}\), shortcut: [Ctrl] + [O]
Function: The command comments the selected network in or out.
Call: Main menu "FBD, \(L D\), \(I L\) ", context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.
See also
- \({ }^{\circ}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Insert Assignment'}

Symbol -vne, shortcut: [Ctrl] + [A]
Function: This command inserts an assignment in the FBD or LD editor.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

See also
- \({ }^{\mu}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Insert Box'}

Symbol: 洉, shortcut: [Ctrl] + [B]
Function: This command inserts a box that is available in the project at the end of the selected network.

Call: Main menu "FBD, LD, IL", context menu

Requirements：The FBD，LD or IL editor is active．A network is selected，but no box is selected． If you select this command the input assistant opens，where you can select the desired box．
See also

－\＆Chapter 6．4．1．9．7＂Using input assistance＂on page 1885

\section*{Command＇Insert Box with EN／ENO＇}

Symbol：：苃，shortcut：［Ctrr］＋［Shift ］＋［E］
Function：This command inserts a box with a boolean input＂Enable＂and a boolean output ＂Enable Out＂at the end of the selected network．
Call：Main menu＂FBD，LD，IL＂，context menu
Requirements：the FBD，LD or IL editor is active．A network is selected，but no box is selected．
See also
－\＆Chapter 6．4．1．20．1．6．1＂FBD／LD／IL Editor＂on page 2082
－\(\&\) Chapter 6．4．1．9．7＂Using input assistance＂on page 1885

\section*{Command＇Insert Empty Box＇}

Symbol：洋，shortcut：［Ctrr］＋［Shift］＋［B］
Function：This command inserts an empty function block at the end of the currently selected network．

Call：Main menu＂FBD／LD／LL＂，context menu
Requirements：The FBD，LD or IL editor is active．A network is selected，but no box is selected．
See also
－＊Chapter 6．4．1．20．1．6．1＂FBD／LD／IL Editor＂on page 2082

\section*{Command＇Insert Empty Box with EN／ENO＇}

Symbol：們
Function：The command inserts an empty box with a Boolean input＂Enable＂and a Boolean output＂Enable Out＂at the end of the selected network．
Call：Main menu＂FBD／LD／IL＂，context menu
Requirements：The FBD editor，the IL editor or the LD editor is active．A network must be selected．No other box may be selected．
If＂Enable＂has the value FALSE at the time of the function block call，then the operations defined in the FB are not executed．Otherwise，if＂Enable＂has the value true，these operations are executed．The ENO output acts as a repeater of the EN input．
See also
－\＆Chapter 6．4．1．20．1．6．1＂FBD／LD／IL Editor＂on page 2082

\section*{Command＇Insert Box Parallel（Below）＇}

Function：This command inserts an empty box parallel below the selected function block． Call：Menu bar：＂FBD／LD／L＂；context menu．

Requirements: A box is selected in the LD editor.

\section*{Command 'Insert Branch'}

Symbol: 七, shortcut [Ctrl] + [Shift] + [V]
Function: This command creates an open line branch on the selected line.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD or LD editor is active. An input or an output of a box is selected.
See also
- ⓨ Chapter 6.4.1.20.1.6.4.9 "FBD/LD/IL element 'Branch'" on page 2093
- \(\sum_{\text {• }}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Insert Branch Above'}

Symbol:荤
Function: This command inserts a line branch above the selected open line branch.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD or LD editor is active. An open line branch is selected.
See also
- \(\underbrace{}_{\text {• }}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082
- \(\boldsymbol{y y}^{2}\) Chapter 6.4.1.20.1.6.4.9 "FBD/LD/IL element 'Branch'" on page 2093

\section*{Command 'Insert Branch Below'}

Symbol: \(\overline{5 \times 1}\)
Function: This command inserts a line branch below the selected open line branch.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD or LD editor is active. An open line branch is selected.
See also
- \(\quad\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082
- \(\quad\) Chapter 6.4.1.20.1.6.4.9 "FBD/LD/IL element 'Branch'" on page 2093

\section*{Command 'Set Branch Start Point'}

Symbol *
Function: This command sets the starting point of a line branch on the selected line.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The LD editor is active. A line is selected.
See also
- ② Chapter 6.4.1.20.1.6.4.14 "Closed branch" on page 2096
- \({ }^{\star}\) ) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Set Branch End Point'}

Symbol *
Function: This command sets the end point of a line branch on the selected line.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The LD editor is active. A line is selected. A starting point of the line branch has been set.

See also
- \({ }^{4}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082
- \({ }^{*}\) Chapter 6.4.1.20.1.6.4.14 "Closed branch" on page 2096

\section*{Command 'Update Parameters'}

Function: This command enters changes to the declaration of the selected element in the diagram.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD, LD or CFC editor is active. A box is selected. An extending change has been made to the declaration.

The command checks whether a box and its declaration in the declaration editor correspond. The change is accepted for the box only if the declaration was extended. Deletions and overwrites are not updated.

See also
- \(\quad \stackrel{y}{c}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Remove Unused FB Call Parameters'}

\section*{Symbol:}

Function: This command deletes inputs and outputs of the selected box to which no variable and no value were assigned. However, the default inputs and outputs are always retained.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD or LD editor is active. A box is selected. The box has interfaces to which no value is assigned.

See also
- \(\quad\) ² Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Repair POU'}

Symbol:
Function: This command repairs internal inconsistencies in the selected box.
Call: Main menu "FBD/LD/IL", context menu
Requirements: The FBD or LD editor is active. The defective box is selected. The editor has found internal inconsistencies in the programming module that can possibly be resolved automatically. CODESYS reports the inconsistencies in the Message window.
This situation is conceivable when editing a project that was created with an older programming system version that did not yet handle the inconsistency concerned as an error.

\section*{Command 'View as Function Block Diagram'}

\section*{CAUTION!}

Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [1]
Function: This command converts the active instruction list or the active ladder diagram into the function block diagram.
Call: Menu "FBD/LD/LL \(\rightarrow\) View"
Requirements: The LD or IL editor is active.
See also
- \& Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'View as Ladder Logic'}

\section*{CAUTION!}

Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [2]
Function: This command converts the current function block code or the active instruction list into a ladder diagram.
Call: Menu "FBD/LD/LL \(\rightarrow\) View"
Requirements: The FBD or IL editor is active.
See also
- \({ }^{4}\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'View as Instruction List'}

If necessary, IL can be activated in the CODESYS options.

\section*{CAUTION!}

Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: [Ctrl] + [3]
Function: This command converts the active function block code or the active ladder diagram into an instruction list.
Call: Menu "FBD/LD/LL \(\rightarrow\) View"
Requirements: The LD or FBD editor is active.

See also
- \(\quad 4\) Chapter 6.4.1.20.1.6.1 "FBD/LD/IL Editor" on page 2082

\section*{Command 'Go to'}

Symbol:
Function: This command allows you to jump to any network.
Call: Main menu "FBD/LD/IL"
Requirements: The LD, FBD or IL editor is active. A network is selected.
This command opens a dialog box with an input field. Enter the number of the desired network in the input field.

6.4.1.21.3.15.3 Command 'Properties'........................................................... 2714
6.4.1.21.3.15.4 Command 'Placeholders'...................................................... 2716
6.4.1.21.3.15.5 Command 'Export Library'...................................................... 2716

\section*{Command 'Add Library'}

Function: The command opens the "Add Library" dialog. In this dialog, you can add libraries to the Library Manager and then integrate them in your application.
Call: Menu bar: "Libraries"
Requirement: The Library Manager is open in the editor.

Dialog 'Add
Library'
In the line above the library list, you can search for library names or library modules by typing an appropriate string.
\begin{tabular}{|l|l|}
\hline "Library" & \begin{tabular}{l} 
Suitable libraries that are installed in the library repository. For example, the \\
selection of libraries is defined in the device description or by the system inte- \\
grator. \\
By default, the displayed libraries are grouped into categories.
\end{tabular} \\
\hline "Company" & Vendor of the library \\
\hline "Advanced" & Opens the advanced "Add Library" dialog \\
\hline W & The displayed libraries are grouped into categories. \\
\hline The displayed libraries are listed in alphabetical order. \\
\hline
\end{tabular}

Specific libraries can be blacklisted in a device description. These libraries cannot be added below this device in the Library Manager.

See also
- \(\quad \begin{gathered} \\ \text { - }\end{gathered}\) Chapter 6.4.1.21.3.9.5 "Command 'Library Repository'" on page 2657

Dialog 'Add You should use this dialog only if you have expert knowledge of library referencing. Using this Library' - 'Addialog, you can link special versions or change placeholder definitions. vanced'

We recommend seriously that you follow the guidelines for the creation of libraries when developing and referencing libraries.

Table 518: Tab 'Library'
\begin{tabular}{|c|c|}
\hline "Company" & Filtering the list according to vendor \\
\hline "Group by category" & Display of the libraries in a tree structure grouped in categories.
: Display of the libraries in alphabetical order in a flat structure. \\
\hline "Display all versions" & Display of all versions of the libraries. Version specification '*' means the latest version available in the repository.
\(\qquad\) Display of the latest versions of the libraries only. A multiple selection of libraries is possible in this display. To do this, hold down the [Shift] key and select the entries. \\
\hline "Details" & Opens a detailed view with the library modules. \\
\hline "Library Repository" & Opens the "Library Repository" dialog. There you can install more libraries to your local system. \\
\hline
\end{tabular}

Table 519: Tab 'Placeholder'
\begin{tabular}{|l|l|}
\hline "Placeholder name" & \begin{tabular}{l} 
The input field provides a combo box for entering the valid placeholder names \\
that are read from the currently accessible device descriptions. You can also \\
enter a new placeholder name in order to define a free placeholder, which is not \\
resolved by the device or by the library profile.
\end{tabular} \\
\hline "Default library" & \begin{tabular}{l} 
CODESYS uses this library when for any reason no device is available that the \\
resolution defines. In this way it is possible to compile the current project without \\
errors.
\end{tabular} \\
\hline
\end{tabular}

\section*{Note about placeholder resolution}

For compiler version V3.5.8.0 and later, the following statement applies in the case of library placeholders with a resolution in the device description that are located in the Library Manager of the POU pool. This placeholder is always resolved automatically according to the description of the device that compiles the application.

\section*{See also}
- \({ }^{4}\) ) Chapter 6.4.1.17.3 "Information for Library Developers" on page 2035
- \(y^{4}\) Chapter 6.4.1.21.3.15.4 "Command 'Placeholders"" on page 2716

\section*{Command 'Try to Reload Library' \\ Function: This command tries to reload the selected library. \\ Call: Main menu "Library". \\ Requirement: A library is selected that failed to load.}

If for any reason a library is not available in the defined repository location when a project is opened, CODESYS displays a corresponding error message. Once you have rectified the error, i.e. when the library is properly available again, you can reload the library with this command without having to leave the project.

See also
- \# Chapter 6.4.1.21.3.9.5 "Command 'Library Repository"' on page 2657

\section*{Command 'Properties'}

Function: The command opens the "Properties" dialog for the library selected in the Library Manager.

\section*{Call}
- Menu bar: "Library"
- Context menu of the selected library
- Symbol \(\boldsymbol{\sim}^{-1}\) in the toolbar of the Library Manager

Requirement: A library is selected.

\section*{NOTICE!}

This dialog is intended for library developers. Use this only if you have profound knowledge of library referencing. In addition, follow the guidelines for library developers.

See also
- \({ }^{\text {• }}\) Chapter 6.4.1.17.3 "Information for Library Developers" on page 2035

\section*{Dialog 'Proper- \\ ties'}

Table 520: "General"
\begin{tabular}{|l|l|}
\hline "Namespace" & \begin{tabular}{l} 
Namespace of the selected library. By default, this is identical to the library \\
name, unless it was defined explicitly in the project information when the library \\
was created. You can change the namespace for the open project. \\
Example: LA
\end{tabular} \\
\hline "Default": & \begin{tabular}{l} 
Library that triggers the placeholder when no other trigger is defined or is pos- \\
sible. \\
Requirement: The selected library is a library placeholder, and therefore the \\
setting is available.
\end{tabular} \\
\begin{tabular}{l} 
Note: For compiler version 3.5.8.0 and higher, the following statement applies \\
in the case of library placeholders with a resolution in the device description \\
that are located in the Library Manager of the "POUs" view. This placeholder \\
is always resolved automatically according to the description of the device that \\
compiles the application.
\end{tabular} \\
\hline
\end{tabular}

If the selected library is developed in compliance with the "Guidelines for Developing Libraries", then we do not recommend that you change the following settings.

Table 521: "Version"
Selection of version constraint
Requirement: The settings are available only if the selected library is not a library placeholder.
Note: Container and interface libraries are created automatically with library references with version constraint. As far as possible, do not create libraries that include library references with version constraint. Otherwise, you reference the libraries by placeholders. Edit a placeholder resolution in the "Placeholders" dialog.
\begin{tabular}{|l|l|}
\hline "Exact version" & \begin{tabular}{l} 
O: (selected from list box) Version is integrated into the project. \\
Note: This option is strongly recommended for container libraries, and it is usu- \\
ally preset for this library type.
\end{tabular} \\
\hline "Always newest version" & \begin{tabular}{l} 
O: The library repository is scanned and the latest detected version is inte- \\
grated. \\
Note: If a newer library version is available, then the library POUs that are \\
actually used can change. This option is strongly recommended for interface \\
libraries, and it is usually preset for this library type.
\end{tabular} \\
\hline
\end{tabular}

Table 522: "Visibility"
\(\left.\begin{array}{|l|l|}\hline \text { "Allow only qualified access to } \\
\text { all identifiers" }\end{array} \begin{array}{l}\text { "Wibrary POUs (and variables) are called in the project only with prepended } \\
\text { namespace paths. } \\
\text { "When the current project is } \\
\text { referenced as a library in } \\
\text { another project" }\end{array} \quad \begin{array}{l}\text { Note: Changing the following settings makes sense only if you created a library } \\
\text { with your project and therefore opened a library project. In this way, the selected } \\
\text { library is referenced in the new library. }\end{array}\right]\)\begin{tabular}{ll} 
"Make visible all IEC symbols \\
in the project if is this reference \\
were directly integrated here." As a container library, the selected library makes the contents of the refer- \\
enced library visible at the top level (later in a project). \\
Requirement: A container project is created with a library project. A container \\
library does not implement its own POUs, but references other libraries exclu- \\
sively. It bundles libraries. A container library can be employed sensibly to \\
bundle multiple libraries (in a reference) in a project. This option must be acti- \\
vated for each library reference. \\
Symbolic access to library POUs: <namespace of container
\end{tabular}
"Optional (if the library is missing, no error will be reported)."
: The selected library is treated as optional. When downloading the project that references the library, no error is reported, even if the library is not available in the library repository.

See also
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.15.4 "Command 'Placeholders"' on page 2716

\section*{Command 'Placeholders'}

Function: This command opens the "Placeholders" dialog box. The dialog shows information on the currently selected placeholder library and allows to assign a project-specific resolution.

Call:
- Menu "Libraries"
- Symbol - \(_{\text {- }}\) in the symbol bar in the upper part of the Library Manager window.

Requirement: A placeholder library is selected in the Library Manager.
A placeholder library, which is included in the "Devices" view, will be resolved as follows:
- If you have assigned a specific resolution to the placeholder library via the dialog "Placeholder", this will be applied.
- If no specific resolution is defined, it will be checked, whether there is one specified in the device description of the application..
- Afterwards the library profile will be checked for a resolution definition.
- The result is displayed in the Library Manager below the "Effective Version".

A placeholder library, which is included in the "POUs" view, gets resolved as follows:
- A specific resolution defined in the dialog "Placeholder" will be ignored.
- For the application it will be checked whether there is a resolution defined in the device description.
- Afterwards the library profile will be checked.
- The result is displayed in the tooltip of the symbol .

- \({ }^{*}\) Chapter 6.4.1.17.3 "Information for Library Developers" on page 2035

Dialog box 'Pla-
ceholders'
\begin{tabular}{|l|l|}
\hline "Name" & Name of the placeholder. \\
\hline "Library" & \begin{tabular}{l} 
Current resolution, valid for the project \\
Double-click on the entry in order to edit the placeholder resolution. A selection \\
list with the available library versions appears. Additionally the command "Other \\
Library" is available.
\end{tabular} \\
\hline Command "Other Library" & \begin{tabular}{l} 
The command opens the dialog box "Bibliothek durchsuchen" for searching \\
and installing libraries. Choose this command, if you do not want to redirect \\
to another version, but on a specific libray.
\end{tabular} \\
\hline "Info" & \begin{tabular}{l} 
Type of placeholder resolution: \\
\(\bullet\) \\
- Resolved by device description
\end{tabular} \\
\hline & Resolved by library profile \\
- Resolved by <specific library>
\end{tabular}

\section*{Command 'Export Library'}

Function: This command is used for saving the library file to the hard disk.
Call: Context menu of the Library Manager
Requirement: A library is selected in the Library Manager.
The command opens the standard dialog for saving a file in the local file system. The library file can have the file type Library files (*.library), Compiled library files (*.compiled-library), or Compiled library files (*.compiled-library-v3).

- \({ }^{*}\) Chapter 6.4.1.9.16 "Refactoring" on page 1910

\section*{Command 'Move Down'}

Symbol:
Function: This command shifts a variable declaration downwards by one row.
Call: Context menu
Requirement: A row with a variable declaration is selected in the tabular declaration editor.
See also
- \(\quad\) Chapter 6.4.1.9.4.2 "Using the declaration editor" on page 1851

\section*{Command 'Move Up'}

Symbol:
Function: This command shifts a variable declaration upwards by one row.
Call: Context menu
Requirement: A row with a variable declaration is selected in the tabular declaration editor.
See also
- \(\Leftrightarrow\) Chapter 6.4.1.9.4.2 "Using the declaration editor" on page 1851

\section*{Menu 'Declarations' (Persistence)}
6.4.1.21.3.18.1 Command 'Reorder List and Clean Gaps'............................. 2719
6.4.1.21.3.18.2 Command 'Save Current Values to Recipe'........................... 2719
6.4.1.21.3.18.3 Command 'Restore Values from Recipe'............................... 2719
6.4.1.21.3.18.4 Command 'Add all instance paths'....................................... 2720

\section*{Command 'Reorder List and Clean Gaps'}

Function: This command cleans the gaps that can result when you make changes to the declaration of persistent variables. The memory requirement is reduced by this cleaning. When the command is executed, CODESYS displays a warning informing the user about the possible loss of data.
Call: Main menu "Declarations", context menu
Requirement: The persistence editor (persistent variable list) is active.
Before cleaning you should consider saving the current values of the persistent variables to a recipe (command "Save Current Values to Recipe"). Then you can load the values to the controller again after the next download.
See also
- \({ }^{*}\) Chapter 6.4.1.9.19 "Data Persistence" on page 1920
- ② Chapter 6.4.1.21.3.18.3 "Command 'Restore Values from Recipe"' on page 2719
- ② Chapter 6.4.1.21.3.18.2 "Command 'Save Current Values to Recipe'" on page 2719

\section*{Command 'Save Current Values to Recipe'}

Function: This command creates a new recipe definition in the recipe manager and stores the current values of the persistent variables in it. You should execute this command before the command "Reorder List and Clear Gaps" in order to avoid a possible loss of data. You can subsequently restore the data with the command "Restore Values from Recipe".
Call: Main menu "Deklarationen"
Requirement: The application is in online mode and the persistence editor (persistent variable list) is active.

> If a list already exists in the recipe manager with the corresponding names when saving a persistent variable list, then the current persistent variables are sorted into the list:
> - New persistent variables are added to the list
> - Variables, that are not in the list, will be deleted
> Therefore, it is possible to add more recipes to the list in the recipe manager and these will be retained. However, if new variables are added to the list, then these are deleted the next time the command "Save Current Values to Recipe" is executed.

See also
- \(\sum^{*}\) Chapter 6.4.1.9.19 "Data Persistence" on page 1920

- \({ }^{\text {• }}\), Chapter 6.4.1.21.3.18.2 "Command 'Save Current Values to Recipe"' on page 2719

\section*{Command 'Add all instance paths'}

\section*{Function:}
- When you execute the command in the persistence editor, the application is searched for declarations of persistent variables with the PERSISTENT keyword which are outside of the persistence editor. For each declaration found, an instance path of this variable is added in the persistence editor.
- When you execute the command in a variable configuration, an instance path is added for each variable with an incomplete address. All function blocks of the application are considered in this case.

Call: Menu bar: "Declarations", right-click.
Requirement
- the persistence editor (global persistent variable list) is active or a variable configuration (global variable list with VAR_CONFIG declarations) is opened.
- The application was compiled successfully.

See also
- « Chapter 6.4.1.20.2.13 "Persistent Variable - PERSISTENT" on page 2122

Menu 'Device Communication', Gateway
6.4.1.21.3.19.1 Command 'Add New Gateway'.............................................. 2720
6.4.1.21.3.19.2 Command 'Configure the Local Gateway'............................. 2721

\section*{Command 'Add New Gateway'}

Function: This command opens the "Gateway" dialog where you can define a gateway channel and add it to the current device configuration.

Call: Menu bar: "Gateway" in the "Communication Settings" dialog of the device editor.

Dialog 'Gateway'
\begin{tabular}{|l|l|}
\hline "Name" & Name of the gateway. \\
\hline "Driver" & Driver type from a drop-down list. \\
\hline \begin{tabular}{l} 
Driver-specific settings, for \\
example: \\
IP address, port
\end{tabular} & \begin{tabular}{l} 
Editable after double-clicking the predefined value. A short description for each \\
parameter is displayed in the lower part of the dialog. \\
Note: You can also specify the address of a DNS domain. This has to begin with \\
dns: (example: dns:MyDynDNSAdress).
\end{tabular} \\
\hline
\end{tabular}

The dialog is also used for later editing of the gateway entries of your project.
See also
- \({ }^{\star}\), Chapter 6.4.1.21.2.8.3 "Tab 'Communication Settings'" on page 2427

\section*{Command 'Configure the Local Gateway'}

Function: The command opens the "Gateway Configuration" dialog where you can configure the block drivers for the local gateway. This is an alternative to manually editing the configuration file Gateway.cfg.

Call: Context menu when a gateway entry is selected in the device editor in the "Communication Settings" dialog.

\section*{NOTICE!}

A correct configuration of the gateway requires detailed knowledge. In case you have any doubts, do not change the default configuration settings.

Dialog 'Gateway The configuration tree displayed in the dialog corresponds to the description currently valid Configuration' configuration file gateway.cfg. It displays the parameters with the current settings for the interfaces involved. Changes to the configuration in the dialog, confirmed by clicking "OK" result in the direct update of the configuration file.

After the gateway configuration file gateway.cfg has been changed, the gateway has to be restarted in order for the changes to be applied.
\begin{tabular}{|l|l|}
\hline "Add" & \begin{tabular}{l} 
Menu with commands for adding interfaces and settings. The commands are \\
also available in the context menu of the dialog. The selection depends on which \\
entry is selected and which settings have already been added:
\end{tabular} \\
& \begin{tabular}{l} 
"Add Interface": Select an interface for communication via the gateway. It is \\
inserted at the top level of the tree. See the table below for the possible block \\
driver interfaces. \\
"Add Configuration Setting": Select a setting for the selected interface. It is \\
inserted below the interface in the tree. To edit the value of the setting, double- \\
click in the "Setting" column to open an editing field. See the table below for the \\
possible settings per block driver interface.
\end{tabular} \\
\hline "Delete" & Deletes the selected configuration setting \\
\hline "Up", "Down" & Moves the selected configuration entry one position up or down. \\
\hline
\end{tabular}

Table 523: Possible block driver interfaces
\begin{tabular}{|c|c|}
\hline "COM Port" & Serial port on the device, for example for data exchange according to the RS-232 standard on a COM port intended for this purpose. \\
\hline & \begin{tabular}{l}
Possible configuration settings: \\
"Name": Symbolic only \\
"Port": Physical serial port which is used for this interface, for example COM 5 on a Windows computer \\
"Baudrate": \(2400,4800,9600,19200,38400,57600,115200\) \\
"Activate auto addressing": \(\square\) (default \(=\square\) ) The setting Local address is evaluated. Both devices, which communicate via the serial port, will negotiate their addresses independently before they begin exchanging messages. If the addresses of both devices are the same, then they are negotiated again. This setting is useful when the local addresses cannot be set explicitly, for example for physically separated devices. \\
"Local address": Evaluated only when "Enable auto addressing" is activated. Default = actual value for port
\end{tabular} \\
\hline "Shared Memory": & Shared memory driver \\
\hline & \begin{tabular}{l}
Possible settings: \\
"Name": Symbolic only \\
"Forced address": Default = -1 (= no forced address); example: 42 means that the driver has to use the fixed address defined here and that addresses are assigned freely in the range \(0-255\). This setting can be useful when more than one shared memory driver is activated in the configuration.
\end{tabular} \\
\hline "Ethernet UDP/IP": & Ethernet interface for data exchange according to the "user datagram protocol". \\
\hline & \begin{tabular}{l}
Possible settings: \\
"Name": Symbolic only \\
"Port index": Port number for the communication. Port indices are in the range \(0-3\). They are mapped to the following Ethernet port: 1740 to 1743. \\
"IP address": Default = 127.0.0.1. This setting can be useful to explicit set an interface when the device has several network interfaces. Example: 127.0.0.1 stands for some local network interface, also known as localhost. Every other address (example: 10.27.7.72) represents a real IP address which has to be available on the device. \\
"Network mask": Default = 255.255.255.0; example: \\
255.255.252.0. This setting can be useful to explicitly set an interface when there are multiple network interfaces on the device. \\
"PPP remote address": Default = 127.0.0.1; example: \\
10.13.42.240; establishes a logical point-to-point connection between the UDP interface and the node named with the address specified here; has the effect that the UDP interface communicates exclusively with this node and that no broadcasts are sent in the network
\end{tabular} \\
\hline "Ethernet TCP/IP": & Ethernet interface for data exchange according to the "Transmission Control Protocol". \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline & \begin{tabular}{l} 
Possible settings: \\
"Name", "Port", "IP address": See Ethernet UDP/IP above. \\
\\
"Inactivity timeout": Default = 0. This setting defines the time \\
span (in seconds) after which the TCP connections are closed \\
when data is no longer exchanged.
\end{tabular} \\
\hline "CAN Client" & \begin{tabular}{l} 
"Name": Symbolic only \\
A description for the other settings can be found directly in the \\
dialog.
\end{tabular} \\
\hline "USB Port" & \begin{tabular}{l} 
"Name": Symbolic only \\
A description for the other settings can be found directly in the \\
dialog.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Insert Variable'}

Symbol: \(\#\)
Function: This command inserts a variable into the currently opened recipe definition before the selected position.
Call: Main menu "Recipes".
Requirement: You have opened a recipe definition in the editor and selected the normal view.
CODESYS inserts the default text "NewVariable" in the column "Variable". You must replace this name with the respective variable name. To do this, open the input assistant by clicking \(\ldots\) or enter the variable name directly into the table element.

- \({ }^{2}\) Chapter 6.4.1.21.3.20 "Menu 'Recipes'" on page 2723

\section*{Command 'Add a New Recipe'}

Symbol: \&
Function: This command opens a dialog box for adding a new recipe (new column) to the recipe definition.

\section*{Call: Main menu "Recipes".}

Requirement: You have opened a recipe definition in the editor.
After choosing the command, a dialog box opens for you to define the name of the new recipe. The dialog box also provides the capability of copying existing recipes into the new recipe.
See also
- \({ }^{4}\) Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- \({ }^{4}\) Chapter 6.4.1.21.3.20 "Menu 'Recipes'" on page 2723

\section*{Command 'Remove Recipe'}

Symbol: \&
Function: This command removes a recipe from the currently opened recipe definition.
Call: Main menu "Recipes".
Requirement: You have selected a field in the recipe column of a recipe definition.
See also
- \(\Rightarrow\) Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.20 "Menu 'Recipes"' on page 2723

\section*{Command 'Load Recipe'}

Symbol: \({ }^{x}\)
Function: The command loads a recipe from a file.
Call: Menu bar: "Recipes".
Requirement: You have selected a field in the recipe column of a recipe definition.
This command overwrites the values of the selected recipe of the recipe definition.
If you have selected the option "Recipe Management in the PLC", please note
the following.
If you change recipes in the project by choosing the command "Load Recipe" or
"Read Recipe", then an online change is required when logging in again.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.
For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

\section*{Command 'Save Recipe'}

Symbol:

Function: This command saves the variable values of a recipe to a file.
Call: Main menu "Recipes".
Requirement: You have selected the value of a recipe in the recipe definition.
When you choose this command, CODESYS saves the values of the selected recipe to a file. You can define the format in the settings for the recipe manager in the tab "Storage".
See also
- \(\Rightarrow\) Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- \(\Rightarrow\) Chapter 6.4.1.21.3.20 "Menu 'Recipes'" on page 2723

\section*{Command 'Read Recipe'}

Symbol: \({ }^{\top}\)
Function: This command reads the variable values of a recipe from the controller.
Call: Main menu "Recipes".
Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values of the selected recipe with the read values from the controller.

If you have selected the option "Recipe Management in the PLC", please note the following.
If you change recipes in the project by choosing the command "Load Recipe" or "Read Recipe", then an online change is required when logging in again.

See also
- \(\quad\) Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- \(\quad \Rightarrow\) Chapter 6.4.1.21.3 "Menu Commands" on page 2551

\section*{Command 'Write Recipe'}

\section*{Symbol:}

Function: This command writes the values of a recipe to the variables in the controller.
Call: Main menu "Recipes".
Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values in the controller with the values of the selected recipe.

See also
- \({ }^{*}\) Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- \({ }^{4}\) Chapter 6.4.1.21.3.20 "Menu 'Recipes'" on page 2723

\section*{Command 'Load and Write Recipe'}

Symbol:
Function: This command loads a recipe from a file and writes the values to the variables in the PLC.

Call: Menu bar: "Recipes".

Requirement: The application is in online mode. You have selected the value of a recipe in the recipe definition.
After choosing the command, you are prompted either to write the variable values also to the recipe in the project or only to write them to the PLC. Updating the values in the recipe could require an online change when logging in again.
When you choose this command, CODESYS overwrites the values of the selected recipe of the recipe definition. In addition, these recipe values overwrite the variable values in the PLC.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.
For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

\section*{Command 'Read and Save Recipe'}

Symbol:
Function: This command reads the variable values of a recipe from the controller and saves them to a file.

Call: Main menu "Recipes".
Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to read the variable values to the recipe or only to save them. Updating the values in the recipe could require an online change when logging in again.
The values are saved with the default name for recipe files according to the settings for the recipe manager (tab "Storage").

\section*{Command 'Remove Variables'}

\section*{Symbol -}

Function: This command removes the selected variables from a "Recipe Definition".
Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from "Tools \(\rightarrow\) Customize" (command category "Recipe").
See also
- \&y Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003

\section*{Command 'Load Recipes from Device'}

\section*{Symbol: B.}

Function: This command initiates the synchronization of the recipes from the open recipe definition in the project and the recipes located on the device in the form of recipe files.

Call: Menu bar: "Recipes".
Requirement: The application is in online mode and a recipe definition is open in the editor.
In detail, the synchronization is described as follows:
- The current values for the recipe variables located in the project are overwritten by the values from the recipes on the controller. As a result, there is likely an online change at the next login.
- If recipe variables are defined in the recipe files on the controller, and the recipe variables are missing in the recipe definition of the project, then these variables are ignored when at the time of download. Before that, a message appears for each recipe file regarding the variables in question.
- If recipe variables are missing in the recipe files on the controller, and these recipe variables are included in the recipe definition of the project, then a message appears for each recipe file with the variables in question.
- If more recipes for these variables have been created on the controller, then they are added to the recipe definition in the project.

\section*{Command 'Update Structured Variables'}

\section*{Symbol:}

Function: This command opens the "Update Structured Variables" dialog box.
Call: Main menu "Recipes".
In this dialog box, you can update recipe definitions if the declaration of a structured variable or a block has changed. For example, if the dimension of an array is changed, then you can automatically add or remove the entries in the recipe definition.

Table 524: Dialog Box 'Update Structured Variables'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Remove not existing \\
variables"
\end{tabular} & \begin{tabular}{l}
\(\checkmark\) \\
the pariables are removed from the recipe definition when they no longer exist in \\
the change to a structured element.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Update instances of structures \\
and function blocks"
\end{tabular} & \begin{tabular}{l} 
V: If the declaration of a structure or function block is extended and available in \\
the recipe definition with an instance, then the respective variables are added to \\
the recipe definition.
\end{tabular} \\
\hline "Update array dimensions of \\
array instances" & \begin{tabular}{l}
\(\checkmark:\) If the dimension of an array is extended and available in the recipe definition \\
with an instance, then the respective variables are added to the recipe definition.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Update contained global \\
variable lists"
\end{tabular} & \begin{tabular}{l}
\(\checkmark:\) If the declaration of a global variable list is extended and available in the \\
recipe definition with an instance, then the respective variables are added to the \\
recipe definition.
\end{tabular} \\
\hline "Update contained programs" & \begin{tabular}{l}
\(\checkmark:\) If the declaration of a program is extended and instanced in the recipe \\
definition, then the respective variables are added to the recipe definition.
\end{tabular} \\
\hline
\end{tabular}

6.4.1.21.3.21.12 Command 'Add Text List Support'. ..... 2732
6.4.1.21.3.21.13 Command 'Remove Text List Support'. ..... 2732

\section*{Command 'Add Language'}

Symbol: 재
Function: This command adds a further language column to the text list.
Call: Main menu "Textlist", context menu
Requirement: A text list or a global text list is open and active.
In the dialog box "Enter Language", enter a code for the new language, for example "en-US". CODESYS inserts the code as column header.

\section*{Command 'Create Global Text List'}

Symbol:
Function: This command creates the global text list in the "POUs" view.
Call: "Visualization", context menu.
Requirements: A visualization is open.
See also
- \({ }^{\star}\) Chapter 6.4.1.21.2.11 "Object 'GlobalTextList'" on page 2465
- \(\quad\) Chapter 6.4.1.9.10.7 "Managing static text in global text lists" on page 1894

\section*{Command 'Export Everything as Text'}

Symbol:
Function: This command exports all the text lists of the project.
Call: Main menu "Textlist", context menu

\section*{Requirement}
- A text list or a global text list is open and active.
- The visualization does not code the characters of the texts in Unicode.

CODESYS creates a file as plain text in the format . txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in "Project \(\rightarrow\) Project Settings \(\rightarrow\) Visualization", category "General" in "Text list files".
A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

\section*{Command 'Export All Unicode .txt Text List Files'}

\section*{Symbol: 画}

Function: This command exports all the text lists of the project.
Call: Main menu "Textlist", context menu

\section*{Requirement}
- A text list or a global text list is open and active.
- The visualization codes the characters of the texts in Unicode.
- The option "Use Unicode strings" in the visualization manager is activated.
- The compiler instruction VISU_USEWSTRING in the application is set. Check this by selecting the command "Properties" in the context menu of the application. Then select the "Compile" tab. VISU_USEWSTRING must be entered in the input field for "Compiler defines".

CODESYS creates a file as plain text in the format . txt for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in "Project \(\rightarrow\) Project Settings \(\rightarrow\) Visualization", category "General" in "Text list files".

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

See also
- \({ }^{4}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Insert Text'}

Symbol:
Function: This command inserts a new line into the text list above the selected line. An input field under "Standard" opens, in which you input the source text.

Call: Main menu "Textlist \(\rightarrow\) Insert Text", context menu
Requirement: A text list, not a "GlobalTextList", is open and active. A field in the table is selected.

See also
- \({ }^{4}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Import/Export Text Lists'}

Symbol: 函
Function: This command exports an active text list, imports a file, or matches a text list with a file. The file has the CSV format. The "Import/Export" dialog provides options for this.

Call: Menu bar: "Text List \(\rightarrow\) Import/Export Text Lists"; context menu
Requirement: A text list or global text list is active.

\section*{Dialog 'Import/ \\ Export'}
\begin{tabular}{|l|l|}
\hline "Select File for Import" & \begin{tabular}{l} 
File that CODESYS reads. \\
\\
\\
\hline "... opens the dialog "Select Text List File" for you to select a file.
\end{tabular} \\
\hline & \begin{tabular}{l} 
File that CODESYS writes to. \\
\\
\hline
\end{tabular}\(\quad ..\)\begin{tabular}{l} 
opens the dialog "Select Text List File" for you to select a file and directory.
\end{tabular} \\
\hline
\end{tabular}

Table 525: "Import/Export Type"
\begin{tabular}{|l|l|}
\hline "Import" & \begin{tabular}{l} 
Requirement: A file is selected in "Select file for compare or import". \\
The file can contain text list entries for both the global text list and text lists. \\
Global text list
\end{tabular} \\
& \begin{tabular}{l} 
- \begin{tabular}{l} 
CODESYS reads the file, compares the text list entries for the same source \\
text, and accepts differences in the translations. CODESYS overwrites any \\
translations in the project. \\
Text lists \\
- \\
CODESYS reads the file, compares the text list entries for the same ID, \\
and accepts differences in the source text and translations into the project. \\
CODESYS overwrites any text list entries in the project.
\end{tabular} \\
- If the file contains a new ID, then the text list entry is imported into the text \\
list of the project and the text list is added.
\end{tabular} \\
\hline "Import replacement file" & \begin{tabular}{l} 
Requirement: A replacement file is selected in "Select file for compare or \\
import". \\
The replacement file contains replacements for the global text list. \\
CODESYS processes the replacement file row by row and performs the speci- \\
fied replacements in the global text list.
\end{tabular} \\
\hline "Export" & \begin{tabular}{l} 
The structure of the replacement file is described in the section "Managing static \\
text in a global text list".
\end{tabular} \\
\hline "Export text differences only" & \begin{tabular}{l} 
Requirement: The file that CODESYS writes to is selected in "Select export file". \\
CODESYS exports all texts from all text lists of the current project. All lan- \\
guages available in the project are inserted as columns in the export file. The \\
file can be used for the external translation of the language-dependent texts.
\end{tabular} \\
\begin{tabular}{ll} 
Requirement: An import file is selected for the comparison in "Select file for \\
compare or export", and an export file that CODESYS writes to is selected in \\
"Select export file". \\
CODESYS reads the import file and then uses that information to compare the \\
rows of the active text list. CODESYS ignores the rows that match. If rows differ, \\
then CODESYS writes the row to the export file and, if necessary, copies trans- \\
lations from the text list. CODESYS accepts the translations from the import file \\
and overwrites them if necessary.
\end{tabular} \\
\hline
\end{tabular}

- \(\xi^{*}\) "Updating the global text list with a replacement file" on page 1895

\section*{Command 'Remove Language'}

Symbol: 느
Function: Removes the selected language column from the text list.
Call: Main menu "Textlist", context menu
Requirement: A text list or a global text list is open and active. A field is selected in the column of the language that you wish to remove.
See also
- \({ }^{4}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Rename Language'}

Symbol: 는

Function: Opens a dialog for specifying a new name for a language that is displayed in the text list as a column heading.
Call: Menu bar: "Text List"; context menu.
Requirement: A text list or global text list is active. A field in the language column to be renamed is selected.

See also
- \(\quad\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Remove Unused Text List Entries'}

Symbol:
Function: This command checks whether a text list entry in the project is used as static text. If not, CODESYS removes it from the text list.

Call: Main menu "Textlist", context menu
Requirement: The "GlobalTextList" is open and active. A field in the table is selected.
See also
- \({ }^{4}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Check Visualization Text IDs'}

Symbol:
Function: This command checks whether the ID of a text list entry in the project is correct and reports the result.

Call: Main menu "Textlist", context menu
Requirement: The "GlobalTextList" is open and active. A field in the table is selected.
If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

See also
- \({ }^{4}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891

\section*{Command 'Update Visualization Text IDs'}

Symbol
Function: This command updates all inconsistent IDs in a static text list.
Call: Main menu "Textlist \(\rightarrow\) Paste Text", context menu
Requirement: The "GlobalTextList" is open and active. A field in the table is selected. The object is write protected.
If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

\section*{Command 'Add Variable'}

Function: This command adds a trace variable to the configuration.

\section*{Call: Main menu "Trace".}

A new variable is displayed in the tree view of the trace configuration. The associated variables configuration appears to the right in "Variable Settings".

See also
- \(\Rightarrow\) Chapter 6.4.1.21.4.16.2 "Dialog 'Trace Configuration'" on page 2804
- \(\Leftrightarrow\) Chapter 6.4.1.13.3.3 "Creating trace configuration" on page 2010

\section*{Command 'AutoFit'}

Symbol: Ir
Function: This command scales the y-axis of the trace diagram for optimum display of all graphs, making sure that the \(y\)-values fit in the visible region of the diagrams. The command works with both single-channel and multi-channel displays.

Call: Menu bar: "Trace"; context menu.

Trace in a single-channel display
Trace in a multi-
Trace in a multi-
channel display
When all trace variables are displayed in one diagram, the trace is in single-channel display.

When the trace variables are displayed in multiple diagrams, the trace is in multi-channel display.

See also
- \(\Rightarrow\) Chapter 6.4.1.21.4.16.2 "Dialog 'Trace Configuration'" on page 2804
- \({ }^{\text {• }}\) Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Compress'}

Symbol: 花
Function: This command compresses the trace graph by zooming into the displayed time range by a fixed percentage.
Call: Main menu "Trace", or context menu.
See also
- \({ }^{4}\) Chapter 6.4.1.21.3.22.18 "Command 'Stretch'" on page 2742
- \& Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Configuration'}

Function: This command opens the "Trace Configuration" dialog box for enabling the configuration of the data recording.
Call: Main menu "Trace", or context menu.
See also
- \({ }^{\mu}\) Chapter 6.4.1.21.4.16.2 "Dialog 'Trace Configuration"' on page 2804
- 步 "Subdialog 'Variable Settings'" on page 2807

\section*{Command 'Cursor'}

Symbol:

\section*{Function：This function}
－inserts a trace cursor into the trace diagram when no trace cursor is available
－inserts a second trace cursor into the trace diagram when 1 trace cursor is available
－removes the trace cursors when 2 trace cursors are available
Call：Menu bar：＂Trace＂；context menu．
A trace cursor is a small black triangle with a vertical black line running parallel to the \(y\)－axis．
\begin{tabular}{ll}
\begin{tabular}{l} 
Trace diagram \\
without trace
\end{tabular} & \begin{tabular}{l} 
In this mode，you can process the trace diagram with the mouse pointer．The \(x\)－value that \\
focuses on with the cursor is displayed in the status bar with normal style．Example：＂Time： \\
cursors
\end{tabular}\(\quad 1 \mathrm{~m} 23 \mathrm{~s} 456 \mathrm{~ms}\) ；Value： 1 ＂
\end{tabular}

Trace diagram In the status bar and \(y\)－value，CODESYS prints the time that was marked by the trace cursor． with one trace cursor

Example：＂Time： 1 m 23 s 456 ms ＂

Trace diagram In the status bar，CODESYS prints the two times and the time interval that are marked by the with two trace cursors
two trace cursors．Example：＂Time： 1 m 23 s 456 ms －Time： \(1 \mathrm{~m} 24 \mathrm{~s} 456 \mathrm{~ms}(\mathrm{\Delta} 1 \mathrm{~s})\)＂．

User input in the If one or two trace cursors are available，then you can move them along the \(x\)－axis． trace diagram
\begin{tabular}{|l|c|l|}
\hline Mouse Input & Symbol & Effect \\
\hline \begin{tabular}{l} 
Drag the triangle of a trace \\
cursor to another position．
\end{tabular} & \begin{tabular}{l} 
While the mouse button is pressed，the cursor can be moved without \\
restriction．The current \(y\)－value is always displayed in the status bar． \\
When the mouse button is released，the cursor jumps to the nearest \\
measuring point
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Keyboard Shortcuts & Effect \\
\hline \begin{tabular}{l}
［Left arrow］ \\
［Right arrow］\(]\)
\end{tabular} & CODESYS moves the black trace cursor to the next measuring point． \\
\hline \begin{tabular}{l}
{\([\) Shift \(]+[\) Left Arrow］} \\
［Shift \(]+[\) Right Arrow \(]\)
\end{tabular} & CODESYS moves the gray trace cursor to the next measuring point． \\
\hline
\end{tabular}

See also
－\＃Chapter 6．4．1．13．3．6＂Navigating into trace data＂on page 2015

\section*{Command＇Download Trace＇}

\section*{Symbol：⿷匚⿱口⿰口口木}

Function：This command transfers the trace configuration on the controller to the associated application，and starts the data recording．The recorded data is transferred back to the develop－ ment system．The trace diagram shows the current samples and continues．
Call：Menu bar：＂Trace＂；context menu．
Requirement：The command is available when the assigned application is in online mode．
See also
－\＆Chapter 6．4．1．13．3．4＂Operating the data recording＂on page 2014

\section*{Command 'Export Symbolic Trace Config'}

Function: This command exports a trace configuration to a traceconfig file.
Call: Main menu "Trace", or context menu.
Requirement: The origin application includes a symbol configuration that defines the configured trace variables as symbols. Access to the IEC variables where data was recorded is therefore symbolic. Then you can use the trace configuration for various similar applications.

Using the configuration file

You can transfer this file to any runtime system. At runtime, its CmpTraceMgr runtime system component can access and perform data recording. The configuration file also includes information about the application context in addition to the configuration data.

The configuration file defines the following context:
- Application name
- Trace name
- Task name

The application that is executed at runtime must fulfill the following conditions:
- The application has the same name as the origin application.
- The trace that is configured in the application has the same as the trace that is configured in the origin application
- The task that is running in the data recording has the same name as the task that is configured in the origin application.

\section*{NOTICE!}

The configuration is not loaded automatically. You must execute the command explicitly.
You can proceed as follows:
- Access the trace manager programmatically via IEC code by using library interfaces.
- Register the configuration file with the trace manager. Then the trace manager loads the configuration file when the application is started.

For more information about the functionality of the trace manager, refer to "Trace Manager Runtime System Component Description".

\section*{Command 'Load Trace'}

Function: This command makes it possible to load a file, which contains the configuration and data, and was saved to the file system of the development system. The "Load Trace" dialog box opens.
Call: Main menu "Trace", or context menu.

Dialog box
"Load Trace"
\begin{tabular}{|l|l|}
\hline "File name" & Name of the file that is loaded \\
\hline "File type" & \begin{tabular}{l} 
File format \\
\\
\\
\\
\\
• *.trace: "Trace file" that includes the trace configuration \\
\\
\hline
\end{tabular} \\
\hline
\end{tabular}

- \& Chapter 6.4.1.13.3.7 "Managing trace" on page 2016

\section*{Command 'Mouse Zooming'}

Symbol: \(-\frac{1}{\infty}\) (command disabled), 国 (command enabled)
Function: This command enables and disables mouse zooming in the trace diagram.
Call: Menu bar: "Trace"; context menu.

User input in the If the command is enabled, then you can stretch a box with the mouse. When you release the trace diagram mouse button, the display zooms in on the box and the data is enlarged.

See also
- ② Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Convert to Multi-Channel'}

Function: This command switches the display in the trace editor from single-channel to multichannel.

Call: Menu bar: "Trace"; context menu.

Multi-channel Multi-channel display means that the trace variables are displayed in multiple diagrams. display

See also
- \(\boldsymbol{y}^{*}\) Chapter 6.4.1.21.4.16.2 "Dialog 'Trace Configuration'" on page 2804
- \(\Rightarrow\) Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Convert to Single-Channel'}

Function: This command switches the display in the trace editor from multi-channel to singlechannel.

Call: Menu bar: "Trace"; context menu.

Single-channel display

If a trace is displayed as single-channel, then all trace variables are included in one diagram.

See also
- \(\quad\) Chapter 6.4.1.21.4.16.2 "Dialog 'Trace Configuration'" on page 2804
- \({ }^{\text {• }}\) Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Online List'}

Function: This command opens the "Online List" dialog. If the trace editor of a DeviceTrace object is active, then all traces that are running on the controller are displayed in a tree view. If the trace editor of an application-specific trace object is active, then only this trace is displayed if it is running on the controller.
Call: Menu bar: "Trace"; context menu of the trace editor.
Requirement: The runtime system uses the CmpTraceMgr components. An application belonging to the device is in online mode.

\section*{NOTICE!}

\section*{Closing the DeviceTrace editor terminates the connection to the controller.}

Please note that the connections to the controller is also terminated when the last open "DeviceTrace" editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the "DeviceTrace" objects.
At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

\section*{Dialog 'Online}

List'
\begin{tabular}{|l|l|}
\hline "Delete from runtime" & Stops and removes the selected trace from the running application. \\
\hline "Upload" & \begin{tabular}{l} 
This command is visible when a Device Trace is loaded in the trace editor. A \\
DeviceTrace is a trace that runs on the controller: In the device tree, it can be \\
represented with a DeviceTrace object directly below a device. \\
When you execute this command, the trace that is selected in the tree view is \\
loaded from the runtime system into the trace editor. Any existing configuration in \\
the project is overwritten. For example, the device can provide traces for data of \\
the processor load (cpuload, plcload), which then you can track in the trace \\
editor in CODESYS. \\
An individual "DeviceTrace" object is necessary in the device tree for each trace \\
of the device that should be displayed in the project.
\end{tabular} \\
\hline
\end{tabular}

See also

\section*{Command 'Reset Trigger'}

Symbol: 热
Function: This command resets the trace configuration after a triggered data recording. Then the application can record new data and react to a trigger again.

Call: Main menu "Trace", or context menu.
Requirement: After triggering, the complete data is in the buffer of the development system.
See also
- \({ }^{4}\) Chapter 6.4.1.13.3.4 "Operating the data recording" on page 2014

\section*{Command 'Reset View'}

Symbol: \(\mathfrak{Q}^{2}\)
Function: This command resets the trace diagram to the default view.
Call: Main menu "Trace", or context menu.

Requirement: The display in the trace diagram has been changed by zooming, scrolling, or "AutoFit".

See also
- \(\sum^{*}\) Chapter 6.4.1.21.3.22.2 "Command 'AutoFit'" on page 2733
- \({ }^{4}\) Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Save Trace'}

Function: This command saves the data to a file on the development system. Depending on the file format, the configuration may also be saved. The "Save Trace" dialog box opens.

Call: Main menu "Trace", or right-click.

Dialog Box
'Save Trace'
\begin{tabular}{|c|c|}
\hline "File name" & Name and location of the trace file \\
\hline "File type" & \begin{tabular}{l}
File format \\
- *.trace: \\
"Trace file" contains the data and configuration. \\
You can run the "Load Trace" command to load the file to the trace editor when offline. \\
- *.txt: \\
"Text file" contains the recorded data. You can load this file type and edit it with tools that support CSV format. \\
It cannot be loaded to the trace editor when offline because the trace editor cannot read this format. \\
- *.trace.csv \\
"Trace CSV file (data only)" contains the recorded data. Address information is provided for each trace variable. The created file can be read in the runtime system. The data is imported but the trace cannot be started because the variable addresses are not saved.
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\star}>\) Chapter 6.4.1.21.3.22.8 "Command 'Load Trace"' on page 2737
- \(\xi^{\circ}\) Chapter 6.4.1.13.3.7 "Managing trace" on page 2016

\section*{Command 'Start Trace'}

Symbol:
Function: This command starts the data recording on the controller when it is stopped.
Call: Main menu "Trace", or context menu.
Requirement: The assigned application on the runtime system is running and a trace configuration is loaded.

See also
- \({ }^{\leftrightarrows}\) Chapter 6.4.1.13.3.4 "Operating the data recording" on page 2014

\section*{Command 'Stop Trace'}

Symbol:

Function: This command stops the data recording of a trace.
Call: Main menu "Trace", or context menu.
Requirement: The assigned application on the runtime system is running and executes a trace.
See also
- \(\Leftrightarrow\) Chapter 6.4.1.13.3.4 "Operating the data recording" on page 2014

\section*{Command 'Stretch'}

Symbol: \(\overleftrightarrow{m}\)
Function: This command stretches the trace graph by zooming out of the displayed time range by a fixed percentage.
Call: Main menu "Trace", or context menu.
See also
- \({ }^{\circ}\) Chapter 6.4.1.21.3.22.3 "Command 'Compress'" on page 2733
- \({ }^{4}\), Chapter 6.4.1.13.3.6 "Navigating into trace data" on page 2015

\section*{Command 'Upload Trace'}

Function: This command establishes the connection to the PLC device, if not already connected. Then it opens the "Online List" dialog listing the traces running on the controller. Then the selected trace is loaded to the trace editor by means of the "Upload" command in the dialog.
Call: Menu bar: "Trace"; context menu of the trace editor.
Requirement: The editor of a "DeviceTrace" object is open. The runtime system uses the CmpTraceMgr components (trace manager). At least one application in the runtime system in running. The communication settings for the PLC are configured correctly in the CODESYS project.

\section*{NOTICE!}

\section*{Closing the DeviceTrace editor terminates the connection to the controller.}

Please note that the connections to the controller is also terminated when the last open "DeviceTrace" editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the "DeviceTrace" objects.
At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

\section*{Command 'Statistics'}

Function: This command opens the "Trace Statistics" dialog box, which shows statistics about each trace variable.
Call: Main menu "Trace", or right-click.
Requirement: The trace editor contains samples.

Dialog Box The analyzed time range and duration are shown in the caption.
'Trace Statistics'
The table contains one line per signal.
\begin{tabular}{|l|l|}
\hline "Signal" & Name pf the trace variable (for example, PLC_PRG. S1) \\
\hline "Index" & 0-based index of the signal order \\
\hline "N" & Number of measurements for the calculations \\
\hline "Min" & Smallest value \\
\hline "Avg" & Average \\
\hline "Median" & Middle value when the values are ordered by size \\
\hline "RMS" & Root mean square \\
\hline "StdDev" & Standard deviation \\
\hline "Max" & Largest value \\
\hline "Integral" & Integral \\
\hline "Min \(\Delta t[s] "\) & Smallest change of time intervals for successive values \\
\hline "Avg \(\Delta t[s] "\) & Average change of time intervals for successive values \\
\hline "Median \(\Delta t[s] "\) & Median change of time intervals for successive values \\
\hline "StdDev \(\Delta t[s] "\) & Standard deviation of change of time intervals for successive values \\
\hline "Max \(\Delta t[s] "\) & Largest change of time intervals for successive values \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
Click a column head in the \\
table.
\end{tabular} & \begin{tabular}{l} 
CODESYS sorts the table by that column, changing the order from ascending to \\
descending and back. \\
Default: The table is sorted ascending by the "Index" column. The signals are \\
then sorted in the same order as in the signal tree.
\end{tabular} \\
\hline Click in the line. & \begin{tabular}{l} 
The line is selected. You can select or clear other lines by pressing [Shift]+ \\
[arrow] up or down.
\end{tabular} \\
\hline\([C t r l]+[C]\) & \begin{tabular}{l} 
CODESYS copies the selected lines as text to the clipboard. The values of the \\
individual columns are tab-separated, and the lines are delimited with the control \\
character [CR] or [LF]. \\
Requirement: At least one line is selected.
\end{tabular} \\
\hline
\end{tabular}

6.4.1.21.3.23.3 Command 'Limit Results to Current Declaration'................... 2744

\section*{Command 'Add Watch'}

\section*{Symbol: 6d}

Function: This command adds the variable of the current location of the cursor to a watchlist for the purpose of online monitoring.

Call: Right-click a variable in an editor when the application is in online mode.
This command adds the variable to the currently opened watchlist. If a watchlist is not open, then the variable is added to the "Watch 1 " list and that view opens.

See also
- \(\boldsymbol{y y}^{*}\) Chapter 6.4.1.13.2.3 "Using watch lists" on page 2002
- \(\Leftrightarrow\) Chapter 6.4.1.13.2 "Monitoring of Values" on page 1995

\section*{Command 'Implement Interfaces'}

Function: This command updates the implemented interfaces for a function block.
Call: Context menu of the selected function block (FB) in the device tree.
Requirement: The function block implements an interface that you have modified. For example, an additional method was added to the interface.

> In object-oriented programming, if you derive a function block (FB) from a base function block, which implements one or more interfaces, for the purpose of inheritance, then the following applies:

> When you execute the "Implement Interfaces" command for the derived FB, all interface methods and interface attributes of the base FB are accepted into the derived FB in the form of stubs (without implementation). Then you are responsible for making sure that an "empty" method/attribute in the derived FB does not conflict with an implemented one in the base FB. The following actions are taken to support you in this case: If there es a base implementation for a method/attribute, then CODESYS adds a pragma attribute \{error..\} in the first line of the affected derived interface method or interface attribute that will generate the error message. If there is no base implementation for the method/ attribute, then there is a pragma attribute entry for a warning. After editing the block, you must remove the error pragma attribute entry explicitly.

\section*{Command 'Limit Results to Current Declaration'}

Function: When multiple declarations have been found, this command collapses the display in the cross-reference list. It shows only the results for the declaration that you selected explicitly in the list.
Call: Right-click.
Requirement: The cross-reference list is active. Multiple declarations for the searched symbol are listed as cross-references.

\section*{General}

The dialogs of the CODESYS user interface bascally are described on the help pages for the CODESYS menu commands or CODESYS objects. The help book "Dialogs" contains only descriptions of dialogs, which
- appear only after multi-step calls after a certain menu command call or within an object editor,
- or which are not placed on a help page for a command or for an object because of their complexity (multiple subdialogs).

\section*{Dialog 'Import Assistant'}

Function: The dialog allows for the transfer of CODESYS options and package installations from an older CODESYS installation that was found in the local computer.
Call: The dialog opens when a recently installed CODESYS version is started for the first time and an older version is installed on the computer.
\begin{tabular}{|l|l|}
\hline "Program settings" & \begin{tabular}{l} 
■: The user-specific CODESYS options are transferred from the older installa- \\
tion to the new installation.
\end{tabular} \\
\hline "Packages" & \begin{tabular}{l} 
目: The packages installed with the older CODESYS version are transferred to \\
the Package Manager of the new version. See the list of discovered package \\
installations with the "Name", "Version", and "Installation date".

\section*{Dialog 'Library Reference Conversion'}

Function: The dialog defines how references to libraries that are no longer available are to be handled. Note: The undefined library references can be found in the Global Library Manager located in the "POUs" view.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a library which cannot be used anymore in the current CODESYS version.

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

Table 526: "What do you want to do?"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Convert and install the library \\
as well."
\end{tabular} & \begin{tabular}{l} 
The converter also converts the library file into the new format. It remains refer- \\
enced in the project. It is installed automatically in the library repository in the \\
"Other" category. If the library does not provide the necessary project information \\
for an installation, then the "Enter Project Information" dialog opens for the infor- \\
mation to be added.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Use the following library that \\
has already been installed"
\end{tabular} & \begin{tabular}{l} 
The previously used library is replaced by another library. The "Browse" button \\
opens a dialog for selecting from the local library repository.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Ignore the library. The \\
reference will not appear in the \\
converted project"
\end{tabular} & The library reference is removed from the project. \\
\hline
\end{tabular}
"Remember this mapping for all future occurrences of that library reference"

The settings made here in the dialog are also used for future project conversions.

- \(\sum^{*}\) Chapter 6.4.1.21.3.9.5 "Command 'Library Repository"' on page 2657

\section*{Dialog 'Select Function Block'}

Function: The dialog is used for selecting a function block for I/O mapping. The function block should be mapped to the I/O channel selected in the "<device name> I/O Mapping" tab or to the object selected in the "<device name> IEC Objects" tab.

\section*{Call:}
- Tab "<device name> I/O Mapping", command button ↔"Add FB for I/O channel"
- Tab "<device name> IEC Objects", command buttonґ "Add"

The dialog provides all function blocks from the active application and the libraries included in the project which fulfill the following:
- The function block has the \{attribute 'io_function_block'\} attribute.
- The function block contains input or output parameters that match the channel type (input, output, data type) and has the \{attribute 'io_function_block_mapping'\} attribute.

When a function block is selected that provides multiple matching parameters, only the first one is mapped automatically to the channel. The others can only be assigned manually in the "<device name> I/O Mapping" tab.

After the function block is assigned, the parameter of the function block instance is entered in the "Variable" column of the mapping table. Then the path is composed as follows:
<application name>.<device channel name>_<FB name>_<continuous FB
instance number>. <FB parameter name>
Example: App1.Out_4_Int_myScale_Output_Int_1.iOutput for the parameter iOutput of the first insēred \(\overline{\text { instance of }} \overline{\text { the }}\) function block myScale_Output.
\begin{tabular}{|l|l|}
\hline "Find" & Input field for searching for function block names \\
\hline "Type" & \begin{tabular}{l} 
Function blocks in the tree structure that match the channel type. Nodes: appli- \\
cation, library name(s)
\end{tabular} \\
\hline "Documentation" & \begin{tabular}{l} 
Shows the available documentation for the library selected in the tree or the \\
library block.
\end{tabular} \\
\hline
\end{tabular}

See also

\section*{Dialog 'Device Conversion'}

Function: The dialog defines how references to devices that are no longer available are to be handled.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a device reference which cannot be used anymore.

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

Table 527: "What do you want to do?"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Use the following device that \\
has already been installed"
\end{tabular} & \begin{tabular}{l} 
CODESYS replaces the previously used device in the device tree with another \\
device. The "Browse" button opens a dialog for selecting from the local device \\
repository.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Ignore the device. All device \\
specific objects will not be \\
available in the new project"
\end{tabular} & \begin{tabular}{l} 
The device entry with all objects inserted below it is removed from the device \\
tree.
\end{tabular} \\
\hline
\end{tabular}
"Remember this mapping for all future occurrences of that device"

The settings made here in the dialog are saved in the CODESYS Options, in the "CODESYS V2.3 Converter" category. As a result, they are also valid for future project conversions.

See also
- \(\quad\) n Chapter 6.4.1.3.3 "Opening a V2.3 project" on page 1809
- \({ }^{4}\) ) Chapter 6.4.1.21.3.9.8 "Command 'Device Repository"' on page 2663

\section*{Dialog 'Breakpoint Properties'}

Function: The dialog is used to display or change the properties of the selected breakpoint in the "Breakpoints" view.

\section*{Call:}
- "Breakpoints" view, 匪"Properties" button- "Breakpoints" view, 汤"New" button, "New Breakpoint" command or "New Data Breakpoint" command
Requirement: An entry is selected in the list of breakpoints.
The dialog is identical to the "New Breakpoint" dialog which is opened in the "Debug" menu by means of the respective commands. Therefore, see the description in the help for the "New Breakpoint" dialog.

See also
- \({ }^{4}\) Chapter 6.4.1.21.4.9 "Dialog 'New Breakpoint"' on page 2750

\section*{Dialog 'Permissions'}

Function: The permissions of user groups are defined here with which they can execute specific actions on specific objects in the project.
Call: Menu bar: "Project \(\rightarrow\) User Management".
Every change made in the dialog is applied immediately.

Actions All possible actions on objects of the projects are listed in "Actions". The actions are divided into four categories and assignments to all current objects of the project are listed below each action. For each "action->object" assignment, you can define the permission for each existing user group.
Action categories:
\begin{tabular}{|l|l|}
\hline\(\square\) "Commands" & Actions regarding the execution of commands \\
\hline \begin{tabular}{l} 
"Users, groups and \\
permissions"
\end{tabular} & \begin{tabular}{l} 
Actions regarding the configuration of user accounts, user groups, and their \\
permissions
\end{tabular} \\
\hline\(\square\) "Object types" & Actions regarding the creation of object types \\
\hline\(\square\) "Project objects" & \begin{tabular}{l} 
Actions regarding the viewing, modification, removal, and child-object handling of \\
objects of the project
\end{tabular} \\
\hline
\end{tabular}

Actions in detail:
\begin{tabular}{|l|l|}
\hline F "Execute" & Execute a menu command \\
\hline 8 "Create" & Create a new object in the project \\
\hline 8 "Add or remove children" & Add or remove a child object below an existing object \\
\hline 8"Modify" & \begin{tabular}{l} 
Modify an object in the editor or modification of user, group, and permission \\
settings in the corresponding editor/dialog
\end{tabular} \\
\hline F "Remove" & Delete or remove an object \\
\hline F"View" & Open the view of an object in the editor \\
\hline
\end{tabular}
\begin{tabular}{|l|l}
\hline\(\Rightarrow\) & Possible target of an action. This can be specific objects of the project, or the
\end{tabular} user, group, and permission configuration.

Permissions All defined user groups (except the "Owner" group) are listed in "Permissions" with a toolbar for configuring the permissions of a group.
\begin{tabular}{|l|l|}
\hline F Granted & \begin{tabular}{l} 
The action, which is selected in the actions view, on the selected target(s) is granted for \\
the selected group.
\end{tabular} \\
\hline - Denied & \begin{tabular}{l} 
The action, which is selected in the "Actions" view, on the selected target(s) is denied for \\
the selected group.
\end{tabular} \\
\hline H & \begin{tabular}{l} 
The permission that executes the actions, which are selected in the "Actions" view, on \\
the selected targets has not been defined explicitly. However, the actions are granted by \\
default; for example, because the corresponding permissions have been granted to the \\
parent object. Example: The group has the permission for the object "myplc". As a result, \\
it also has the permission by default for the object "myplc.pb_-1".
\end{tabular} \\
\hline No symbol & \begin{tabular}{l} 
The action, which is expanded in the actions view, on the selected targets has not been \\
denied explicitly. However, it is denied by default; for example, because it has been \\
denied to the parent object.
\end{tabular} \\
\hline & \begin{tabular}{l} 
There are currently multiple actions selected in the Actions view for which the group \\
does not have the same permission.
\end{tabular} \\
\hline
\end{tabular}

Toolbar:
\begin{tabular}{|c|c|}
\hline ヶ"Grant" & The selected action on the selected target object is granted explicitly for the selected group. \\
\hline - "Deny" & The selected action on the selected target object is denied explicitly for the selected group. \\
\hline * "Clear" & The permission for the selected action on the selected target object is reset to the default value for the selected group. \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Export/Import" & \begin{tabular}{l}
Opens a menu with the commands \\
- "Export all permissions" \\
- "Export selected permissions" \\
- "Import permissions"
\end{tabular} \\
\hline "Export all permissions" & \begin{tabular}{l}
Exports all actions and their configured access permissions of the current project to a user-specific file of data type *. perms. \\
To do this, the "Export Permissions" dialog opens for you to specify a file name and to select a location in the file directory. The default file type is Permissions (*.perms).
\end{tabular} \\
\hline "Export selected permissions" & \begin{tabular}{l}
Exports all selected actions and their configured access permissions of the current project to a user-specific file of data type *. perms. \\
To do this, the "Export Permissions" dialog opens for you to specify a file name and to select a location in the file directory. The default file type is Permissions (*.perms).
\end{tabular} \\
\hline "Import permissions" & \begin{tabular}{l}
The contents of \(a^{*}\). perms file is merged with the actions and permissions of the current project. Groups that are part of the file but not part of the project are ignored. The actions and permissions are aligned by name. \\
To do this, the "Import Permissions" opens for you to select the *. perms file from the file system.
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\Perp}\) Chapter 6.4.1.6.6 "Protecting Objects in the Project by Access Rights" on page 1826

\section*{Dialog Box 'Prepare Value'}

Function: This dialog box is used for preparing a value for a forced variable. CODESYS executes the prepared action with the next forcing.

CODESYS opens the dialog box in the following situations:
- When clicking in the field "Prepared value" of a forced variable in the declaration section
- When clicking in the inline monitoring field of a forced variable
- When clicking in the field "Prepared value" of a forced variable in the monitoring window
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Prepare a new value for the \\
next write or force operation"
\end{tabular} & Value that CODESYS writes to the variable with the next force operation \\
\hline \begin{tabular}{l} 
"Remove a preparation with a \\
value"
\end{tabular} & CODESYS deletes the prepared value. \\
\hline \begin{tabular}{l} 
"Release the force, without \\
modifying the value"
\end{tabular} & \begin{tabular}{l} 
CODESYS retains the forced value and ends forcing. CODESYS marks the \\
variable <Unforce>.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Release the force and restore \\
the variable to the value it had \\
before forcing it"
\end{tabular} & \begin{tabular}{l} 
CODESYS resets the forced value and ends forcing. The variable is marked with \\
<Unforce and restore>.
\end{tabular} \\
\hline
\end{tabular}

See also
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.8.16 "Command 'Force Values'" on page 2649

\section*{Dialog 'New Breakpoint'}

Function: In the dialog, you define the settings for a new breakpoint or data breakpoint. It is identical to the "Breakpoint Properties" dialog which is used in the "Breakpoints" view.
Call:
- "Debug \(\rightarrow\) New Breakpoint"
- "Debug \(\rightarrow\) New Data Breakpoint"

Requirement: The application is in online mode.

Tab 'Condition' The dialog defines the requirements for which program processing should halt at a breakpoint.

\section*{NOTICE!}

Using conditional breakpoints slows down code execution, even when the condition does not yield TRUE.

Conditional breakpoints required a CODESYS runtime >= V3.5.4.0.

Table 528: "Tasks"
> "Break only when the breakpoint is hit in one of the following tasks"
\(\boxed{\square}\) : CODESYS evaluates the breakpoint only if it is reached by specific tasks. The required tasks must be activated.

For example, you can define a single debug task and also prevent other tasks that use the same block from being affected when debugging.

Table 529: "Hit Count"
\begin{tabular}{|l|l|}
\hline "Hit Count" & "Break always": The program always halts at this breakpoint. \\
& \begin{tabular}{l} 
Alternative: The program halts at the breakpoint when the breakpoint has been \\
hit as often as defined in the following (type in the required hit count or select it \\
from the number list):
\end{tabular} \\
& \begin{tabular}{l} 
- "Break when the hit count is equal to" \\
- "Break when the hit count is a multiple of" \\
- "Break when the hit count is greater than or equal to"
\end{tabular} \\
\hline
\end{tabular}

Table 530: "Condition"
\begin{tabular}{|l|l}
\hline "Break, when true" & \begin{tabular}{l}
\(\boxed{V}\) \\
breakpoint only when the result yields TRUE. You can define a condition as a \\
valid Boolean expression. Examples: \(x>100, x[y]=z, ~ a ~ A N D ~ b, ~ b o o l V a r . ~\)
\end{tabular} \\
\hline
\end{tabular}

Tab 'Data' Requirement: This is used for the properties of a data breakpoint.

The function of data breakpoints depends on the target system. Currently, data breakpoints are possible only with the CODESYS Control Win V3.
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ On the tab, the variable or memory address is specified for which the data breakpoint is set or will be set. } \\
\hline \begin{tabular}{l} 
"Break execution when the \\
value of the variable or \\
address changes"
\end{tabular} & \begin{tabular}{l} 
• Input of a qualified variable name \\
\(\bullet \quad . .\). \\
Variables" category \\
Examples: variable: PLC_PRG. fb_DoSth. dwVariable; address: 16\#12A,
\end{tabular} \\
\hline "Size" & \begin{tabular}{l} 
Number of bytes of the specified variable or memory address above which \\
should be monitored for changes. When a new variable or memory address is \\
specified, a value that matches the data type or memory is set automatically at \\
first. \\
Note: The "Size" and quantity depend on the target system. For the CODESYS \\
Control Win V3, a maximum of four data breakpoints with a maximum size of 8 \\
bytes can be defined. \\
Example: 4 for data type DWORD \\
Example: 2 for data type DWORD: Only the two first bytes of the variable are \\
monitored.
\end{tabular} \\
\hline
\end{tabular}

Tab 'Execution
Here. an existing breakpoint or data breakpoint can be converted into an execution point. Point Settings'
\begin{tabular}{|l|l|}
\hline "Execution point (execution \\
does not stop at breakpoint)" & \begin{tabular}{l} 
l. The breakpoint becomes an execution point. Processing does not halt at this \\
point and the given code is executed. \\
- Execution point of a breakpoint: activated: \\
- Execution point of a data breakpoint: activated: \(;\); deactivated:
\end{tabular} \\
\hline "Execute the following code" & \begin{tabular}{l} 
Code that is executed when the execution point is reached. \\
Looping structures (For, While) and IF or CASE expressions are not possible.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Print a message in the device \\
log"
\end{tabular} & \begin{tabular}{l} 
This option is available only when you select the "Enable logging in breakpoints" \\
option in "Project Settings \(\rightarrow\) Compile Options". \\
CODESYS can print variables with the placeholder \{variable name\} in the mes- \\
sage text.
\end{tabular} \\
\hline
\end{tabular}

Tab 'Location' Requirement: The command "New breakpoint" was selected.
\begin{tabular}{|l|l|}
\hline "POU" & POU of the active application where the breakpoint is placed. \\
\hline "Position" & \begin{tabular}{l} 
Position of the breakpoint in the POU. Entry as row and column numbers (text \\
editor) or as network or element numbers.
\end{tabular} \\
\hline "Instances" & \begin{tabular}{l} 
In the case of function blocks, you have to define whether the breakpoint should \\
be set in the implementation or in an instance.
\end{tabular} \\
& \begin{tabular}{l} 
"Instance Path". \\
\\
\(\square\) CODESYS sets the breakpoint in the implementation.
\end{tabular} \\
\hline
\end{tabular}
"Enable breakpoint immediately"
The breakpoint is activated.
\(\square\) : The breakpoint is not activated. To activate later, click the 西 button in the "Breakpoints" view.

\section*{Dialog 'Monitoring Range'}

Function: This dialog restricts the range of array elements whose values are displayed during monitoring.

Call: Click in the column field "Data Type" that belongs to the array variable.
Requirement: A POU is in online mode and is being monitored. In addition, a variable of the POU has the data type "ARRAY".
\begin{tabular}{|l|l|}
\hline "Valid range" & \begin{tabular}{l} 
The validity range of the array elements that are monitored. \\
Example of a three-dimensional array: \([1 \ldots 10][-3 \ldots 3][-10 \ldots 10]\)
\end{tabular} \\
\hline \begin{tabular}{l} 
"Maximum number of array \\
elements"
\end{tabular} & \begin{tabular}{l} 
Number of elements of the array variables \\
Example: 1470
\end{tabular} \\
\begin{tabular}{l} 
When you edit one of the settings "Start", "End", or "Scroll range of 1000 elements", both of the other settings are \\
adapted automatically.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Start" & Index of the first array element whose value is displayed. \\
\hline "End" & Index of the last array element whose value is displayed. \\
\hline \begin{tabular}{l} 
"Scroll range of 1000 \\
elements"
\end{tabular} & Scrollbar for selecting a range from the set of array elements. \\
\hline
\end{tabular}

\section*{General}

This dialog box is for the configuration of the properties of an object in CODESYS. In addition, depending on the object, it contains different tabs that each handle a category of properties.
Call: Menu "View", context menu of the object in the "Devices", "POUs" or "Modules" view.

\section*{Dialog Box 'Properties' - 'Common'}

Function: This dialog box shows common information about the selected object.
Call: Main menu "View \(\boldsymbol{\rightarrow}\) Properties", or context menu of the object ("Common").
Requirement: An object is selected in the device tree or POUs view.

Table 531
\begin{tabular}{|l|l|}
\hline "Name" & Object name as shown in the device tree or POUs view \\
\hline "Object type" " & Type of object (for example, POU, application, or interface) \\
\hline "Open with" & Type of editor to display or edit the object \\
\hline
\end{tabular}

\section*{Dialog 'Properties' - 'Boot Application'}

Function: The settings on this tab define when and how a boot application is created from the application.
Requirement: The device supports the settings.
Call: Select the application object; context menu: "Properties"; menu bar: "View \(\rightarrow\) Properties", "Boot Application" category
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Create implicit boot \\
application on download"
\end{tabular} & A boot application is created automatically when downloading the application. \\
\hline \begin{tabular}{l} 
"Create implicit boot \\
application on Online Change"
\end{tabular} & A boot application is created automatically when for an online change. \\
\hline \begin{tabular}{l} 
"Remind boot application on \\
project close"
\end{tabular} & Before closing the project, CODESYS prompts to create the boot application. \\
\hline \begin{tabular}{l} 
"Verify boot application after \\
creation"
\end{tabular} & \begin{tabular}{l} 
After the boot application is created, an independent service checks whether or \\
not the boot application has been created correctly.
\end{tabular} \\
\hline
\end{tabular}

Regardless of the presets defined here, you are always able to create a boot application explicitly when you login.

See also
- \(\boldsymbol{y y}^{4}\) Chapter 6.4.1.11.7 "Generating boot applications" on page 1978
- \(\Leftrightarrow\) Chapter 6.4.1.21.3.7.6 "Command 'Online Change'" on page 2629

\section*{Dialog: Properties: Security}

Function: The dialog contains the properties of the application for encryption. If the CODESYS Security Agent is installed, then you can start a wizard for the encryption of downloads, online changes, and boot applications.
Call:
- Menu bar: "View \(\rightarrow\) Properties"
- Context menu of an application object

Table 532: "Encryption Technology"
If the "Enforce encryption of downloads, online changes and boot applications" option is selected in the "Security Screen" view in the "Security level" group, then the encryption technology is set to "Encryption with certificates" and cannot be changed in this dialog.
"No Encryption"
\begin{tabular}{|l|l|}
\hline "Simple Encryption" & \begin{tabular}{l} 
You can download the boot application to the controller only when the defined \\
dongle (license key) is connected to the computer. \\
The dongle is provided by ABB AG or by the respective hardware manufacturer. \\
The firmcode is displayed. Type in the delivered product code.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Encryption with license \\
management"
\end{tabular} & \begin{tabular}{l} 
You can download the boot application to the controller only after you have \\
specified the product code and firmcode, and the respective dongle is connected \\
to both the development computer and the controller. You receive the codes from \\
the vendor that manages the licenses.
\end{tabular} \\
\hline "Encryption with certificates" & \begin{tabular}{l} 
You can download the boot application to the controller only when a valid certifi- \\
cate exists for it. The "Certificates" group is enabled. See the description below. \\
The option is already selected if the "Enforce encryption of downloads, online \\
changes and boot applications" option is selected on the "User" tab of the \\
"Security Screen" view. \\
You can also select the "Digitally sign application code" option.
\end{tabular} \\
\hline
\end{tabular}

Table 533: "Certificates"
Note: If the "Enforce encryption of downloads, online changes and boot applications" option is selected in the "Security Screen" view in the "Security Level" group, then the encryption technology is set to "Encryption with certificates" and cannot be changed in the "Properties" dialog.
\begin{tabular}{|c|c|}
\hline 7 & The "Certificate Selection" dialog opens. Here you can select previously installed certificates of devices for which the encryption of download, online change, and boot application is enabled. The list can contain several entries if several devices are authorized to run this application. \\
\hline "Digitally sign application code" & The application is signed with a digital signature. The certificate for the digital signature is specified in the "Security Screen" view on the "User" tab. \\
\hline Area for the display of the selected certificates with corresponding information & \begin{tabular}{l}
Information per certificate: \\
- "Issued for" \\
- "Issued by" \\
- "Valid from" \\
- "Valid until" \\
- "Thumbprint"
\end{tabular} \\
\hline "Encryption Wizard" & This button is available only if the CODESYS Security Agent is installed. It starts the wizard with the same name. See the help for CODESYS Security Agent in this case. \\
\hline
\end{tabular}

\section*{Dialog 'Properties' - 'Build'}

Symbol: 组
Function: The dialog contains options for building (build operation) the object.
Call: Menu bar: "View \(\rightarrow\) Properties"; context menu of the object in the device tree
\begin{tabular}{|c|c|}
\hline Name & Description \\
\hline "Exclude from build" & \begin{tabular}{l}
This object and recursively its child objects are not considered for the next compile process. \\
The object entry is displayed in green fonts in the "Devices" or "POUs" view.
\end{tabular} \\
\hline \begin{tabular}{l}
"External implementation" \\
"(Late link in the runtime system)"
\end{tabular} & \begin{tabular}{l}
CODESYS does not generate any code for this object when compiling the project. The object is linked as soon as the project is running on the target system, provided it is available there (for example, in a library). \\
The object name is postfixed with (EXT) in "Devices" or "POUs" view.
\end{tabular} \\
\hline "Enable system call" & \begin{tabular}{l}
A system call (runtime system) for functions is possible. \\
Background: As opposed to CoDeSys V2.3, the ADR operator in V3 can be used with function names, program names, function block names, and method names. It replaces the INSTANCE_OF operator. \\
BUT: It is not possible to call function pointers from within CODESYS.
\end{tabular} \\
\hline "Link always" & \begin{tabular}{l}
The object is marked by the compiler and therefore always included in the compile information. This means that it is always compiled and downloaded to the PLC. \\
Note: The pragma \{attribute 'linkalways'\} can also be used to instruct the compiler to always include an object.
\end{tabular} \\
\hline "Compiler defines" & \begin{tabular}{l}
Here you can specify defines or conditions for compiling the object (conditional compile). You can also type in the expression expr, which is used in these kinds of pragmas. Multiple entries are possible as a comma-separated list (see \{define \} statements). \\
Example: hello, test:='1'
\end{tabular} \\
\hline \multicolumn{2}{|l|}{"Additional compiler definitions from the device description"} \\
\hline "Defined in device" & List of compiler definitions that originate from the device description. These compiler definitions are used in the build if they are not listed in the "Ignored definitions" field. \\
\hline "Ignored definitions" & List of compiler definitions from the device description that are not used in the build. \\
\hline \(\square\) & Copies the selected compiler definition from the "Defined in device" field to the "Ignored definitions" field. \\
\hline < & Moves the selected compiler definition from the "Ignored definitions" field to the "Defined in device" field. The compiler definition is used in the build. \\
\hline
\end{tabular}

\section*{Dialog 'Properties' - 'Build' (C-integration)}

Function: In this dialog, you configure the build environment and the necessary data for the integration of the \(C\) development environment.

Call: Main menu "View", context menu of the object "C Code Module"
Requirement: The object "C Code Module" is selected in the device tree.

\section*{NOTICE!}

The dialog in this form is valid only for CODESYS Control Win V3 and Visual Studio. For other environments, the dialog can look different or may not even be available at all.
\begin{tabular}{|l|l|}
\hline "Visual Studio location" & \begin{tabular}{l} 
Installation path of Visual Studio on the hard disk \\
You can also select the path with the input assistant or search for it with the \\
magnifying glass.
\end{tabular} \\
\hline "Windows SDK location" & \begin{tabular}{l} 
Installation path of Windows SDK on the hard disk \\
You can also select the path with the input assistant or search for it with the \\
magnifying glass.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Temporary build folder \\
Location"
\end{tabular} & Path on the hard disk for the temporary build files \\
\hline
\end{tabular}

See also

\section*{Dialog 'Properties' - 'Access Control'}

Function: The dialog defines the access rights of user groups for objects.
Call: Main menu "View \(\rightarrow\) Properties", context menu of an object in the view "Device" or "POUs".
Requirement: An object is selected in the view "Device" or in the view "POUs".
\begin{tabular}{|c|c|}
\hline "Groups, actions and permissions" & \begin{tabular}{l}
A table which displays the following user groups access rights on objects: \\
- "View" \\
- "Modify" \\
- "Remove" \\
- "Add/remove children" \\
Perform a double click on the access right symbol to open the drop down list with the available rights.
\end{tabular} \\
\hline
\end{tabular}

See also
- \& Chapter 6.4.1.6.6 "Protecting Objects in the Project by Access Rights" on page 1826
- \& Chapter 6.4.1.21.4.7 "Dialog 'Permissions'" on page 2748

\section*{Dialog 'Properties' - 'External file'}

Function: The dialog is used to view and edit the properties of the external file. The properties were defined when the object was created. Changed properties are saved by pressing the "OK" button.

Call: Menu bar: "View \(\rightarrow\) Properties"; context menu of the object
Requirement: The object of the external file is selected in the "Devices" view or the "POUs" view.

Table 534
\begin{tabular}{|l|l|}
\hline "What do you want to do with the external file?" \\
\hline "Remember the link" & The file is available in the project only as long as it exists in the defined file path. \\
\hline \begin{tabular}{l} 
"Remember the link and \\
embed into project"
\end{tabular} & \begin{tabular}{l} 
CODESYS saves an internal copy of the file in the project, as well as the link to \\
the defined file path. The update option selected below applies as long as the \\
external file exists there. Otherwise CODESYS uses the version saved in the \\
project.
\end{tabular} \\
\hline "Embed into project" & \begin{tabular}{l} 
CODESYS saves only one copy of the file in the project. There is no longer a link \\
to the external file.
\end{tabular} \\
\hline
\end{tabular}

Table 535: "When the external file changes, then"
\begin{tabular}{|l|l|}
\hline "Reload the file automatically" & If the external file changes, then CODESYS updates the file in the project. \\
\hline \begin{tabular}{l} 
"Prompt whether to reload the \\
file"
\end{tabular} & \begin{tabular}{l} 
If the external file changes, then a dialog prompt opens whether CODESYS \\
should also update the file in the project.
\end{tabular} \\
\hline "Do nothing" & The file remains unchanged in the project, even if the external file changes. \\
\hline
\end{tabular}

Table 536: "Linked File"
Requirement: Either the "Remember the link" option or the "Remember the link and embed into project" option is selected.
The following information about the linked file is displayed: "Name", "Location", "Size", "Changed".
"Display File Properties" \(\quad\) Clicking this button opens the default "Properties of <file name>" dialog, which you can also open in the Windows file system by right-clicking the file.

Table 537: "Embedded file"
Requirement: Either the "Remember the link and embed into project" option or the "Embed into project" option is selected.
Display of the following information about the embedded file: "Size" and "Changed"
"Update the embedded file" \(\boxed{\square}\) : If the external file that was added to the project is changed in the specified file path, then CODESYS updates the embedded file in the project.

See also
- \({ }^{\star}\) Chapter 6.4.1.21.2.10 "Object 'External File'" on page 2464

\section*{Dialog Box 'Properties' - 'Bitmap'}

Function: The dialog is for assigning a bitmap file to the object. The image will be used in the graphic view of the Library Manager and in the Toolbox view of the FBD/LD/IL editor.
Call: Main menu "View \(\rightarrow\) Properties", context menu of the object
Requirement: The object is selected in the view "Devices" or in the view "POUs"
\begin{tabular}{|l|l|}
\hline "Render pixels of this color & The selected color will be displayed transparently. \\
translparently: "
\end{tabular}

Render pixels of this color
The selected color will be displayed transparently.

\section*{Dialog 'Properties - Application Build Options'}

Function: The dialog includes settings that CODESYS uses for creating a boot application for the controller.

Call: Menu bar: "View \(\rightarrow\) Properties"; context menu of an application object
\begin{tabular}{|l|l|}
\hline "Download application info" & \begin{tabular}{l} 
This feature requires compiler version \(>=3.5 .0 .0\), runtime version >= \\
3.5.0.0. \\
The information about the application contents is also downloaded to \\
the PLC. We recommend that you keep this option enabled because \\
it allows for a difference check between the current application and \\
the application on the PLC. This compares the number of blocks, \\
data, and memory locations. \\
To get the information about the differences, click "Details" in the \\
"Applications" tab of the device editor. This is also in the message \\
view that opens when you are downloading an application to the \\
PLC when it is different from the one already on the PLC.
\end{tabular} \\
\hline "Stop parent application in case of & \begin{tabular}{l} 
Available for applications with a parent application.
\end{tabular} \\
\hline "Dynamic memory settings" & \begin{tabular}{l} 
Memory is allocated dynamically for the application, for example \\
when using the operator __NEW. In this case, define the "Maximum \\
size of memory (bytes)". \\
Caution: The entire memory is not available for creating objects \\
dynamically. Instead, the system always uses part of it for manage- \\
ment information.
\end{tabular} \\
\hline
\end{tabular}

- をy Chapter 6.4.1.21.2.2 "Object 'Application'" on page 2410

\section*{Dialog 'Properties' - 'Target memory settings'}

Function: The dialog allows for changing the memory settings of the target device.
Call: Menu bar: "View \(\rightarrow\) Properties"; context menu of the application
Requirement: The application is selected in the "Devices" view.
\begin{tabular}{|l|l|}
\hline "Override target memory \\
settings" & \begin{tabular}{l}
\(\checkmark:\) The memory settings stored in the device description are overridden by the \\
values specified in "Input size", "Output size", and "Memory size". \\
Note: If the memory settings of the target device are changed, then it is no \\
longer possible to log in to an existing application on the target device, nor is it \\
possible to perform an online change.
\end{tabular} \\
\hline "Input size" & \begin{tabular}{l} 
Input fields for the memory sizes used to override the values \\
"memory-layout \(\backslash\) \input-size", "memory-layout \(\backslash\) output-size", and \\
"Output size" \\
"memory-layout \\
memory-size" stored in the device description.
\end{tabular} \\
Requirement: The "Override target memory settings" option is selected.
\end{tabular}

See also
- \({ }^{\circ}\) Chapter 6.4.1.21.2.2 "Object 'Application'" on page 2410

\section*{Dialog 'Properties' - 'Network Variables'}

Symbol:
Function: In this dialog, you define network properties for the variable list that is selected in the device tree. Furthermore, any variables in it that are declared as network variables are also available.
Call: "Context menu of variable list in device tree \(\rightarrow\) Properties", "Network Variables" tab
\begin{tabular}{|l|l|}
\hline "Network type" & UDP \\
\hline "Task" & \begin{tabular}{l} 
Task of the current application that controls the variables to be sent. \\
CODESYS always sends the variables at the end of a task cycle.
\end{tabular} \\
\hline "List identifier" & Used to identify the network variable list. Must be unique \\
\hline "Pack variables" & \begin{tabular}{l} 
The size of the packages (telegrams) that are transmitted depends \\
on the network type. In the case of "UDP", a package is 256 bytes. \\
\(\boxed{V}\)
\end{tabular} \\
& \begin{tabular}{l} 
CODESYS bundles the variables for sending in packages in \\
order to reduce as much as possible the number of packages to \\
send. In the case of variables of type array or structured data types, \\
this can lead to the splitting of the variables into multiple telegrams. \\
As a result, data inconsistencies are possible within these variables, \\
even if the variable size is smaller than the package size. \\
\(\square: ~ C O D E S Y S ~ g e n e r a t e s ~ o n e ~ p a c k a g e ~ p e r ~ v a r i a b l e . ~\)
\end{tabular} \\
\hline "Transmit checksum" & \begin{tabular}{l} 
Che A checksum is provided for each variable package. The receiver \\
checks the checksum to make sure that the variable definitions \\
match from the sender and receiver. A package with non-matching \\
checksums is not accepted.
\end{tabular} \\
\hline "Acknowledgement" & \begin{tabular}{l} 
V: CODESYS sends an acknowledgement message for each \\
received data package. If the sender does not receive a confirmation \\
before it sends again, then an error is written to the diagnostic struc- \\
ture. \\
Note: For the NetVarUdp library version 3.5.7.0 and later, a receiver
\end{tabular} \\
channel is no longer assigned when confirmed transfer is not \\
selected. In this way, network variable exchange is also possible \\
between two controllers on one hardware device .
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Transmit on event", "Variable" & \begin{tabular}{l}
\(V:\) CODESYS sends the variables as soon as the defined variable \\
yields TRUE.
\end{tabular} \\
\hline "Settings" & \begin{tabular}{l} 
Protocol-specific settings; possible entries depend on the network \\
library. \\
"Port": Number of the port that CODESYS uses for data exchange \\
with other network units. The "Default value" is "1202". You can \\
change the current value in the "Value" field at any time. Select the \\
field, press the [Space Bar], and type the value. \\
Caution: The other nodes in the network must define the same port. \\
If more than one UDP connection is defined in the project, then the \\
port numbers in all configurations are adapted to this value. \\
"Broadcast Adr.": The "Default value" is 255.255 .255 .255, which \\
means that data exchange will take place with all network units. \\
You can change the current value in the "Value": select the field, \\
press the [space bar], and type the address or address range of \\
a subnetwork (for example, 197. 200.100.255 when communica- \\
tion should be with all nodes that have an IP address in the range \\
\(197.200 .100 . x\).
\end{tabular} \\
\hline
\end{tabular}

See also
- \(\Rightarrow\) Chapter 6.4.1.10.5 "Network Variables" on page 1946
- \(\quad\) を Chapter 6.4.1.21.2.19 "Object 'Network Variable List (Receiver)"' on page 2475
- \({ }^{\circ}\) Chapter 6.4.1.21.2.18 "Object 'Network Variable List (Sender)'" on page 2475

\section*{Dialog 'Properties' - 'Network Settings'}

If the device supports the network functionality, then the current network settings for a GNVL (global network variable list) can be displayed and changed in the "Properties" dialog of the object. These are the settings that were used when adding the GNVL in the "Add Network Variable List (Receiver)" dialog.

See also
- « "Dialog Box 'Add Network Variable List (Receiver)'" on page 2475
-

\section*{Dialog 'Properties' - 'CFC Execution Order'}

Function: The tab switches the mode of the execution order for CFC objects.
Call: Context menu: "Properties" of a CFC object in the "Devices" view or "POUs" view

Tab 'CFC Execu-
tion Order'
\begin{tabular}{|c|c|}
\hline "Execution order" & In the CFC editor, you position the elements and therefore also the networks freely. Two modes are available to prevent the execution order in the CFC POU from being undefined. \\
\hline "Auto Data Flow Mode" & \begin{tabular}{l}
In this mode, the execution order is determined automatically by data flow, or in case of ambiguity, by network topology. The POUs and the outputs are numbered internally. The networks are executed from top to bottom and left to right. \\
Advantage: The automatically defined execution order is optimized by time and by cycle. You do not need any information about the internally managed execution order during the development process. \\
The following commands are provided afterwards in the "CFC \\
\(\rightarrow\) Execution Order" menu: \\
- "Display Execution Order" \\
- "Set Start of Feedback" \\
The elements in the CFC editor are displayed without markers and without numbering. It is not possible to change the execution order manually. For networks with feedback, you can also set a starting point.
\end{tabular} \\
\hline "Explicit Execution Order Mode" & \begin{tabular}{l}
In this mode, you can define the execution order explicitly. To do this, the elements are displayed in the CFC editor with markers and numbering, and menu commands are provided for defining the order. \\
The following commands are provided in the "CFC \(\rightarrow\) Execution Order" menu: \\
- "Send to Front" \\
- "Send to Back" \\
- "Move Up" \\
- "Move Down" \\
- "Set Execution Order" \\
- "Order by Data Flow" \\
- "Order by Topology" \\
Note: Up to CODESYS V3.5 SP1, this was the usual behavior of CFC POUs. Pay attention that it is your responsibility to adapt the execution order and assess the consequences and impacts. This is another reason why the execution order is always displayed.
\end{tabular} \\
\hline "Apply to All CFCs" & Changes the mode for all other CFC objects in the project to the mode selected in the list \\
\hline
\end{tabular}

\section*{Dialog 'Properties' - 'SFC Settings'}

Function: The dialog defines the default settings for all POUs used in the project, which are programmed in SFC.
Call: Main menu "View \(\rightarrow\) Properties", context menu of a SFC POU in the view "Device" or "POUs".

Flag
\begin{tabular}{|l|l|}
\hline List of all possible SFC flags & \begin{tabular}{l} 
"Use" \\
execution. The SFC flag is activated and will be considered in the program \\
"Declare" \\
\\
(If: The SFC flag is declared automatically. \\
If "Declare" is activated, but "Use" is not activated, the variable will be declared \\
but the flag has no effect in the program execution. \\
Hint: If you have manually declared a SFC variable you have to disable the dec- \\
laration of this flag in the "SFC Settings". Otherwise the automatically generated \\
flag will overwrite the manually declared flag. \\
Hint: A automatically declared flag variable is only visible in the online mode in \\
the declaration part of the SFC editor.
\end{tabular} \\
\hline "Use defaults" & \begin{tabular}{l} 
: The settings of this dialog overwrites the "SFC settings" of the single POUs. \\
\hline
\end{tabular} \\
\hline See also
\end{tabular}
- \# Chapter 6.4.1.20.1.5.6 "SFC Flags" on page 2067

\section*{Build}

Table 538: "Code generation"
"Calculate active transitions
CODESYS generates code for the currently active transition only. only"

\section*{Dialog 'Properties' - 'Link to File'}

Function: The dialog defines the link of an external file with the contents of the global variable list (GVL). You can either export the GVL to an external file or import it from an external file.

Call: Menu bar: "View \(\rightarrow\) Properties"; context menu of an object of type "Global Variable List"
\begin{tabular}{|l|l|}
\hline "File name" & Input field of the file path \\
\hline "Export before compile " & \begin{tabular}{l} 
冋: Before each compile of the project (for example with [F11]), CODESYS saves \\
a file with the extension gvl in the path, which is specified in the "File name" \\
field.
\end{tabular} \\
\hline "Import before compile" & \begin{tabular}{l}
\(\square:\) The export file which is specified in the "File name" field is read automati- \\
cally before each project compile. Therefore you can import a GVL which was \\
exported from another project, for example to set up a communication by means \\
of network variables.
\end{tabular} \\
\hline
\end{tabular}

See also
- \(\Rightarrow\) Chapter 6.4.1.21.2.12 "Object 'GVL' - Global Variable List" on page 2465
- linktarget [cds_configuring_network_variables_exchange] doesn't exist but @y.link.required='true'

\section*{Dialog 'Properties' - 'Cam'}

Function: Use this dialog to define the global variables of the cam.

Table 539: "Dimensions"
\begin{tabular}{|l|l|}
\hline "Master start/end position" & \begin{tabular}{l} 
The start and end positions of the master define the range of the master values \\
and therefore the scale of the horizontal axis of the cam. The default settings are \\
given in angular degrees with 0 and 360 as limiting values.
\end{tabular} \\
\hline "Slave start/end position" & \begin{tabular}{l} 
The associated slave positions are determined by the graph type that is defined \\
for the cam. However, the segment depicted by the curves (this is also the scale \\
of the vertical axis) can be defined by the slave start and end positions given \\
here.
\end{tabular} \\
\hline
\end{tabular}

Table 540: "Period"
These settings affect the work in the cam editor and cam table. Depending on these parameters, the slave start point is adjusted automatically when the end point is changed, as well as the other way around. This adjustment optimizes the period transition to be as smooth and jerk-free as possible.
\begin{tabular}{|l|l|}
\hline "Smooth transition" & \(\boxed{\text { : The values for position, velocity, and acceleration are adjusted automatically. }}\) \\
\hline "Slave period" & \begin{tabular}{l} 
Indicates when the slave period is repeated mechanically. The slave position at \\
the start and end of the master period may then be in an interval of a whole \\
number multiple of this value. \\
This value is effective only if the "Smooth transition" check box is selected.
\end{tabular} \\
\hline
\end{tabular}

Table 541: "Continuity Requirements"
Activation of these options for the continuity of the curve does not have any effect when editing the cam. It does, however, prompt a continuity check, which reports any violations to the message view (CAM). It is not possible to edit jumps in the position curve. The default setting also requires the continuity of velocity and acceleration. You can clear these options, for example in the special case of a curve that consists of only linear segments. However, this will lead to kinks in the position curve. By default, the jerk (3rd derivative) is not tested for jumps.
\begin{tabular}{|l|l|}
\hline "Position" & \\
\hline "Velocity" & \multicolumn{1}{l}{ 目: The entire curve is tested for jumps. } \\
\hline "Acceleration" & \\
\hline "Jerk" & \\
\hline
\end{tabular}

Table 542: "Compile Format"
When compiling, MC_CAM_REF structure variables are generated. A cam is described according to the following options:
"Polynomial (XYVA)" \(\quad\)\begin{tabular}{l} 
Polynomial description of the individual points consisting of the master position, \\
\hline
\end{tabular} slave position, slave velocity, and slave acceleration.

\section*{Dialog 'Properties' - 'Image Pool'}

Function: The dialog allows for setting the basic properties of the selected image pool.
Call: "View \(\rightarrow\) Properties" of an "Image Pool" object type; context menu of an "Image Pool" object type.
\begin{tabular}{|l|l|}
\hline "Download only used images" & \multicolumn{1}{l}{ : Instead of loading all images from the image pool, CODESYS loads only the } \\
images that are actually used in the application on the PLC.
\end{tabular}

Table 543: "Symbol library settings"
\begin{tabular}{|l|l|}
\hline "Mark library as symbol library" & \begin{tabular}{l} 
Marks the image pool as a symbol library for use in a visualization. The symbol \\
library receives the key VisuSymbolLibrary = TRUE as file property in the \\
project information. The VisuElements library is inserted automatically as a \\
placeholder library in the "POUs" pool of the Library Manager. \\
Requirement: A library project is open. \\
CODESYS displays symbol libraries that are installed in the repository in the
\end{tabular} \\
"Project Settings" "Visualization" category, "Symbol Libraries" tab).
\end{tabular}

- \(\boldsymbol{y}^{2}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

\section*{Dialog 'Properties' - 'Options'}

Options (Con- Function: This dialog provides the settings for monitoring an login for objects of type device. troller) The availability of the options depends on the device description.
Call: Context menu of the device, or main menu "View \(\rightarrow\) Properties", if the device is selected.
"Monitoring interval (ms)" \(\quad\) Interval of the monitoring (10 ms - 1000 ms )

Table 544: "Interactive Login Mode"
\begin{tabular}{|l|l|}
\hline This mode is used to prevent an accidentally login to a different controller. \\
\hline "None" & \begin{tabular}{l} 
No interaction with the user during login. Corresponds to the behavior of pre- \\
vious versions.
\end{tabular} \\
\hline "Enter ID" & \begin{tabular}{l} 
During login CODESYS asks to enter an ID. The ID is stored in the controller. \\
Without a valid ID no login is possible. \\
When login a second time, CODESYS does not ask again for the ID if the \\
computer name, the user name, the device name and the device address have \\
not changed. The information is saved in the project options.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Press key" & \begin{tabular}{l} 
During login a dialog prompts and requests the user to press a key on the \\
controller. The timeout for this action is saved in the device description.
\end{tabular} \\
\hline "Wink (= blink an LED)" & During login a led blinks on the connected controller. \\
\hline
\end{tabular}

Table 545: "Symbol Configuration"
"Access variables in sync with IEC tasks"Default setting, consistent access is not permitted
\(\checkmark\) : Consistent access is permitted
The setting only will take effect when all applications and boot applications are re-downloaded to the controller.

Note: If the option is activated, then the jitter for all IEC applications may increase on this device! The consistent access can disturb the real-time capability.

\section*{General}

Symbol:
Function: The object contains the basic configuration of the project. In the "Project Settings" dialogs the configuration can be adjusted.

Call: Double click on the "Project Settings" object in the device tree, or main menu "Project \(\rightarrow\) Project Settings".
CODESYS saves the project settings directly in the project. If a project is transferred to another system for example the "Project Settings" object is transferred as well without the need of a project archive.

The project settings are valid project wide. Dependent on the installed packages the dialogs provide settings for several categories, as for example "SFC" or "User and Groups".

See also
- \(\quad\) y Chapter 6.4.1.21.3.9.4 "Command 'Package Manager'" on page 2655

\section*{Dialog 'Project Settings' - 'SFC'}

Symbol: [
Function: This dialog is used for configuring the settings of SFC objects. The properties of each new SFC object automatically have the configured settings.
Call: Menu bar: "Project \(\rightarrow\) Project Settings" ("SFC").
Requirement: A project is open.

Tab 'Flags'
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|c|}{ Implicitly generated variables for checking and monitoring the processing in an SFC diagram } \\
\hline "Active" & \(\boxed{\square}\) : The corresponding variable is used. \\
\hline "Declare" & \begin{tabular}{l}
\(\square:\) The corresponding variable is created automatically. Otherwise, you have to \\
declare the variable explicitly if you intend to use it ("Use" is selected).
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l}
\hline "Apply to all" & \begin{tabular}{l} 
In this dialog, CODESYS applies changes to existing SFC objects. CODESYS \\
selects the "Use defaults" check box in the properties of the SFC POUs.
\end{tabular}
\end{tabular}

\section*{NOTICE!}

Automatically declared variables are visible in the declaration part of the SFC editor only in online mode.

\section*{Tab 'Build'}

Table 546: "Code Generation"
"Calculate active transitions only"

Table 547: "SFC Library"
This part of the dialog is available only for compiler versions < 3.4.1.0.
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Company" \\
"Title" \\
"Version"
\end{tabular} & Defines the SFC library that CODESYS uses by default. \\
\hline "Namespace" & \begin{tabular}{l} 
Enables unique references to libraries. Required when various versions of the \\
library are available on the system. Please make sure that there are no discrep- \\
ancies between the namespace defined in the library manager and the name- \\
space defined for the individual object. The SfcIec.library data is used for \\
the default settings that CODESYS provides with the default profile.
\end{tabular} \\
\hline
\end{tabular}

Each SFC block stores the information via the library version that applied when you added the block. This can cause you to use multiple library versions within the same project. In order to prevent this, you are prevented from defining specific versions of IecSfc. library (as of compiler version 3.4.1.0). The library version, which you use for all SFC blocks in the project, is defined with a placeholder. CODESYS resolves the placeholder depending on the compiler version in use. The allocation of the library version to the compiler version is defined in the library profile.

\section*{Dialog 'Project Settings' - 'Users and Groups'}

Symbol: 88
Function: This dialog is for the configuration of the user management for the current project.
Call: Menu "Project \(\rightarrow\) Project Settings", category "Users and Groups"

Tab 'User'
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ Displays the users and their memberships in groups } \\
\hline "Add" & Opens the "Add User" dialog. \\
\hline "Edit" & Opens the "Edit User" dialog. \\
\hline "Delete" & \begin{tabular}{l} 
An error message appears if you attempt to delete the last user of a group, since \\
a group must have at least one member.
\end{tabular} \\
\hline
\end{tabular}

Table 548: "Add User / Edit User"
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ Input fields for setting up a new user account or changing an existing one } \\
\hline "Active" & \begin{tabular}{l} 
: You may use the user account, default \\
\(\square:\) The user cannot log in. If he attempts to login again with incorrect login data, \\
this can result in automatic deactivation of the account; see below: Settings.
\end{tabular} \\
\hline "Memberships" & \begin{tabular}{l} 
List of all user groups that you have defined in addition to the group "Everyone" \\
(to which each new user automatically belongs). \\
保
\end{tabular} \\
\hline
\end{tabular}

Table 549: "Export/Import"
\begin{tabular}{|l|l|}
\hline "Export Users and Groups" & \begin{tabular}{l} 
The command opens the standard dialog for saving a file in the local file system. \\
You can store the users and groups definitions of the project in a file *. users in \\
xml format.
\end{tabular} \\
\hline "Import Users and Groups" & \begin{tabular}{l} 
Export users and groups opens the standard dialog for browsing the local file \\
system for a file. Search for a file with extension *. users in order to import the \\
users and groups definitions, stored in this file, into the project.
\end{tabular} \\
\hline
\end{tabular}

\section*{Tab 'Groups'}
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ Display of the groups and their members. A group can also be a member of a group. } \\
\hline "Add" & Opens the "Add Group" dialog. \\
\hline "Edit" & Opens the "Edit Group" dialog. \\
\hline "Delete" & \begin{tabular}{l} 
If you delete a group, the user accounts of the members remain unchanged. \\
You cannot delete the groups "Everyone" and "Owner".
\end{tabular} \\
\hline
\end{tabular}

On button "Export/Import" please see above the "User" paragraph.

\section*{Tab 'Settings'}

Display of the groups and their members in a tree structure. A group can also be a member of a group.
"Maximum number of authentication trials"
(standard) : If the user has attempted to login with an incorrect password the number of times specified here, the user account is deactivated. \(\square\) : The number of the unsuccessful attempts is unlimited
"Automatic logoff after time of inactivity"
\(\checkmark\) : The user is automatically logged out if CODESYS does not register any user actions by mouse or keyboard during the time period (minutes) specified here.

\section*{Dialog Box 'Project Settings' - 'Compileoptions'}

Symbol: \({ }^{\#}\)
Function: This dialog box is for configuring the compiler options.
Call: Main menu "Project \(\rightarrow\) Project Settings" ("Compileoptions" category).
Requirement: A project is open.

Table 550: "Compilerversion"
\begin{tabular}{|l|l|}
\hline "Fix Version" & \begin{tabular}{l} 
Defines the compiler version that CODESYS uses when compiling and down- \\
loading for compile (for example, "3.5.6.0" for version 3.5 SP6).
\end{tabular} \\
\hline
\end{tabular}

Table 551: "Settings"
\(\left.\begin{array}{|l|l|}\hline \begin{array}{l}\text { "Allow unicode characters for } \\ \text { identifiers" }\end{array} & \begin{array}{l}\text { Cleared by default because using Unicode characters in identifier names is not } \\ \text { permitted in the IEC standard. May be required for some foreign languages (for } \\ \text { example, Asian languages). }\end{array} \\ \hline \text { "Replace constants" } & \begin{array}{l}\text { (default): CODESYS loads the value directly for every scalar constant (not for } \\ \text { strings, arrays, and structures). In online mode, CODESYS marks the constants } \\ \text { with a symbol that is prepended to the value in the declaration editor or moni- } \\ \text { toring view. In this case, access is not possible, for example by means of an ADR } \\ \text { operator, forcing, and writing. } \\ \square\end{array} \\ \hline \text { "Access to constants is possible, but it prolongs the computation time. }\end{array}\right\}\)

Table 552: "Compiler Warnings"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Maximum number of \\
warnings"
\end{tabular} & \begin{tabular}{l} 
Refers to the warnings that CODESYS prints to the messages view. \\
You define the selection of displayed compiler warnings in the "Project Settings" \\
dialog box in the "Compiler Warnings" category.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Project Settings' - 'Source Download'}

Symbol:
Function: This dialog defines the compilation and the storage of the source code as a sourcecode download archive on one or more controllers.
Call: "Project \(\rightarrow\) Project settings" menu, "Download source code" category

A source-code download archive is a project archive with the name Archiv.prj.

The settings affect the command "Online
\(\rightarrow\) Load source code to connected controller". These settings do not affect the command "File \(\rightarrow\) Load source code to controller".

Table 553: "Destination device"
Defines the location of the project archive.
\begin{tabular}{|l|l|}
\hline "<name of controller>" & \begin{tabular}{l} 
Selected controller. CODESYS loads the project archive to this controller. \\
Requirement: the project contains several controllers.
\end{tabular} \\
\hline "<all devices in project>" & CODESYS loads the project archive to all controllers in the project. \\
\hline
\end{tabular}

Table 554: "Content"
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{Defines the contents of the project archive.} \\
\hline "Use compact download" & The project archive contains only that device in the project that contains the active application.
: The project archive contains all the devices in the project \\
\hline \multirow[t]{2}{*}{"Additional Files"} & Opens the "Additional files" dialog where you can select additional files for downloading. \\
\hline & \begin{tabular}{l}
Not all types of additional files are available for each project. \\
"Download information files" - Project information files \\
"Library profile" - Includes the applied profile \\
"Project information" - Includes the project information \\
"Referenced devices" - Includes all device descriptions of third party devices into the archive \\
"Referenced libraries" - Includes all referenced libraries into the archive \\
"Referenced visualisation styles" - Includes the used styles \\
"Visualisation profile" - Includes the used profile \\
The most important types "Referenced devices" and "Referenced libraries" should always be included, if the archive shall be usable by Automation Builder installations without availability of the required devices or libraries.
\end{tabular} \\
\hline
\end{tabular}

Table 555: "Timing"
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ Defines the time at which CODESYS creates a project archive. } \\
\hline \begin{tabular}{l} 
"Implicitly at program download \\
and online change"
\end{tabular} & \begin{tabular}{l} 
Each time an application is loaded or an online change is made, CODESYS \\
additionally loads the project archive to the target device(s) with no further \\
prompt.
\end{tabular} \\
\hline "Implicitly at creating boot \\
project" & \begin{tabular}{l} 
Each time a boot application is created, CODESYS additionally loads the project \\
archive to the target device(s) with no further prompt.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Implicitly at creating boot \\
project, download and online \\
change"
\end{tabular} & \begin{tabular}{l} 
Each time a boot application is created, an application is loaded or an online \\
change is made, CODESYS additionally loads the project archive to the target \\
device(s) with no further prompt.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Prompt at program download \\
and online change"
\end{tabular} & \begin{tabular}{l} 
Each time an application is loaded or an online change is made, CODESYS \\
opens a prompt, where you can select whether CODESYS should load the \\
project archive to the controller.
\end{tabular} \\
\hline "Only on demand" & \begin{tabular}{l} 
A prompt opens only if the command "Online \\
(
\end{tabular} \\
whether CODESYS shource code to connected controller" is called. There you can select
\end{tabular}

\section*{Dialog 'Project Settings' - 'Page Setup'}

Symbol:
Function: This dialog defines the layout for the print version of the project contents. This layout is used for the printout of the project information by clicking "File \(\rightarrow\) Print" and the printout of the project documentation by clicking "Project \(\rightarrow\) Document".

Call: Main menu "Project \(\rightarrow\) Project Settings" ("Page Setup")
You can change settings the following:
- "Paper"
- "Margins"
- "Header and Footer"
- "Document"
- "Title Page"

Table 556: "Edit Header, Edit Footer"
The headers and footers are structured in table style. You can configure rows and columns, and add text and images to the resulting cells.
\begin{tabular}{|l|l|}
\hline "Row spanning" & Number of rows that CODESYS should merge into a single column. \\
\hline "Column spanning" & Number of columns that CODESYS should merge into a single row. \\
\hline\(>\) & \begin{tabular}{l} 
Opens the list of available placeholders for the "Text" field. When printing the \\
page, CODESYS provides the placeholders with the current values.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Project Settings' - 'Security'}

Symbol: 8
Function: this dialog is for the configuration of the project protection by a password, a dongle, or a certificate.
Call: Menu bar: "Project \(\rightarrow\) Project Settings" (category "Security").

\section*{NOTICE!}

If the encryption password is lost you can no longer open the project. You can also no longer restore it.
\begin{tabular}{|l|l|}
\hline "No protection" & \begin{tabular}{l} 
O: The project file is not protected from unauthorized access and data manipula- \\
tion. \\
Note: We strongly recommend that you use security functionality. \\
O: The "Password", "Dongle", and "Certificates" options cannot be selected.
\end{tabular} \\
\hline "Integrity check" & \begin{tabular}{l} 
When you create a new project, this option is enabled by default. \\
O: The project file is stored in a proprietary format and its integrity is checked \\
each time the project is loaded. The file may be incompatible with older versions \\
of the development system. \\
Please note that the project file is not encrypted. To better protect your data, \\
activate one of the encryption functions.
\end{tabular} \\
\hline "Encryption" & \begin{tabular}{l} 
O: The "Password", "Dongle", and "Certificates" encryption functions can be \\
selected.
\end{tabular} \\
\hline "Password" & \begin{tabular}{l} 
Entering, changing and confirming the encryption password. \\
If you save the project with these settings you must enter the password later in \\
order to open the project again, even if it is to be loaded as a library reference.
\end{tabular} \\
\hline "Dongle" & \begin{tabular}{l} 
Requirement: you have connected the CODESYS security key (dongle) to the \\
computer. \\
"Add": The dialog "Add Registered Dongle" opens.
\end{tabular} \\
\hline "Registered dongles" & Drop-down list of the registered dongles. \\
\hline "Certificates" & \begin{tabular}{l} 
Certificates are used for the encryption of contents of the open project file. \\
Requirement: The certificates for all users who share the project must be \\
installed in the local memory. \\
Ral : The "Certificate selection" dialog opens.
\end{tabular} \\
\hline
\end{tabular}

Table 557: Adding a registered dongle
\begin{tabular}{|l|l|}
\hline "Dongle" & Drop-down list of all connected dongles. \\
\hline "Update" & CODESYS refreshes the drop-down list. \\
\hline "Flash" & \begin{tabular}{l} 
The LEDs of the currently selected dongle flash for two seconds (if it supports \\
this function).
\end{tabular} \\
\hline
\end{tabular}

The dongle must be connected to the computer when CODESYS loads the project, even if it is loaded as a library reference.

\section*{Dialog 'Project Settings' - 'Static Analysis Light'}

Symbol:
Function: This dialog activates the tests that the light version of CODESYS Static Analysis performs each time code is generated.
Call: Menu bar: "Project \(\rightarrow\) Project Settings" ("Static Analysis Light" category).

You can exclude lines of code from the static code analysis by marking the code with the pragma \{analysis . . .\} or the pragma \{attribute 'analysis' := '...'\}.

Additional compile tests
\begin{tabular}{|c|c|}
\hline "SA0033: Unused variables" & \begin{tabular}{l}
Finds variables that are declared, but not used within the compiled program code. \\
For GVL variables: If there are multiple applications in one project, then only the objects under the currently active application are affected. If there is only one application, then the objects in the POUs view are also affected.
\end{tabular} \\
\hline "SA0028: Overlapping memory areas" & Detects the locations where two or more variables reserve the same storage space. For example, this occurs for the following declarations: var1 AT \%QB21: INT and var2 AT \%QD5: DWORD. In this case, both variables use byte 21 , which means that the memory range of the variables overlap. \\
\hline "SA0006: Write access from multiple tasks" & Detects variables that are written by more than one task. \\
\hline SA0004 "Multiple write access on output" & \begin{tabular}{l}
Detects outputs that are written to more than one location. \\
Note: No error is reported when an output variable (VAR_IN_OUT) is written in different branches of IF and CASE statements. \\
Note: A pragma cannot deactivate this rule.
\end{tabular} \\
\hline "SA0027: Multiple use of identifiers" & \begin{tabular}{l}
Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project. \\
The following cases are detected: \\
- The name of an enumeration constant is the same as in another enumeration in the application or used in an included library. \\
- The name of a variable is the same as an object in the application or an included library. \\
- The name of a variable is the same as for an enumeration constant in and enumeration in the application or an included library. \\
- The name of an object is the same as another object in the application. \\
- The name of a variable is the same as the name of a method. \\
- The name of an object is the same as the name of a superordinate object ("parent object").
\end{tabular} \\
\hline "SA0167: Temporary function block instances" & The test detects function block instances that are declared as temporary variables. This concerns instances that are declared in a method or in a function or as VAR TEMP, and therefore are reinitialized in each processing cycle and for each POŪ call. \\
\hline
\end{tabular}
```

Examples SA0003: Empty statements
;
(* Comment *);
iVar;
SA0006: Concurrent access

```

## Dialog 'Project Settings' - 'Visualization'

Symbol: ${ }^{(1)}$
Function: The dialog is used to configure the project-wide settings for objects of type "Visualization".

Call: Menu bar: "Project $\rightarrow$ Project Settings", "Visualization" category
Requirement: A project is open.

## Tab 'General'

Table 558: "Visualization Directories"

| "Text list files" | Directory which contains text lists that are available in the project to configure <br> texts for different languages. CODESYS uses the directory, for example to <br> import or export text lists. |
| :--- | :--- |
| "Image files" | After clicking $\ldots .$. , the "Select Directory" dialog opens which allows for the selec- <br> tion of a directory in the file system. |
|  | Directory which contains image files that are available in the project. Multiple <br> folders are separated with a semicolon. CODESYS uses the directory, for <br> example to import or export image files. <br> After clicking $\ldots$, the "Select Directory" dialog opens which allows for the selec- <br> tion of a directory in the file system. |

Table 559: "Advanced"

| "Activate property handling in all element properties" | You can also configure a visualization element with a property 䛼 in those of its properties in which you select an IEC variable. Then CODESYS creates additional code for the property handling when a visualization is compiled. <br> Requirement: Its IEC code contains at least an object of type "Interface property" (a property 野). <br> PLC_PRG (PRG) <br> - $\mathrm{I}_{\mathrm{C}}^{2}$ Property_A <br> Get <br> Set <br> Requirement: "Visible" is selected. |
| :---: | :---: |
| "Enable implicit checks for visualization POUs" | The implicit check is also performed for visualization POUs. As a result, additional code is generated, which increases memory usage. When memory is limited, this option should be disabled. |

6.4.1.21.4.13.7 Dialog 'Project Environment' - 'Visualization Symbols'. ..... 2780

## General

Function: You use this dialog for checking the actuality of the software and of the files, which are included in the project. CODESYS checks for example the selected compiler and finds out if there is a newer version. In such a case you can update the affected components.
Call: Main menu"Project"

## Dialog 'Project Environment' - 'Library Versions'

Function: This dialog displays the libraries of the opened project for which newer versions are available.
Call: Main menu "Project $\rightarrow$ Project Environment", tab "Library Version"
This dialog opens automatically when you open a project containing outdated libraries.

Table 562

| The list shows the name of the outdated library with version, the currently available version and the planned action. |  |
| :---: | :---: |
| "Action" | Double-click inside the field to select the desired actions. |
| "Check for updates when loading this project" | Checking takes place each time the project is opened. : Checking takes place once only. |
| "Set all to newest" | CODESYS uses the newest available version of the library. |
| "OK" | CODESYS performs the selected action(s). |

## Dialog 'Project Environment' - 'Compiler Version'

Function: This dialog shows the current compiler version of the project and provides the capability of updating.
Call: Main menu "Project $\boldsymbol{\rightarrow}$ Project Environment" ("Compiler Version" tab).

Table 563

| "Current compiler version in <br> project" | Shows the set compiler version for the open project. |
| :--- | :--- |
| "Recommended, newest <br> version" | Shows the latest version. |
| "Action" | - "Do not update": The compiler version of the project remains the same. <br> - "Update to x.x.x.x": The selected compiler version is set for the project. |
| "Check for updates when <br> loading this project" | V: CODESYS checks for new versions each time the project is opened. If there <br> is a new version, then the respective update dialog opens automatically. <br> : The compiler version is not checked. The update dialogs do not open auto- <br> matically. |
| "Set all to newest" | The compiler version is set to the latest version. |

## Dialog 'Project Environment' - 'Device Versions'

Function: This dialog shows the devices of the open project in which there are new versions available.

Call: Main menu "Project $\rightarrow$ Project Environment" ("Device Versions" tab)
This dialog opens automatically when you open a project that contains an outdated device.

Table 564

| Names of the outdated devices and their versions, as well as the current version and the planned action. |  |
| :--- | :--- |
| "Action" | Double-click in the field to select the required actions. |
| "Check for updates when | l: The check is performed when the project is opened. <br> loading this project" |
| "Set all to newest" | The check is performed one time only. |

## Dialog 'Project Environment' - 'Visualization Profile'

Function: This dialog shows the current visualization profile of the project. The profile can be updated here.

Call: Menu bar: "Project $\rightarrow$ Project Environment" ("Visualization Profile" tab).

| "Current visualization profile in <br> the project" | The set visualization profile of the open project. |
| :--- | :--- |
| "Recommended, newest <br> profile" | The newest version. |
| "Action" | $\bullet$ "Do not update": The visualization profile of the project remains unchanged. <br> - "Update to x.x.x.x": CODESYS updates the project to the selected visualiza- <br> tion profile. |
| "Check for updates when |  |
| loading this project" | Q: CODESYS checks for new profiles each time the project is opened. If there is <br> a new version, then the respective update dialog opens automatically. <br> $\square: ~ N o t ~ t e s t ~ o f ~ t h e ~ p r o f i l e ~ w h e n ~ o p e n i n g ~ t h e ~ p r o j e c t . ~ T h e ~ u p d a t e ~ d i a l o g s ~ d o ~ n o t ~$ |
| open automatically. |  |

See also

- Help about visualization

## Dialog 'Project Environment' - 'Visualization Styles'

Function: This dialog shows the current visualization style of the project and provides the capability of updating it.

Call: Menu bar: "Project $\rightarrow$ Project Environment" ("Visualization Styles" tab).

Table 565: "Newer versions are available for the following visualization styles currently in use"

| "Visualization style" | Version of the set visualization style in the open project |
| :--- | :--- |
| "Current" | Current version of the visualization style (example: 3.5.6.0) |
| "Recommended" | Recommended version of the visualization style (example: 3.5.7.0) |
| "Action" | - "Do not update": The visualization style of the project remains unchanged. <br> - "Update to x.x.x.x": CODESYS updates the project to the version of the <br> selected visualization style. |
| "Check for updates when <br> loading this project" | V: CODESYS checks for new versions each time the project is opened. If there <br> is a new version, then the respective update dialog opens automatically. <br> $\square: ~ T h e ~ v e r s i o n ~ i s ~ n o t ~ c h e c k e d . ~ T h e ~ u p d a t e ~ d i a l o g s ~ d o ~ n o t ~ o p e n ~ a u t o m a t i c a l l y . ~$ |
| "Set all to newest" | CODESYS updates the version. |

## Dialog 'Project Environment' - 'Visualization Symbols'

Function: The dialog lists installed symbol libraries and allows for you to assign symbol libraries to a project.
Call: Menu bar: "Project $\rightarrow$ Project Environment", "Visualization Symbols" tab
Requirement: The open project contains a visualization and has been saved with a compiler version < 3.5.7.0. CODESYS recognizes symbol libraries in compiler version 3.5.7.0 and higher.

| "Symbol library" | List of all installed symbol libraries |
| :--- | :--- |
| "Active" | : Symbol library is selected for the project. CODESYS provides its symbols in <br> the "Visualization Toolbox" view. <br> $\square$ |
|  | : Symbol library has been previously installed only in the library repository. |

## General

Function: You use the dialog box for selecting the CODESYS options. With these options you configure the appearance and the behavior of the user interface. CODESYS saves the current configuration as standard settings in the local system.

Call: Main menu "Tools $\rightarrow$ Options"

## Dialog 'Options' - 'Automation Builder'

Symbol: $3^{*}$
Function: This dialog is for the configuration of the settings for the Automation Builder.
Call: menu "Tools $\rightarrow$ Options", category "Automation Builder"

## Tab 'DeviceTree'

| "Show warning message on delete objects" | A warning appears whether the selected object should really be deleted from the project. |
| :---: | :---: |
| "Show device type" | $\checkmark$ : In the project tree the device type is displayed in brackets |
| "Show device tag" | $\checkmark$ : Show device tag |

| "Close Add / Update object |  |
| :--- | :--- |
| dialog after single transaction" | 目: The "Add/Update Object" dialog is closed after a single transaction. |
| "Display all versions" | all : Some devices in all versions are displayed. If the checkbox is not set (default), then <br> only the latest version is displayed. |

## Tab 'Project'

| "Check integrity on open project" | The integrity of an open project is automatically checked in the background. « Chapter 6.4.1.21.3.5.10 "Command 'Check integrity"' on page 2603 |
| :---: | :---: |
| "Check configuration on the fly directly on modify" | $\square$ : The configuration can be checked directly when changing. |
| "Incremental update of configuration data" | $\checkmark$ : Performs an incremental update of configuration data. |
| "Activate legacy version of CSV signal export / import" | If this checkbox is set, the old version of the CSV signal export/import is activated. |

Tab 'Editors' Max parallel opened editors allowed 25 (max. 99).

| "//O-mapping" |  |
| :--- | :--- |
| "Use tree based I/O mapping <br> dialog" | $\square:$ The view of the I/O mapping dialog is defined, here use tree based I/O <br> mapping dialog. |
| "Use list based I/O mapping <br> dialog" | $\square:$ The view of the I/O mapping dialog is defined, here use list based I/O <br> mapping dialog. |
| "Use both I/O mapping dialog" | 凹: The view of the I/O mapping dialog is defined, here use both based I/O <br> mapping dialog. |

Tab 'General' $\square$ : "Participate in ABB usability improvement program" (Function not yet active.)

## Dialog 'Options' - 'C Compiler'

Symbol:
Function: This dialog is for the configuration of the settings for the "C Compiler".
Call: menu "Tools $\boldsymbol{\rightarrow}$ Options", category "C Compiler"

## Tab 'GCC 4.7.3'

| "Path to Compiler executable" | Path to the file location. |  |
| :---: | :---: | :---: |
|  | "...") Opens the file manager to search for the file location. |  |
|  | "Reset": Resets the input. |  |
| "Environment Variables" | "New..": A new input window opens. | "Variable name:" Enter new variables. |
|  |  | "Variable value:" Enter new variables. |
|  | "Edit...": A new input window opens. | "Variable name:" Edit new variables. |
|  |  | "Variable value:" Edit new variables. |
|  | "Delete": Deletes the entries. |  |
|  | "Reset": Deletes the entries. |  |

| "Include path" | "New..": A new input <br> window opens. | "Path:" Enter a new path. |
| :--- | :--- | :--- |
|  | "Edit...": A new input <br> window opens. | "Path:" Edit include path. |
|  | C:IProgram Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11 |  |
|  | "Delete": Deletes the entries. |  |
|  | "Reset": Deletes the entries. |  |

Tab 'GCC 4.7.3
PM595-4ETH'

| "Path to Compiler executable" | Path to the file location. |  |
| :---: | :---: | :---: |
|  | "...": Opens the file manager to search for the file location. |  |
|  | "Reset": Resets the input. |  |
| "Environment Variables" | "New..": A new input window opens. | "Variable name:" Enter new variables. |
|  |  | "Variable value:" Enter new variables. |
|  | "Edit...": A new input window opens. | "Variable name:" Edit new variables. |
|  |  | "Variable value:" Edit new variables. |
|  | "Delete": Deletes the entries. |  |
|  | "Reset": Deletes the entries. |  |
| "Include path" | "New..": A new input window opens. | "Path:" Enter a new path. |
|  | "Edit...": A new input window opens. | "Path:" Edit include path. |
|  | C:\Program Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11 |  |
|  | "Delete": Deletes the entries. |  |
|  | "Reset": Deletes the entries. |  |

Tab 'GCC ++
4.7.3

PM595-4ETH'

| "Path to Compiler executable" | Path to the file location. |  |
| :---: | :---: | :---: |
|  | "...": Opens the file manager to search for the file location. |  |
|  | "Reset": Resets the input. |  |
| "Environment Variables" | "New..": A new input window opens. | "Variable name:" Enter new |
|  |  | "Variable value:" Enter new |
|  | "Edit...": A new input window opens. | "Variable name:" Edit new |
|  |  | "Variable value:" Edit new |
|  | "Delete": Deletes the entries. |  |
|  | "Reset": Deletes the entries. |  |
| "Include path" | "New..": A new input window opens. | "Path:" Enter a new path. |
|  | "Edit...": A new input window opens. | "Path:" Edit include path. |
|  | C:\Program Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11 |  |

|  | "Delete": Deletes the entries. |
| :--- | :--- |
|  | "Reset": Deletes the entries. |

## Tab 'External diff tool'

| "Path to external <br> diff tool" | "..": Opens the file manager to search for the file location. |
| :--- | :--- |

## Dialog 'Options' - 'CFC Editor'

Symbol: 으
Function: This dialog is for the configuration of the settings for editing and printing in the CFC editor.

Call: menu "Tools $\rightarrow$ Options", category "CFC Editor"

## Tab 'General'

| "Enable AutoConnect" | V: If you drag a CFC element onto the work area of the editor and insert it, <br> CODESYS automatically connects together unconnected pins that 'touch' one <br> another. Make sure that you do not create unwanted connections when shifting <br> elements! |
| :--- | :--- |
| "Prepare values in <br> implementation part" | in online mode you can also prepare variable values for writing and forcing <br> in the implementation part of the CFC module. In addition, CODESYS displays <br> the values you have just prepared in the inline monitoring box of the variable in <br> angle brackets. |

## Tab 'View'

| "Display grid points" | $\checkmark$ : Grid points at which you can position the elements are visible in the editor. |
| :---: | :---: |
| "Show box icon" | Existing function blocks that are linked with a bitmap are displayed by CODESYS in the CFC editor as symbols. <br> Requirement: You have either created the link for a function block or a function in the object properties or loaded it via a library. |
| "Edit Line Colors" | Opens the "Edit Line Colors" dialog for the definition of the colors of the connecting lines, depending on the data type applied. The lines appear in offline and online mode in these colors, unless CODESYS paints over them with the thick black and blue lines used to display the boolean data flow. <br> - "Add Type:" Adds a data type to the list. <br> "Delete Type" |
| "Font" | Display of the font and button for changing the font. |

- ${ }^{4}$ Chapter 6.4.1.21.4.11.9 "Dialog Box 'Properties' - 'Bitmap"" on page 2758

Tab 'Print'

| Setting the "Layout Options" |  |
| :--- | :--- |
| "Fit method" | "Page" or "Poster" |
| "Scale" | Possible values: $20 \%-200 \%$ |

## Dialog 'Options' - 'Declaration Editor'

Symbol:
Function: This dialog is for the configuration of the display settings for the declaration editor.
Call: Main menu "Tools $\rightarrow$ Options", category "Declaration Editor"

| "Textual only" | Textual view of the declaration editor |
| :---: | :---: |
| "Tabular only" | Tabular view of the declaration editor |
| "Switchable between textual and tabular" | The declaration editor offers two buttons for switching between the textual and tabular views: <br> 䝉: textual view $\square$ tabular view <br> The following option defines the view that appears by default when opening a programming object: <br> - "Always textual" <br> - "Always tabular" <br> - "Remember recent setting (per object)" <br> - "'Remember recent setting (global)" |

See also

- $y^{*}$ Chapter 6.4.1.9.4.2 "Using the declaration editor" on page 1851

## Dialog 'Options' - 'Device Description Download'

Symbol:
Function: This dialog is for the configuration of addresses of download servers for device descriptions.

Call: Menu "Tools $\rightarrow$ Options", category "Download the Device Descriptions".
See also

- $\quad$ \& Chapter 6.4.1.18 "Managing devices" on page 2038

Table 566: "Download server"
List of download servers containing device descriptions. By default 'https://store.codesys.com/ CODESYSDevs' is entered as the download server.

If you select the button "Download Missing Device Descriptions" in the "Device Repository" dialog, CODESYS uses the servers entered here and uses the set login data for the proxy server.

| Double-click on "(Enter new <br> download server here...)" | An input field opens in which you can enter the URL address of a server. |
| :--- | :--- |
| $[D e l]$ | Deletes the selected download server. |

## Dialog 'Options' - 'Device Editor'

Symbol:
Function: This dialog includes settings for displaying the device editor.
Call: Menu bar: "Tools $\rightarrow$ Options"; category: "Device Editor".

## Tab 'View'

| "Show generic device configuration views" | This tab with the list of device parameters is available in the device editors of parameterizable devices. |
| :---: | :---: |
| "Create cross references for IEC addresses (clean necessary)" | $\checkmark$ : CODESYS creates the cross-references for unmapped I/Os. |
| "Communication page" | - "Classic mode": The "Communication" tab of the device editors appears as a split window with the left side showing the current configured gateway channels in a tree structure and the right side showing the associated data and information. <br> - "Simple mode": The "Communication" tab appears as described in the corresponding section in the help. <br> Additional modes may also be available from customer-specific extensions. |
| "Show implicit files for application download on the editor of a PLC" | The tab for synchronized files is available in the device editors. Synchronized files are downloaded to the PLC at the time of application download. These can be external files that were added to the application, or implicit files such as a source code archive. |
| "Show access rights page" | The "Access Rights" tab is available in the device editors. <br> Note: Depending on the device, the device description may overwrite this setting. |

See also

- $\quad \triangleq$ Chapter 6.4.1.21.2.8.3 "Tab 'Communication Settings'" on page 2427
- ${ }^{*}$ Chapter 6.4.1.21.2.8.7 "Tab 'Synchronized Files'" on page 2436

## Dialog 'Options' - 'Diagnosis'

Symbol:
Function: This dialog is for the "Diagnosis" setting and views.
Call: menu "Tools $\rightarrow$ Options", category "Diagnosis"

Table 567: 'Diagnosis view'

| "Enable subtree diagnosis" | $\boxed{\square}$ : The subtree diagnosis is switched on. |
| :--- | :--- |
| "Enable debug columns" | $\square$ : Debug columns are enabled. |

## Dialog 'Options' - 'External tools'

Symbol: 礝
Function: This dialog is for setting of "External tools".
Call: menu "Tools $\rightarrow$ Options", category "External tools"

| Tool | Version |
| :---: | :---: |
| "Panel builder" | "Default" |
|  | "Custom": Opens the file manager to search for the file location. Sometimes it is required to used dedicated versions of these tools (qualified versions, versions supporting more legacy types, ...) |
| "Drive composer pro" | "Default" |
|  | "Custom": Opens the file manager to search for the file location. Sometimes it is required to used dedicated versions of these tools (qualified versions, versions supporting more legacy types, ...) |

| "Restore defaults" | Resets the custom settings to default. |
| :--- | :--- |

The modified settings will be valid after restart of Automation Builder.

## Dialog 'Options' - 'FBD, LD, and IL'

Symbol: ©
Function: This dialog is used for configuring the display options for the FBD/LD/IL editor.
Call: "Tools $\rightarrow$ Options" (category "FBD, LD, and IL".

Tab 'General'
Table 568: "View"

| "Show network title" | The network title is displayed in the upper left corner of the network. |
| :--- | :--- |
| "Show network comment" | The network comment is displayed in the upper left corner of the network. When <br> the network title is also shown in CODESYS, the comment is shown in the line <br> below. |
| "Show box icon" | The block symbol is displayed in the block element in the FBD and LD editor. <br> The standard operators also have symbols. |
| "Show operand comment" | CODESYS shows the comment that you indicated for a variable in the imple- <br> mentation part. The operand comment refers to the local occurrence of the <br> variable only, as opposed to the symbol comment. <br> This comment is truncated automatically depending on available space. <br> You can limit the comment to a defined width by activating the option "Fixed size <br> for operand fields". |
| "Show symbol comment" | The comment that you indicated for a variable or symbol in the declaration is <br> displayed in CODESYS above the variable name. You can also assign a local <br> operand comment in addition to or instead of the symbol comment. |
| "Show symbol address" | If an address is assigned to a symbol (variable), then this address is displayed <br> above the variable name. |
| "Show network separators" | A separator is displayed between the individual networks. |

Table 569: "Behavior"

| "Placeholder for new <br> operands" | The operand field of pins for the new function block is left blank (instead of <br> "???"). |
| :--- | :--- |
| "Empty operands for function <br> block pins" | Adds blank operands instead of ???. |

Table 570: "Font"
Click the input field to open the "Font" dialog.

| "Fixed size for operand fields" | : "Edit operand sizes" can be enabled. |
| :--- | :--- |
| "Edit operand sizes" | The "Operand Sizes" dialog opens for setting the number of characters and <br> lines. |

## Tab 'FBD'

Table 571: "View"

| "Networks with line breaks" | $\square$ <br> as : Display of the network with line breaks so that so that CODESYS can show <br> as possible in the current width of the window. |
| :--- | :--- |
| "Connect boxes with straight | $\boxed{\square}$ : The length of the lines between the elements are fixed and short. |
| line" |  |

Table 572: "Behavior"

| "Default network content" | Drop-down list: Contents of a new network |
| :--- | :--- |
| "After insertion select" | Drop-down list: Element that CODESYS selects after inserting a new network |

## Tab 'LD'

Table 573: "View"

| "Networks with line breaks" | Display of the network with line breaks so that so that CODESYS can show <br> as many blocks as possible in the current width of the window. |
| :--- | :--- |

Table 574: "Behavior"

| "Default network content" | Drop-down list: Contents of a new network |
| :--- | :--- |
| "After insertion select" | Drop-down list: Element that CODESYS selects after inserting a new network |

## Tab 'IL'

Table 575: "View"

| "Enable IL" | The IL implementation language is available in the development system. |
| :--- | :--- |

Table 576: "Behavior"

| "Default network content" | Drop-down list: Contents of a new network |
| :--- | :--- |
| "After insertion select" | Drop-down list: Element that CODESYS selects after inserting a new network |

## Tab 'Print'

Table 577: "Layout Options"

| "Fit method" | Drop-down list for resizing. |
| :--- | :--- |
| "Avoid cutting of elements" | Elements that do not fit on the page are printed on the next page. |
| "Mark connections on adjacent <br> pages" | Enabled for selection when "Avoid cutting of elements" is selected. |

## Dialog 'Options' - 'Help'

Symbol: (10
Function: This dialog defines whether CODESYS Online Help or CODESYS Offline Help opens when help is called.
Call: Menu bar: "Tools $\rightarrow$ Options"; category: "Help".
"Use CODESYS Online Help, if
available" $\quad \begin{aligned} & \text { default setting }\end{aligned}$ default setting.

- $\quad \square$ CODESYS Offline Help opens when CODESYS Help is called.

See also
-

## Dialog 'Options' - 'Help'

Symbol: (1)
Function: This dialog activates the online help if available.
Call: menu "Tools $\rightarrow$ Options", category "Help"

## "Use Online Help if available".

## Dialog 'Options' - 'IEC 60870-5-104'

Symbol: \#
Function: In this dialog you can set this notation of the "Address format".
Call: menu "Tools $\rightarrow$ Options", category "IEC 60870-5-104"

## Tab 'Adress for- <br> mat'

$\checkmark 1.2 .3$ (separated by dots)
$\square$ 1-2-3 (separated by hyphens)
66051 (decimal number, big endian --> 0x10203)
197121 (decimal number, little endian --> 0x30201)

## Dialog 'Options' - 'International Settings'

## Symbol:

Function: This dialog is for the setting of the language in the user interface and in the help.
Call: Menu bar: "Tools $\boldsymbol{\rightarrow}$ Options", category "International Settings".

## Dialog 'Options' - 'Libraries'

Symbol:
Function: This dialog helps you to manage the mappings of library references that CODESYS uses during the conversion of an old project. If you have not yet stored any mapping for a certain library, you must redefine the mapping each time when opening an old project in which this library is integrated.
Call: Menu bar: "Tools $\boldsymbol{\rightarrow}$ Options"; category: "Libraries".
A mapping defines what a library reference looks like following the conversion of the project to the current format. There are three possibilities:

- You retain the reference. This means that CODESYS similarly converts the library into the current format (*.library) and installs it in the local library repository.
- You replace a reference with another reference. This means that one of the installed libraries replaces the library that was integrated until now.
- You delete the reference. This means that the converted project no longer integrates the library.

CODESYS applies all the listed mappings to the library references of an old project the next time it is converted. Hence, you must repeat the mapping definition if the same library is integrated again in a project that is to be converted. You can enter a new mapping in the last line.

| "Source Library" | Path of the library that is integrated in the project before the conversion. <br> A double-click an entry makes the field editable and the button for the input <br> assistance appears. |
| :--- | :--- |
| "Target Library" | Name and location of the library that is to be integrated in the project after the <br> conversion. <br> A double-click an entry opens the dialog "Set target system library". |

Table 578: "Set target system library"

| "Scan" | The "Select Library" dialog opens. You can select a library from the library repo- <br> sitory here. The dialog corresponds to the dialog in the library repository. |
| :--- | :--- |
| "Ignore" | When CODESYS converts the project, CODESYS always removes the existing <br> source library from the project. |

## Dialog 'Options' - 'Library Download'

Symbol 值
Function: This dialog is for the setting of download servers.
Call: menu "Tools $\boldsymbol{\rightarrow}$ Options", "Library Download" category

If you click on the button "Download Missing Libraries" in the library manager, CODESYS browses these download servers for libraries marked as missing in the library manager and uses the set login details for the proxy server.

| "Download servers" | URL of a server containing library files |
| :--- | :--- |
| Double-click on "(Enter new <br> download server here)" | An input field opens in which you can enter the URL address of a server. |

## Dialog 'Options' - 'Load and Save'

Symbol:
Function: The dialog contains settings for the behavior of CODESYS when loading and saving a project.
Call: Menu bar: "Tools $\rightarrow$ Options", "Load and Save" category

| "Create backup files" | Each time the project is saved, CODESYS also saves the project as the file <project name>.project in addition to the file <project name>. backup. You can rename the backup file and open it in the programming system. |
| :---: | :---: |
| "Automatically save every ... minutes" | CODESYS automatically saves the project at the specified time intervals in a file <project name>. autosave, which you can reload following non-regular closing of the programming system. <br> CODESYS deletes the . autosave file whenever the project is closed or saved regularly. CODESYS retains the . autosave file in the case of an irregular termination. When you open a project for which there is an associated autosave file, the "Auto Save Backup" dialog opens. In this dialog you select whether the . autosave file or the version of the project last saved by the user should be opened. |
| "Save before build" | CODESYS saves the project automatically before each build operation. |
| "Create project recovery information" | Requirement: The "No protection" option is selected in the project settings in the "Security" category. This means that the project is not protected against unauthorized access and data manipulation, and there is no integrity check when the project is loaded. $\square$ If a project crashes during editing, then the next time the project is opened, a prompt is displayed asking whether or not you want to restore the unsaved data and create a new project file. If you click "Yes", then another dialog opens. In this dialog, you can select whether you want to open the restored project or open the project comparison. This project comparison displays the differences between the last saved project and the restored project. <br> Note: The project restore records every change on the hard disk when the change is made. If a power failure or hard disk error occurs on the hard disk during this operation, then the last change may be lost. |
| "Advanced Settings" | The "Advanced Settings" dialog opens. |

| "At startup" | List box for the startup screen of CODESYS: <br> - "Show start page": The start page of CODESYS is shown. <br> - "Load last loaded project" <br> - "Show "Open Project" dialog" <br> - "Show "New Project" dialog" <br> - "Show empty environment" |
| :---: | :---: |
| "News page" | URL that is opened by means of the command "Help $\rightarrow$ CODESYS CODESYS Homepage". <br> By default, this page is http://www.codesys.com/startpage. |

Table 579: Dialog "Advanced Settings"

| "Project compression" | Requirement: The "No protection" option is selected in the project settings in <br> the "Security" category. This means that the project is not protected against <br> unauthorized access and data manipulation, and there is no integrity check when <br> the project is loaded. <br> List box for the compression level that is used when saving the project. <br> - "Least compression - best speed (recommended)" |
| :--- | :--- |
| "Load Behavior" "Medium compression - medium speed" |  |
| - "Most compression - worst speed" |  |

## Dialog 'Options' - 'PLCopenXML'

Symbol:
Function:This dialog contains settings for the behavior of CODESYS when exporting or importing PLCopenXM.
Call: Main menu "Tools $\rightarrow$ Options", category "PLCopenXML"

Table 582: "PLCopenXML Export Settings"

| "Additionally export <br> declarations as plain text" | By default, CODESYS splits the declaration parts in accordance with the PLCo- <br> penXML scheme into individual variables and thus loses the formatting and <br> some comment information. <br> 目: Formatting and comments are retained. CODESYS additionally writes the |
| :--- | :--- |
| plain text of the exported declaration part into the PLCopenXML file and thus |  |
| extends the PLCopenXML scheme. |  |

Table 583: "PLCopenXML Import Settings"

| "Import folder structure" | $\checkmark$ : If the import file contains information about the folder structure of the objects, <br> CODESYS also imports this structure. <br> $\square$ <br> $\square$ |
| :--- | :--- |
| SODESYS imports objects without structure. |  |

## Dialog 'Options' - 'Proxy Settings'

Symbol:
Function: You use this dialog for storing the authentication data for the proxy server which is currently used for accessing the internet from CODESYS.
Call: Main menu "Tools $\rightarrow$ Options", category "Proxy Settings"

Requirement: Internet access of the network via proxy server

| "Enter proxy credentials" | A double click opens the input request for the user name and the password for <br> the proxy server. |
| :--- | :--- |
| CODESYS uses the access data for the establishment of the connection to |  |
| the download server for libraries and the device description, for the establish- |  |
| ment of the connection to the CODESYS Store and for the command "View |  |
| $\rightarrow$ Start Page". |  |
| Requirement: If the internet access of your computer or of the network takes |  |
| place via a proxy server, then the button is available. |  |

## Dialog 'Options' - 'SFC Editor'

Symbol: 医
Function: This dialog is used for configuring the settings for the SFC editor.
Call: Menu bar: "Tools $\rightarrow$ Options" ("SFC Editor" category).
See also

- ${ }^{*}$, Chapter 6.4.1.9.5.5.2 "Programming in SFC" on page 1880
- ๕ Chapter 6.4.1.21.3.12 "Menu 'SFC"" on page 2675
- ※ Chapter 6.4.1.20.1.5.1 "SFC editor" on page 2062

## Tab 'Layout'

Table 584: "Elements"
This defines the dimensions of the SFC elements: step, action, qualifier, property. The values are given in matrix units, where one matrix unit equals the font size that you set in the text editor options (text area / font). The settings are always active immediately in all open SFC editor views.

| "Step height" | Possible values: 1-100 |
| :--- | :--- |
| "Step width" | Possible values: 2-100 |
| "Action width" | Possible values: 2-100 |
| "Qualifier width" | Possible values: 2-100 |
| "Property width" | Possible values: 2-100 |

Table 585: "Font"
The example text shows the current font. Click it to change the font.

Table 586: "Step Actions"

| "Default insertion method" | - "Copy reference": The reference to the action objects that call the step are <br> also copied when the step is copied. The copied step and new step call the <br> same action. |
| :--- | :--- |
|  | "Duplicate implementation": The reference to the action objects that call the <br> step are linked to this step. When copying the step element, new action <br> objects are created for the new step, and the implementation is duplicated. |
|  | "Always ask": When inserting a step action, you are always prompted <br> whether the actions of a step element should be duplicated when it is copied, <br> or whether the reference to the existing action should be applied. <br> Note: If a step already contains an embedded action, then new inserted <br> actions of this step are also embedded. Likewise, new inserted actions are <br> not embedded when the step already contains a non-embedded action. In <br> these cases, you are no longer prompted for a duplication mode. |

Table 587: "Embedded Objects"
"Show action and transition $\quad \square$ : Action and transition objects that are embedded in the SFC box by a step are objects in the navigator" displayed in the "Devices" or "POUs" tree view.

Tab 'View'
Table 588: "Property Visibility"

| List of element properties for the categories "Common" and "Specific" with definitions of the display options. |  |
| :--- | :--- |
| "Property" | Defines the element properties displayed next to the element in the SFC dia- <br> gram. |
| "Value" | $\boxed{\square}$ : Display of the property value. |
| "With Name" | $\boxed{\square}:$ Display of the property value including name. |

Table 589: "Online"

| "Show step time" | $\boxed{\checkmark}$ : In online mode, CODESYS displays the step time to the right of the steps. |
| :--- | :--- |

## Dialog 'Options' - 'SmartCoding'

Symbol: 橉
Function: This dialog is for configuring the settings for easier coding.
Call: Menu bar: "Tools $\rightarrow$ Options", "SmartCoding" category

| "Declare unknown variables <br> automatically (AutoDeclare)" | $\boxed{\natural}$ : The "Declare Variable" dialog opens when you type an undeclared identifier <br> into an implementation language editor and then click away from the input line. <br> In order for the AutoDeclare function to be available in the ST editor as well, the <br> "Enable for ST editor" option also has to be selected. |
| :--- | :--- |
| "Enable for ST editor" | Requirement: The "Declare unknown variables automatically (AutoDeclare)" <br> option is selected. <br> $\square:$ The AutoDeclare function is also available in the ST editor. |
|  | $\square:$ The AutoDeclare function is not available in the ST editor. |

| "Show all instance variables in <br> Input Assistant" | $\boxed{\checkmark}$ : The "List components" function also lets you select the local variables of a <br> function block instance. <br> $\square$ |
| :--- | :--- |
| variables of a function block instance. |  |

## Dialog 'Options' - 'Startup settings'

Symbol: +
Function: In this dialog the "Version profile" and the "License" are set.
Call: menu "Tools $\rightarrow$ Options", category "Startup settings"

| "Version profil:" | Automation Builder 2.5 |
| :--- | :--- |
|  | $\square$ "Display selected dialog at each start": Refers to the version <br> of the AB to be displayed |

| "License:" | $\boxed{\square}$ "Default: take any available license" |
| :--- | :--- |
|  | $\square$ "Use only local license" |
|  | $\square$ "Display license selection dialog if shared licenses are |
|  | available" |

The modified settings will be valid after restart of the Automation Builder.

## Dialog 'Options' - 'Text Editor'

Symbol: []
Function: The dialog contains settings for displaying and working in a text editor.
Call: Menu bar: "Tools $\rightarrow$ Options", "Text Editor" category

Tab 'Theme' On this tab, you set the desired theme in the interface design of the ST editor.
"Theme"
Color theme for the text editor. The selected theme is shown in the "Preview" window. The available color schemes are stored in the installation directory in the Themes folder.

Tab 'Editing'

| "Number of undos" | Maximum number of editing steps that you can apply the "Edit $\rightarrow$ Undo" command to. |
| :---: | :---: |
| "Folding" | Defines the structuring of the code by indentation. <br> When you select an indentation, you can expand or collapse the indentation section by means of a plus and minus sign in front of the first line of each section. <br> - "Indent": CODESYS combines all lines that are indented in relation to the preceding line into one indentation unit. <br> - "Explicit": You mark the code segment explicitly with comments that should be combined in one indentation unit: a comment with three opening braces " $\{\{\{$ " has to be before the segment, and a comment with three closing braces "\}\}\}" has to be after the segment. The comments can contain additional text. Example: <br> IF iVar1=1 |
| "Word wrap" | - "Soft": The line break occurs at the edge of the editor window when 0 is specified for "Wrap margin". <br> - "Hard": The line break occurs after the number of characters specified for "Wrap margin". |
| " Tab width" | Number of characters |
| "Keep tabs" | CODESYS does not break up the space you have inserted with the [Tab] key into individual spaces afterwards. |
| "Indent width" | If you have selected "Smart" or "Smart with code completion" for the "AutoIndent" option, then CODESYS inserts the number of spaces at the beginning of the line. |
| "Autolndent" | - "None" <br> - "Block": A new line automatically applies the indentation of the previous line. <br> - "Smart": Lines that follow a line which contains a keyword (for example, VAR) indent automatically by the specified Indent width. <br> - "Smart with code completion": Indentation as in the case of the "Intelligent" option, but CODESYS also inserts the closing keyword (for example, END_VAR). |

## Tab 'Text Area'

| "Highlight current line" | $\boxed{\square}:$ The line where the cursor is located is highlighted. |
| :--- | :--- |
| "Matching brackets" | When the cursor is positioned before or after a bracket within a line of code, <br> the corresponding closing or opening bracket is marked by a frame. |

| "End of line markers" | ワ: The end of each editor line is marked by a small dash after the last character <br> (including spaces) of the line. |
| :--- | :--- |
| "Wrap guide" | W: When a soft or hard line break is activated, the defined line break position is <br> displayed with a vertical line. |
| "Font" | Clicking the field opens the default dialog for configuring the font. |

## Tab 'Margin'

| Settings for the left margin of the text editor window, which is separated from the input area by a vertical line: |  |
| :---: | :---: |
| "Line numbering" | The declaration and implementation parts of the editor are numbered on the left, each beginning with 1 . |
| "Highlight current line" | $\checkmark$ : The line number of the line where the cursor is located is highlighted. |
| "Show bracket scope" | $\square$ : Brackets include the lines between the keywords that open and close a construct (for example, IF and END_IF). When the option is enabled and the cursor is positioned before, after, or in one of the keywords of a construct, the bracket area is displayed with a square bracket in the margin. |
| "Mouse Actions" | You can assign one of the following actions to each of the specified mouse actions or mouse-keyboard combinations. CODESYS performs the selected action when you move the mouse to the plus or minus sign in front of the header of a bracketed area: <br> - "None": The mouse action does not trigger an action. <br> - "Select fold": CODESYS selects all lines of the bracketed area. <br> - "Toggle fold": CODESYS opens or closes the bracketed area, or if there are nested brackets, the first level of the bracketed area. <br> - "Toggle fold fully": CODESYS opens or closes all levels of a nested bracketed area. |

## Tab 'Monitoring'

| Settings for displaying the monitoring fields |  |
| :--- | :--- |
| "Enable inline monitoring" | $\square:$ Display of the monitoring fields behind the variables in online mode |
| "Number of displayed digits" | Number of comma places in the monitoring field |
| "String length" | Maximum length of string variable values in the monitoring field |

## Dialog 'Customize'

6.4.1.21.4.15.1 General ..... 2800
6.4.1.21.4.15.2 Dialog 'Customize' - 'Menu'. ..... 2801
6.4.1.21.4.15.3 Dialog 'Customize' - 'Command Icons' ..... 2801
6.4.1.21.4.15.4 Dialog 'Customize' - 'Toolbars'. ..... 2802
6.4.1.21.4.15.5 Dialog Box 'Customize' - 'Keyboard' ..... 2802

## General

The dialog contains the tabs to configure the user interface.
You can reset the CODESYS settings to default by use of the "Reset" button.

## Dialog 'Customize' - 'Menu'

Function: With this dialog, you define the structure and contents of the user interface.
Call: Main menu "Tools $\rightarrow$ Customize" ("Menu").
When you click "OK" to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 590: "Menu"
Display of currently defined menus, submenus, and included commands. In CODESYS, a menu or submenu caption is identified by the caption symbol (圆). The layout from top to bottom corresponds to the layout displayed later in the CODESYS menu.

| "Add Command" | Enabled when a command is selected. <br> Adds a command above the selected command. Opens the "Add Command" <br> dialog. <br> Use the "Add Command" dialog for selecting one or more commands. Left part: <br> List of categories. Right part: List of commands in the selected category. |
| :--- | :--- |
| "Add Separator" | Adds a separator above the selected command. |
| "Add Popup Menu" | Adds a popup menu above the selected menu, submenu, or command. Opens <br> the "Add Popup Menu" dialog. |
| "Edit Popup Menu" | Opens the "Edit Popup Menu" dialog. |
| "Reset" | Resets the default settings of the entire menu. |
| "Load" | Loads the settings from a stored file (<file name>.opt.menu). |

Table 591: "Add Popup Menu"

| In CODESYS, a new menu is shown in the menu bar only when the menu contains at least one command. |  |
| :--- | :--- |
| "Default text" | Select this check box when localization is available. |
| "Localized Texts" | List: Languages and localized texts. |
| "Add Language" | Opens a drop-down list of available languages. <br> In CODESYS, the selected language is displayed in the area "Localized Texts". <br> Use the "Text" column for typing the localized texts. |

- ⓨ Chapter 6.4.1.21.4.15.4 "Dialog 'Customize' - 'Toolbars'" on page 2802

## Dialog 'Customize' - 'Command Icons'

Function: This dialog defines the icons of the menu commands.
Call: Menu bar: "Tools $\rightarrow$ Customize" ("Command Icons").

Table 592: "Command icon"

| "Assign" | Opens a dialog for selecting the new icon (*.ico). |
| :--- | :--- |
| "Remove" | Removes the user-defined icon. The default icon is active again. |
| "Reset" | Resets all default settings of the command icons. |
| "Load" | Loads the settings from a stored file (<file name>.opt.keyb). |
| "Save" | Saves the current settings to a file (<file name>.opt.keyb). |

See also

- \& Chapter 6.4.1.2.2.4 "Customize command icon" on page 1805

## Dialog 'Customize' - 'Toolbars'

Function: Use this dialog for generating new toolbars or customizing existing toolbars.
Call: Main menu "Tools $\boldsymbol{\rightarrow}$ Customize" ("Toolbars").
When you click " OK " to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 593: "Toolbars"
Display of currently defined toolbars. In CODESYS, the associated commands are listed below each toolbar in the order they will appear in the toolbar.
Double-clicking a toolbar in the list switches to editing mode.

| "Add Toolbar" | Enabled when a toolbar is selected. <br> In CODESYS, this adds a toolbar above the selected toolbar and places the <br> cursor in the name field of the new toolbar. |
| :--- | :--- |
| "Add Command" | Enabled when you select a command or blank command entry below a toolbar. <br> Adds a command above the selected command. Opens the "Add Command" <br> dialog. <br> Use the "Add Command" dialog to select one or more commands. Left part: List <br> of categories. Right part: List of commands in the selected category. |
| "Add Separator" | Adds a separator above the selected command. |
| "Hide" | Hide the selected toolbar from the user interface. |
| "Show" | Shows the selected hidden toolbar in the CODESYS user interface. |
| "Reset" | Resets the default settings of the toolbars. |
| "Load" | Loads the settings from a stored file (<file name>.opt.tbar). |

## Dialog Box 'Customize' - 'Keyboard'

Function: This dialog box is used for defining keyboard shortcuts (quick access keys or keyboard combinations) for commands.
Call: Main menu "Tools $\boldsymbol{\rightarrow}$ Customize" ("Keyboard").

Table 594: "Keyboard"

| "Shortcuts for selected <br> command" | Keyboard shortcuts for the selected command The drop-down list can include <br> more than one keyboard shortcut for the command. |
| :--- | :--- |
| "Press shortcut keys" | Input field for the keyboard shortcut of the selected field. Permitted combinations <br> include [Ctrl], [Alt], [Shift], and other keys. You clicking "Assign" to assign a <br> recorded keyboard shortcut to a selected command. |
| "Shortcut keys currently used <br> by" | Command assigned to the currently defined keyboard shortcut |

| "Reset" | Resets the default settings of the keyboard shortcuts. |
| :--- | :--- |
| "Load" | Loads the settings from a stored file (<file name>.opt.keyb). |

## Dialog 'Trace Configuration'

6.4.1.21.4.16.1 Dialog 'Advanced Trace Settings'.......................................... 2803
6.4.1.21.4.16.2 Dialog 'Trace Configuration'................................................... 2804

## Dialog 'Advanced Trace Settings'

Function: This dialog provides extended settings for recording data.
Call: "Advanced" button in "Trace Configuration" dialog, "Record Settings" subdialog
Requirement: The trace editor is open and active. The dialog "Trace configuration" is open and the top node of the trace record tree is selected so that the subdialog "Record settings" is available.

For the calculation of the values, you have to select a task in the "Trace Configuration" dialog.

The buffer size is defined as "number of samples". CODESYS calculates the time intervals that corresponds to this number and displays the result in normal fonts on the right outside the table (for example, "1h1m1s1ms"). The calculation is possible only with the help of the task configuration settings and when the task cycle time is known.

| "Measurement in every n- <br> th cycle" | Data sampling in every n task cycle <br> Default: 1; then the application performs the data sam- <br> pling in each task cycle. | Sampling interval which <br> is automatically calculated <br> from the value specified in <br> the Measurement in every <br> n -th cycle option <br> Example: 100 ms |
| :--- | :--- | :--- |
| "Recommended runtime |  |  |
| buffer size (samples)" |  |  |$\quad$| Calculated automatically and therefore recommended |
| :--- |
| number of samples which the application can store per |
| trace variable at runtime |
| This value determines the maximum ring buffer size in |
| the runtime system. This buffer size is automatically cal- |
| culated from the task cycle time and the value in the |
| "Measure in every n-th cycle" option, and the displayed. |
| This buffer size is used when the "Override runtime |
| buffer size" option is disabled. | | Maximum length of the <br> time interval during which <br> the application samples <br> data on the runtime system <br> Example: 2s |
| :--- |
| Note: The calculation is <br> possible only when the set- <br> tings of the trace configu- <br> ration are set in the "Trace <br> Configuration "dialog and <br> therefore the task cycle <br> time is known. |

$\left.\begin{array}{|l|l|l|}\hline \begin{array}{l}\text { "Override runtime buffer } \\ \text { size" }\end{array} & \begin{array}{l}\text { Enables the input field for you to specify your own } \\ \text { defined buffer size At runtime, the value which you have } \\ \text { specified here is used, not the value displayed in the } \\ \text { Recommended runtime buffer size (samples) option. } \\ \text { Example: } 100 \\ \text { At least } 10 \\ \text { V The application uses this value, not the value calcu- } \\ \text { lated by CODESYS from the Recommended runtime } \\ \text { buffer size (samples) option. }\end{array} & \begin{array}{l}\text { Maximum length of the } \\ \text { time interval during which } \\ \text { the application samples } \\ \text { data on the runtime system } \\ \text { without overwriting it. }\end{array} \\ \text { Example: } 6 \mathrm{~s}\end{array}\right\}$

Example | Column (1) notifies you about the number of samples. |
| :--- |
| Column (2) next to it displays the calculated time intervals which result. |
| _cds_img_trace_example_calculation.png |
| The information displayed in the example means that one sample is taken per task cycle in the |
| runtime system and continuously cached in a ring buffer, which can hold a maximum of 201 |
| samples. The enabled "Override runtime buffer size" option has the effect that, due to the ring |
| buffer, the first cached values are first overwritten after 100 samples. During this time, 10000 |
| samples are continuously displayed in the trace editor so that a value curve can be displayed |
| over an interval of 1 minute and almost 40 seconds. | l$l$

Tree view 'Trace The tree view lists the variables that are traced and allows for access to the variable settings. Record'

| Selected trace name | The "Record Settings" subdialog is displayed on the right. |
| :--- | :--- |
| Selected trace variable | The "Variable Settings" subdialog is displayed on the right. |

Table 595: Context menu commands

| + "Add Variable" | Adds a new trace variable. The "Variable Settings" subdialog opens on the right <br> and it is partially configured. Select a variable in the input field of the "Variable" <br> setting to trace its value curve. |
| :--- | :--- |
| "Assign to Diagram" | Lists the diagrams (in the submenu on the right) where the selected variable is <br> not currently displayed. Select a diagram to display the variable there. <br> The command is available when a variable is selected in the tree view. <br> Hint: When the command is deactivated, the variable is already displayed in all <br> diagrams. |
| "Enabled" | Selected by default <br> Disabled variables are displayed as disabled. They are neither displayed nor <br> recorded. |

Tree view 'Presentation (Diagrams)'

The tree view lists the diagrams that are displayed in the trace editor and allows for access to their display mode.

| Selected node "Time axis" | The "Display Mode" subdialog for the time axis is displayed on the right. You can <br> specify the time axis display. See below. |
| :--- | :--- |
| Selected diagram name | The settings for the coordinate system of the diagram and a preview are dis- <br> played on the right. See below. |
| Selected node "Y-axis" | The "Display Mode" subdialog is displayed on the right. You can specify the axis <br> display. See below. |
| "Show variables" | The "Variable Settings" subdialog is displayed on the right. You can configure the <br> trace variable. See below. <br> Note: These are the same settings that can be accessed in the "Trace Record" <br> tree view. |
| Selected trace variable |  |

Table 596: Context menu commands

| + "Add Diagram" | Adds a new diagram below and displays it in the tree view "Presentation <br> (Diagrams)". |
| :--- | :--- |
| + "Add New Variable" | Adds a new trace variable. The "Variable Settings" subdialog opens on the right <br> and it is partially configured. Select a variable in the input field of the "Variable" <br> setting to trace its value curve. Specify its display. In addition, the variable is <br> assigned to the selected diagram. |
| "Add Existing Variable" | Lists all trace variables (in the submenu on the right) where the selected diagram <br> is not currently displayed. Select a variable in order to display it in the selected <br> diagram. <br> Hint: When the command is deactivated, all trace variables are already displayed <br> in the selected diagram. |

Subdialog 'Re- Requirement: The top node is selected in the "Trace Record" tree view. cord Settings'
$\left.\begin{array}{|l|l|}\hline \text { "Enable trigger" } & \begin{array}{l}\text { V: Triggering is enabled. Subdialog 'Vari- Requirement: A trace variable is selected in the "Trace Record" or "Display (Diagrams)" tree able Settings' view.

| "Variable" | Valid variable Variable; value recorded with full instance path. <br> Valid: <br> - IEC variable <br> - Property <br> - Reference <br> - Contents of the pointer <br> - Array element <br> Allowed data type <br> - IEC-based type except STRING, WSTRING, or ARRAY <br> - Enumeration when the base type is not STRING, WSTRING, or ARRAY <br> When the runtime system uses the CmpTraceMgr component, a property that is linked to the 'monitoring' attribute can then be recorded as a variable. |
| :---: | :---: |
| "Parameter" | Parameter whose data is recorded. <br> Requirement: Runtime system with CmpTraceMgr component <br> The "Input Assistant" dialog lists all valid system parameters in the "Parameters" category of the "Categories" tab. |
| $\square$ | Allows toggling between "Variable" and "Parameter" |
| "Color" | Color of the variable in the trace diagram |
| "Line type" | Display as line chart <br> - / "Line": Values are linked to form a line. <br> - ـ "Step": Values are linked in the form of steps <br> - "None": Values are not linked |
| "Point type" | Display as scatter chart <br> - - "Dot": Value is displayed as a dot <br> - $\mathbf{x}$ "Cross": Value is displayed as a cross. <br> - "None": value is not displayed |
| "Activate minimum warning" | V: Warning when less than the lower limit |
| "Critical lower limit" | If the value of the trace variable falls below the limit, the variable is displayed in the warning color. |
| "Color" | Warning color on falling below the limit |
| "Activate maximum warning" | $\checkmark$ : Warning when exceeding the upper limit |

| "Critical upper limit" | If the value of the trace variable exceeds the upper limit, the variable is displayed <br> in the warning color. |
| :--- | :--- |
| "Color" | Warning color on exceeding the limit |

Subdialog 'Dis- Requirement: An axis is selected in the tree view "Presentation (Diagrams)" play Mode'

| "Display Mode" | Scaling <br> - "Auto": <br> Automatically scaled time axis <br> - "Fixed length": <br> Time axis segment with a constant "Length" <br> - "Fixed" <br> Time axis segment from "Minimum" to "Maximum" |
| :---: | :---: |
| "Minimum" | Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The "Display Mode" is "Fixed". <br> Examples: 20,PLC_PRG.iLimit_Min, GVL.c_iLimit_Min <br> Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: iLimit_Min : INT := 20 |
| "Maximum" | Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The "Display Mode" is "Fixed". <br> Examples: 80,PLC_PRG.iLimit_Max, GVL.c_iLimit_Max <br> Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: iLimit_Max : INT := 80 |
| "Length" | Constant segment length; the initial value is adapted automatically. |
| "Grid" | Diagram with grid line in the X -direction. Select the grid line color from the list box of colors. |

Table 597: "Tick marks"

| "Fixed spacing" | : Display of tick marks with "Distance" and "Subdivisions". |
| :--- | :--- |
| "Distance" | Distance between tick marks |
| "Subdivisions" | Number of subdivisions between two tick marks |

| "Font" | Font for the time axis. |
| :--- | :--- |

| Link "Preview" | Displays the preview of the diagram. |
| :--- | :--- |

[^41]

| "Background color" | Background color of the diagram. $\square$ opens the list box of colors. |
| :--- | :--- |
| "Background color on <br> selection" | Background color of the selected diagram. |

| Link "Add Variable" | Adds a new trace variable (in the "Trace Record" tree view). |
| :--- | :--- |
| Link "Delete Variable" | Deletes the selected trace variable (in the "Trace Record" tree view). |
| Link "Add Diagram" | Adds a new diagram (in the "Display" tree view). |
| Link "Delete Diagram" | Deletes the selected diagram (in the "Display" tree view). |
| Link "Reset Display Settings" | Resets the display settings of either the selected diagram or Y-axis to the default <br> values. |

"OK" $\quad$ Accepts the configuration changes and saves the trace configuration.

## Dialog Box 'Trend storage'

Function: This dialog box includes the configuration for buffering the trend data of a trend recording.

Call: "Trend Storage" button in the editor of a trend recording.

| "Maximum number of variables" | Maximum number of trend variables that can be managed in the database. If you increase this value afterwards, then will CODESYS perform a download and reconfigure the database. |
| :---: | :---: |
| "Store every N milliseconds" | Time interval (in ms) when the CmpTraceMgr runtime system component buffers the recorded data before storing it persistently in the database. The application calculates internally the number of task cycles from the time interval. The duration of a task cycle is defined in the task configuration. <br> A high value results in better runtime performance. The disadvantage is the increased risk of losing data if the controller crashes or shuts down. A low value reduces this risk. The disadvantage is the slower control over a trend visualization with large amounts of data. |
| "Limit" | Limit the recording <br> - "No Limit": Unlimited number of data records (not recommended) <br> - "Maximum number of records": Maximum number of data records that are stored in the database. A data record consists of time stamp and the values of the trend variables at this time. <br> - "Maximum storage size": Maximum size of the trend storage. The application calculates internally the number of data records. <br> Clicking the "down" symbol ( $\boldsymbol{*}$ ) of the drop-down list will set the units to kilobytes (KB), megabytes (MB), or gigabytes (GB). |

- $\&$ Chapter 6.4.1.13.4.2 "Getting started with trend recording" on page 2017

## Dialog Box 'Advanced Trend Settings'

Function: This dialog box provides more settings for configuring trend recording.
Call: Click "Advanced" in the editor of a "TrendRecording" object.

| "Measure in every n-th cycle" | Frequency that the runtime system records data, depending on the number of <br> processed task cycles. Select a value from the drop-down list or type a value into <br> the input field. <br> Using the settings from the task configuration, CODESYS calculates the time <br> interval according to the frequency. Therefore, the calculation is possible only if <br> at least the task cycle time is set. The result is shown on the right of the input <br> field in normal syntax (for example, "1h1m1s1ms"). <br> Default: 1 means that data is recorded in each task cycle. |
| :--- | :--- |
| "Additional Runtime Buffer for" | Length of the time interval when the runtime system can record more data (for <br> example, 1000 ms ). <br> If a delay occurs when writing data in the runtime system component, then there <br> is a risk of data loss due to overwriting. In this case, the runtime system uses the <br> addition buffer. |

### 6.4.2.1 Device Diagnosis

CODESYS provides general and fieldbus-specific function blocks for performing a diagnosis on the connected devices.

General diag- You can perform a diagnosis on devices regardless of the fieldbus. The function blocks from the nosis CAA Device Diagnosis library are provided for this purpose.

Before you can work with these function blocks, you have to select the "Enable diagnosis for devices" option in the PLC settings. This causes CODESYS to create instances of the diagnosis functions blocks automatically. These function blocks can be used for your diagnosis.

Work exclusively with the automatically generated instances of the diagnosis function blocks. Do not create your own instances.

## See also

- ${ }^{4}$ Chapter 6.4.1.21.2.8.10 "Tab 'PLC Settings'" on page 2439
- Library CAA DeviceDiagnosis

Bus-specific For bus-specific diagnosis options, see the diagnosis chapters of the individual fieldbuses. diagnosis

### 6.4.2.2 Fieldbus Devices and I/O Drivers

The technical basis for each fieldbus device, which is configured in the device tree, is the CODESYS I/O driver.
The I/O driver is the link between the fieldbus stack, the IEC application, and the CODESYS IDE. The driver configures the fieldbus stack from the data of the device configuration. It shows the diagnosis, provides an API for the IEC application, and is responsible for the I/O mapping (see chapter "I/O Mapping").
This chapter provides a brief overview of the basic functionality of CODESYS I/O driver devices, without discussing the details of specific bus systems. In addition, some recommendations for the configuration are provided.

Bus cycle task The bus cycle task is the IEC task in whose context the I/O driver is executed. Some I/O drivers use multiple tasks: usually one real-time critical task (with high priority), which is used for the transfer of I/O data, and another task with low priority for tasks such as evaluating diagnostics and executing acyclic services of the bus system.
With real-time critical bus systems, it has to be ensured that no operations are executed in the context of this bus task that would interrupt the bus clock due to the execution time.
The bus task can be configured in the I/O mapping dialog of the I/O driver device. Note that the settings of the parent device are inherited by default. If this device is the PLC, then its PLC setting applies in the bus cycle task.

## NOTICE!

If this above setting is not set, then the task with the shortest cycle time is used. In this way, a non-real-time I/O driver can be executed unintentionally in the task context of a real-time critical driver, thus interrupting its communication. To diagnose these communication problems, it is recommended to check the task monitoring.

See also

- 出 Table 418 ""Bus Cycle Options"" on page 2440

## I/O mapping

An essential function of an CODESYS I/O driver is to update the I/O mapping. This means the mapping of the I/O data of the bus system to variables of the IEC application (and vice versa).

The input/output data is mapped cyclically by copy and conversion operations in both directions from the internal memory image of the bus system to IEC variables assigned to \%I and \%Q addresses.

For the I/O driver, there is no internal difference whether symbolic names or "direct" access to the \%I and $\%$ Q addresses are used for this I/O mapping. For the maintainability of the application, it is recommended to always use descriptive variable names (example: variable "TemperatureReactor" instead of "\%IW117" access).
The updating of the I/O mapping can be set with "Always update variables" (globally in the "PLC Settings" or individually for each device in the I/O mapping dialog):

- Disabled:

Only I/O data used in the application is mapped.
This may improve performance by avoiding the copy operations, but may cause confusion if the I/O data in the I/O mapping dialog is not updated (the values are then grayed out). This setting is recommended for an application whose development has been completed.

- Enabled 1:

All data is updated.

- Enabled 2:

Caution: For productive use in special cases only.
As a result, inconsistent I/O data may occur, because the bus cycle task reads/writes this data while the application code uses it in other tasks.
See "Consistency of I/O data".
See also

- ${ }^{*}$ ) Chapter 6.4.1.21.2.8.12 "Tab '<device name> I/O Mapping'" on page 2444

Consistency of The CODESYS programming system allows the IEC application to use multiple tasks executed I/O data in parallel (for visualization, field buses, or other POUs). The application code can access I/O data from the context of these tasks via the mapped IEC variables. By accessing the same data from different tasks, inconsistent or corrupt data could occur (for example, due to interrupted write access).
The I/O driver ensures data consistency by providing each task executing a task cycle with a consistent mapping - a snapshot, so to speak - of all I/O data used.
So a code like in the following example cannot cause problems: (Note "DIV by ZERO")

```
IF(inputData <> 0) THEN // inputData is mapped to %I
    x := y / inputData; // This will never result in
DIV_BY_ZERO Exception
END_IF-
bus cycle during execution of POU
```

## NOTICE!

With the "Always update variables" option set to "Enabled 2 - always in bus cycle task", this mechanism is overridden. Accordingly, the application code has to take this into account.

## Services In addition to the basic functionality, some I/O drivers provide services that can be called from

 the CODESYS IDE, such as the device scan function or the setting of device addresses.
## General recom- Settings:

- "PLC Settings": $\checkmark$ I/O updates in stop:

The bus cycle continues even when the application is stopped, for example when the application is on a debug breakpoint. In this way, communication with the field devices is maintained and can be continued immediately without interruption.

- "PLC Settings": "Always update variables" is set to "Enabled 1 - use bus cycle task if not used in any task":
During the development of the application, it is useful to see the values of all I/O data.
Task configuration:
- Especially for real-time critical fieldbus systems such as Profinet, EtherCAT, or CAN, which depend on maintaining an exact send/receive clock, it is recommended to use a separate bus cycle task with high priority. For less real-time-critical tasks (for example, visualization) a significantly lower priority should be selected than for the bus cycle task.
- In order to achieve maximum I/O throughput with as little offset as possible, separate POUs can be executed in the bus task of the fieldbus system. However, these then have to meet the real-time requirements: for example, no file access or blocking socket functions may be executed, but for example only the calculation of the output data.

Multiple I/O If consistent access to I/O data from multiple tasks and possibly across multiple I/O driver drivers and tasks (troubleshooting) instances has to be synchronized, then undesired reciprocal interference between the bus and application task may occur under certain circumstances.

This is the case, for example, when the general system load is high or when the I/O data of the real-time critical fieldbus system is used together with I/O data of a slow and blocking local bus system in the same task.

In case of unexpected interference of the communication, with the particularly real-time-critical fieldbuses (EtherCAT, Profinet, CAN), the task monitoring should therefore first be examined for very large jitter or outliers in the cycle time (maximum value compared to average value). The task list provides detailed information about the use of I/O data in different tasks.
It may be possible to avoid using I/O data from different bus systems in one and the same task or to reduce the number of I/O tasks.

See also

- 留 Chapter 6.4.1.21.2.8.18 "Tab 'Task deployment'" on page 2459

### 6.4.2.3 Bus Cycle Task

Generally, for each IEC task, the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for additional transfer of the I/O data. It is responsible for the time frame and time point that the actual transfer to the corresponding bus system occurs.
The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). The messages are normally sent on the bus in this task.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

(1) Read inputs from input buffer
(3) Write outputs to output buffer
(5) Input buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

## Task usage

The "Task Deployment" tab provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

## WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.
If the same inputs are used in various tasks, then it is possible for the input to change during the processing of a task. This happens when the task is interrupted by a task with a higher priority and causes the process image to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.
Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

### 6.4.2.4 Symbolic Access to I/O Channels

### 6.4.2.4.1 General

You get direct access to the I/O channels of your device by means of specially generated function blocks, without having to actively set up a mapping manually for each device and for each channel.

Automated generation

- The inputs and outputs are combined into a function block under the name of the I/O channel. If possible, the basic block defined in the device description is extended.
- The channel name corresponds to the name as specified in the device editor on the I/O Mapping tab in the "Channel" column.
- The input and output variables created in this way are also displayed in the Input Assistant.
- If the I/O channels are structured or enumerations, then their function blocks are also structured accordingly. As such, the generated function blocks contain structured inputs and outputs or enumerations.
- For channels with identical names, the suffix _ $\langle X\rangle$ is appended to the input or output of the function block.
- If a device does not have its own I/O channels (example: EK1100 Slave), then no function block is created.

### 6.4.2.4.2 Enable automatic mapping

1. In the Devices view, open the top device. In the device editor, select the PLC Settings tab.

Under Additional Settings, there is the Enable symbolic access for I/Os option.
2. Select the check box.

The generated function block instance is displayed on the IEC Objects tab of the device.
For each I/O channel, a (usually extended) function block is now automatically created and instantiated. This provides you with direct access immediately. You can access the I/O channel by means of the variables of the function block.

## Example: EtherCAT Slave

The new function block extends the existing function block. The EL1008 function block instance is listed in the device editor below the EtherCAT IEC Objects tab.

Function block: EL1008_FB
The DrvEthercatLib.ETCSlave_Diag function block is extended to EL1008_FB and gets the output variables Input_<n>.

Example: If no function block is defined in the device description which can be extended, then a new Device without a function block is generated. For example, the Generic_XN1AI function block instance is listed in defined basic block

Example: The BK5120_FB function block, which extends the existing _3SCOS.CANRemoteDevice funcCANopen tion block according to the device description, is generated. The BK5120 function block instance is listed in the device editor on the CANopen IEC Objects tab.

### 6.4.2.4.3 Online Mode

In online mode, the data is updated by means of the existing functions. However, only those of the generated variables which are actually used are updated. Or if the Always update variables option is enabled.

If a channel is simultaneously accessed symbolically and via I/O mapping, then compiler warnings are issued.

### 6.4.2.5 EtherNet/IP

### 6.4.2.5.1 Introduction

EtherNet/IP is used to connect any number of different terminals in a network, using a scanneradapter relationship. The scanner can be thought of as a teacher and the adapter as a student. The scanner gives commands to the adapter in the form of input data and the adapter responds to the request with output data. For example, a PLC might send input to a motor to determine the speed of the machine. The motor, acting as an adapter, would respond with an output containing the speed of the machine.

The difference of EtherNet/IP from other protocols, is that the adapters can accept connections from more than one scanner. With other protocols, such as Modbus RTU, slave devices can only connect to a master device. A scanner can connect to any number of adapters and access their data. However, only one scanner can control the outputs of an adapter. Other scanners can monitor the output of an adapter.

(4) "Pin assignment" on page 381

### 6.4.2.5.2 Configuration EtherNet/IP adapter

## Setting up the communication gateway

Setting up of To set up the communication between the PC and the PLC, e.g., for downloading the compiled communication program, you have to set up the communication parameters. parameters The IP address of your PC must be in the same class as the IP address of the CPU.
The factory setting of the IP address of the CPU is 192.168.0.10.
The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.

Subnet mask should be 255.255.255.0.

## Changing of the IP address

1. Open Windows control panel. Click "Network and Internet
2. Click "Change adapter settings"
$\Rightarrow$
If using existing network with several devices, please pay attention on given network rules or contact your system administrator.
3. Right-click "Local Area Connection (Ethernet)" and select [Properties].

4. Double-click "Internet Protocol Version 4 (TCP/IPv4)".

5. Enter your desired IP address and subnet mask.

## Setting up the communication gateway

$\checkmark \quad$ CPU and PC are connected with an Ethernet cable．

|  |  | Reset Origin Device［PLC＿AC500＿V3］ |
|  |  | Check configuration |

1．In the Automation Builder device tree right－click＂PLC＿AC500＿V3＂．
2．Select＂Communication Settings＂．

3. Keep the default value in the IP address of the CPU or type in the current IP address, if differs.

The standard (default) IP address of the port ETH1 is: 192.168.0.10
4. Select $[O K]$ to implement the IP address.

Network scan If you need to scan the network for the CPU or if you have multiple CPUs on the same network.

1. Right-click "PLC_AC500_V3" in the device tree.
2. Select "Communication Settings".

3. Select "..."
$\Rightarrow$ "Pick IP Address for PLC_AC500_V3" opens.

| Pick IP Address for 'PLC_AC500_V3'.... | - |  |
| :--- | :--- | :--- | :--- | :--- |
| Abort scan $\square$ Extended Scan     <br> MAC address Device name Port Serial number Device ID IP Address <br>  Config. IP Address Device Type    <br>       <br>       |  |  |
| Scarning |  |  |

The automatic scan runs.
The results will appear in this field.
4. Select the CPU in the field and select [OK] to implement the needed communications gateway.

Checking the communication settings

If you need to check the communications settings or if you want to see more information about the current selected CPU.

1. Double-click "PLC_AC500_V3" in the device tree.
2. Select "Communication Settings".
$\Rightarrow$ The selected IP address is shown.
3. If the IP address is not visible, enter the IP address manually.
4. To test the connection and/or to see the CPU information press [Enter] or click on the black dot next to the PLC figure.

### 6.4.2.5.3 EtherNet/IP - Bus Cycle Task

General infor- The term "bus" includes all fieldbuses as well as the ${ }^{*} / \mathrm{I} / \mathrm{O}$ bus. Consider that there is no bus mation cycle task for Modbus as Modbus does not provide I/O mapping and is controlled by POUs.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the ""PLC Settings" to avoid unexpected behavior. The task defined in "PLC Settings" determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If [unspecified] is set in the "PLC Settings", the EtherCAT task might be automatically used by other fieldbuses, potentially causing the EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in the "PLC Settings".

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task. The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.
Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

```
(1) Read inputs from input buffer
(2) IEC task
(3) Write outputs to output buffer
(4) Bus cycle
(5) Input buffer
(6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5
```

## Using tasks

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.
When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

### 6.4.2.5.4 Tabs EtherNet/IP Scanner

Tab EtherNet/IP Scanner - "General"
This tab in the configurator of the EtherNet/IP scanner includes the basic settings. The network interface used by the scanner is configured in the settings of the Ethernet adapter.

Table 598: Options

| Auto-reestablish of connec- <br> tions | The scanner always attempts to automatically reestablish an interrupted <br> connection. <br> For example, if a timeout is detected for UDP I/O messages or the TCP connec- <br> tion to the adapter is interrupted. If the option is activated, then the scanner <br> reconnects to the adapters with the lost connection. |
| :--- | :--- |

## Tab "NetX Configuration"

This tab is only displayed if Ethernet communication modules (e. g. CI50xPNIO) based on the highly integrated netX100 microcontroller is used.

As an alternative to the general EtherNet/IP node in case of a NetX field bus the EtherNet/IP node ( $\operatorname{NetX}$ ) can be added to the device tree. This node provides the additional NetX configuration dialog to select the NetX chip (slot for the card) and the communication channel of this chip. The name of the setting used in the dialog and the possible settings provided by the selection lists are defined by the device description.

Table 599: NetX settings

| Slot | Slot to be used. In case of PCI cards with NetX chip, the slot numbers usually <br> correspond to the PCI card numbers. |
| :--- | :--- |
| NetX Com channel | Channel on the card to be used for the communication. A NetX board may have <br> up to four communication channels for different fieldbuses. |
| Auto-initialize bus | Ve user is asked to determine if the bus should be reinitialized when down- <br> loading or when resetting the application. A new initialization will interrupt the <br> bus and may lead to unwanted behavior of the machine. |

## Tab EtherNet/IP Scanner NetX - "General"

This tab in the configurator of the EtherNet/IP scanner contains the basic settings for communication in the network.

Table 600: Address Settings

| Use static IP address |  |
| :--- | :--- |
| IP address <br> Subnet mask <br> Gateway address | These entries each occupy four bytes and serve to identify the scanner within <br> the network environment |
| Optain IP address automati- <br> cally | This option is available only for the NetX scanner |
| BOOTP | Assignment of the IP address by a server by means of Bootstrap Protocol <br> (BOOTP) |
| DHCP | Automatic configuration of the network settings by the host by means of Dynamic <br> Host Configuration Protocol (DHCP) |

Table 601: Ethernet Settings

| Speed and duplex: | Bit rate of the transmission. In case of "Auto-negotiation", the highest of the <br> available bit rates is selected automatically. |
| :--- | :--- |

Table 602: Options

| Auto-reestablish connections | $\boxed{\square}:$ The scanner always attempts to automatically reestablish an interrupted <br> connection. <br> For example, if a timeout is detected for UDP I/O messages or the TCP connec- <br> tion to the adapter is interrupted. If the option is activated, then the scanner <br> reconnects to the adapters with the lost connection. |
| :--- | :--- |

### 6.4.2.5.5 Tabs EtherNet/IP Adapter

Tab EtherNet/IP Adapter - "General"
The device editor tab shows general information from the device description file. You can modify these values.

Table 603: EDS File

| Vendor name |  |
| :--- | :--- |
| Vendor ID | Provided by the ODVA (Open DeviceNet Vendors Association) |
| Product name |  |
| Product code | Values from the EDS file |
| Major revision |  |
| Minor revision |  |

| Enable ACD | Enables the ACD functionality (Address Conflict Detection) for the EtherNet/IP <br> adapter. <br> Note: The ACD functionality is normally applied by the operating system. There- <br> fore, the user should only use this function very conscientiously. By enabling <br> ACD, complications can result between the controller and the operating system. <br> ACD is a mechanism that EtherNet/IP devices can use to detect and respond to <br> IPv4 address conflicts. The ACD mechanism used in EtherNet/IP complies with <br> the IETF RFC 5227 standard. |
| :--- | :--- |
| Install to Device Repository | If a device with the same device identification has already been installed, then <br> you are asked whether the device should be overwritten. If the device is inserted <br> as a remote adapter below an EtherNet/IP scanner, then you will be asked to <br> automatically update the device. |
| Export EDS File | The EDS file is created and stored on the local computer. In this way, the EDS <br> file can be used in an external configuration file. |

## Tab EtherNet/IP Adapter - "Connections"

The upper part of this tab displays a list of all configured connections. When there is an "Exclusive owner" connection in the EDS file, it is inserted automatically when adding the adapter. The configuration data for these connections can be changed in the lower part of the dialog.
The configuration data is defined in the EDS file. The data is transmitted when the connection to the adapter is established.

| RPI (ms) | Requested Packet Interval: Exchange interval of the input/output data |
| :--- | :--- |
| O --> T Size (Bytes) | Size of the producer data from the scanner to the adapter (Originator --> Target) |
| T --> O Size (Bytes) | Size of the consumer data from the adapter to the scanner (T --> O) |
| Proxy Config Size (Bytes) | Size of proxy configuration data |
| Target Config Size (Bytes) | Size of adapter configuration data |
| Connection Path | Address of the - configuration objects - input objects - output objects |
| Add Connection | Opens the "New Connection" dialog. The parameters for the new connection are <br> determined here. |
| Delete Connection | Deletes the selected connection from the list |
| Edit Connection | Opens the "Edit Connection" dialog. The parameters for the existing connection <br> are modified here. |

Table 604: "Configuration Data"
The table shows the connections with the configuration parameters from the EDS file. The connections are divided into configuration groups.

| Raw data values | If the scaling parameters are defined in the EDS file for the data, then you can show the values as raw data or converted data. The data is displayed without conversion. In the case of enum data types, the index of the enumeration value is shown. $\square$ : The data is displayed with conversion. In the case of enum data types, the enumeration value is shown. |
| :---: | :---: |
| Show parameter groups | If groups are defined in the EDS file, then the parameters that are defined in these groups are displayed in a sorted list. |

| Defaults | Resets to the default values |
| :--- | :--- |
| Value | Double-click to change the value. Depending of the data type, you can specify <br> the value directly in the input field or select from a list box. <br> In the case of bit field data types and deactivated raw data values, a dialog <br> opens for you to choose the individual bits. Only those bits can be selected <br> which fall within defined minimum and maximum values. If bit field data types <br> contain enumerations in the associated EDS file, then only these enumerations <br> are shown with the associated bit positions. <br> If a connection contains a parameterizable connection path in the EDS file, then <br> here you can modify the different parameters of the respective connection. |

## Dialog "New Connection"

Generic connec- The dialog contains the parameters for the new connection. tion (freely con-
figurable)
Table 605: Connection Path Settings

| Automatically generated path | The "Connection Path" is generated automatically from the values for <br> "Configuration assembly", "Consuming assembly", and "Producing assembly". |
| :--- | :--- |
| User-defined path | The "Connection Path" is specified manually in the corresponding input field. |
| Path defined by symbolic name | The path is specified by a symbolic name. <br> Requirement: The device must support symbolic connection paths. |

Table 606: General Parameters

| Connection Path | The connection path is used to address one or more objects in the adapter that <br> provide the input data and receive the output and configuration data. <br> Requirement: The connection path is set to "User-defined path". |
| :--- | :--- |
| Symbolic name | An ANSI string is used instead of the normal connection path. See the manual of <br> the respective EtherNet/IP adapter for permitted ANSI strings. <br> Requirement: The connection path is set to "Path defined by symbolic name". |
| Trigger type | - "Cyclic": Data exchange takes place cyclically at intervals set by the RPI. <br> - "Change of State": Data is exchanged automatically after a change to the <br> scanner outputs or adapter inputs. |
| Transport type "Application": Not implemented |  |

[^42]Table 607: Scanner to Target (Output)

| O-->T size (bytes) | Amount of data from scanner to adapter |
| :--- | :--- |
| Proxy config size (bytes) | Size of proxy configuration data |
| Target config size (bytes) | Size of adapter configuration data |
| Connection type | - "Multicast": A network connection is established. The connection data can be <br> - "Poived by multiple consumers. <br> "Point to Point": A network connection is established. The connection data <br> can be received by exactly one consumer. <br> "Null": A network connection is not established. |
| Connection Priority | Two scanners using different priorities to one adapter can cause conflicts. <br> Adapting the connection priority solves this problem. |
| Fixed/Variable | See the specifications CIP volume 1 and volume 2 for details of the parameters. |
| Transfer format | Requirement: The "Transfer format" is "Heartbeat". <br> Extends the interval at which the scanner sends heartbeat messages to the <br> adapter. This value is multiplied by the "RPl" value. <br> Inhibit time (ms) <br> Heartbeat multiplier <br> sent every 100 ms. |

Table 608: Target to Scanner (Input)

| T-->O size (bytes) | See description for "Scanner to Target". |
| :--- | :--- |
| Connection type |  |
| Connection Priority |  |
| Fixed/Variable |  |
| Transfer format |  |
| Inhibit time (ms) |  |

## Tab EtherNet/IP Adapter - "Assemblies"

The upper part of this tab displays a list of all configured connections. When a connection is selected, the associated assemblies in the lower area of the tab are displayed.

Table 609: Connections
A description of the columns is found on the "Connections" tab.

Table 610: Consuming Assembly O-->T, Producing Assembly T-->0

| Add | Opens the "Select Parameters" dialog. |
| :--- | :--- |
| Delete | Deletes all selected parameters. |
| Move Up <br> Move Down | Moves the selected parameter within the list. The order in the list determines the <br> order in the I/O mapping. |

| Name | You can double-click in the text field to edit the values. |
| :--- | :--- |
| Unit |  |
| Help string |  |$\quad$| Show filling bytes of assem- |
| :--- |
| blies | | helpful in iling bytes of the assemblies are shown in the I/O mapping. This can be |
| :--- |
| the EDS file. |

## Dialog Select <br> Parameters

| Display parameter groups | The dialog displays all parameters from the EDS file by group. <br> $\square$ The dialog displays all parameters from the EDS file in a flat structure. <br> Individual parameters from this list can be selected and added to the list of <br> assemblies by clicking "OK". |
| :--- | :--- |
| Generic parameters | Q You can add generic parameters. Individual values of the parameter can be <br> edited. |

## Tab EtherNet/IP Adapter - "User-Defined Parameters"

The tab displays all additional parameters that are transmitted once only into the bus system during the phase of the starting procedure allotted to this.

## NOTICE!

The user parameters are also transmitted again when a connection is reestablished, for example after the failure of a remote adapter.

| New | Opens the "Select Parameters" dialog for adding a new parameter. The new <br> parameter is inserted before the selected line. |
| :--- | :--- |
| Edit | Opens the "Select Parameters" dialog for changing an existing parameter. |
| Delete | Delete the marked lines. |
| Move Up, Move Down | Changes the order of the user parameters. The order of the parameters in the <br> list corresponds to the order at the initialization. |
| Line | Number of the line |
| Name | Name of the parameter |
| Value | The value of the respective parameter can be changed directly by double- <br> clicking the value. If applicable, a list box opens containing possible values. |
| Unit | Unit |
| Bit Length | Length of the bit |
| Abort on Error | $\boxed{\square}:$ In case of error, the entire transmission of the parameters is aborted. |
| Jump to Line on Error | Line" column. In this way, an entire block can be skipped during the ine initialization, <br> or a return can be defined. <br> Note: A return can lead to an infinite loop if it is never possible to write a certain <br> parameter. |
| Next Line | - |
| Comment | Space for comments |

## Dialog "Select Parameters"

The dialog contains a list of the parameters that are defined in the EDS file. You can define your own generic parameters in addition to the specified parameters.

The values of the selected parameter are displayed in the lower section of the dialog. They can be changed there.

| Show parameter groups | V: Display of the parameters sorted by parameter groups |
| :---: | :---: |
| Generic parameter | : Enables the creation of generic parameters |
| Name | Name of the generic parameter |
| Class | Each object class that can be addressed by the network is identified by an integer value. <br> A class can also be addressed from the class by specifying a special object instance (see "Instance"). |
| Instance | Integer value for the unique identification of an object instance within a class. <br> Example of an object instance: <br> If the value 0 is assigned to the instance, then the class itself is referenced by this special instance. <br> Example - object instance 0: |

| Attribute | Integer value that can belong to a certain class or instance. <br> Example attribute: <br> Object class \#5, Instance \#2, Attribute \#' |
| :--- | :--- |
|  |  |
|  | Different data types (e.g. BOOL, UDINT, WORD, DWORD...) |
| Data type | $8,16,32$ |
| Bit length | Input of different values in different output formats. |
| Value |  |

The values for "Class", "Instance", and "Attribute" are defined in the "CIP Networks Library" (Vol. 1 and 2) or in the manual of the device manufacturer.

## Tab EtherNet/IP Adapter - "General", local

The tab in the device editor of the EtherNet/IP adapter contains the basic settings for network communication.

Table 611: Address Settings

| IP address | Address for the identification of the EtherNet/IP adapter device. |
| :--- | :--- |

Table 612: BOOTP

| Bootstrap Protocol <br> This option is available only for adapters under the NetX scanner. |  |
| :--- | :--- |
| MAC address | Device-specific MAC address of the slave. |
| Save IP address | $\square:$ The address of the slave is saved. The requirement, however, is that the <br> slave supports this function. This option is only available for the CIFX scanner. |

Table 613: Electronic Keying

| Compatibility check | The adapter uses its own keying values to perform a compatibility check of the keying values from the EDS file. All keying values are sent to the device. Then the device decides whether it is compatible with the received values. The adapter uses its own keying values to perform an exact check of the keying values from the EDS file. The user decides which keying information should be checked. <br> - Vendor ID <br> - Device type <br> - Product code <br> - Major revision <br> - Minor revision <br> If the check fails, then an I/O connection is not established to the device and an error message is issued to the status page. |
| :---: | :---: |
| Restore Default Values | For generic devices only. |

### 6.4.2.5.6 Application notes

| Application | How to set up an EtherNet/IP connection and use a PLC as a scanner and set <br> example |
| :--- | :--- |
|  | it up with another PLC as adapter is described in detail in the application example. |
|  | $\underline{C} 500$ V3 EtherNet/IP $-A C 500$ as scanner connected to another $A C 500$ as adapter |

Application How to set up an EtherNet/IP connection and use a PLC as a scanner example and set it up with a drive is described in detail in the application example. AC500 V3 EtherNet/IP - AC500 as scanner connected to a drive.

### 6.4.2.5.7 Command EtherNet/IP - "Scan for Devices"

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: "Project"; context menu of a device object in the device tree
Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller and PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the "Scan Devices" dialog opens and displays the found devices.

Dialog 'Scan
Devices'

Table 614: "Scanned Devices"

| "Device name, Device type, | Data about the scanned device depending on network type. |
| :--- | :--- |
| Address, Station name, etc." | When you change a value in the list of scanned devices, the value is shown <br> in italics. This indicates that the new value has been changed in the editor in <br> CODESYS, but not in the device. When you download the value to the device, it <br> is shown normally. <br> Value that indicate differences between the project and the scanned device are <br> shown in orange. <br> If multiple device descriptions are available for the scanned device, then the <br> name is displayed in bold. The selection of the matching device description is <br> resolved differently for different fieldbuses. For more detailed information, see <br> the corresponding fieldbus chapters. <br> If a device description cannot be found, then the following message is shown: |
|  | "Attention! The device was not found in the repository." Depending on the bus <br> system, additional information is displayed, such as manufacturer number and <br> product number. The device cannot be inserted into the project without the <br> installed device description. |
| "Show differences to project" | V: The table in the dialog also shows additional configured devices (in the <br> device tree of the project). <br> $\square:$ The table shows all scanned devices. The configured devices are not shown. |
| "Scan for Devices" | Starts a new search. |

## NO If $y$ with of be

Table 615: "Configured Devices"
This part of the dialog is visible only when you select the "Show differences to project" option.
Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.

|  | If you have selected a device in both views, then the scanned devices are <br> inserted above the selected configured device. |
| :--- | :--- |
| if you have selected a device in both views, then the scanned devices are |  |
| inserted below the selected configured device. |  |

Scanning an adapter can fail if the PLC is in RUN mode and a connection already exists from the scanning controller to the adapter. Then the scanning causes another connection to be established to the adapter, which interrupts the existing connection in some adapters. Then the scanner restarts the connection to the adapter, which causes the adapter to interrupt the connection to the scanning controller.
For this reason, it makes sense to perform a network scan in STOP mode after a "Reset". If RUN mode cannot be interrupted, then scanning is possible without an projected remote adapter (EtherNet/IP scanners in the device tree only).

For experts When accepting the remote adapter by means of the "Copy to Project" command, the I/O dimensions with which the adapter responded are set for the first "exclusive owner" connection. In order to log all of the detected assembly instances after scanning, the definition IODRVETHERNETIP_PRINT_SCAN_RESULT must be set. By default, it is scanned by the instance ID 100-199. This can be adapted by means of the library parameters ParamScanStartOfInstanceAssem and ParamScanLastofInstanceAssem from the library IoDrvEtherNetIP Library. This might be necessary, for example to scan in another manufacturer-specific range (assembly instance ID ranges).

### 6.4.3 Runtime systems, OPC UA server

### 6.4.3.1 OPC UA server for AC500 V3 products

### 6.4.3.1.1 General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2.
The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.
The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of events according to the OPC UA standard.

Application note How to install and configure an OPC V2 or OPC V3 server and how to use it for AC500 PLCs is described in the application note How to use OPC server.

Application The application example How to use OPC server V3-for DA and UA is available to gain a example deeper understanding of the OPC protocol and to configure AC500 V3 accordingly.

### 6.4.3.1.2 Creating a project for OPC UA access

1. Click "File $\rightarrow$ New Project $\rightarrow$ AC500 project" in Automation Builder 2.1 or newer.
2. Choose a PLC - AC500 V3 and click [Add object].
3. Right-click on node ETH1 or ETH2 and "Add object".
4. Choose OPC UA Server in the dialog and click [Add object].
5. Declare some variables of different types in the program.
6. Right-click "Application $\rightarrow$ Add object". Choose "Symbol configuration" and click [Add object].
7. Enable checkbox "Support OPC UA Features" in the dialog "Add symbol configuration".
8. Double-click "Symbol configuration" in the Devices tree to open the editor "Symbol configuration".
9. Click [Build].
$\Rightarrow$ The variables are displayed in a tree structure.
10. Activate the variables that you want to publish to an OPC UA client. Specify the access rights.
11. Download the project to the PLC.

### 6.4.3.1.3 Use node name

1. Double-click node "OPC_UA_Server".
2. Set parameter "Use node name" to TRUE.
3. Double-click node "PLC_AC500_V3 <...>".
4. Click "Device" and "Rename active device..."
5. Enter new device name in the following dialog and click [OK].

### 6.4.3.1.4 Use UaExpert client

The OPC UA client UaExpert is available for download from the Unified Automation website and can be used free of charge (freeware license).
Using this client, you can connect to the AC500 OPC UA server.
The following description refers to this program. Other OPC UA clients work in a similar way.

1. Start the UaExpert program.

2. Click on the "blue cross symbol".
3. Double-click on the "blue cross symbol" in the "Add Server" dialog.
4. Enter URL and click [OK].
$\Rightarrow$ The URL appears in the "Add Server" dialog.
5. Select "Advanced" tab and click [OK].
6. Click [Connect].

7. Expand the project tree in the "Address Space" window.

8. Drag and drop the needed symbols to "Data Access View".

### 6.4.3.1.5 Working with encryption

## Creating a certificate for the OPC UA server

$\checkmark$ Prerequisite: A battery is inserted and the clock is set to actual time.

1. Double-click the Security symbol in the lower right corner of Automation Builder.
2. Select the "Devices" tab.
$\Rightarrow$ The certificate information opens.
3. Select the PLC in the left "Information" view.
$\Rightarrow$ All services of the PLC that require a certificate are displayed in the right Information view.
4. Select the service "OPC UA Server".
5. Click the icon ${ }^{\frac{1}{4} \text { ti }}$ to create a new certificate for the device.
$\Rightarrow$ "Certificate Settings" dialog appears.

6. Define the certificate parameters according the figure above and click [OK].
$\Rightarrow$ The certificate is created on the PLC.

7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see ${ }^{\mu}$, Chapter 6.3.4.7.3.4 "OPC UA secure" on page 1728.

## Encrypted connection with UaExpert client

1. Start the UaExpert program.

2. Click on the "blue cross symbol".
3. Double-click on the "blue cross symbol" in the "Add Server" dialog.
4. Enter URL and click [OK].
$\Rightarrow$ The URL appears in the "Add Server" dialog.
5. Select "Advanced" tab.

6. Choose option "Basic256ha256" of drop-down list "Security Policy" and "Sign \& Encrypt" of drop-down list "Message Security Mode" and click [OK].

7. Click menu "Settings" and "Manage Certificates"

8. Click [Create new Application Certificate...].
$\Rightarrow$ Dialog "New Application Instance Certificate" opens.

9. Enter the required informations and click [OK].
$\Rightarrow$ Dialog "Manage Certificates" opens

10. Click [Copy Application Certificate To...] your PC.

11. Download the certificate to AC500 via the "Security Screen" view.
12. Click [Connect] in the UaExpert client.

$\Rightarrow$ Dialog "Certificate Validation" opens.

Certificate Validation

## Validating the certificate of server 'OPCUAServer@PM5670' returned an error:

BadCertificateChainIncomplete
Certificate Chain

| Name | Trust Status |
| :---: | :--- |
| 8 OPCUAServer@PM5670 | Trusted |
|  |  |
|  |  |

Certificate Details

Working with a trusted certificate will avoid this error message.
14. Enable checkbox Accept the server certificate temporarily for this session and click [Continue].
$\Rightarrow$ Dialog "Connect Error" opens

15. Click [lgnore]

16. Check settings in dialog "Manage Certificates".

### 6.4.3.1.6 Changing variables via UaExpert client

1. Expand in view "Address Space" "Objects $\rightarrow$ DeviceSet $\rightarrow$ PM5670 $\rightarrow$ Resources $\rightarrow$ Application $\rightarrow$ PLC_PRG".
$\Rightarrow$ The variables of the global variable list are visible.

2. Drag and drop the variables to the Data Access View.
3. Change values in the column Value.

### 6.4.3.1.7 Configuring OPC UA client

## Operating modes

Polling

- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

Pub/Sub Not yet supported

Subscription (recommended mode)

- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

| Client defines a group of sym- <br> bols with | Description |
| :--- | :--- |
| Publishing interval | Interval, in which server publish data to client |
| Sampling interval | Interval for sampling and storing data at server and send in <br> each publishing interval |
| Queue size | Array of data to save data if sampling Interval is faster than <br> publishing Interval (At AC500 in the moment only 1) |
| Data change filter | Can be used to reduce traffic from server to client. <br> Criteria: <br> $\bullet \quad$ Change of data, <br> $\bullet \quad$ Change of status <br> $\bullet$ <br> Change of time stamp <br> AC500 is fix configured for change of data and change of <br> status. |

## Using OPC UA with subscription mode

## Recommendations:

- Define only variables you need as symbols
- Do not configure publishing Intervals to short (increase load)
- Use different subscriptions with different publishing intervals in order to decrease load
- Do not use sampling intervals faster then publishing intervals as long as AC500 OPC UA server don't support Queue Size different from 1
- Be careful: Setting „0" at sampling Interval at client will be interpreted in server as „as fast as possible", which is 100 ms at AC500 and create a high load.

Publishing and sampling intervals in UaExpert

1. Right-Click on an Item in "Data Access View" and click "Subscription Settings".

2. Set the recommended values.

Life Time Count: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deletet.

Max Keep Alive Count: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

Click [OK].
3. Right-Click on an Item in "Data Access View" and click "Monitored Item Settings".

4. Set the recommended values.

### 6.4.3.2 Using OPC UA Information Models

The OPC UA information models provide plant information according to the OPC UA standard. This plant data contains both data and metadata, such as data origin, data quality, and data cross-connections. OPC UA-based plants can therefore be connected and analyzed faster.
In plant and mechanical construction, there are several sector-specific OPC UA information models. For example, the Companion Specification EUROMAP77 is an information model for plastics and rubber machinery.

An information model consists of different objects that contain meta-information, runtime information, and user data, such as process variables.

Requirements:

- A CODESYS project is open.
- A controller with integrated OPC UA server functionality has been added to the project.

1. Click "Tools $\rightarrow$ OPC UA Information Model Repository".
$\Rightarrow$ The "OPC UA Information Model" dialog opens.
The information models with the URI http: / /opcfoundation.org/UA/ and http: / /opcfoundation.org/UA/DI / are already installed by default.
2. To install the OPC UA information model that you need in your project, select it and click "Install".
3. In the "Select OPC UA Information Model" dialog, select the information model file *NodeSet $2 . x m 1$ from the file directory and click "Open".
$\Rightarrow$ Now the selected OPC UA information model is displayed in the "OPC UA Information Model Repository".
4. Add a "Communication Manager" object to the application of your CODESYS project.
5. Add an $\triangle$ "OPC UA Information Model" object to the ©iaincomunication Manager".
6. In the "Add OPC UA Information Model" dialog, specify a name for the information model according to IEC 61131-3 and select the desired information model in the "Information Model URI" list box. The list box shows all OPC UA information models from the OPC UA information model repository. Then click "Add".
$\Rightarrow$ The $\bigcirc$ publishing object for which you specified a name in the last step is inserted in the "Devices" view with the selected
The publishing object is opened in the editor.
7. In the next steps, select those objects and data types from the OPC UA information model which you want to use in your CODESYS application. To do this, first open the "Information Model" in the editor.
$\Rightarrow$ The type declarations of the OPC UA information model are displayed on the left side.
8. Add the OPC UA type declarations desired for your CODESYS application by dragging them from the left area to the right area. For all types with the "Modelling Rule" as "Mandatory", a corresponding IEC member is generated for the application later when the IEC declarations are generated. For the "Modelling Rule" as "Optional", in the right area you can activate an IEC member to be generated for this type as well.
9. For OPC UA types with the modelling rule as "Optional Placeholder", in the right area you can drag and drop another corresponding IEC type to insert it.
$\Rightarrow$ Example:

| Data Modes |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | ¢ Filter by Name, OPC UA Type |  |  |  |
| Types | Element Type | Reference Ty... | Modelling Rule |  | IEC Type | OPC UA Type | Generate member |
| Object Types <br> *- ModileGroupType <br> + MyAddinType <br> * MyInterfaceType <br> - NestedObjectType <br> *- PlaceholderObjectType <br> $=$ TestrootObjectType <br> + Var 1 <br> - Var2 <br> Testlacehoider_N_ <br> + [hasinterfoce] <br> t Menber 1 <br> * Numberinist <br> *. MyAddlin <br> Aundaries <br> - Modiles <br> - Examplemethod <br> * ExampleComplexMethod <br> + ExampleArrayOutputMethod <br> - Data Types <br> *- DataTypeSimple |  |  |  | Name <br> 3.TestRootObjectType | FunctionElock | TestRootObjectiype | [1] |
|  |  |  |  | Var1 | Dint | Int32 | - |
|  |  |  |  | Var2 | NestedObjectType | NestedObjectives | B |
|  |  |  |  | TestPacehoider JIV_ | Placeholder Cbjecttype | PlaceholderObjectivpe | $\square$ |
|  |  |  |  | Audisries | AusilaresFolderType | FolderType | $\square$ |
|  |  |  |  | Modies | ModuesModieGroupType | ModuleGroup Type | $\square$ |
|  |  |  |  | - Examplelvethod | Method | Method | $\square$ |
|  | Int32 | HasComponent | Mandatory | - Inputarguments | None | Argument | $\square$ |
|  | Nestedobiect Tine | HasComponent | Mandatory | * Outputarguments | None | Argument | $\square$ |
|  | PlaceholderObjectType | HasComponent | Optiond Placeholder | - ExampleComplesMethod | Method | Method | 민 |
|  | Myinterfacetrpe |  |  | - InoutArguments | None | Argument | $\square$ |
|  | Int32 | HasComponent | Mendatory | summand1 | Dint | Int32 | g |
|  | UInt16 | HasComponent | Mandatory | summand2 2. | Dint | Int32 | V |
|  | MyAddinType | HasAddln | Mandatory | duttest | DataTypeSimple | DataTypeSimple | $\square$ |
|  | FolderType | HasComponent | Optional | aryTest | ARRAY[I OF DataTypeSimple | DataTypeSimple[] | V |
|  | ModuleGroup Type | HasComponent | Optional | - Outputarguments | None | Argument | $\square$ |
|  | Method | HasComponent | Mandatory | sum | Dint | Int32 | $\square$ |
|  | Method | HasComponent | Mandatory | aryout | ARRAYII OF Dint | Int32] | $\square$ |
|  | Method | HasComponent | Mendatory | - ExampleArrayOutbutMethod | Method | Method | $\square$ |
|  |  |  |  | + IngutArguments | None | Argument | (1) |
|  | Struct |  |  | * Outputioguments | None | Argument | 8 |
|  |  |  |  | * NestedObjectType | FunctionElock | NestedObiect ${ }^{\text {ches }}$ | $\square$ |
|  |  |  |  | * PlocehoidercbjectType | Functionelock | Piaceholderoblectives | $\checkmark$ |

10. When you have mapped all desired OPC UA types to IEC, click the "Generate IEC declarations" button.
$\Rightarrow$ The generated IEC members are visible, for example in the "OPC_UA_Symbols Objects" folder, and can be used in the application. These members are available in the Input Assistant for the implementation of the POUs in your application.
11. When arrays are generated, in the declarations you have to define the upper limits for the arrays because this information is not included in the installed information model file *NodeSet2.xml.
12. In the next steps, you configure the OPC UA types which should be published in an OPC UA Client. To do this, double-click the OPC UA publishing object $\triangle$ in the device view.
13. In the OPC UA publishing editor that just opened, you can generate new instances for the POUs which you have generated in the "Information Model"... Or you can use instances which you have already declared in your application in PRGs and GVLs.
14. To create a new instance, click "Generate New Instance".
15. In the "Generate New Instance" dialog, select the "IEC Type" from the list box and click "OK".
$\Rightarrow$ An instance of the selected IEC type is generated and inserted in the editor. You can double-click the automatically generated name "inst_n" to change it.
16. To search for instances which have already been declared in the application, click "Search for Mapped Instances".
17. In the editor, in the "Root Node" list box, select the directory where the instances should be displayed on the OPC UA Client. The directories that can be selected depend on the OPC UA companion specification.
18. To publish these instances on an OPC UA Client, click "Online $\rightarrow$ Login".
19. When the application has been successfully downloaded to the controller, start the application.
20. Start the OPC UA Client.
$\Rightarrow$ In the OPC UA Client, the instances are displayed which you have selected in the previous steps in the OPC UA publishing editor.

### 6.4.3.3 Mapping of OPC UA Types to IEC Types

Mapping of basic data types

Table 616: Basic data types

| OPC UA | IEC | Description |
| :--- | :--- | :--- |
| Basic types |  |  |
| Boolean | BOOL |  |
| Byte | BYTE |  |
| SByte | SINT |  |
| Int16 | INT |  |
| UInt16 | UINT |  |
| INT32 | DINT |  |
| UInt32 | UDINT |  |
| Int64 | LINT |  |

| OPC UA | IEC | Description |
| :---: | :---: | :---: |
| UInt64 | ULINT |  |
| FLOAT | REAL |  |
| Double | LREAL |  |
| Duration | LREAL |  |
| DateTime | LDATEANDTIME |  |
| UtcTime | LTIME |  |
| String | STRING | Simple strings are converted to IEC strings. <br> The length of the IEC string can be changed afterwards and can be chosen without restriction. |
| Special types (examples: NodeId, Bytestring) | Not currently supported | The special data types are ignored when generating the IEC mappings. Members are not generated. |
| Inheritance | Inheritance is allowed for all OPC UA types. For example, new types can also be derived from String and Int32. | Note: In the case of derivations of base types, the base type is used as the basis for the mapping. As a result, the derived OPC UA type is no longer available in IEC. |

## Mapping of object types

All declarations are declared altogether as local variables between VAR and END_VAR. The user can change the declarations as needed in VAR_INPUT and VAR_OUTPUT.

Table 617: Object types

| OPC UA | IEC | Description |
| :--- | :--- | :--- |
| OPC UA <br> object types | Function blocks |  |
|  |  |  |
| Interfaces and <br> add-ins | Function block. The members <br> of the interface are members <br> of the function block. | Example: |

| OPC UA | IEC | Description |
| :---: | :---: | :---: |
| Inheritance | Instead of generating multiple function blocks with "Extends", a flat hierarchy is generated. | Example: |
| Folder | A separate type for each instance of a folder in an OPC UA object type. <br> The user may add the instances on his own by editing the declaration of the IEC POUs. However, function blocks have to be used which originate from an OPC UA companion. <br> All instances of function blocks below the folder are exported. Semantic checks based on NodeSet2.xml are not possible. | Initially, a folder is set as an object type in OPC UA. However, it is not enough to generate a folder type. <br> The user is responsible for adding appropriate elements to the folder. |

## Mapping of structured data types

Table 618: Structured data types

| OPC UA | IEC |
| :--- | :--- |
| Structure | DUT |
| Union | Not currently supported |
| Optional member | Not currently supported |
| Inheritance | Implementation as for the object types |

Mapping of OPC Table 619: OPC UA reference types

## UA reference

 types| OPC UA | Meaning in OPC UA | Mapping in IEC |
| :--- | :--- | :--- |
| Organizes |  | Normally only the derivations <br> of this type are relevant. The <br> exception is when folders are <br> mapped directly to IEC. <br> See n Chapter 6.4.3.3 "Map- <br> ping of OPC UA Types to IEC <br> Types" on page 2848 |
| HasSubtype "Map- |  |  |
|  |  | See „ Chapter 6.4.3.3 "Ma <br> ping of OPC UA Types to IEC <br> Types" on page 2848 |

| OPC UA | Meaning in OPC UA | Mapping in IEC |
| :---: | :---: | :---: |
| HasTypeDefinition |  | - Used to collect all elements of a type when the UA types are compiled according to IEC. <br> - Declarations of instances in IEC are then referenced again by the OPC UA Server with this reference to the type in the information model. <br> - HasTypeDefinition for OPC UA variables is currently supported only for the special case when the variable type has the same members as the data type. Then the single access to the individual variables of the DUT instance is allowed in IEC. |
| HasComponent |  | Variables and objects are mapped in IEC as variables. Therefore, each HasComponent reference becomes an variable declaration in IEC. Methods also become methods of the function block in IEC. <br> The user has to apply the modelling rules in the information model editor before the IEC POUs are generated. Optional members can be selected or deselected and concrete members can be generated for placeholders. |
| HasProperty | In OPC UA, properties have the character of additional meta-information for process data. They can be of static nature, for example engineering units. But they can also change when the server is running. | In IEC, this reference is handled exactly like HasComponent. As a result, variables are also created for this at the function block. An unresolved issue is the handling of properties at variables in UA (by means of the detour of HasTypeDefinition and VariableType). In IEC, the variable of type INT would have to be structured once again and have children. Currently, properties at variables in OPC UA are ignored and cannot be reached from IEC. |

### 6.4.4 Libraries

### 6.4.4.1 General

Libraries are used for preparing POUs and functions for use in CODESYS applications. In addition to the descriptions presented here in the help, always see the documentation included in the library as well.
For using libraries in your CODESYS project, see the "Managing Libraries" chapter.
To create your own CODESYS libraries, follow the guidelines for library developers.
y Chapter 6.4.1.17 "Using Libraries" on page 2034

### 6.4.4.2 Guidelines for creating libraries

Libraries must be created according to specific rules to avoid compatibility issues.
The main items include the following:

- Select a meaningful library name (required)
- Use templates to ensure consistency (optional)
- Use a familiar and uniform project structure, when possible (optional)
- Register a unique library namespace (required)
- Enter all project information (required)
- Apply the correct method for referencing other libraries correctly (required)
- Design smart external and internal interfaces (required)
- Implement a user-friendly error handling (required)
- Apply the correct method (protection) for deployment (required)
- Apply a consistent naming convention to get clean code (optional)
- When revising an existing library, consider the interface compatibility with previous versions.

Please follow these guidelines when developing libraries in CODESYS: "Library Development Summary". You will find this document as a CHM file (LibDevSummary.chm) in the installation directory of CODESYS, or in the online help.

### 6.4.5 CODESYS Visualization

### 6.4.5.1 Introduction

## Everything in one project

In the same CODESYS project, you use CODESYS Visualization to create the suitable user interface for your application. You link the visualization to the application variables and in this way they can animate and display data. When creating a visualization and an application, you use common functions, for example, as library and source code management or find/replace throughout the project.

## Overview of

functionality

- Display variant depending on the target platform

You can execute the same visualization on various target platforms. Possible display variants are CODESYS WebVisu, CODESYS TargetVisu. In addition, there is a display integrated in the development system.

- Visualization editor

In the graphic editor you design the desired user interface from visualization elements. The visualization elements are provided via libraries in a "ToolBox". You drag them into the editor area and adapt them with the help of a property configurator.

- Referenceable visualizations

A visualization can be referenced in other visualizations. This enables the creation of user interfaces with a complex structure. For this purpose CODESYS Visualization also provides predefined visualizations, e.g. for dialogs.

- Simple design change

The simple change of the look \& feel of a visualization is possible in one place by creating a different visualization style.

- Multilingualism

You can conveniently prepare visualization texts in several languages with the help of text lists. You can configure a user input element for switching to a different language in online mode.

- User management

You can set up the visualization's own user management for access control up to individual element level.

- Other useful features

Function block instances of visualizations, array accesses to the visualization, real-time data logging, extendability of the pool of visualization elements, provision of graphic objects via symbol libraries, calls of PLC functions from the visualization, reusability of visualizations by depositing them in libraries.

Table 620: Overview of the objects, editors, repositories, etc. relevant for the visualization in the CODESYS Development System
$\left.\begin{array}{|l|l|}\hline & \\ \hline \text { Visualization } & \begin{array}{l}\text { Object below an application in the device tree or in the POUs } \\ \text { pool that contains a visualization image. A visualization can } \\ \text { reference other visualizations. }\end{array} \\ \hline \begin{array}{l}\text { Visualization editor and addi- } \\ \text { tional views }\end{array} & \begin{array}{l}\text { In this IEC 61131-3-compliant editor you can create the } \\ \text { desired graphical user interfaces, panels, dialogs, etc. from } \\ \text { visualization elements. The editor is made up of the following } \\ \text { components: }\end{array} \\ & \begin{array}{l}\text { - Graphic editor area for arranging the elements } \\ \text { - Interface Editor": for the parameterization of the visualiza- } \\ \text { tion } \\ \text { "Hotkey Configuration": editor for defining keys for online } \\ \text { operation } \\ \text { "Elementlist": overview of all visualization elements used, } \\ \text { editor for the position of the elements on the z-axis }\end{array} \\ \text { The following views are also available: } \\ \text { "ToolBox": view for the provision of visualization elements } \\ \text { - "Properties": view with editor for the configuration of the } \\ \text { element that currently has the focus in the graphic editor }\end{array}\right\}$

|  |  |
| :--- | :--- |
| Visualization Manager | Each application has a visualization manager of its own <br> for its visualizations with various settings such as user man- <br> agement, style, language, input type, etc. The "Visualization <br> Manager" object is suspended in the device tree below the <br> application. |
| Display variant | A visualization can be displayed in online mode in the fol- <br> lowing variants, which are created as objects under the visual- <br> ization manager: <br> - CODESYS TargetVisu (target visualization and remote |
|  | -CODGet visualization on PLC devices) <br> browser) <br> - Visualization integrated in the development system |
| Visualization library | Collection of visualization elements that are provided in the <br> toolbox. |
| Symbol library | Collection of images and graphics that you can use in visuali- <br> zations. When inserting a visualization object you can choose <br> whether the installed system libraries should be available in <br> the project. |
| Visualization Element Reposi- <br> tory | Repository for the management of the visualization profiles <br> and the visualization element libraries. |
| Visualization Styles Repository | Repository for the management of visualization styles. |
| VISU_TASK | This task is automatically present as an object in the task <br> configuration of an application as long as an object for a dis- <br> play variant of the type WebVisu or TargetVisu is also inserted <br> under the Visualization Manager. |

## System overview and mechanism, display variants

The user interfaces created in CODESYS can be used in different display variants, depending on which ones the controller employed supports.
The display variants

- Visualization ("diagnostic visualization") integrated in the CODESYS Development System: The integrated visualization in the development system is ideal for application tests, for service or diagnostic purposes and for the commissioning of a system. As soon as a connection to the controller has been established, the visualization editor switches over and animates the elements displayed. This variant is part of the free CODESYS Development System and can always be used, irrespective of the controller employed.
- CODESYS WebVisu:

This variant means web-based display of the user interface in a standard browser (PCs, tablets, smartphones), enabling remote access, remote monitoring and service and diagnosis of a system via the Internet. A standard web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

- CODESYS TargetVisu:

This variant runs independent of the platform on control systems with an integrated display. Logic application and user interface run on the same device; the user interface is displayed directly on the controller. This variant is suitable for the operation and monitoring of machines and plants. An optional extension of the runtime system is required for the use of CODESYS TargetVisu.

### 6.4.5.2 Tutorial

### 6.4.5.2.1 CODESYS visualization - Getting started

If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

Visualization More examples and step by step instructions are available in the Automation Builder. basics

Chapter 3.4.10 "Setting up a visualization" on page 53
y Chapter 3.4.11 "Creation of a visualization" on page 57
*y Chapter 3.4.12 "Enabling a web visualization" on page 65

### 6.4.5.2.2 Show instance names

For complex visualizations, it can be helpful if the instance names are displayed within the visualization. How to show instance names is described in the application example Visualization - Instance names.

### 6.4.5.2.3 Visualizing a Refrigerator Controller

This tutorial demonstrates how to add visualizations to the project and link the elements of the visualization to the variables of the control program.

Preparation This tutorial is based on the sample program RefigeratorControl, which was created in the "Your First Program in CODESYS" chapter. The finished program can also be found in the installation directory of CODESYS, in the "Projects" subfolder.

Creating the vis- The visualization consists of the following three visualization screens:

## ualizations

- Visualization: Control elements and display of the refrigerator
- Diagnosis: History of the set and actual temperature, parameter settings
- Live Visu: Animation with refrigerator

1. Select the "Application" object in the device tree.
2. Click "Project $\rightarrow$ Add Object $\rightarrow$ Visualization".
3. Specify Live_Visu as the name.
4. Create two more visualizations with the names Diagnosis and Visualization.

Structure of the This screen consists of control and display elements that control the refrigerator. visualization Visualization

- (1) Numeric display of the actual temperature
- (2) Pointer to display of the actual temperature
- (3) Numeric display of the set temperature
- (4) Potentiometer for setting the set temperature
- (5) Label for compressor lamp
- (6) Lamp for compressor on
- (7) Label for signal lamp
- (8) Lamp for signal "Close doors"
- (9) Switch for opening and closing the refrigerator door

1. Open the visualization Visualization in the editor.
2. Drag a "Rectangle" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text": Actual temperature: $\% 2.1 \mathrm{f}{ }^{\circ} \mathrm{C}$
- "Text variables $\rightarrow$ Text variable": Glob_Var.rTempActual

3. Drag a "Meter $180^{\circ}$ " visualization element to the editor.

Change the following properties

- "Value": Glob_Var.rTempActual
- "Scale $\rightarrow$ Scale end": 20
- "Scale $\rightarrow$ Main scale": 5
- "Scale $\rightarrow$ Subscale": 1

4. Drag a "Rectangle" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text": Temperature presetting: \%.1f ${ }^{\circ} \mathrm{C}$
- "Text variables $\rightarrow$ Text variable": Glob_Var.rTempSet

5. Drag a "Potentiometer" visualization element to the editor.

Change the following properties

- "Variable": Glob_Var.rTempSet
- "Background $\rightarrow$ Background color": "yellow"
- "Pointer $\rightarrow$ Color": "red"
- "Scale $\rightarrow$ Subscale position": "Outward"
- "Scale $\rightarrow$ Scale start": 3
- "Scale $\rightarrow$ Scale end": 13
- "Scale $\rightarrow$ Subscale": 1
- "Scale $\rightarrow$ Main scale": 1
- "Label $\rightarrow$ Unit": ${ }^{\circ} \mathrm{C}$
- "Label $\rightarrow$ Scale format (C syntax)": \%.Of
- "Label $\rightarrow$ Max. text width of labels": 21
- "Label $\rightarrow$ Height of labels":15

6. Drag a "Label" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text": Cooling compressor

7. Drag a "Lamp" visualization element to the editor. Position it behind the text Cooling compressor.

Change the following properties

- "Variable": Glob_Var.bCompressor

8. Drag a "Label" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text": Signal (beep)

9. Drag a "Lamp" visualization element to the editor. Position it behind the text "Signal (beep)".
Change the following properties

- "Variable": Glob_Var.bSignal
- "Background $\rightarrow$ Image": Red

10. Drag a "Rectangle" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text":Door open

11. Drag a "Rocker Switch" visualization element to the editor.

Change the following properties

- "Variable": Glob_Var.rDoorOpen

Structure of the In this screen, you can monitor the temperature curve and optimize the parameters. visualization
Diagnosis

- (1) "Label" elements for the heading
- (2) "Trace" element for displaying the temperature curve
- (3) "Rectangle" elements for displaying the values

1. Open the visualization Diagnosis in the editor.
2. Drag a "Label" visualization element to the editor.

Change the following properties

- "Texts $\rightarrow$ Text": Refrigerator Diagnosis \& Service Menu
- "Text properties $\rightarrow$ Font": Arial, Standard, 18

3. Drag a "Trace" visualization element to the editor.
4. Click the Diagnosis_Trace1 value of the "Trace" property.
$\Rightarrow$ The "Trace Configuration" dialog opens.
5. Select the "MainTask" in "Task".
6. Click the "Add Variable" link.
$\Rightarrow$ A variable is added to the trace. The variable settings are displayed in the dialog.
7. Select Glob_Var.bCompressor for the variable.
8. Add the Glob_Var.rTempSet and Glob_Var.rTempActual variables to the trace. For the other settings, you can use the default values.
9. Click "OK" to exit the dialog.
10. Drag a "Rectangle" visualization element to the editor. Position it on he right next to the trace element.
Change the following properties

- "Texts $\rightarrow$ Text": \%s
- "Text variables $\rightarrow$ Text variable": PLC_PRG.rHysteresis

11. Configure the "OnMouseDown" input configuration of the element. Click "Input configuration $\rightarrow$ OnMouseDown $\rightarrow$ Configure".
$\Rightarrow$ The "Input Configuration" dialog opens.
12. Assign the "Write Variable" command to the action. Accept the default values and click "OK".
13. Drag a "Label" visualization element to the editor. Position it over the first rectangle.

Change the following properties

- "Texts $\rightarrow$ Text": Hysteresis Regulator

14. Adjust the size and position of both elements.
15. Select both of the "Rectangle" and "Label" elements and duplicate them by means of copy and paste.
16. Adjust the labels and variables of the copied elements.

- "Text": Compressor Efficiency, "Text variable": Simulation.P_Cooling
- "Text": Environment Efficiency, "Text variable": Simulation.P_Environment
- "Text": Environ. Efficiency DoorOpen Sim, "Text variable": Simulation.P_EnvironmentDoorOpen
- "Text": Time until Beep for DoorOpen, "Text variable": Glob_Var.timDoorOpenThreshold
- "Text": Time until Beep for Compressor On, "Text variable": Glob_Var.timAlarmThreshold

See also

- ② Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration'" on page 3370

Structure of the This screen includes the representation of a refrigerator. The refrigerator consists of several visualization 'Live Visu' polygon type visualization elements. The doors of the refrigerator are drawn in both the closed and open states. Both doors consist of a group of single elements.

1. Open the Live_Visu visualization in the editor.
2. Select the "Polygon" visualization element in the "Visualization Toolbox" view.
3. Click several times in the editor to create a surface. Right-click to stop adding corner marks.
4. Move the corner marks to the required position so that the element (1) is formed.

5. Select the element.

Change the following properties:

- "Colors $\rightarrow$ Use gradient color":
- "Appearance $\rightarrow$ Line style": "Invisible"

6. Click the "Colors $\rightarrow$ Use gradient color" property.
7. Select the color "Gray" for "Color 1" in the "Gradient Editor" dialog.

8. Create all other elements with the "Polygon" visualization element.
9. Group the elements of the closed doors $(2+3+4)$ and the open doors $(5+6+7+8)$. To do this, press the [Shift] key and click "Visualization $\rightarrow$ Group" to select the elements.
10. Move the elements together so that the completed refrigerator is formed. Position the open doors precisely on the closed doors.
11. Select the "Open doors" group.
12. In the properties, double-click the input field "State variable $\rightarrow$ Invisible".
13. Press [F2] to open the Input Assistant.
14. Select the rDoorOpen variable in the "Variables" category (below "Application $\rightarrow$ Glob_Var").
15. Negate the variable with NOT (--> NOT Glob_Var.rDoorOpen).
$\Rightarrow$ If the rDoorOpen variable is FALSE (door is closed), then the element is invisible. Then the underlying doors are visible.
16. Copy the following elements from the Visualization screen:

- Potentiometer for setting the temperature
- Rectangle for displaying the set temperature
- Door open switch
- Cooling compressor lamp
- Signal (beep) lamp

17. Insert the elements from the clipboard to the Live_Visu visualization screen.
18. Reduce the elements and position them on the refrigerator.

Visualization in When the visualization is complete, test it in simulation mode. online mode (simulation)

1. Click "Online $\rightarrow$ Simulation".
2. Click "Online $\rightarrow$ Login".
$\Rightarrow$ A dialog opens and prompts you to create and download the application.
3. Click "Yes" to confirm the dialog.
4. Click "Debug $\rightarrow$ Start".
5. Open the visualization Live_Visu in the editor.
$\Rightarrow$ The refrigerator is in online mode.
6. Open the doors with the switch and monitor the temperature and the alarms. Change the parameters in the screen Diagnosis and watch the reaction in the temperature curve.

### 6.4.5.2.4 Displaying Array Data in a Histogram

## Setting element properties for the histogram

## Requirements

- A project contains a visualization object and a program.
- A one-dimensional array is declared in the program (example: histogram : ARRAY[1...10] OF INT;).
- In the program, histogram data is assigned to the array (example: within the range from 0 to 50).

1. Double-click the "Visualization" object in the device tree.
2. In the "Visualization Toolbox" view, click "Measurement Controls" and drag the "Histogram" element to the visualization editor.
3. In the visualization editor, click the inserted "Histogram".
$\Rightarrow$ The "Properties" view opens.
4. In the "Properties" view, double-click the "Value" input field in the "Data array" element property. Then click... .
5. In the "Input Assistant" dialog in the "Variables" category of the "PLC (PRG)" program, select the array (example here: histogram : ARRAY[1..10] OF INT; ) and click "OK".
6. To display only part of the array as a histogram, activate the "Use subrange" option and specify the index values of the array in "Start index" and "End index" to define the subrange.
7. Select the "Display type" (example: "Bar").
8. Specify a value between 1 and 100 (example: 30) for the "Relative bar width".
9. Click the histogram in the visualization editor and change the size and position as desired.
$\Rightarrow$ The "Position" property changes its values accordingly.
10. Specify the values for the "Scale" element property. Select the values for "Scale start" and "Scale end" so that the array is displayed completely. For the example: "Scale start" 0, "Scale end" 50.
For the distance between values on the main scale, specify the value 10 , for example, in "Main scale".
11. In the "Label" element property, specify the "Unit" for the display values.
12. Click "Build $\rightarrow$ Generate Code".
13. If the project has been compiled without errors, then click "Online $\rightarrow$ Login" and click "Debug $\rightarrow$ Start" to start the application.
$\Rightarrow$ The histogram is displayed in the visualization as follows:

$\checkmark$ The visualization displays a histogram with bars all the same color (example: green).
Now you want the bars with values less than 30, for example, to be displayed in another color (example: red).
14. Click the element property "Colors $\rightarrow$ Alarm color".
15. Specify the limiting value in "Alarm value" above or below which the bars should be displayed in another color.
16. Select "More" from the list box in "Alarm condition" if all values greater than the "Alarm value" should be displayed in another color. Otherwise, select "Less".
17. Select an "Alarm color" (example: "Red").
18. Click "Build $\rightarrow$ Generate Code".
19. If the project has been compiled without errors, then click "Online $\rightarrow$ Login" and click "Debug $\rightarrow$ Start" to start the application.
$\Rightarrow$ In the example histogram, all bars with values greater than 30 are displayed in red.

See also

- ${ }^{2} \gg$ Chapter 6.4.5.20.1.29 "Visualization Element 'Histogram"" on page 3216

### 6.4.5.2.5 Displaying Array Variables in Tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element "Table" for this.
In the configuration of the element "Table", enter an array variable in the property "Data array". The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MYSTRUCT DUT and the declarations in the PLC_PRG program.

```
TYPE MYSTRUCT :
    STRUCT
        iNo : INT;
        bOnStock : BOOL;
        strPartNumber : STRING;
        END_STRUCT
END_TYPE
PROGRAM PLC_PRG
VAR
    arrStruct : ARRAY[0..6] OF MYSTRUCT;
    iSelectedColumn : INT;
END_VAR
```

1. Drag the "Table" visualization element to the visualization editor.
2. Assign the array variable arrStruct to the "Data array" property.
$\Rightarrow$ The structure members are displayed as column headings and the array index as row headings.
3. Change the "Columns $\rightarrow$ Column $\rightarrow$ [0] $\rightarrow$ Column header" property to an informative heading (example: Number).
4. Change the heading of column [1] to in stock and column [2] to Part number. Adjust the column width.
5. Assign a color to the "Selection $\rightarrow$ Selection color" property.
6. Define the "Selection $\rightarrow$ Selection type" property as Row selection.
7. In the "Selection $\rightarrow$ Variable for selected row" property, define the PLC_PRG.iSelectedColumn variable.
$\Rightarrow$ The following display results in online mode:

|  | Number | in Stock | PartNumber |
| :---: | :---: | :---: | :---: |
| 0 | 0 | FALSE |  |
| 1 | 0 | FALSE |  |
| 2 | 0 | FALSE |  |
| 3 | 0 | FALSE |  |

See also

- ${ }^{\text { }} \boldsymbol{y}$ Chapter 6.4.5.20.1.13 "Visualization Element 'Table"" on page 3106

### 6.4.5.2.6 Displaying Web Contents

Displaying websites in a visualization
$\checkmark$ Requirement: A visualization open in a CODESYS project. The "Visualization Toolbox" and "Properties" views of the visualization are also open.

1. Drag the "Web Browser" element from "Special Controls" to the visualization editor.
2. Select the element in the editor.
$\Rightarrow$ In the "Properties" view, the element properties are listed for the "Web Browser" element.
3. In the "Position" property, specify the size (in pixels) for the "Width" and the "Height" (example: 600).
4. In "Control variables $\rightarrow$ URL", specify the URL for the website (example: ' http: / / de.wikipedia.org'). You can also specify a variable here (STRING or WSTRING) where the URL is assigned in the project.
5. In "Control variables $\rightarrow$ Display", specify a Boolean variable (example: bSetURL).
$\Rightarrow$ If the variable bSetURL has the value TRUE, then the website 'http:// en.wikipedia.org' is displayed at runtime.

## Configuring the

 buttons for forward and back navigation of the website$\checkmark$ Requirement: The "Web Browser" element of your visualization is configured as described above.

1. In a POU, declare both Boolean variables bGoBack and bGoForward.
2. In the visualization editor, click the "Web browser".
3. For the property "Control variables $\rightarrow$ Back", select the variable bGoBack from the Input Assistant. For the property "Control variables $\rightarrow$ Forward", select the variable bGoForward.
4. In "General Controls", add the "Button" element to your visualization two times.
5. Click a "Button" in the visualization editor and drag the "Button" to the required position (for example above the "Web Browser" element).
6. In the property "Texts $\rightarrow$ Text", specify the character $>$. In "Text properties $\rightarrow$ Font", select a font from the Input Assistant (example: Arial, Bold, 14).
7. Configure the property "Input configuration $\rightarrow$ OnMouseClick" so that the variable bGoForward switches.
8. Configure the second button for back navigation in the same way as described in Steps 5 to 7.
$\Rightarrow$ If the variable bSetURL has the value TRUE, then the website 'http:// de.wikipedia.org' is displayed with the forward and back buttons. When you click the buttons, navigation to the previous and next websites is successful.
(3) Chapter 6.4.5.20.1.38 "Visualization Element 'Web Browser'" on page 3262
"Input action 'Toggle Variable"' on page 3379

### 6.4.5.2.7 Using Client Animation

The example shows a visualization with 3 screens. A menu controls the navigation of the screens. The menu is hidden until it moves into view by means of a hamburger button. During the movement, the transparency of the menu is changed. After the screen is selected, the menu moves back out of view. The animation is computed entirely on the target system. The CODESYS visualization only defines the target values (positions, transparency).

## 1. Preparation

1. Create a new standard project with the CODESYS Control Win V3 controller.
2. Add a "Visualization" object below the "Application". Choose the name Visu_Main.
3. Open the Visualization Manager in the editor and select the "Support client animations and overlay of native elements" option.
4. Creating the PLC_PRG program

The program checks whether the menu button has been pressed. If the menu bar is not visible (position -300), then the position is moved to the visible area (0). If the menu bar is already visible (position 0 ), then the position is moved to the hidden area.

1. Open the "PLC_PRG" program in the editor.
2. Input the following code into the declaration editor:
```
PROGRAM PLC_PRG
VAR
    iSelection : INT; // to switch the
referenced visualization page
    xVisible: BOOL; // auxiliary variable to
toggle the menu bar
    iMenuPos : INT := -300; // position of the menu bar
    xToggle: BOOL; // button variable to
toggle the menu bar
END_VAR
```

3. Input the following code into the implementation:
```
IF xToggle THEN
    xToggle := FALSE;
    IF xVisible THEN
        xVisible := FALSE;
        iMenuPos := -300;
    ELSE
        xVisible := TRUE;
        iMenuPos := 0;
    END_IF
END
    IF
``` menu bar
3. Creating the The menu bar has 3 menu items. A visualization screen is displayed by clicking the corresponding menu item.
1. Insert a "Visu_Menu" visualization below the application.
2. Open the object properties. In the "Visualization" tab, set the "Visualization size" to a "Width" of 300 and a "Height" of 180.
3. Open the visualization in the editor.
4. Select the "Advanced" option in the "Properties" view.
5. In the upper left corner, add a button with a "Width" of 300 and a "Height" of 60.
6. Label the button as "Visu 1". Set the font size to 24.
7. Open the "Input configuration \(\rightarrow\) OnMouseClick" property.
8. Select the "Execute ST code" action.
9. Input the following ST code:
```

PLC_PRG.iSelection := 0;
PLC_PRG.xToggle := TRUE;

```
10. Set the "Button state variable \(\rightarrow\) Digital variable" property to PLC_PRG.iSelection \(=0\)
11. Add two more buttons named "Visu 2" and "Visu 3".
12. Edit the button properties of "Visu2" (PLC_PRG.iSelection = 1) and "Visu3" (PLC_PRG.iSelection = 2).
\(\Rightarrow\) Result:
Visu1
Visu2
Visu3

\section*{4. Creating more visualization screens}
1. Insert the "Visu1" visualization below the application.
2. Open the object properties. In the "Visualization" tab, set the "Visualization size" to a "Width" of 800 and a "Height" of 600.
3. Change the background color of the screen (for example, light gray).
4. Insert a "Label" object into the visualization screen and name the element (example: "Visu 1").
5. Insert two more visualizations "Visu2" and "Visu3" below the application. Edit the properties in the same way as for "Visu1".
5. Creating the main visualization screen

On this screen, you can see the menu bar and a button to show or hide the menu bar. The different visualization screens are navigated in a "Frame" visualization element.
1. Open the properties of the "Visu_Main" visualization. In the "Visualization" tab, set the "Visualization size" to a "Width" of 800 and a "Height" of 600.
2. Open the visualization in the editor.
3. Insert a "Frame" element into the visualization.
\(\Rightarrow\) The "Frame Configuration" dialog opens.
4. Add the "Visu1" (Index 0), "Visu2" (Index 1), and "Visu3" (Index 2) visualizations.
5. Set the property values of "Position" as follows: " \(X\) " \(=0, " Y\) " \(=0\), "Width" \(=800\), and "Height" = 600 .
6. Set the property value of "Switch frame variable \(\rightarrow\) Variable" to PLC_PRG.iSelection.
7. Insert a "Button" element into the visualization.
8. Set the property values of "Position" as follows: " \(X\) " \(=0, " Y\) " \(=0\), "Width" \(=800\), and "Height" = 600.
9. Set the property value of "Texts \(\rightarrow\) Text" to \(=\).
10. Set the property value of "Text properties \(\rightarrow\) Font" to Arial; 36.
11. Open the "Input configuration \(\rightarrow\) OnMouseClick" property.
12. Select the "Execute ST code" action.
13. Input the following ST code:

PLC_PRG.xToggle := TRUE;
14. Set the property value of "Button state variable \(\rightarrow\) Digital variable" to PLC_PRG.xVisible.
15. Insert the "Visu_Menu" visualization element from the "Current Project" category into the visualization.
16. Set the property values of "Position" as follows: "X" = 0, "Y" \(=0\), "Width" \(=300\), and "Height" \(=180\).
17. Set the property value "Absolute movement \(\rightarrow\) Movement \(\rightarrow \boldsymbol{X}\) " to PLC_PRG. iMenuPos.
18. Set the property value of "State variables \(\rightarrow\) Invisible" to not (PLC_PRG.xVisible).
19. Set the property value of "Animation duration" to 2000.
\(\Rightarrow\) Result:

See also
- \({ }^{*}>\) Chapter 6.4.5.20.1.6 "Visualization Element 'Frame'" on page 3053
6. Downloading the project to the controller and starting the WebVisu
1. Build the project and download it to the PLC.
2. Start the project.
3. In the browser, connect to the visualization (http: / /localhost:8080).
\(\Rightarrow\) The WebVisu connects to the controller and the visualization opens.
4. In the visualization, click the menu button.
\(\Rightarrow\) The menu moves into view.
5. Select a menu item.
\(\Rightarrow\) The visualization screen is selected and the menu moves back out of view.

\subsection*{6.4.5.3 Preparing CODESYS and projects}

The following provides details of the presets that exist for visualizations and the steps that are necessary for creating a visualization in a project.

Presets When you create a visualization in a project, you should know that the following presets apply:
\begin{tabular}{|c|c|c|}
\hline Scope & Location & Setting \\
\hline Throughout CODESYS & \begin{tabular}{l}
"Tools \(\rightarrow\) Options" \\
Categories "Visualization" and "Visualization styles"
\end{tabular} & \begin{tabular}{l}
- Visualization editor: display, handling \\
- Paths of the basic text and image files \\
- Visualization styles
\end{tabular} \\
\hline Throughout the project & \begin{tabular}{l}
"Project \\
\(\rightarrow\) Project settings" \\
Categories "Visualization" and "Visualization profiles"
\end{tabular} & \begin{tabular}{l}
- "Properties handling" for the visualization elements \\
- Paths of the basic text and image files \\
- Symbol libraries with ready content \\
- Visualization profile
\end{tabular} \\
\hline Throughout the application & "Visualization Manager": & \begin{tabular}{l}
- Unicode, CurrentVisu variable, multitouch, semitransparency, memory size, data transmission, number of clients \\
- Visualization styles \\
- Language setting, language-specific font \\
- Default keyboard configuration \\
- Visualizations and visualization references \\
- Font for each language \\
- User management
\end{tabular} \\
\hline Single visualization & \begin{tabular}{l}
"Properties" of the visualization object \\
Category "Visualization"
\end{tabular} & \begin{tabular}{l}
- Purpose and scope of use \\
- Size definition
\end{tabular} \\
\hline Display variant of a single visualization & Editor of the WebVisu or TargetVisu object & \begin{tabular}{l}
- Start visualization, refresh rate, buffer size, html file name \\
- Scaling options \\
- Display options \\
- Default text input
\end{tabular} \\
\hline
\end{tabular}

Project-specific updates of the visualization profile, the visualization styles, and the visualization symbol libraries are possible in "Project \(\rightarrow\) Project environment" of the respective tabs.
Customization of the visualization menu is performed in "Tools \(\rightarrow\) Customize".

- Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

Creating visuali- For each visualization, you insert a "Visualization" object into your project like any other object. zation objects in This also applies to visualizations that should be used later only within other visualizations. You the project can insert the new visualization object directly below an application, or below the root node of the "Devices" view (for availability throughout the entire project).
The required base libraries and other objects, such as the Visualization Manager, are inserted automatically. When you insert the visualization object below an application, the subordinate objects for the display variants supported by the device are also displayed.
Every visualization object can be edited separately in the visualization editor.
The following steps describe a simply example for creating an object for an application-specific visualization.
Requirement: A project is open. An application is created in the device tree.
1. Select the application in the device tree. Click "Add object \(\boldsymbol{\rightarrow}\) Visualization" in the context menu.
\(\Rightarrow\) The "Add visualization" dialog box opens. In the "Symbol libraries" table, there is at least the standard entry "VisuSymbols Vx.x.x. (System)", and possibly other installed symbol libraries.
2. Accept the default name Visualization. Activate the "VisuSymbols"option. Then the visualization symbols (graphical objects) are contained in the library in the visualization project. Click "Add" to close the dialog box.
\(\Rightarrow\) In the device tree, the "Visualization manager" and "Visualization" objects are inserted below the application. Depending on the device in use, the "TargetVisu" and/or "WebVisu" objects are also created below the visualization manager.
If a "TargetVisu" object or "WebVisu" object is created, then a "VISU_TASK" object is also created below the task configuration with an implicit program call.
The required visualization libraries are added automatically in the "Library Manager" of the application.
The visualization editor opens with the "Visualization" editor window and the "ToolBox" and "Properties" views.
In the "ToolBox" view, there is a "Symbols" button for viewing the symbols from the library VisuSymbols.library.
3. Now you can create the required visualization in the visualization editor.
4. Note: You can create structured visualizations by using a frame element to reference one visualization in another visualization. Dialog visualizations are a special option for this. In this case, the input configuration of a visualization element is used for referencing.

For creating an application-dependent visualization, insert the visualization object directly below the root node of the device tree. This corresponds to insertion in the "POUs" view. In this case, the visualization manager is not created with objects for the display variants.
(4) Chapter 6.4.5.21.3.7 "Dialog 'Options' - 'Visualization Styles'" on page 3382
«2 Chapter 6.4.5.21.3.13 "Dialog 'Project Settings' - 'Visualization'" on page 3387
* \({ }^{4}\) Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

\subsection*{6.4.5.4 Limitation of the number of usable web pages on AC500 V3 PLCs}

Automation Builder will get all the available visualizations in the project and count those reachable from the visualization client objects (WebVisu and RemoteTargetVisualization).
In case the predefined number of visualizations is exceeded an error is shown in the message window, preventing the user from compiling the project.
The error will be shown under "Build" category when the user executes the build command. The PLC program won't download to the PLC until this error is solved (like with any other build errors). In the image below, there are 5 visualizations being used (3 of them added directly into the Automation Builder project and the other 2 referenced from a library that was added to the project).

The error will look like this when build command is executed:
```

Messages - Total }3\mathrm{ error(s), 2 warning(s), 2 message(s)

```

```

Description
----- Build started: Application: PLC_AC500_V3.Application ------
Typify code...
(%)There are 5 used visualizations. The limit of used visualizations is 4.
Compile complete --1 errors, 1 warnings

```

If the visualizations are in the project but not being referenced (e.g. not reachable from the "Start Visualization" in the WebVisu) they are not taken into account for this limitation. If the error condition is solved, the error will disappear when the user executes the build command again.

\subsection*{6.4.5.5 Designing a visualization with elements}

\subsection*{6.4.5.5.1 General}

The visualization editor provides the visualization elements for designing a user interface in the "Visualization Toolbox" view.

Drag the desired element into the editor view and adapt it in the "Properties" view: purely visual design, labeling, display of data, reaction to user inputs, possibility to input values, etc.
Static or dynamic configuration of the properties is possible. This means the assignment of fixed values or the assignment of application variables. A dynamic configuration allows for an animation which is executed at runtime.
See also
- \(\Rightarrow\) Chapter 6.4.5.21.4.1.1 "Visualization Editor" on page 3393
- « Chapter 6.4.5.10 "Animating visualization elements" on page 2912

\subsection*{6.4.5.5.2 Select Element}

The "Visualization Toolbox" view provides the following elements for selection:
- All visualization elements which the set visualization profile defines.
- Image elements for all images of the project from the integrated libraries or symbol libraries.
- Frame elements for all visualizations of the project or from the libraries.

The elements are combined into specific categories, each of which has its own button in the "Visualization Toolbox" view. You can create new categories and assign its elements.
The elements of the categories are displayed in the "Visualization Toolbox" view as preview images. It is also possible to search for an element name.
Simply drag the preview image of the element to the desired position in the editor window. Then the configurable properties of the element are displayed automatically in the "Properties" view of the visualization editor.
(4) Chapter 6.4.5.21.4.1.1 "Visualization Editor" on page 3393

Chapter 6.4.5.21.4.1.2 "View 'Visualization Toolbox"' on page 3394
« Chapter 6.4.5.20.1.5 "Visualization Element 'Image"" on page 3038
« Chapter 6.4.5.20.1.6 "Visualization Element 'Frame'" on page 3053

Create or Requirement: The visualization editor is open. remove new element category
1. In the "Visualization Toolbox" view, click the 国 button.
\(\Rightarrow\) the "Configure Categories and Items" dialog opens.
2. In the dialog, click the + symbol to open the "Add Category" dialog. Note: Click the symbol or press the [Del] key to delete the definition of a category.
3. In the "Name" field, specify a name (example: tagA) and click "OK" to close the dialog.
\(\Rightarrow\) In the "Configure Categories and Items" dialog, the new custom category tagA is inserted below in the tree view. It is provided with the es symbol.
4. Click the "Enable" option for the new category, and click "OK" to close the dialog.
\(\Rightarrow\) CODESYS adds a "tagA" button in the "Visualization Toolbox" view. When you click the button, all elements that are assigned to this category are displayed.
* \({ }^{2}\) Chapter 6.4.5.21.3.4 "Dialog 'Configure Categories and Items"' on page 3368

Assigning a vis- Requirement: The visualization editor is open. You have already created a custom category ualization ele- tagA. A button labeled tagA is visible in the "Visualization Toolbox" view. ment of an element category
1. In the "Visualization Toolbox" view, right-click an element to open its context menu.
\(\Rightarrow\) A context menu opens. It contains the "Add Item to Category 'tagA"" and "Add to Categories" commands.
2. Click "Add to Category 'tagA"" and click "OK" to close the dialog.
3. Click the "tagA" button.
\(\Rightarrow\) All elements are displayed which are assigned to this category, below it also the currently assigned element.
« Chapter 6.4.5.21.4.1.2 "View 'Visualization Toolbox'" on page 3394

\subsection*{6.4.5.5.3 Positioning the Element, Adapting Size and Layer}

A visualization is a raster image in pixels. The pixel position is specified in \(X / Y\)-coordinates. The origin \((0,0)\) is located at the upper left corner of the window. The positive \(X\)-values run to the right, and the positive Y -values run downwards. The position of an element on the Z-axis of the visualization is controlled by the position in the element list (see below).

Configuring the The size and position of an element are specified as pixel coordinates in the "Properties" view. size and posiThese settings are displayed graphically in the editor view at the same time.
When you drag a visualization element from the "Visualization Toolbox" view to the editor view, it is shown as selected, as in the following example of a rectangle element:

The possible positions depend on the set grid. You can change its settings CODESYS options. Commands in the context menu are available for alignment and grouping.

Now you can move or resize the element directly in the editor. As an alternative, you configure the "Position" property in the properties editor, which opens automatically for the selected element. See the description for this, for example in the help page for the "Button" element. The changes are also updated in the other editor.

Changing the element size and position in the editor
1. Focus the element so that the shape of the mouse pointer indicates movement (example:

解)
2. Drag the element to any position.
\(\Rightarrow\) The position of the element is also updated in the properties "Position \(\rightarrow X\) " and "Position \(\rightarrow Y\) ".
3. Focus on a blue box.
\(\Rightarrow\) The shape of the mouse pointer is a double arrow that indicates the direction you can drag the box in order to resize the box: 野.
4. Drag the blue box to resize the element.
\(\Rightarrow\) The position of the element is also updated in the properties "Position \(\rightarrow X\) " and "Position \(\rightarrow Y\) ".

Moreover, you can rotate the "Rectangle", "Line", "Polygon", and "Pie" elements.

Static rotation of rectangle, line, polygon, pie, or image
1. Select the element for static rotation. Example: Rectangle
\(\Rightarrow\) The rectangle is displayed with a handle next to the movable position boxes.

(1) Handle
2. Drag the mouse pointer over the handle.
\(\Rightarrow\) The cursor is displayed as a rotating arrow \(\boldsymbol{A}\).
3. Rotate the element to any position.

\(\Rightarrow\) In the property "Position \(\rightarrow\) Angle", the set angle is displayed in degrees.

๕ Chapter 6.4.5.10.2 "Configuring rotations and offsets" on page 2912

Moving the visu- Each visualization element is in its own layer of the visualization (Z-axis). It can be hidden alization element forward and back
by other elements in the foreground and hide other elements in the background. The order of layers is visible on the "Element List" tab above the editor view. The order of elements from front to back specifies the order of visualization layers from back to front.
Use the commands from the "Order" context menu to move a selected element.
Example of an element list (1):

«y Chapter 6.4.5.21.4.1.1 "Visualization Editor" on page 3393

(y) Chapter 6.4.5.21.2.7 "Command 'Group'" on page 3347

\subsection*{6.4.5.5.4 Assigning a color}

You configure the color of a visualization element either statically by means of the "Color" property, or dynamically by assigning an application variable by means of the "Color variables" property. Depending on the element, color assignments are also available in other properties. For example, for the font color, this is provided in the "Text" property of a labeled element.
For the static assignment of a color value, you can always use the color dialog in the properties editor, which provides color palettes to choose from.
You can specify the color as a style color. Style colors are color names for color definitions from the actively applied style. When configuring an corresponding property, you are provided with a list of available style colors. We recommend that you use style colors because then you can change colors centrally by means of a style selection or a style customization. You can also open the "Color" dialog to select a value from color palettes.

In addition, you can define the fill color of an element as a "Gradient". Then the color changes linearly, radially, or axially from the initial color to the final color. You configure the "Gradient setting" in the "Gradient Editor" dialog.

Designing a visualization element with a style color or a fixed color value

\section*{NOTICE!}

A color assignment with style color allows for easy global color changes.

Requirement: The visualization editor is open.
1. Insert some Rectangle elements.
2. Select an element.
\(\Rightarrow\) The "Properties" view is active.
3. Click in the "Colors \(\rightarrow\) Normal state \(\boldsymbol{\rightarrow}\) Fill color" property.
\(\Rightarrow\) A list box and the... button appear.
4. Assign a style color to the rectangle. For example, select "Elementfillcolor" from the list box.
5. Define the degree of transparency in the "Colors \(\boldsymbol{\rightarrow}\) Normal state \(\boldsymbol{\rightarrow}\) Fill color \(\rightarrow\) Transparency" property. Use the slider to select the value " 136 ".
6. Select another rectangle. Click in the "Colors \(\boldsymbol{\rightarrow}\) Normal state \(\rightarrow\) Fill color" property. \(\Rightarrow\) A list box and the \(\ldots\) button appear.
7. Assign a fixed color value to the rectangle. Click \(\square .\). to do this.
\(\Rightarrow\) The "Color" dialog opens.
8. Select a standard color or "Define Custom Colors" to fine-tune your selection. Then click "OK".
\(\Rightarrow\) The color is set as a fixed value. The color is displayed as a small rectangle. The RGB values are also indicated next to it.
9. Click in the "Colors \(\rightarrow\) Normal state \(\boldsymbol{\rightarrow}\) Fill color \(\boldsymbol{\rightarrow}\) Transparency" property.
10. Use the slider to select the value " 136 ".
\(\Rightarrow\) The color is semitransparent.
*) Chapter 6.4.5.19 "Applying Visualization Styles" on page 2979

Designing a visualization element with a color gradient
\(\square\) Requirement: The visualization editor is open.
1. Drag a "Rectangle" element to the visualization.
2. Select the "Colors \(\boldsymbol{\rightarrow}\) Use gradient color" property.
3. Click in the "Colors \(\rightarrow\) Gradient setting" property.
\(\Rightarrow\) The "Gradient Editor" dialog opens.
4. Define the color gradient for the element:
- "Gradient type": "Radial"
- "Standard radial": "Center"
\(\Rightarrow\) The fill color of the element changes radially from white to black.

ⓨ Chapter 6.4.5.21.3.5 "Dialog 'Gradient Editor'" on page 3369

\section*{Configuring a visualization element for color animation}

The "Color variables" property, which certain elements may have, is used for the color animation of the element. If you assign a variable there, then you can program color changes in the application code or configure a user input that results in a color change.
You can see an example in the "Animating Visualization Elements" chapter.
«y Chapter 6.4.5.10 "Animating visualization elements" on page 2912
苂 Chapter 6.4.5.21.4.2 "Object 'Visualization manager'" on page 3398
\({ }^{\star}\) Chapter 6.4.5.19 "Applying Visualization Styles" on page 2979
\(\boldsymbol{\wedge}\) Chapter 6.4.5.10.4 "Animating a color display" on page 2914

\subsection*{6.4.5.5.5 Using texts}

You can get displayed text in an element by assigning a string in the element property "Texts \(\rightarrow\) Text". For example all base elements have this property. Also, you can get displayed a text as a tooltip (element property "Texts \(\rightarrow\) Tooltip"). Texts assigned in this way are static. They are managed in the object "GlobalTextList" in view "POUs" and they cannot be modified during runtime, neither programmatically nor via an user input.
However, you can extend a static text by (exactly) 1 placeholder containing a formatting specification, in order to output the content of a variable at this place. At runtime the current value of the variable, which you have assigned to the element via property "Textvariable", will be output.

On the possible formatting specifications please see: \(\#\) Chapter 6.4.5.20.2
"Placeholders with Format Definition in the Output Text" on page 3329

By dynamic configuration you can animate the optical representation of the text.
You can localize the static texts, if you have set up multilingualism in your project.
See some examples for the text configuration of visualization elements in the following chapters.
丞 Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329
Chapter 6.4.5.8 "Setting Up Multiple Languages" on page 2906

\section*{Labeling an image element with a static text}

Precondition: A project containing a visualization is opened. You have an image file representing a stop symbol.
1. Below the Application object insert an object "Image Pool" named ImagePool_A.
2. In the image pool ImagePool_A add your stop symbol image file with ID Stop.

3. Open the visualization and from the ToolBox draw an element "Image" into the editor. \(\Rightarrow\) The input assistant opens. In tab Category you see the image poolImagePool_A.
4. Select the image Stop and close the dialog with "OK".
5. Configure the property "Text" of the image: ImagePool_A, Stop
6. Configure the property "Text properties \(\rightarrow\) Horizontal alignment": Left.
7. Configure the property "Text properties \(\rightarrow\) Vertical alignment": Bottom.

\section*{STOP}

ImagePool_A, Stop

Text output: Element outputs the result of ST code which is executed on a mouse-click

Precondition: A project containing a visualization is opened.
1. Open the visualization and insert a "Button" element.
\(\Rightarrow\) The "Properties" view opens for the new element.
2. Configure property "Text": Number of clicks: \%I
\(\Rightarrow\) The string contains the placeholder \(\% I\).
3. In POU PLC_PRG of the application declare a type-conform variable: iClicks : INT;
4. Configure the property "Text variable" of the button element with PLC_PRG.iClicks.
\(\Rightarrow\) At runtime the variable value will be output instead of the placeholder.
5. Below property "Inputconfiguration", in the cell containing the input event OnMouseClick, click on "Configure".
6. From the list of possible actions choose Execute ST-Code.
7. Enter the code for the action in the editor "Execute ST-Code":

PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
8. Close the dialog with "OK".
\(\Rightarrow\) The user input is configured.
9. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens. The element is labeled and the number of clicks will be output. If you as user click on the button, the number will be increased.

Text output: Using the "Text field" element you can produce a dynamic text output. The text output can be Dynamic output using a textlist effected via an user input or via the application program.
\(\checkmark\) Precondition: A project containing a visualization is opened.
1. Open the visualization and insert a "Text field" element.
\(\Rightarrow\) The "Properties" view shows the configuration of the element.
2. Below the application add a Text List with the following entries: Textlist_A.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{2}{|r|}{1 TextList_A \(\times\)} & - \\
\hline ID & Standard & \\
\hline 0 & None & \\
\hline 1 & Dynamic: F & \\
\hline 2 & Dynamic: F & \\
\hline 3 & Dynamic: F & \\
\hline 4 & Information & \\
\hline 5 & Information & \\
\hline 6 & Information & - \\
\hline & III & , \\
\hline
\end{tabular}
3. In POU PLC_PRG of the application declare the text variable:strTextID : STRING := '0';
4. Also declare the variable strTooltipID : STRING := '0';
5. Also declare the variable iText : INT;
6. Configure the property "Dynamic texts \(\rightarrow\) Text List" with 'Textlist_A'.
7. Configure the property "Dynamic texts \(\rightarrow\) Text index" with PLC_PRG.strTextID.
8. Configure the property "Dynamic texts \(\rightarrow\) Tooltip index" with PLC_PRG.strTooltipID.
9. In POU PLC_PRG implement the CASE instruction as shown below.
\(\Rightarrow\) The variables in property "Dynamic Texts" are programmed.
10. Configure the property "Inputconfiguration \(\rightarrow\) OnMouseclick" for Execute ST-Code with PLC_PRG.iText := (PLC_PRG.iText + 1) MOD 4;
\(\Rightarrow\) For element "Text field" an user input is configured.
11. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens. In the text field the text None is output. When you as user click on the element, the text changes to Dynamic File_A. And the matching tooltip is available: Information A. With each click the text changes according to the CASE instruction.

\section*{Dynamic: File_A}

Sh

> Information A
```

CASE instruc- CASE iText OF
tion 0: strTextID := '0';
strToolTipID := '0';
1: strTextID := '1';
strToolTipID := '4';
2: strTextID := '2';
strToolTipID := '5';
3: strTextID := '3';
strToolTipID := '6';
ELSE
strTextID := '0';
strToolTipID := '0';
END_CASE;

```

\section*{Text output: \\ Configuring a static + dynamic text output}

In property "Texts \(\rightarrow\) Text" you can define a text in order to get a static text output. A text in "Texts \(\rightarrow\) Tooltip" will be displayed as tooltip. You can configure the text in a way, that the content of a variable is additionally output.

You can extend a static text by (exactly) 1 placeholder including a formatting definition, in order to output the content of a variable at this place at runtime. The variable must be assigned in property "Text variable". When the variable value changes in the application code, then at the same time the output in the visualization changes.
\(\checkmark\) Precondition: A project containing a visualization is opened.
1. Open the visualization and insert an element "Text field".
\(\Rightarrow\) The "Properties" view shows the element configuration.
2. Configure the property "Texte \(\rightarrow\) Text": File name: \%s
\(\Rightarrow\) The text contains the placeholder \(\% s\).
3. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING :='File_A';
4. Configure the property "Text variable" of the text field with PLC_PRG.strFileName. \(\Rightarrow\) At runtime the variable value will be output instead of the placeholder.
5. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens. The text field element displays the text: File name: File_A
* \({ }^{4}\) Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329

Configuring text You can use the "Text field" element in order to output the text given by a variable, or to provide input in a text a place, where the user can give input on the variable.
field

Additionally you can configure a text input. In this case on an user input an input field in the element "Text field" will appear. As a precondition you must have configured an user input action in the property "Inputconfiguration".

Chapter 6.4.5.8 "Setting Up Multiple Languages" on page 2906

\section*{Showing text as a tooltip}
\(\checkmark\) Precondition: A project containing a visualization is opened.
1. Open the visualization and insert an element "Text field".
\(\Rightarrow\) The "Properties" view shows the element configuration.
2. Configure the property "Texts \(\rightarrow\) Text": File name: \%s
\(\Rightarrow\) The text contains the placeholder \(\% \mathrm{~s}\)
3. Configure the property "Texts \(\rightarrow\) Tooltip": Storage location: \%s
4. In POU PLC_PRG of the application declare a type-conform variable strFileName : STRING :=-'File_A';
5. In POU PLC_PRG of the application declare also the variable strFileDir : STRING :=-'D:/Data';
6. Configure the property "Text variable" of the text field with PLC_PRG. strFileName. \(\Rightarrow\) At runtime the variable value will be output instead of the placeholder.
7. Configure the property "Tooltip" of the text field with PLC_PRG.strFileDir.
8. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens. The text field element shows the text File name: File_A. When the mouse cursor is moved above the text field, the tooltip will be displayed: Storage location : D/Data.

\section*{File name : File_A}

Storage location: D:/Data

\section*{Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329}

Configuring ele- The user should be able to enter text in a text field. For this configure an input of type "Write ment "Text field" for text input variable" on a text output variable. This text output variable will store the text input of the user and will display this text instead of the placeholder (this is \%s in the example below). You specify the text output variable in the property "Text variables \(\rightarrow\) Text variable".
\(\checkmark\) Precondition: A project containing a visualization is opened.
1. In POU PLC_PRG of the application declare a string variable: strInput : STRING;
2. Open the visualization and insert an element "Text field".
\(\Rightarrow\) The "Properties" view shows the configuration of the element.
3. In property "Texts \(\rightarrow\) Text" enter Input: \%s.
4. In property "Inputconfiguration" for mouse action "OnMouseClick" click on "Configure" to open the "Input Configuration" dialog box. There choose action "Write a Variable" and activate option "Use text output variable". Close with "OK".
5. In the element property "Text variables \(\rightarrow\) Text variable" assign the text output variable PLC_PRG.strInput.
6. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens. The element outputs the text: Input: . Click in the element to open an input field, where you can enter a string. After having terminated the input by [Enter], the text will be adopted.

Input: My current input.

\section*{Animating the text display}

Configure the property "Font variables" in order to animate the display of a text. All base elements have this property, additionally the table, scrollbar and text field element.

Chapter 6.4.5.10.3 "Animating a text display" on page 2914

\section*{Configuring the}

\section*{'Label' element}

Making an element invisible
\(\checkmark \quad\) Precondition: A project containing a visualization is opened.
1. Open a visualization and insert an element "Label".
\(\Rightarrow\) The "Properties" view with the pre-set property configuration opens.
2. Configure the property "Texts \(\rightarrow\) Text": Visualization A.

You can configure the property "State variables \(\rightarrow\) Invisible" in order to hide an element in the visualization.
\(\checkmark\) Precondition: In the visualization you have configured a text field, which gets visible only, if a certain application variable gets TRUE. For example in order to show certain instructions or descriptions only in a certain state of the machine.
1. For the text field element configure the property "Texts \(\rightarrow\) Text" with Error detected:

Do the following....
Configure the property "Text properties \(\rightarrow\) Font color" with "dark red".
2. In PLC PRG declare the variable bIsInvisible : BOOL : TRUE; (this is the initialization for the current example; normally the variable should be set to TRUE by the application program under certain conditions.
3. Configure the property "State variables \(\boldsymbol{\rightarrow}\) Invisible" with PLC_PRG.bIsInvisible.
4. Build, download and start the application.
\(\Rightarrow\) The application is running. The visualization opens and the text field is not visible. When you set bIsInvisible to TRUE, the textfield will be displayed.

\subsection*{6.4.5.5.6 How to display variable values in the visualization}

There are simple to very specialized visualization elements for displaying data from a running application.

\section*{Examples:}
- Simple output of variable values: For example, you can configure a purely formatting specification for a "Rectangle" element in the "Text" property and the variable whose value is to be displayed in the element in the "Text variable" property.
- Display of structured variable values (structure, array, function block): You use the "Table" element and specify an array variable in its configuration in the "Data array" property whose values are to be displayed in the table. One-dimensional arrays can also be displayed in a "Histogram".
- Display of values by image switching. Example: A specific screen is displayed depending on the error message that occurs. You do this by configuring an "Image" element with a variable for the "Bitmap ID variable" property.
- Display a variable value as a bar or with a pointer on a scale: You specify a variable in the "Value" property of the "Bar Display" element or "Meter" element to display its value as a bar on a horizontal or circular scale.
- Display of alarms: The alarms configured in the alarm management of the application can be made visible by means of the "Alarm Table" and "Alarm Banner" elements in the user interface.
- "Trace" and "Trend": For graphical recording of variable values over a period of time.

For details, see the descriptions of the element properties.
See also
- \({ }^{\text {® }}\) Chapter 6.4.5.20.1 "Visualization Elements" on page 2987
- \({ }^{\text {• }}\) Chapter 6.4.5.5.5 "Using texts" on page 2878
- \(\quad\) Chapter 6.4.5.2.4 "Displaying Array Data in a Histogram" on page 2862

\subsection*{6.4.5.5.7 How to Change Variable Values via the Visualization}

In addition to displaying values from the controller, a user interface is also used to enter and change values.

In general, you can configure user input for each element in its "Input configuration" properties. Moreover, elements have been developed especially for specific input.
Examples:
- A "Button" element (or "Rectangle" element, and so on) that is clicked to open a predefined dialog visualization for easily specifying a value.
- A "Slider" element for changing the value of a variable by moving visual element parts, for example with the mouse. In the case of the slider: The element adjusts the value of a variable, depending on the position of the slider within the slider. You define the value range of the slider bar by means of the scale start and scale end.
- A switch element (example; "Power Switch") for setting a Boolean value.
- A "Spin Box" element for incrementing or decrementing the value of a variable in defined intervals.
- A "Button" element for writing a recipe, executing a specific ST code, writing a specific variable, and so on (definition in the input configuration).
See also
- \({ }^{\text {® }}\) Chapter 6.4.5.21.5 "Visualization Elements" on page 3412
- \({ }^{\bullet}\) Chapter 6.4.5.6 "Configuring user inputs" on page 2885

\subsection*{6.4.5.5.8 Designing a background}

You can design the background of your visualization in color or with an image. To do this, use the command "Visualization \(\rightarrow\) Background".
See also
- \(\xi^{*}\) Chapter 6.4.5.21.2.10 "Command 'Background'" on page 3349
- \(\quad\) \& Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

Configuring an image as a background

In addition, you can use the property "Integrate background" in the dialog "Properties" of a visualization object to specify whether the background image should always be displayed in its entirety or whether it should be truncated.

Requirement: A project with a visualization is open.
1. Open the visualization and select the command "Visualization \(\rightarrow\) Background".
2. Activate the option "Image" and open the input assistant.
3. Select an image in the dialog "Input Assistant".
\(\Rightarrow\) The image serves as a background image.

See also
- Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

\section*{Configuring a colored background}
\(\square\) Requirement: A project with a visualization is open.
1. Open the visualization and select the command "Visualization \(\rightarrow\) Background".
2. Activate the option "Color".
3. Select a style color such as "Element background color" from the selection list.
\(\Rightarrow\) The background of the visualization is colored.

\subsection*{6.4.5.6 Configuring user inputs}

\subsection*{6.4.5.6.1 General}

User inputs for a visualization are configured in order to operate the visualization.
For this purpose, you configure input events on visualization elements where follow-up actions are triggered. The combination of user inputs and follow-up actions are defined in the "Input configuration" of an element. For example, you can select a mouse click on an element as the input event and opening a dialog box as the input action.
Keyboard events can also be configured that trigger actions in a specific visualization window when the events occur. You program this kind of input configuration for a visualization in its "Keyboard configuration" editor.

In addition, keyboard events can be configured that occur in all visualizations programmed in the application. You configure this kind of input configuration per application below the visualization manager in the "Standard keyboard shortcuts" tab.
Input is usually performed with the mouse and keyboard as controlling device. You can also configure a user operation by means of gestures.
If a visualization device is not equipped with a mouse, then you can activate default keyboard usage. Then a user can operate the visualization with the keyboard only by navigating with the arrow keys and triggering events by pressing the [Enter] key.
If a visualization device is not equipped with a keyboard, then you can call a virtual keyboard or a virtual numeric keypad.

\section*{NOTICE!}

Configure keyboard events only for keys that the visualization device supports.
« Chapter 6.4.5.21.2.2 "Command 'Keyboard Configuration"' on page 3341
* Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration"' on page 3370
\# Chapter 6.4.5.21.4.3 "Tab 'Visualization Manager' - 'Default Hotkeys"' on page 3402
1. Event handler of the application. Requirement: The event handler is activated.
2. Events of the default keyboard usage
3. Events of the keyboard usage are configured in the tab "Visualization manager" - "Default hotkeys".
4. Events of keyboard usage are configured in the tab "Keyboard configuration" for the currently visible visualization.
« Chapter 6.4.5.6.6 "Capturing user input events" on page \(2895 \Longleftrightarrow\) Chapter 6.4.5.21.1 "Keyboard Shortcuts for Default Keyboard Action" on page 3338
«乡 "Tab 'Keyboard configuration"' on page \(3341 \Leftrightarrow\) Chapter 6.4.5.21.2.2 "Command 'Keyboard Configuration'" on page 3341
Chapter 6.4.5.21.4.3 "Tab 'Visualization Manager' - 'Default Hotkeys'" on page 3402
« \(\boldsymbol{y}^{2}\) Chapter 6.4.5.21.4.3 "Tab 'Visualization Manager' - 'Default Hotkeys'" on page 3402

\subsection*{6.4.5.6.2 Configuring user inputs for visualization elements}

All base elements and some common control elements have the "Input configuration" property. This is where you can configure a user input for an element. For this purpose, you select an input event and an input action.

\section*{Configuring \\ user inputs}
\(\checkmark\) Requirement: A project is open with a visualization.
1. Open the visualization and added a "Button" element.
\(\Rightarrow\) The "Properties" view opens for the new button.
2. Configure the property "Text" with Number of clicks: \%i.
3. Declare a variable iClicks : INT; in the application in the PLC_PRG POU.
4. Configure the "Text variable" property of the button as PLC_PRG.iClicks.
\(\Rightarrow\) At runtime, its variable value will replace the placeholder in the "Text" property.
5. In the "Input configuration" property, click the "Configure" button in the OnMouseClick line.
6. Select the Execute ST code action from the list of possible actions and click the \(\square\) symbol.
\(\Rightarrow\) The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.
\begin{tabular}{|c|c|c|}
\hline \(F\) Execute ST-Code & \multicolumn{2}{|l|}{Execute ST-Code} \\
\hline & 1 & \\
\hline
\end{tabular}
7. Program the action in the editor at "Execute ST code":
```

PLC_PRG.iClicks := PLC_PRG.iClicks + 1;

```
8. Click "OK" to close the dialog box.
\(\Rightarrow\) The user input is configured.
9. Compile, download, and start the application.
\(\Rightarrow\) The application runs. The visualization opens. If the user clicks the button, then the action is executed, the variable PLC_PRG.iClicks is incremented, and the number of clicks is printed.

« Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration"' on page 3370

\subsection*{6.4.5.6.3 Configuring gesture recognition}

You can execute a visualization on a device that is operated by means of gestures. The visualization retains its user input configuration for mouse and keyboard operation and also recognizes gestures and multi-touch events. Gesture events are recognized and interpreted as mouse events.

For this purpose, activate the "Activate multi-touch" setting in the visualization manager.
Elements of the type "Frame" or "Tab control element" display contents that a user should be able to move. Therefore, configure their "Scaling type" property with "Fixed and scrollable".

Gesture recognition for:
- Tapping

A quick tap on the element is interpreted as a mouse click.
- Panning

Pressing, moving, and releasing with one finger in a frame or with a tab control element (in the window area of the element) will move the contents.
- Multi-finger touch detection

Touching several elements at the same time will input for all elements. These touch events are interpreted as the respective mouse events.
Example:
Two-hand operation in order to trigger an action with two simultaneous inputs on two different elements.
Virtual mixing console where multiple sliders can be operated at the same time.
In addition, the IGestureEventHandler interface is available in the
VisuElems. VisuElemBase library. You can use this to implement application code that recognizes gestures and executes follow-up actions.

The following display variants can execute a visualization on a multi-touch device
- CODESYS WebVisu
(4) "Implementing event handling with multi-touch" on page 2888

\section*{Using gestures to control visualizations}
\(\checkmark\) Requirement: A project is open with a visualization and a user input configuration. It contains one button. The visualization device is a display with multi-touch support.
1. Double-click the "Visualization manager" object.
\(\Rightarrow\) The editor opens.
2. Click the "Settings" tab.
3. In the "Additional settings" group, activate the "Activate multi-touch" option.
4. Compile, download, and start the application.
\(\Rightarrow\) The application runs. The visualization opens. When a user touches the display of the visualization device, the visualization responds. Elements that respond to mouse events also respond to touch events Several buttons can be pressed at the same time. Scrollable frames or tab control elements are displayed without scrollbars and can be moved by panning.

Note: The "Scaling type" property of elements type "Frame" or "Tab control element" must be set to "Fixed and scrollable".
※ Chapter 6.4.5.20.1.6 "Visualization Element 'Frame"' on page 3053
* Chapter 6.4.5.20.1.10 "Visualization Element 'Tabs'" on page 3084

Implementing event handling with multi-touch
\(\checkmark\) Requirement: The device is multi-touch capable
1. Implement and register a function block that receives the gesture events.
```

A FUNCTION_BLOCK GesturesHandler IMPLEMENTS
VisuElems.VisuElemBase.IGestureEventHandler2
VisuElems.g_VisuEventManager.SetGestureEventHandler(THIS^);

```
2. Implement and register a function block that sets the touch areas.
```

A FUNCTION_BLOCK RectProvider IMPLEMENTS
VisuElem\overline{s.VisuElemBase.IApplicationRectangleProvider}
VisuElems.g_VisuRectangleProvider := THIS^;

```
3. Implement actions as application code that are executed when a gesture event occurs

\subsection*{6.4.5.6.4 Configuring text input with the virtual keyboard}

A visualization is usually configured so that it calls a virtual keyboard for a text input event when an input device is not available. For this purpose, the follow-up action "Write variable" is preset accordingly in the user input: The value "Standard" is selected for the "Input type" setting.

However, you can also configure especially how text is input. For this purpose, more input types are available in the user input, such as Text input or the listed visualizations. These visualizations have the visualization type "Numpad/Keypad" and display virtual keyboards or numeric keypads.
In the "Settings for default text input" setting of the visualization manager you can preset a keyboard visualization that is called from all visualizations in the application when required. This is possible without having to customize the user inputs of the visualizations.
Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration"" on page 3370

\section*{Configuring text input especially for virtual keyboards}
\(\square\) Requirement: A project is open with a visualization.
1. Declare an input variable in the PLC_PRG program.
\(\Rightarrow\) VAR_INPUT stInput : STRING; VAR_END
2. Add a button to the visualization and select the element.
3. Configure the property "Texts \(\boldsymbol{\rightarrow}\) Text" with Text input: \%s.
4. Configure the property "Text variables \(\rightarrow\) Text variable" with PLC_PRG.stInput.
5. Click auf "Configure" in the property "Input configuration \(\rightarrow\) OnMouseClick".
\(\Rightarrow\) The "Input Configuration" dialog box opens. The selected input event is printed below the caption.
6. Select the "Write variable" action.
7. Select the visualization Visudialogs. Keypad in "Input type" of the implementation of the action.
\(\Rightarrow\) The virtual keyboard Visudialogs. Keypad is selected as the input device.
8. Compile, download, and start the application.
\(\Rightarrow\) The visualization opens.
9. Click the button as a visualization user.
\(\Rightarrow\) The virtual keyboard appears and allows text input by means of the mouse.
```

Text input:My user defined text

```

\section*{Configuring numeric input especially for virtual numeric keypads}
\(\checkmark\) Requirement: A project is open with a visualization.
1. Declare an input variable in the PLC_PRG program.
```

| VAR_INPUT iInput : INT; VAR_END

```
2. Open the visualization and added a "Rectangle" element.
3. Select the element in the editor.
\(\Rightarrow\) The properties are visible in the "Properties" view.
4. Configure the property "Texts \(\boldsymbol{\rightarrow}\) Text" with Number input: \% i.
5. Configure the property "Text variables \(\boldsymbol{\rightarrow}\) Text variable" with PLC_PRG.iInput.
6. In the "Input configuration" property, click the "Configure" button in the onMouseClick line.
\(\Rightarrow\) The "Input Configuration" dialog box opens. The selected input event is printed below the caption.
7. Select the Write variable action from the list of possible actions and click the symbol.
\(\Rightarrow\) The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.
8. Select the following settings:
"Input type" set to VisuDialogs. Numpad.
"Choose variable to edit" set to "Use text output variable".
"Dialog title" set to 'My virtual numpad'.
9. Click "OK" to close the dialog box.
\(\Rightarrow\) The user input is configured.
10. Compile, download, and start the application.
\(\Rightarrow\) The application runs. The visualization opens. When a user clicks the rectangle, the numeric keypad opens.

\section*{Input number: 154}

\section*{My virtual numpad}
\[
154
\]

\section*{Defining standard text input}
\(\checkmark\) Requirement: A project is open with a visualization and a user input configuration. For all "Write variable" follow-up actions, the value "Default" is selected for the "Input type" setting.
1. Double-click the visualization manager.
2. Click in the default text input in the "Settings" tab ("Default text input" group) and assign visualizations.
\(\Rightarrow\) These visualizations are defined as default text input. If a display variant does not have a keyboard, then these visualizations are called without you having to adapt the user input.

\subsection*{6.4.5.6.5 Configuring Keyboard Shortcuts}

You can define keyboard shortcuts and assign specific actions to them. At runtime, a visualization detects the keyboard input event and executes the action.
There are different locations where you can configure a keyboard input event.
The options include the following:
- Configure keyboard input for a specific element.
- Configure keyboard input for a specific visualization.
- Configure keyboard input that is valid for all visualizations.
- Select the default hotkeys.

If the visualization integrated in CODESYS is executed, then you can deactivate the keyboard input of the visualization in order to use the keyboard shortcut from CODESYS in this state.

Configuring You can define a keyboard shortcut that triggers an action for an element. The elekeyboard short- ment has to be visible and operable. For this purpose, the property "Input configuration cuts for ele- \(\quad \rightarrow\) Keyboard shortcuts" is available in the "Properties" view of the visualization editor. ments
\(\square\) Requirement: A CODESYS project is open with the existing visualizations visEllipse and visRectangle.
1. Select the application in the device tree and add a visualization named visMain.
\(\Rightarrow\) The visualization editor opens.
2. In the "Visualization Toolbox" view, select and drag the "Frame" element to the editor.
\(\Rightarrow\) The "Configuration of Frame Visualizations" dialog opens.
3. Double-click in succession the visEllipse and visRectangle visualizations in "Available Visualizations". \(\Rightarrow\) The visualizations appear in "Selected Visualizations".
4. Click "OK" to exit the dialog.
\(\Rightarrow\) The visualization contains a new element type "Frame". The 2 selected visualizations appear under its property "References".
In the editor, the frame shows the visualization with the index 0 .
5. Add a button and configure its properties:

Select Rectangle in the property "Texts \(\rightarrow\) Text".
In the "Input configuration \(\rightarrow\) OnMouseDown" property, select "Toggle frame visualization" for the visualization visRectangle.
Specify the value R in the property "Input configuration \(\rightarrow\) Keyboard shortcuts \(\rightarrow\) Key".
\(\Rightarrow\) The button has a user input and a keyboard shortcut.
6. Add a button and configure its properties:

Select Ellipse in the property "Texts \(\rightarrow\) Text".
In the "Input configuration \(\rightarrow\) OnMouseDown" property, select "Toggle frame visualization" for the visualization visEllipse.
Specify the value E in the property "Input configuration \(\rightarrow\) Keyboard shortcuts \(\rightarrow\) Key".
\(\Rightarrow\) The button has a user input and a keyboard shortcut.
7. Click "Online \(\rightarrow\) Login" for the device and start the application.
\(\Rightarrow\) The visualization starts. It has a frame where one of the referenced visualizations runs. Focus on the visEllipse visualization and press [E]. The visualization switches the contents in the frame to the visEllipse visualization. When you press \([R]\), the visualization switches the contents in the frame to the visRectangle visualization.

Chapter 6.4.5.20.1.6 "Visualization Element 'Frame"' on page 3053
ⓨ "Input action 'Switch Frame Visualization"" on page 3377

Configuring You can define keyboard shortcuts that trigger an input action on a specific visualization. The keyboard short- "Keyboard Configuration" tab in the editor of the visualization is used for this purpose. cuts for a specific visualization

\section*{\(\checkmark \quad\) Requirement: A CODESYS project is open with the visualizations visEllipse and visRectangle.}
1. Open the CODESYS TargetVisu object and select visEllipse as the start visualization.
2. Open the visEllipse visualization and click the "Keyboard Configuration" tab.
3. Click "Visualizations \(\rightarrow\) Keyboard Configuration".
\(\Rightarrow\) The "Keyboard Configuration" tab opens.
4. Select the value C in the "Key" column.
5. Activate the "Press key" option.
6. Select the "Change shown visualization" value in the "Action Type" column.
7. Select visRectangle in the "Action" column.
\(\Rightarrow\) The user input is configured for [C].
8. Open the visRectangle visualization and click the "Keyboard Configuration" tab.
9. Select the value C in the "Key" column.
10. Activate the "Press key" option.
11. Select the "Change shown visualization" value in the "Action Type" column.
12. Select visEllipse in the "Action" column.
\(\Rightarrow\) The user input for [C] is also configured for this visualization.
13. Build the application.
14. Click "Online \(\rightarrow\) Login" for the device and start the application.
\(\Rightarrow\) The visualization starts and displays an ellipse. Focus on the visEllipse visualization and press [C]. The visRectangle visualization is displayed. Focus on the visualization and press [C] again. Now the visualization is switched again to visRectangle.

4. "Tab 'Keyboard configuration"' on page 3341
ⓨ "Input action 'Change Shown Visualization'" on page 3373

Configuring keyboard shortcuts for all visualizations in the application

You can define keyboard shortcuts that trigger the same input action for all visualizations of the application. The "Default Hotkeys" tab in the Visualization Manager is available for this purpose.

Requirement: A project is open with a visualization.
1. Open the visualization.
2. Add a rectangle.
3. Configure the property "Texts \(\rightarrow\) Text" with Keyboard shortcut.
4. Double-click the "GlobalTextList" object.
5. Click in the table, "Add Language", and then specify de.
\(\Rightarrow\) The language de is configured.
6. Click in the table, "Add Language", and then specify en.
\(\Rightarrow\) The language en is configured.
7. Configure translations for de and en for the text Keyboard shortcut.
\(\Rightarrow\) Hotkey Keyboard Shortcut Hotkey
8. Open the Visualization Manager and select the "Default Hotkeys" tab.
9. Specify D in the "Key" column.
10. Activate the "Press key" option.
11. Select the "Change language" value in the "Action Type" column.
12. Select the language de in the "Action" column.
\(\Rightarrow\) The keyboard event for \([D]\) is configured.
13. Specify \(D\) in the "Key" column.
14. Activate the "Press key" option.
15. Select the "Alt" option.
16. Select the "Change language" value in the "Action Type" column.
17. Select the language en in the "Action" column.
\(\Rightarrow\) The keyboard event for \([A I t]+[D]\) is configured.
18. Compile, download, and start the application.
\(\Rightarrow\) The visualization opens.
19. As the visualization user, press [D].
\(\Rightarrow\) The text is displayed in the language de.
« Chapter 6.4.5.21.4.3 "Tab 'Visualization Manager' - 'Default Hotkeys'" on page 3402
步 "Input action 'Change Language'" on page 3372

\section*{Activating standard keyboard handling}

When you activate the universal keyboard shortcuts for standard keyboard handling, the user can operate the visualization without a mouse. Elements that respond to user input can process a keyboard event instead of a mouse event without adapting its input configuration.
\(\checkmark\) Requirement: A project with a visualization is open.
1. Click the "Visualization Manager" object.
2. Activate the "Activate standard keyboard handling" option.
\(\Rightarrow\) The universal keyboard shortcuts are activated.
3. Download the application to a device and start the application.
\(\Rightarrow\) The visualization starts. Now operation can proceed without the mouse. You can navigate in the window by means of the [Arrow] and [Tab] keys and press [Enter] instead of the mouse button.

③ Chapter 6.4.5.21.1 "Keyboard Shortcuts for Default Keyboard Action" on page 3338

Activating and deactivating keyboard shortcuts for integrated visualizations

If you execute the visualization as an integrated visualization, then the "Visualization \(\rightarrow\) Activate Keyboard Usage" command is available in order to deactivate the capturing of keyboard events. It is actually possible for the same keyboard shortcuts to be defined in the visualization and in CODESYS
When you activate the command, the visualization executes the configured keyboard events.
When you deactivate the command, CODESYS executes the keyboard events. Capturing keyboard events is then deactivated for the visualization.
出 Chapter 6.4.5.21.2.4 "Command 'Activate Keyboard Usage'" on page 3343

\subsection*{6.4.5.6.6 Capturing user input events}

'other visu',
'targetvisu'));

```
Recording vari-
able value
changes trig-
gered by input
events

All visualization elements that change the value of a variable by user input call the IValueChangedListener interface. With this interface, the value changes can be recorded and then processed programmatically.
1. Implement a function block (example: POU) that implements the IValueChangedListener interface.

FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IValueChangedListener
\(\Rightarrow\) In the device tree, the "ValueChanged" method is inserted below the function block.
2. In a program (example: "PLC_PRG"), implement the IEC code that registers the interface.

VisuElems.g_itfValueChangedListenerManager.AddValueChangedListene r(itfValueChangedListener)
\(\Rightarrow\) "PLC_PRG" receives all value changes by means of the "ValueChanged" method. Now you can record and process the value changes.

\subsection*{6.4.5.7 Setting Up User Management}
6.4.5.7.1 General ..... 2899
6.4.5.7.2 Creating runtime-based user management initially ..... 2900
6.4.5.7.3 Switch to legacy user management. ..... 2902
6.4.5.7.4 Creating a group with administrator rights for visualizations. ..... 2902
6.4.5.7.5 Setting up access control and login operation ..... 2903
6.4.5.7.6 Group-dependent restriction of functionality. ..... 2905

\subsection*{6.4.5.7.1 General}

If you want to deploy a web visualization and securely protect it from third-party access, it is advantageous to set up runtime-based user management for it.
Runtime-based user management makes sure that users will log in securely with current technology. The credentials are managed using standard web technologies. In addition, user accounts can be created at runtime via secure channels, user credentials can be managed, and user permissions can be restricted according to the role of the user.

For this, it is necessary that the visualization user management is coupled with the device user management. You need to map the groups with their rights in the visualization to the groups in the device. You configure the user accounts centrally on the "Users and Groups" tab of the device editor.

If you do not want this because you value independent user management for your visualization and accept the outdated technology for this, then you can alternatively switch to legacy user management. This is not recommended if your controller supports runtime-based user management.
«2 Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971
² Chapter 6.4.1.6.5 "Setting up a user management" on page 1825

\section*{Runtime-Based User Management}

User management linked to device user management for higher security.
Whenever possible, always use runtime-based user management.
If you want to convert to your existing user management, then open
the "User Management \(\rightarrow\) Groups" tab in the "Visualization Manager" and click
the "Convert to Runtime-Based" button. At this time, the user groups are taken
over. The credentials of the users will be lost because these then have to be set
up in the controller.

The users are configured in the device user management on the "Users and Groups" tab of the device editor. If you want a user to have access only to a visualization but not to any device, then assign them a group membership and restrict the group permissions so that they are only allowed access to a visualization but not to any other device functionality.
\({ }^{\mu}\) Chapter 6.4.5.7.2 "Creating runtime-based user management initially" on page 2900
« Chapter 6.4.1.21.2.8.14 "Tab 'Users and Groups"" on page 2450

Legacy User Management

Deprecated but still available user management.
Legacy user management runs independently of device user management.

In the deprecated visualization user management, you define user groups and visualization users in the "Visualization Manager". In the user management dialogs, which request the credentials at runtime, authorized users log in to their visualization with their group permissions. In the visualization, elements can have group-dependent permissions and therefore be visible only to the group, for example.
In a project with several applications, you can configure user management for each application.

\section*{NOTICE!}

When a visualization user management exists, an unregistered user automatically receives the access rights from the None group.
(4) "Tab 'Groups'" on page 3404

Login operation on the display variants

The login operation is always the same for all display variants. This means it is independent of which user management is set up.
Login operation on the display variants:
- The integrated display ignores the user management functionality and starts with the user who logged in to the controller using CODESYS.
- When a TargetVisu is started, no user is initially logged in and the operator then has to log in if this is required by the designed visualization
- When starting a remote TargetVisu, the user from the communication settings of the remote TargetVisu itself is initially logged in. This can be changed via a new login within the visualization.
- Web visualizations start with the secure login operation of runtime-based user management

\subsection*{6.4.5.7.2 Creating runtime-based user management initially}
Whenever possible, use a runtime version >= 3.5 SP18 Patch 1 and CODESYS
Visualization version >= 4.2.0.0 for a new project with a visualization.

\section*{With standard groups}

\section*{Empty with None group}

First create an empty user management if you want new created groups with self-determined permissions.

Requirement: You have inserted a WebVisu below the Visualization Manager.
1. Double-click the "Visualization Manager" object in the device tree.
2. Select the "User Management" tab.
3. Click the [Create Runtime Based Empty User Management] button.
\(\Rightarrow\) The "Groups" and "Settings" tabs are displayed.
\(\Rightarrow\) The "Group" tab is open.
4. To create new user groups, click in the empty field in the "Group Name" column and specify the name of the new group.
5. Connect the application to the controller and click the [Upload device groups names] button.
\(\Rightarrow\) The user groups of the device user management are uploaded and are now selectable in the "Mapping in Runtime Group" column.
6. On the "User Management" tab: For the user groups of the visualization of the "Group Name" column, select a group of the device user management from the list box in the "Mapping in Runtime Group" column to which the user group of the visualization should be assigned.
\(\Rightarrow\) By assigning the visualization user groups to the device user groups, the visualization groups get the same permissions on the controller as the respective groups of the device user management.

The newly created user management groups are now coupled with the device user management and are mapped to the device user management groups. You get their group permissions.

To configure the login operation, see: \({ }^{\sharp}\) Chapter 6.4.5.7.5 "Setting up access control and login operation" on page 2903

\subsection*{6.4.5.7.3 Switch to legacy user management}

Whenever possible, use a runtime version >= 3.5 SP18 Patch 1 and CODESYS Visualization version \(>=4.2 .0 .0\) for a new project with a visualization.

You have initially created a runtime-based user management. Now you want to decouple this from the device user management and have a separate management only for the visualization users.
1. In the Visualization Manager, open the "User Management" tab and click the "Groups" tab.
2. Click the [Convert to Legacy] button.

User management is decoupled from device user management and converted to legacy. The "Users" tab opens.

\subsection*{6.4.5.7.4 Creating a group with administrator rights for visualizations}

Only with runtime-based user management.

\section*{Configuration of user groups with restricted administrator permissions for the visualization.}

Typically, operators of the visualization are a separate user group from application developers. Therefore, the following steps can also be used to configure an administrator for the visualization, who has access only to the groups of the visualization.
This configuration is possible with runtime version 3.5.18.10 and higher.
For detailed information about CODESYS device user management and its operation, see: Handling of Device User Management.
« Chapter 6.4.1.11.4 "Handling of Device User Management" on page 1971
Requirement: A visualization group (example: VISU_ADMIN) has been assigned to a runtime group (example: RTS_GRP_RESTR) in the Visualization Manager on the User Management tab. In the device user management, the User_Restr user has been assigned to the RTS_GRP_RESTR group. The RTS_GRP_RESTR group has full View permissions for the controller.
1. n the device user management, on the "Access Rights" tab, grant the "View" permission for the "UserManagement" object to the "RTS_GRP_RESTR" group. To do this, select the "UserManagement" object, and in the "Rights" area on the right side, double-click the "View" field of the "RTS_GRP_RESTR" group. This opens a dialog prompting whether or not the changed permissions should also be changed for all child objects. Click [No] to refuse this action. Double-click the field again and click [No] again in the next dialog.
\(\Rightarrow\) The \(\bumpeq\) symbol is displayed for the View permission. For all other groups (except Administrator), the permission should have the \(=\) symbol.
2. To the "RTS_GRP_RESTR" group, grant the "View" and "Modify" permissions for the "UserManagement \(\rightarrow\) Users" object.
\(\Rightarrow\) The』 symbol is displayed for both permissions.
3. To the "RTS_GRP_RESTR" group, grant the "View" and "Modify" permissions for those objects of the "UserManagement \(\rightarrow\) Groups" object which are relevant for the visualization.
\(\Rightarrow\) Access to the groups which are relevant for the visualization is granted to the RTS_GRP_RESTR group. For the respective objects, the 亿 symbol is displayed for both permissions.
4. For the "RTS_GRP_RESTR" group, deny the "View" permission to the "Administrator" group. As a result, users of the "RTS_GRP_RESTR" group cannot extend their permissions.
Moreover, select the "UserManagement \(\rightarrow\) Groups \(\rightarrow\) Administrator" object and deny the "View" permission to the "RTS_GRP_RESTR" group.
\(\Rightarrow\) The \(=\) symbol is displayed.
\(\Rightarrow\) Now when you are logged in as a user with restricted administrator permissions on the application, you can create new users or modify existing users for the visualization, but not for groups with additional permissions on the controller.

\subsection*{6.4.5.7.5 Setting up access control and login operation}

In the user management dialogs, you define the login, logout, changing of the user password, and editing of the user management in the visualization at runtime.
Editing and Selecting User Management Dialogs

\section*{NOTICE!}

If you create your own dialog as a user management dialog, then you should use the visualizations from the included library project VisuUserMgmtDialogs as the basis, because it uses the required interfaces. Your own user management dialog is listed then in "Visualization Manager \(\rightarrow\) Settings", "Settings for User Management Dialogs".

For information about the login visualization in runtime-based user management, see: "Creating runtime-based user management initially".

²) Chapter 6.4.5.7.2 "Creating runtime-based user management initially" on page 2900

\section*{Creating Login Pages}
1. If you do not want to configure your own login page, then a preconfigured login page from a library is automatically used when logging in to the visualization. This visualization is automatically entered in the editor of the "WebVisu" as the "Login visualization" when the user administration is created, but it can be changed if necessary.
2. If you want to create your own login page, then follow the steps below:
3. Add a "Visualization" object (for example, named "Login_Visu") to the application.
4. In the context menu of this object, click "Properties". In the properties dialog, open the "Visualization" tab.
5. In the context menu of this object, click "Properties". In the properties dialog, open the "Visualization" tab.
6. Open the "Login_Visu" visualization and design your login page with the input fields for user name, password, and buttons for logging in and canceling the dialog.
7. To do this, only certain visualization elements are available to you. In these visualization elements, you can use placeholders to configure the input fields for the user name and password, as well as the buttons for logging in and canceling the dialog.
8. Compile the application and perform a download to the controller.

When you open the web visualization, the login page which you created for the visualization opens. Type in your user name and the password for the controller which you have stored in the device user management and click the [LOGIN]button.

Editing user Requirement: The library project VisuUserMgmtDialogs.library exists in the installation management dialogs directory.
1. Click "File \(\rightarrow\) Open Project".
2. Select the project VisuUserMgmtDialogs.library from the Projects folder of the installation directory.
3. Click "View \(\rightarrow\) POUs".

In the "POUs" view, the project is displayed with the visualizations "UserMgmtChangePassword", "UserMgmtConfig", and UserMgmtChangePassword.
4. Double-click a visualization (example: "UserMgmtLogin").
5. Change the visualization as you like and save the project.
6. Then, reinstall the library and add it to the "Library Manager" of your application.

Selecting user A user management already exists in your application in the "Visualization Manager" object on management dialogs
the "User Management" tab.
The "VisuUserManagement" library is in the "Library Manager".
1. In the device tree, click the "Visualization Manager" object.
2. Select the "Dialog Settings" tab.
3. In "Settings for User Management Dialogs", select the dialogs for "Login dialog", "Change password dialog", and "Change configuration dialog".

> If no entries can be seen in "Settings for User Management Dialogs" in the dialog lists, then close the "Visualization Manager" and reopen it.

Customizing th
dialogs of the user management
agement dialogs as follows:
Requirement: A visualization is open.
1. Drag a "Button" element from the "Visualization Toolbox" view ("Common Controls" category) to the visualization.
2. In the "Properties" view, click the "Input configuration" node.
3. In the "Input Configuration \(\rightarrow\) OnMouseClick" property, click "Configure".
4. In the "Input Configuration" dialog, click "User management" and
\(\Rightarrow\) The following "Dialogs and actions" are listed on the right: "Login, Logout, Change User Password", and "Open User Configuration".
5. elect the dialog or action to assign to the button and click [OK].
\(\Rightarrow\) When the button is clicked at runtime, the selected dialog opens or the selected action is executed.

If you want to open and edit the user management in the visualization at runtime, you have to be a member of a group that has P"ermission to Change User Data".

\subsection*{6.4.5.7.6 Group-dependent restriction of functionality}

Configuring per- Permissions for visualization-elements are not granted to individual users, but to groups with missions for an assigned users. element of the visualization
1. Click a visualization element in the editor.
2. Click the "Value" field of the "Permissions" element property in the "Properties" view. \(\Rightarrow\) The "Permissions" dialog opens.
3. Select the permissions that the respective user group should have for the visualization element.

If the option "Group hierarchy is used" is activated, the groups lower in the hierarchy cannot be granted more permissions than groups higher in the hierarchy.
\begin{tabular}{ll}
\begin{tabular}{l} 
Updating \\
groups and \\
group permis-
\end{tabular} & \begin{tabular}{l} 
In the project below the application, a visualization is stored which has at least one element with \\
restricted permissions.
\end{tabular} \\
sions
\end{tabular}
1. Open the Visualization Manager and click the "User Management" tab.
2. Click the "List Usage of Groups" button.
\(\Rightarrow\) In "Messages", all elements with restricted permissions are listed which exist in the visualizations that are used across the application. This will give you an overview of functional limitations.

\section*{3. Click the [Update Visualizations/Hotkeys] button.}
\(\Rightarrow\) The "Update Visualizations and Hotkeys" dialog opens. Here you can centrally rename groups, delete groups, or change group permissions. The affected visualization elements are updated. This means that the "Access Rights" property is updated for each of the affected elements: There, the group names are removed or renamed or the permissions are reset.

\subsection*{6.4.5.8 Setting Up Multiple Languages}

Texts and tooltip texts for visualizations are managed in text lists and can be displayed in different languages. To switch a visualization between the available languages, configure a visualization element with the corresponding input configuration for changing the language.
There are static texts that are managed in "GlobalTextList" (generated automatically) and dynamic texts from created text lists. A dynamic text can be changed at runtime with a variable that defines the index of the text list entry. Static texts are fixed labels within a visualization; dynamic texts are often used for displaying variable values or error messages.
For creating and using text lists, see: \({ }^{\Downarrow}\) Chapter 6.4.1.9.10 "Managing text in text lists" on page 1891.

You can modify the appearance and formatting of texts and tooltips with the element properties "Text properties" and "Font variables".

See also
- \({ }^{\text {® }}\) Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329
- \(\xi^{2}\) Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration'" on page 3370

Configuring language switching for texts from text lists

Requirement: An empty visualization object is inserted into the project and it is open for editing in the visualization editor. There is also a "Visualization Manager" object. User management is not created for the visualization.
The following instructions provide a simplified example:
- By means of two buttons, the user should be able to toggle the visualization texts between English and German.
- Static texts in the visualization include the labels "State, Machine 01", "State, Machine 02", "English", and "German". These texts are located in the "GlobalTextList" in English and German.
Dynamic texts will describe the state of both machines. The texts are provided in the text list "Status_Texts" in English (en) and German (de).
1. Drag a "Text Field" from the "Visualization Toolbox" view ("Common Controls" category) to the editor view. Specify the value State, Machine M01 in the properties editor for the element property "Texts \(\rightarrow\) Text".
2. Copy the element and change the copy label to State, Machine M02.
3. See also the figure in step 14 for the following steps.

Insert two elements of type "Button" from the "Visualization Toolbox" view ("Common Controls" category) in the visualization editor. With these elements, the user should be able to toggle the language of the visualization. Specify the text German or English in the properties editor for element property "Texts \(\rightarrow\) Text" (4).
4. Double-click and open "GlobalTextList" in the "POUs" view.
\(\Rightarrow\) The texts are entered in the "Standard" (1) column, and the "ID"s 0 and 1 are assigned automatically as additional information.
5. Add the languages "de" and "en" with the texts shown in the following figure.
\begin{tabular}{|c|c|c|c|c|}
\hline \multicolumn{4}{|l|}{国 GlobalTextList \(\mathbf{x}\)} & - \\
\hline & Default (1) & de & en & \\
\hline 3 & English & Englisch & English & \\
\hline 2 & German & Deutsch & German & \\
\hline 0 & State, Machine M01: & Zustand Maschine M01: & State, Machine M01: & \\
\hline 1 & State, Machine M02: & Zustand Maschine M02: & State, Machine M02: & \\
\hline
\end{tabular}
6. Close the "GlobalTextList".
7. Add two elements of type "Rectangle" from the "Visualization Toolbox" view ("Basic" category) in the visualization editor. The current state of each machine should be displayed.
8. For managing the texts for describing the states, add an object of type "Text List" below the application. Name the list Status_Texts.
9. Specify the texts shown in the figure for the standard language (1) and the target languages "en" and "de" in the editor of "Status_Texts".
\begin{tabular}{|l|l|l|l|}
\hline \multicolumn{8}{|c|}{ Stas_Texts \(\mathbf{x}\)} & & \\
\hline ID & Default & de & en \\
\hline 0 & running & läuft & running \\
\hline 1 & stopped & lauft nicht & not running \\
\hline 2 & starting & läuft gerade hoch & starting \\
\hline 3 & error & Fehlermeldung! & error message! \\
\hline
\end{tabular}
10. Close the text list "Status_Texts".
11. Select the rectangle element for displaying the state of machine M01. Select the text list Status_Texts from the combo box in the properties editor (2) for the "Dynamic texts" element property (5). Specify an application variable for "Text index" that shows the appropriate text index for the state of the machine at runtime. Example: PLC_PRG.ivar_status_m01.
12. Now configure the user input for both buttons for toggling the language in the visualization.

Select the "German" button. Double-click "Configure" of the property "Input configuration" (6), "OnMouseClick".
\(\Rightarrow\) The "Input configuration / OnMouseClick" dialog opens.
13. Select "Change the language" on the left. Click the arrows to accept the setting to the right. Select "de" in "Language" to the right of the dialog in the ... input assistance. Click "OK" to confirm.
14. In the same way, configure the entry for the second button: English: "Text list": Status_Texts, "Text index": 3, "Change the language": English).
\(\Rightarrow\) The following figure shows the performed properties configurations for the four visualization elements.

15. When the application is compiled without errors, you can test the visualization in simulation mode. Activate the option "Online \(\rightarrow\) Simulation". Click "Online \(\rightarrow\) Login".
\(\Rightarrow\) The visualization appears in the visualization editor view in online mode:

16. Click the "German" button.
\(\Rightarrow\) The language changes to German:

\footnotetext{
«» "Input action 'Change Language"" on page 3372
}
Setting up fonts The font for a visualization element is defined in the properties editor. If a language switch is for a language provided, you can overwrite this basic font with another font for each language in the visualization manager.
Requirement: A visualization is set up with at least one language in addition to the default language.

\section*{. Example}
1. Double-click and open the "Visualization Manager" object and select the "Font" tab.
2. Double-click the field in the "Font" line for a particular language. Select a font from the combo box.
3. In the "Font size" line, replace the value 1 with a value greater than 1 (example: 2 ) in order to increase the size of the font as defined by the visualization style; or replace it with a value less than 1 in order to decrease is (example: 0.5 ).
\(\Rightarrow\) In online mode, the font changes depending on the set language.

③ Chapter 6.4.5.21.4.6 "Tab 'Visualization Manager' - 'Font"' on page 3407

\subsection*{6.4.5.9 Visualizing alarm management}

In CODESYS, the alarm management is a powerful object for creating and managing alarms. You can group alarms and set the acknowledgement behavior individually. The alarm display in the visualization can also be customized.

The "Alarm Table" and "Alarm Banner" visualization elements are available for displaying and processing alarms. The alarm table lists the alarm texts. The alarm banner is a simplified version of the alarm table. It visualizes a single alarm only. However, by adding scroll elements you can allow for switching the display from one active alarm to another active alarm.
\& Chapter 6.4.1.9.20 "Alarm Management" on page 1928

Creating an Requirement: In your project, alarms are defined in alarm groups and they are assigned to alarm table an alarm class. The following instructions are based on the example that is described in the "Configuring alarm management" chapter.
1. Open the visualization editor.
2. Drag the "Alarm Table" element from the "Alarm Manager" group to the visualization editor.
\(\Rightarrow\) The "Alarm Table" visualization element is visible in the editor.
3. In the "Alarm configuration" / "Alarm groups" property, define the alarm groups that you want to visualize. Click into the value field.
\(\Rightarrow\) The "Select Alarm Group" dialog opens.
4. Clear the "All" check box and select the "PartsDeficit" alarm group. Add the group to the selected alarm groups by clicking the \(>\) button.
5. In the "Alarm configuration"/ "Alarm classes" property, define the alarm classes that you want to visualize. Click into the value field.
\(\Rightarrow\) The "Select Alarm Class" dialog opens.
6. Clear the "All" check box and select the "PartsDeficit" alarm class. Add the alarm class to the selected alarm classes by clicking the \(\triangle\) button.
7. Add an additional column. Click the "Columns" / "Create New" button.
\(\Rightarrow\) CODESYS adds the column "[2]" to the properties. The "Symbol" column is added to the table.
8. Select data type "State" for column [2].
\(\Rightarrow\) The default column heading "State" is shown in the table.
9. Name the "Column heading" column "Status".
10. Specify the appearance of the selected table cell. Set the "Selection" / "Selection color" to "Green".
11. In the "Control variables" / "Confirm selection" property, specify the variable bQuitAlarm for confirming messages.
12. Adjust the other properties to your requirements. See the "Alarm table" visualization element for a complete description of the properties.
« Chapter 6.4.5.20.1.22 "Visualization Element 'Alarm Table"" on page 3166

Inserting elements for acknowledging alarms

In CODESYS, predefined buttons are available for controlling the alarms in an alarm table.
Requirement: An "Alarm table" element exists in the visualization.
1. Select the visualization element in the editor.
2. Click "Visualization \(\rightarrow\) Insert elements for acknowledging alarms".
\(\Rightarrow\) The "Alarm Table Wizard" dialog opens.
3. Click "OK" to accept all settings.
\(\Rightarrow\) Four buttons are added for controlling the alarm table.

\section*{③ Chapter 6.4.5.20.1.22 "Visualization Element 'Alarm Table"" on page 3166}

\section*{Creating an alarm banner}

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following statement is based on the example that is described in the "Configuring alarm management" chapter.
The alarm banner displays an active alarm in online mode. If there are multiple active alarms, filtering takes place by means of the filter criteria set in the alarm banner (newest for filter criterion "Priority" and most important for filter criterion "Newest"). See the instructions below for adding scroll elements in order to switch the display between multiple alarms.
1. Open the visualization editor.
2. Drag the "Alarm banner" element from the "Alarm manager" group to the visualization editor.
\(\Rightarrow\) The "Alarm banner" visualization element is visible in the editor.
3. In the "Alarm configuration" / "Alarm groups" property, define the alarm groups that you want to visualize. Click into the value field.
\(\Rightarrow\) The "Select Alarm Group" dialog opens.
4. Clear the "All" check box and select the "PartsDeficit" alarm group. Add the group to the selected alarm groups by clicking the \(\triangle\) button.
5. In the "Alarm configuration"/ "Alarm classes" property, define the alarm classes that you want to visualize. Click into the value field.
\(\Rightarrow\) The "Select Alarm Class" dialog opens.
6. Clear the "All" check box and select the "PartsDeficit" alarm class. Add the alarm class to the selected alarm classes by clicking the \(\square\) button.
7. Set the "Alarm configuration" / "Filter criterion" property to "Newest".
\(\Rightarrow\) In online mode, the newest alarm message is always shown.
8. Add an additional column. Click the "Columns"/ "Create new" button.
\(\Rightarrow\) CODESYS adds the column "[2]" to the properties. The "Symbol" column is added to the table.
9. Select data type "State" for column [2].
\(\Rightarrow\) The default column heading "State" is shown in the table.
10. In the "Confirmation variable" property, specify the variable bQuitAlarm for confirming messages.
* \({ }^{4}\) Chapter 6.4.5.20.1.23 "Visualization Element 'Alarm Banner"" on page 3175

Elements can be added to an alarm banner for switching the display between the individual active alarms. You can control the scrolling with visu-local variables or application variables.
1. Select the added "Alarm banner" visualization element. Click "Insert Elements for Scrolling Alarms" in the context menu.
\(\Rightarrow\) The "Alarm Banner Wizard" opens.
2. Select the element type for the scroll elements: "Button" or "Rectangle".
3. Activate the action(s) for which a control should be inserted: "Scroll to next alarm", "Scroll to previous alarm".
4. Specify a Boolean variable that gets the value TRUE when multiple active alarms are present. If you have already configured a project variable in the element properties, then it is also specified here in the wizard. Otherwise CODESYS automatically creates the visu-local variable "xMultipleAlarmsActive".
5. In the next step, check the configuration of the element properties of the extended alarm banner.
6. Select the alarm banner element and look at the section "Handling of multiple active alarms" in the "Properties" view. You have two options:
7. Option 1: The display should switch automatically. Activate the "Switch automatically" property.
\(\Rightarrow\) Now, in "Every \(N\) seconds" you define the time interval after which the display in the alarm banner in online mode should switch to the next alarm.
8. Option 2: The display should be controlled by means of the application. Deactivate the "Switch automatically" property.
\(\Rightarrow\) Switching between the active alarms can be controlled by two variables. By default, xNext and xPrev are created for scrolling to the next or previous alarm. You can replace these variables with custom your own defined application variables.

Filter alarm Filtering by the contents of a latch variable can be useful when there are a lot of alarm events events by the contents of the latch variable displayed. If the latch variable assigned to an alarm in the alarm group definition contains, for example, the error number or the name of a device instance, then you can filter the alarms in the visualization by it.

For this purpose, you configure an input option in the alarm visualization for the contents of the latch variable to be filtered by. For example, insert an input field which writes to the variable that is specified in the "Alarm configuration" - "Filter by latch 1" - "Filter variable" property of the configuration of the "Alarm table" element or "Alarm banner" element.
In addition, you configure an input option for the type of filtering. The type determines whether a numeric value (typed literal, LINT literal) or the string value of the latch variable is used for filtering. Filtering can also be switched off by means of type setting 0 . For example, in the visualization, insert another input field which writes to the variable that is specified in the "Filter type" property of the configuration of the alarm table or alarm banner.

For more information, see the "Alarm Filter Latch Example" sample project in the CODESYS Store.

\subsection*{6.4.5.10 Animating visualization elements}
\(\qquad\)
6.4.5.10.2 Configuring rotations and offsets.................................................. 2912
6.4.5.10.3 Animating a text display............................................................... 2914
6.4.5.10.4 Animating a color display............................................................. 2914

\subsection*{6.4.5.10.1 General}

The animation of a visualization element at runtime can serve to visualize value curves in addition to serving purely visual purposes. Animation is possible through a dynamic configuration of certain element properties, i.e. by controlling these properties with a variable. See the following examples of possible animations.

\subsection*{6.4.5.10.2 Configuring rotations and offsets}

You can animate a visualization element and have it shifted or rotated at runtime. To do this you assign variables in its property "Absolute movement" and then program the animation in the application code.

Configuring an You can configure an offset of the element by programming the variables in
offset
\(\checkmark\) Requirement: A project with a visualization is open.
1. Open the visualization and add an element "Rectangle".
\(\Rightarrow\) The view "Properties" displays the configuration of the element.
2. In the application in the POU PLC_PRG, declare type-compliant variables: diOffsetX : DINT; and diOffsetY : DINT;
3. Configure the property "Absolute movement \(\rightarrow\) Movement \(\rightarrow X\) " with PLC_PRG.diOffsetX and "Y" with PLC_PRG.diOffsetY.
4. Implement a shift of the element, for example by means of a modulo division of the value:
diOffsetX := diOffsetX MOD 100;
diOffsetY := diOffsetY MOD 100;
5. Compile, load and start the application.
\(\Rightarrow\) The application runs. The visualization opens. The rectangle moves.

Configuring a When an element rotates, then the center point of the element rotates precisely around its rotating element center. The center is defined in the property "Center". The center point of an element is calculated internally. If the center point and center coincide, then there is no rotation.
You can configure a clockwise rotation of the element by increasing the value of the variable "Absolute movement \(\rightarrow\) Rotation".
\(\checkmark \quad\) Requirement: A project with a visualization is open.
1. Open the visualization and add an element "Rectangle".
\(\Rightarrow\) The view "Properties" displays the configuration of the element.
2. In the application in the POU PLC_PRG, declare a type-compliant variable:rValue : REAL;
3. Configure the property "Absolute movement \(\rightarrow\) Rotation" with PLC_PRG.rValue.
4. Implement the clockwise rotation of the element by increasing the value of the variable:
```

rValue := rValue + 0.1;

```
5. Compile, load and start the application.
\(\Rightarrow\) The application runs. The visualization opens. The rectangle rotates about the center. The alignment of the element with respect to the coordinate system is fixed.

Configuring a When an element performs an inner rotation and rotates, then the center point of the element rotating element rotates precisely around its center. This is the point defined in the property "Center". The alignment of the element also rotates relative to the coordinate system. If the center point of the element and the center coincide, this produces a rotation on the spot.
You can configure a clockwise rotation of the element by increasing the value of the variable "Absolute movement \(\rightarrow\) Inner rotation".
If the visualization is In runtime, you can see that the element rotates (also relative to the coordinate system of the visualization).
\(\square\) Requirement: A project with a visualization is open.
1. Open the visualization and add an element "Polygon", which you form into a pointer. \(\Rightarrow\) The view "Properties" displays the configuration of the element.
2. Drag the center point of the element to the base of the pointer.
3. In the application in the POU PLC_PRG, declare a type-compliant variable:
```

rValue : REAL;

```
4. Configure the property "Absolute movement \(\rightarrow\) Inner rotation" with PLC_PRG.rValue.
5. Implement the clockwise rotation of the element by increasing the value of the variable:
rValue := rValue + 0.1;
6. Compile, load and start the application.
\(\Rightarrow\) The application runs. The visualization opens. The pointer rotates about its base.

\(\boldsymbol{y}^{\text {C }}\) Chapter 6.4.5.20.1.1 "Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse"" on page 2988

\subsection*{6.4.5.10.3 Animating a text display}

An animation of the text display can be configured in the property "Font variables". All basic elements have this property as well as tables, scrollbars and text fields.

\section*{Example: animating the font size}
\(\square\) Requirement: A project with a visualization is open.
1. Open the visualization and add an element "Rectangle".
\(\Rightarrow\) The view "Properties" displays the configuration of the element.
2. Configure the property "Texts \(\boldsymbol{\rightarrow}\) Text" with Important:
3. In the application in the POU PLC_PRG, declare a type-compliant variable:
```

| iFontHeight : INT;

```
4. Configure the property "Font variables \(\boldsymbol{\rightarrow}\) Size" with PLC_PRG. iFontHeight.
5. Implement a change of the font size.
\(\Rightarrow\) iFontHeight:= iFontHeight + 1) MOD 20;
6. Compile, load and start the application.
\(\Rightarrow\) The application runs. The visualization opens. The rectangle is labelled with Important. The font size grows from 1 to 20 .

See also
- «s Chapter 6.4.5.20.1.1 "Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse"' on page 2988

\subsection*{6.4.5.10.4 Animating a color display}

The colors of an element are specified in the "Colors" properties of the element properties. There you can select either a predefined style color from the selection list or a color in the color dialog.

The "Color variables" element property is used for the color animation of the element. If you pass variables to the properties, then you can program color changes in the application code or configure a user input that results in a color change. A color constant or color variable in the code has the data type DWORD and is encoded according to the RGB color space or RGBA extension.

\section*{Color definition in RGBA color space}

Animating a visualization element in color
1. Create a standard project in CODESYS.
2. Declare global color constants in the POU tree.
\(\Rightarrow\)
```

{attribute 'qualified_only'}
VAR_GLOBAL CONSTANT
gc_dwRed : DWORD := 16\#FFFF0000;
gc_dwGreen: DWORD := 16\#FFO0FF00;
gc_dwYellow: DWORD := 16\#FFFFFF00;
gc_dwBlue: DWORD := 16\#FF0000FF; // Highly opaque
gc_dwBlack : DWORD := 16\#88000000; // Semitransparent
END_VAR

```
3. In the device tree, declare local color variables in PLC_PRG.
```

=>
VAR
dwFillColor: DWORD := GVL.gc dwGreen;
dwFrameColor : DWORD := GVL.g
dwAlarmColor : DWORD := GVL.gc_dwRed;
END_VAR

```
4. Declare a control variable.
```

b bChangeColor : BOOL;

```
5. Declare an input variable in PLC_PRG.
```

=> bInput : BOOL;

```
6. Enable the visualization editor.
7. Drag a "Rectangle" element to the visualization editor. \(\Rightarrow\) The "Properties" view of the element opens.
8. Configure the properties of the rectangle as follows:
- Property "Color variables", "Normal state", "Filling color": PLC_PRG.dwFillColor
- Property "Color variables", "Normal state", "Frame color": PLC_PRG.dwFrameColor
- Property "Color variables", "Alarm state", "Filling color": PLC_PRG. dwAlarmColor
- Property "Color variables", "Toggle color": <toggle/tap variable>
- Property "Input configuration", "Toggle", "Variable": PLC_PRG.bInput
9. Program the variables as follows:
```

PROGRAM PLC_PRG
VAR
dwFillColor: DWORD := GVL.gc_dwGreen;
dwFrameColor : DWORD := GVL.gc_dwBlack;
dwAlarmColor : DWORD := GVL.gc_dwRed;
bChangeColor : BOOL;
bInput : BOOL;
END_VAR
IF bChangeColor = TRUE THEN
dwFillColor := GVL.gc_dwYellow;
dwFrameColor := GVL.gc_dwBlue;
ELSE
dwFillColor:= GVL.gc_dwGreen;
dwFrameColor := GVL.g}c_dwBlack
END_IF

```
\(\Rightarrow\) The colors are initialized at runtime. If the variable bChangeColor is then forced to TRUE, the color display of the rectangle changes. When the rectangle is clicked in the visualization, the rectangle is displayed in alarm colors.

6.4.5.11 Displaying data arrays in tables
\[
\text { 6.4.5.11.1 General.......................................................................................... } 2917
\]
6.4.5.11.2 Displaying Array Variables in Tables.............................................. 2917
6.4.5.11.3 Configuring and Multiplying Visualization Elements as Templates 2918

\subsection*{6.4.5.11.1 General}

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element "Table" for this.
In the configuration of the element "Table", enter an array variable in the property "Data array". The array components are displayed in the rows and columns of the table.
A table for displaying data arrays can also be created in the following way. You duplicate a single element having at least one property that is described by a structured variable. The single element is configured as a "template" for this and duplicated with a command.

\subsection*{6.4.5.11.2 Displaying Array Variables in Tables}

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element "Table" for this.
In the configuration of the element "Table", enter an array variable in the property "Data array". The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the MYSTRUCT DUT and the declarations in the PLC_PRG program.
```

TYPE MYSTRUCT :
STRUCT
iNo : INT;
bOnStock : BOOL;
strPartNumber : STRING;
END_STRUCT
END_TYP\overline{E}
PROGRAM PLC_PRG
VAR
arrStruct : ARRAY[0..6] OF MYSTRUCT;
iSelectedColumn : INT;
END_VAR

```
1. Drag the "Table" visualization element to the visualization editor.
2. Assign the array variable arrStruct to the "Data array" property.
\(\Rightarrow\) The structure members are displayed as column headings and the array index as row headings.
3. Change the "Columns \(\rightarrow\) Column \(\rightarrow[0] \rightarrow\) Column header" property to an informative heading (example: Number).
4. Change the heading of column [1] to in stock and column [2] to Part number. Adjust the column width.
5. Assign a color to the "Selection \(\rightarrow\) Selection color" property.
6. Define the "Selection \(\rightarrow\) Selection type" property as Row selection.
7. In the "Selection \(\rightarrow\) Variable for selected row" property, define the PLC_PRG.iSelectedColumn variable.
\(\Rightarrow\) The following display results in online mode:
\begin{tabular}{|c|c|c|c||}
\hline & Number & in Stock & PartNumber \\
\hline 0 & 0 & FALSE & \\
\hline 1 & 0 & FALSE & \\
\hline 2 & 0 & FALSE & \\
\hline 3 & 0 & FALSE & \\
\hline
\end{tabular}

See also
- \({ }^{n} \boldsymbol{y}\) Chapter 6.4.5.20.1.13 "Visualization Element 'Table"" on page 3106

\subsection*{6.4.5.11.3 Configuring and Multiplying Visualization Elements as Templates}

A table can also be created to display data arrays in the following way. You multiply a single element that has at least one property which is described by a structured variable. To do this, the single element is configured as a "template" and multiplied by means of a command.

You can use the "Visualization \(\rightarrow\) Multiply Visu Element" command to display array data in a visualization. The command multiplies a template element to create an element of the same type for each array component. The layout of the new elements in the visualization is one-dimensional as a row or column, or two-dimensional as a table.

To do this, drag an applicable element into the visualization editor. Then configure the properties of the element with array variables and specify the index access placeholder \$FIRSTDIM\$ as component access. If you have declared a multidimensional array, then you can use the second index access placeholder \$SECONDDDIM\$ for the additional dimension. Configure the remaining properties as usual with the typical values. The purpose is to create a valid template element. Then execute the "Multiply Visu Element" command on the template element. Now the dialog with the same name opens. There you define in detail how many elements should be created and where they should be located.
After multiplying, the visualization contains as many of the same elements as are indexed using placeholders. In doing so, the settings in the "Multiply Visu Element" dialog are taken into consideration. All new elements in the properties that were preset with placeholders have these replaced with precise indexes. The remaining properties have been applied and copied without changes.

For example, you can have a layout of nine buttons as \(3 \times 3\) tables, which are all the same size or the same color, but vary in the labeling. The labels are declared as a string array (nine components) and are passed as a value to the "Texts"->"Text" property.
Valid template element:
- Declaration of array variables

Example: asText: ARRAY[1..3, 1..3] OF STRING;
- Element with applicable element type
- Configuration of at least one property of the applicable element with array variables with index access placeholders
Example: Property "Texts", "Text" = PLC_PRG. asText[\$FIRSTDIM\$, \$SECONDDIM\$]
This is possible for all properties that permit a variable as a value (for example, also properties from the "Animation" or "Input" categories. To configure multiple properties for an element with arrays and index access placeholders, all arrays must have the same structure with the same dimension. The declarations have to be compatible.
- Configuration of properties that do not vary (and are therefore the same for all generated elements) with the usual values without index access placeholders Example:
```

sButtonTip : STRING := 'This element is created by multiplication'

```
Property "Texts", "Tooltip" = \% s
Property "Text variables", "Tooltip variable" = sButtonTip

You can still use the placeholder \% as usual for the text display of variable values in the properties in "Texts".

Applicable visu- Visualization elements that can be multiplied: alization elements
- "Rectangle"
- "Rounded Rectangle"
- "Ellipse"
- "Line"
- "Polygon"
- "Polyline"
- "Bézier Curve"
- "Image"
- "Frame"
- "Button"
- "Pie"
- "Spin Box"
- "Text Field"
- "Check Box"
- "Image Switcher"
- "Lamp"
- "Dip Switch"
- "Power Switch"
- "Push Switch"
- "Push Switch LED"
- "Rocker Switch"
- "Rotary Switch"

\section*{Configuring and multiplying lamps and buttons as templates}
1. Create a new standard project.
\(\Rightarrow\) A CODESYS Control Win V3 is configured as the device. The MainTask calls PLC_PRG. The implementation language is ST.
2. In PLC_PRG in the program code, declare array variables with basic data type STRING.
\(\Rightarrow\)
PROGRAM PLC_PRG
VAR
axLampIsOn: ARRAY[1..2,1..3] OF BOOL; // For lamp, property 'variable' and button, user input
asButtonText: ARRAY[1..2,1..3] OF STRING := // Output text for button, property 'text variables''text variable'
[
'1A Lamp', '2A Lamp',
'1B Lamp', '2B Lamp',
'1C Lamp', '2C Lamp'
];
END_VAR
3. Select the application in the device tree and click "Add Object \(\rightarrow\) Visualization".
4. In the "Add Visualization" dialog, specify the name VisuMain and click "Add" to close the dialog.
5. Drag a "Lamp" element from the "Visualization Toolbox" view to the visualization.

6．Configure the fixed property values．
\begin{tabular}{|c|c|c|c|c|}
\hline 明 Visualization \(\times\) & ＊ & \multicolumn{2}{|l|}{Properties} & \(-4 \times\) \\
\hline \multirow[t]{16}{*}{} & A & \multicolumn{2}{|l|}{マ Filter＊＊Sort by＊ \(\mathrm{A} \downarrow\) Sort order＊\(\square\) Advanced} & \\
\hline & & Property & Value & \\
\hline & 三 & Element name & Array of lamps & \\
\hline & & Type of element & Lamp & \\
\hline & & －Position & & \\
\hline & & X & 50 & \\
\hline & & Y & 20 & \\
\hline & & Width & 70 & \\
\hline & & Height & 70 & \\
\hline & & Variable & & \\
\hline & & －Texts & & \\
\hline & & Tooltip & & \\
\hline & & －State variables & & \\
\hline & & Invisible & & \\
\hline & & －Background & & \\
\hline & & Image & Yellow & \\
\hline
\end{tabular}

7．Double－click the value field of the＂Variable＂property．
\(\Rightarrow\) The line editor opens．
8．Click ．．．．
\(\Rightarrow\) The Input Assistant opens．
9．Select the array variable PLC＿PRG．axLampIsOn from the variable tree．
10．Extend the string at the end，for example with＂［ f ＂．
\(\Rightarrow\) If you have activated SmartCoding（＂Options＂dialog，＂SmartCoding＂category，＂List components immediately when typing＂option），then the current variable list appears with the placeholders：

11．Select the placeholder \＄FIRSTDIM\＄for the first dimension and confirm the selection．
12．Extend the string at the end，for example with＂，s＂．
\(\Rightarrow\) The variable list appears again．
13．Select the placeholder \＄SECONDDIM\＄for the second dimension and confirm the selection．
14．Complete the string with a closing bracket．
```

A PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]

```

The lamp is configured as a template．
15. Click "Visualization \(\rightarrow\) Multiply Visu Element".
\(\Rightarrow\) The "Multiply Visu Element" dialog opens. The default values are derived from the array declarations.
"Total number of elements", "Horizontal" = 2
"Total number of elements", "Vertical" = 3
16. Declare the distance between the new elements.
\(\Rightarrow\) "Offset between elements", "Horizontal" = 3
"Offset between elements", "Vertical" = 3
17. Check the advanced settings.
18. Click "OK" to confirm the selection.
\(\Rightarrow\) The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.
19. In the "Visualization Toolbox", in the "Common Controls" category, drag the "Button" element to the visualization editor.
\(\Rightarrow\) The "Properties" view of the element opens.
20. Configure the fixed property values.

21. Configure the value for the "Text variables"->"Text variable" property.
```

=> PLC_PRG.asButtonText[$FIRSTDIM$, $SECONDDIM$]

```
22. Configure the value for the "Input configuration"->"Toggle"->"Variable" property.
```

A PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]

```

The button is configured as a template.
23. Click "Visualization \(\rightarrow\) Multiply Visu Element".
\(\Rightarrow\) The "Multiply Visu Element" dialog opens. The default values are derived from the array declarations.
"Total number of elements", "Horizontal" \(=2\)
"Total number of elements", "Vertical" \(=3\)
24. Declare the distance between the new elements.
\[
\begin{aligned}
\Rightarrow & \text { "Offset between elements", "Horizontal" = } 3 \\
& \text { "Offset between elements", "Vertical" }=3
\end{aligned}
\]
25. Check the advanced settings.
26. Click "OK" to confirm the selection.
\(\Rightarrow\) The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.

27. Build, start, and download the application.
\(\Rightarrow\) Visualization at runtime:

Array variable You can also configure the template element with array variables that have more than two with more than dimensions, but you can only assign placeholders to a maximum of two of the dimensions. In two dimensions the additional dimensions, the indexes are fixed.
```

Example Declaration

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    asText: ARRAY[1..2, 1..3, 1..6, 1..2] OF STRING;
    asText: ARRAY[1..2, 1..3, 1..6, 1..2] OF STRING;
    END_VAR
    END_VAR
Configure the "Text variables", "Tooltip variable" property for the template element:
PLC_PRG.asText[2, $FIRSTDIM$, $SECONDDIM$, 2]
```

Layout of a one- You can configure the template element with a one-dimensional array by means of the index dimensional array in a table access placeholder \$FIRSTDIM\$. If the number of new elements to be created is greater than five, then a tabular layout is preset in the "Multiply Visu Element" dialog. The layout of the new elements is as quadratic as possible.

## Example

```
PROGRAM PLC_PRG
VAR
    asText: ARRAY[1..100] OF STRING;
END_VAR
```

The default setting in the "Multiply Visu Element" dialog allows for a layout of 100 new elements in a $10 \times 10$ field.

### 6.4.5.12 Displaying data curve with trace

### 6.4.5.12.1 General

With this element, you can integrate a trace graph in the visualization that monitors and displays variable values permanently. You configure the displayed trace graph in the element properties. In addition, you can add control elements that control the trace functionality. This is done manually or by using the "Insert Elements for Controlling Trace" command.

Configurations for the 'Trace' visualization element can be taken from the 'Trace' object.

- $\Leftrightarrow$ Chapter 6.4.1.13.3 "Data Recording with Trace" on page 2007

### 6.4.5.12.2 Getting started with trace

## Create a project

with the fol-
PROGRAM PLC_PRG
lowing program VAR
PLC_PRG:
iVar : INT;
rSin : REAL;
rVar : REAL;
END_VAR

```
iVar := iVar + 1;
iVar := iVar MOD 33;
rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

1. In the device tree, select the application and add a new visualization by clicking "Project $\rightarrow$ Add Object $\rightarrow$ Visualization".
$\Rightarrow$ The respective visualization editor opens.
2. Add the "Visualization" object to the device tree below "Application".
$\Rightarrow$ An empty visualization appears.
3. Open "Toolbox $\rightarrow$ Special Controls".
4. Drag the "Trace" element to the visualization editor.
$\Rightarrow$ The element properties are displayed on the right side.
5. Click the symbol in the "Trace" property.
$\Rightarrow$ The "Trace Configuration" dialog opens.
6. Click "Add Variable" to add an entry to the tree view of the trace configuration and select a project variable (for example, PLC_PRG.rSin).
7. Click the top node of the trace configuration.
$\Rightarrow$ The group "Record Settings" is shown on the right.
8. Select the MainTask option for the "Task" setting.

Tip: The trace recording and the corresponding program should be executed in the same task.
9. Click "OK".
$\Rightarrow$ The task configuration is applied.
10. Select the trace element and click "Visualization $\boldsymbol{\rightarrow}$ Add Elements for Trace Control"
$\Rightarrow$ The "Trace Wizard" dialog opens. By default, all control elements are activated there.
11. Click " $O K$ " to close the dialog.
$\Rightarrow$ The control elements are added to the visualization and the control variables are declared. Then the control elements and the trace element are configured with the control variables.
12. Download the application to the controller and start it.

## Example

The PLC PRG program is running on the PLC. When you follow the "Getting Started" instructions, the following interface is displayed:

You can control the trace recording by clicking the buttons.

### 6.4.5.13 <br> Displaying data curve with trend

6.4.5.13.1

General
A trend visualizes data that is used in the database of a trend recording. In contrast to the trace element, the trend element is particularly appropriate for long-term data recording.

The visualization of a trend encompasses the Trend element and the control elements. The three possible control elements can be seen in the illustration.

- Legend (1): Outputs the trend variables with values.
- Time range picker (2): Provides buttons for selecting predefined time ranges.
- Date range picker (3): encompasses control elements for navigation and zooming in the historical and current data on basis of the set date range.
A cursor is optionally available that enables the reading of a value at a certain time.
You can execute a trend visualization in the following clients:
- Target visualization
- Integrated visualization

See also

- ${ }^{\text {y }}$ Chapter 6.4.5.20.1.46 "Visualization Element 'Time Range Picker'" on page 3306

### 6.4.5.13.2 Getting Started with Trend Visualization

When you execute a Trend, it is best to proceed with user guidance and the help of the trend wizard.

Development of a visualization with trend

1. Create an empty standard project and program at least one variable into PLC_PRG. $\Rightarrow$ PLC_PRG is declared and implemented
2. Add the "Visualization" object to the device tree below "Application".
$\Rightarrow$ An empty visualization appears.
3. Open "Toolbox $\rightarrow$ Special Control".
4. Drag the "Trend" element to the visualization $\Rightarrow$ The "Trend Recording" dialog opens with the "Recording Settings".
5. Select the task in which the trend recording will be executed.

In general the trend recording runs in the same task as the main program, i.e. PLC_PRG.

Therefore, select MainTask.
6. Add a trend variable with "Add Variable" and assign an IEC variable from PLC_PRG to the trend variable.
7. Click "OK" to close "Trend Configuration".
$\Rightarrow$ There is a newly created object of the type Trend recording under "Trend Recording Manager". The active visualization contains a "Trend" element that is selected.
8. Click "Visualization $\rightarrow$ Insert Elements for Controlling Trend Elements".
$\Rightarrow$ The "Trend Wizard" dialog box opens.
9. By default, all three control elements are activated in the dialog. Click "OK" to close the dialog box.
$\Rightarrow$ The active visualization contains a "Trend" with control elements.
10. Set the application containing the trend objects to active.
11. Compile the application with [F11].
12. Click "Online $\rightarrow$ Login".
13. Start the application with [F5].
$\Rightarrow$ The target visualization appears. The visualization contains the trend diagram with the value curve of the variable. The control elements enable user inputs.

« $\boldsymbol{y}^{2}$ Chapter 6.4.5.21.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 3360

```
Example: Visu-
alization of the
sinusoidal trend
of an IEC vari-
able.
- PLC_PRG
- Visualization_Trend1
able.
- VisuWithTrend
```

The following objects are implemented in the project:

```
PLC_PRG PLC_PRG runs as part of the application on the controller.
```

```
    PROGRAM PLC_PRG
VAR
        iVar : INT;
        rSin : REAL;
        rVar : REAL;
END_VAR
iVar := iVar + 1;
iVar := iVar MOD 33;
rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

Visualizatio Visualization_Trend1 is the object that contains the configuration of the trend recording. n_Trend1

VisuWithTren VisuWithTrend is the object that visualizes the trend.
d
The visualization contains four elements: one "Trend" and three control elements. The properties of the trend are defined as follows.

| Properties | Value |
| :--- | :--- |
| "Trend recording" | Visualization_Trend1 |
| "Display cursor" | $\checkmark$ |
| "Display tool tip" | $\boxed{ }$ |
| "Show frame" | $\boxed{ }$ |
| "Date Range Picker" | "㬂 Trend1DateRangeSelector |
| "Time Picker" | (2) Trend1TimeSelector |
| "Legend" | i Trend1Legend |

VisuWithTrend at runtime

### 6.4.5.13.3 Programming a Trend Visualization

To display a trend recording in the visualization, you define which application provides which trend recording. You define the display by means of the "Properties" of the trend element and the controls used.

## Defining the application and data source

The visualization task and the trend recording task generally run under the same application. If this is not the case, then the application containing the visualization task requires a data source manager.

1. Select a trend element in the active visualization editor.
$\Rightarrow$ The properties of the trend element are displayed on the right side.
2. Double-click the value field "Properties $\rightarrow$ Application".
3. Use the Input Assistant (...$)$ to select the application. You can also specify the name of the application directly.

See also

- Trend Recording
- Data Source Manager

## Adding a con-

 trol1. Select a trend element in the active visualization editor.
2. Click "Visualization $\rightarrow$ Insert Elements for Trend Controlling".
$\Rightarrow$ The "Trend Wizard" dialog opens.
3. Select the desired control. Examples: "Date Range Picker", "Time range Range Picker", "Legend". Click "OK" to confirm.
$\Rightarrow$ The selected controls are inserted for the trend element. You can move them to any position you like. In the "Properties" of the trend element, the controls are shown below "Assigned controls".

See also

- ${ }^{\text {® }}$, Chapter 6.4.5.21.2.18 "Command 'Insert Elements for Controlling the Trend"" on page 3360

## Defining the trend recording <br> to visualize

1. Select a trend element in the active visualization editor.
$\Rightarrow$ The properties of the trend element are displayed on the right side.
2. Click the value field of "Properties $\rightarrow$ Trend recording"
$\Rightarrow$ "Select trend recording" is displayed. The trend recordings available application-wide are listed under "Available trend recordings".
3. Select a trend record below "Available trend recordings".
4. Click $\rightarrow$.
$\Rightarrow$ The trend recording is located under "Selected trend recording".
5. Click "OK" to confirm the entry.
$\Rightarrow$ The selected trend recording is listed in "Values" in "Properties $\rightarrow$ Trend recording".

See also

- Trend Recording

A control that was added with the help of the "Trend Wizard" cannot be deleted via the Trend wizard dialog.

1. Select a control of a trend in the active visualization editor.
2. Press [Del] or "Delete" to delete the element.
3. Select the trend in the active visualization editor.
4. Delete the assigned value in "Properties $\rightarrow$ Assigned controls $\rightarrow$ <control>".

## NOTICE!

It is absolutely necessary to delete this reference manually. The property is not deleted automatically by deleting the control.

## Configuring the coordinate system of the trend diagram

1. Select a trend in the active visualization editor.
2. Use the "Visualization $\rightarrow$ Configure Trend Display Settings" command.
$\Rightarrow$ The "Display Settings" dialog opens.
3. Adapt the settings as needed.

See also

- \& Chapter 6.4.5.21.2.18 "Command 'Insert Elements for Controlling the Trend"" on page 3360

Reading a trend value at runtime

1. Open "View $\rightarrow$ Element Properties".
2. Select a trend element in your visualization.
$\Rightarrow$ The properties of the trend element are displayed on the right side.
3. Select the "Properties $\rightarrow$ Show cursor" option and "Show tooltip".
$\Rightarrow$ A cursor is drawn in the coordinate system.
4. Select the "Properties $\rightarrow$ Show tooltip" option.
5. Download the application to the controller and start the application.
6. 

If the diagram "runs", then the date range has been placed in such a way that its end time is the current time.

Select the date range so that the diagram does not run. If necessary, drag the scroll bar to an earlier date range.
$\Rightarrow$ A cursor is available. The tooltip of the cursor informs you of the trend values. For each trend variable, the legend displays the value at the point in time at which the cursor is positioned.

Deleting the You can insert an input element in the visualization which the operator can use to delete the trend recording history previous value recording in the trend visualization at runtime. The curve displayed until then is removed and the display starts over.

1. In the application (example: in the program PLC_PRG), implement the following code:
```
itfTrendRecording : ITrendRecording;
itfTrendStorageWriter : ITrendStorageWriter;
itfTrendStorageWriter3 : ITrendStorageWriter3;
sTrendRecordingName : STRING := 'TrendRecording';
itfTrendRecording :=
GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTr
endRecordingName));
xClearHistoryTrend: BOOL;
IF xClearHistoryTrend THEN
itfTrendRecording :=
GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTr
endRecordingName));
IF itfTrendRecording <> 0 THEN
    itfTrendStorageWriter :=
itfTrendRecording.GetTrendStorageWriter();
        IF QUERYINTERFACE(itfTrendStorageWriter,
itfTrendStorageWriter3) THEN
itfTrendStorageWriter3.ClearHistory();
            END IF
END IF
```

2. In the visualization of the trend recording, add a button for deleting the previous curve. Configure its "Toggle" property with the variable PLC_PRG.xClearHistoryTrend.
$\Rightarrow$ When xClearHistoryTrend is set to TRUE, the previously recorded curve is deleted. The recording immediately starts again.

### 6.4.5.14 Displaying and Editing Text Files

6.4.5.14.2 Configuring the Display of a Text File ..... 2934
6.4.5.14.3 Configuring the Editing of a Text File ..... 2937

### 6.4.5.14.1 General

With the help of the element "Text Editor" you can display a text file in the user interface and optionally also enable the user to edit the file.

### 6.4.5.14.2 Configuring the Display of a Text File

In order to display a text file that is located on the controller, you need not only the element "Text Editor", but also control elements for selecting, opening and closing the file. Optionally a text search function can be set up in the file with further control elements.
Example:

## Display File

Read-only mode

Configuring the element "Text Editor", example

1. Drag an element "Text Editor" into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the GVL object.
$\Rightarrow$ Refer to the declaration of the control variables for this.
3. For the "Text Editor", configure the property "Editing mode" with "Read only".
4. Also configure the property "Control variables".

Assign the following variables there:

- "Control variables $\rightarrow$ File $\rightarrow$ Variable" with g_sFileName
- "Control variables $\boldsymbol{\rightarrow}$ File $\rightarrow$ Open" with g_bFileOpen
- "Control variables $\rightarrow$ File $\rightarrow$ Close" with g_bFileClose
- "Control variables $\rightarrow$ File $\rightarrow$ New $\rightarrow$ Variable" with g_bFileNew
- "Control variables $\rightarrow$ File $\rightarrow$ Save $\rightarrow$ Variable" with g_bFileSave
- "Control variables $\rightarrow$ Edit $\rightarrow$ Variable" with g_sEditSearchFor
- "Control variables $\rightarrow$ Edit $\rightarrow$ Find" with g_bEditFind
- "Control variables $\rightarrow$ Edit $\rightarrow$ Find next occurrence" with g_bEditFindNext

Declaring the control variables

Configuring control elements for the file selection

## Control elements for searching for a text.

VAR_GLOBAL

```
```

g_sFileName: STRING := 'Readme.txt';

```
```

g_sFileName: STRING := 'Readme.txt';
g_bFileOpen : BOOL;
g_bFileOpen : BOOL;
g_bFileClose: BOOL;
g_bFileClose: BOOL;
g_bFileNew: BOOL;
g_bFileNew: BOOL;
g_bFileSave: BOOL;
g_bFileSave: BOOL;
g_sEditSearchFor : STRING;
g_sEditSearchFor : STRING;
g_bEditFind : BOOL;
g_bEditFind : BOOL;
g_bEditFindNext : BOOL;
g_bEditFindNext : BOOL;
g_usiErrorHandlingVarForErrorCode: USINT;
g_usiErrorHandlingVarForErrorCode: USINT;
g_bVarForContentChanged : BOOL;
g_bVarForContentChanged : BOOL;
g-bVarForReadWriteMode: BOOL;
g-bVarForReadWriteMode: BOOL;
ENDD VAR

```
```

ENDD VAR

```
```

1. Add an element "Label".
2. Configure the property "Texts $\rightarrow$ Text" with File:.
3. Add an element "Rectangle" next to it, in which the user can then enter the file name:
4. Configure the property "Texts $\rightarrow$ Text" with $\% s$ :
5. Configure the property "Texts $\rightarrow$ Text variable" with g_sFileName.
6. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Write a variable". In the dialog "Input Configuration", select "Text input" as the "Input type".

Activate the option "Use text output variable".
$\Rightarrow$ The rectangle for the input of the file name is configured.
7. Add an element "Button" for opening the file.
8. Configure the property "Texts $\rightarrow$ Text" with Open:
9. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bFileOpen as a variable.
$\Rightarrow$ The button Open is configured.
10. Add a further element "Button" for closing the file.
11. Configure the property "Texts $\rightarrow$ Text" with Close:
12. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bEditFile as a variable.
$\Rightarrow$ The button Close is configured.

1. Add an element "Label".
2. Configure the property "Texts $\rightarrow$ Text" with Text: .
3. Alongside it, add an element "Rectangle" for the input of the text to be found.
4. Configure the property "Texts $\rightarrow$ Text" with $\% \mathrm{~s}$ :
5. Configure the property "Texts $\rightarrow$ Text variable" with g_sEditSearchFor.
6. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Write a variable". In the dialog "Input Configuration", select "Text input" as the "Input type".

Activate the option "Use text output variable".
$\Rightarrow$ The rectangle is configured.
7. Add an element "Button" for starting the search.
8. Configure its property "Texts $\rightarrow$ Text" with Find.
9. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable". Assign g_bEditFind as a variable.
10. Also add the action "Execute ST-Code".

Program the action with: g_bEditFindNext := FALSE;
$\Rightarrow$ The button is configured.
11. Add a further element "Button".
12. Configure the property "Texts $\rightarrow$ Text" with Find next.
13. Configure the property "Input Configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bEditFind as a variable.
14. Also add the action "Execute ST code".

Program: g_bEditFindNext := TRUE;
$\Rightarrow$ The button is configured.

### 6.4.5.14.3 Configuring the Editing of a Text File

In order to be able to create a new text file or edit an existing one on the controller with the "Text Editor" in the user interface, you need not only the element "Text Editor", but also control elements for selecting, opening, closing, saving and creating a file.

Example:

## Configuring the

 element "Text Editor", example:1. Drag an element "Text Editor" into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the GVL object.
$\Rightarrow$ Refer below to the declaration of the control variables for this.
3. For the "Text Editor", configure the property "Editing mode" with "Read/Write".

Declaring the control variables
4. Also configure the property "Control variables".

Assign the following variables there:

- "Control variables $\rightarrow$ File $\rightarrow$ Variable" with g_sFileName
- "Control variables $\rightarrow$ File $\rightarrow$ Open" with g_bFileOpen
- "Control variables $\rightarrow$ File $\rightarrow$ Close" with g_bFileClose
- "Control variables $\rightarrow$ File $\rightarrow$ Save" with g_bFileSave
- "Control variables $\rightarrow$ File $\rightarrow$ New" with g_FileNew

VAR_GLOBAL

```
g_sFileName: STRING := 'Readme.txt';
g_bFileOpen : BOOL;
g_bFileClose: BOOL;
g_bFileSave: BOOL;
g_FileNew: BOOL;
g_usiErrorHandlingVarForErrorCode: USINT;
g_bVarForContentChanged : BOOL;
g_bVarForReadWriteMode: BOOL;
ENDD_VAR
```

Configuring control elements for file selection

1. Add an element "Label".
2. Configure it in the property "Texts $\rightarrow$ Text" with File:
3. Add an element "Rectangle" next to it.
4. Configure its property "Texts $\rightarrow$ Text" with $\% s$.
5. Configure its property "Texts $\rightarrow$ Text variable" with g_sFileName.
6. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Write a variable". In the dialog "Input Configuration", select "Text input" as the "Input type".

Activate the option "Use text output variable".
$\Rightarrow$ The rectangle for the input of the file name is configured.
7. Add an element "Button".
8. Configure its property "Texts $\rightarrow$ Text" with New.
9. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bFileNew as a variable.
$\Rightarrow$ The button New is configured.
10. Add a further element "Button".
11. Configure the property "Texts $\rightarrow$ Text" with Open:
12. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bFileOpen as a variable.
$\Rightarrow$ The button Open is configured.
13. Add a further element "Button".
14. Configure its property "Texts $\rightarrow$ Text" with Save.
15. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable".

Assign g_bFileSave as a variable.
$\Rightarrow$ The button Save is configured.
16. Add a further element "Button".
17. Configure its property "Texts $\rightarrow$ Text" with Close.
18. Configure the property "Input configuration $\rightarrow$ OnMouseclick" with "Toggle a variable". Assign g_bEditFile as a variable.
$\Rightarrow$ The button close is configured.

See also

- \& Chapter 6.4.5.20.1.41 "Visualization Element 'Text Editor"' on page 3274

### 6.4.5.15 Configuring a variable assignment with unit conversion

A variable that was assigned in a visualization can be linked with a unit conversion. This causes the variable value to be converted according to a predefined rule and the result is edited in the visualization.

You have already configured the conversion rules in the editor of an object of the type "Unit Conversion".

See also
-

## Linking a vari- <br> able with unit <br> conversion

$\checkmark$ Requirement: A project with a visualization is open. In addition, the application contains the object UnitConversion with the rule convert_A.

1. Select an element.
$\Rightarrow$ The view "Properties" opens.
2. When assigning a variable, link the variable iVar_A with a rule of the unit conversion:
convert_A.convert(iVar_A)
3. Compile, load and start the application.
$\Rightarrow$ The application runs. The visualization opens. The unit conversion is applied.
6.4.5.16 Using recipes in visualization elements

You can manage and use the recipes created in CODESYS by means of a visualization. For this purpose, the input configuration of a visualization element provides the following commands:

- "Read Recipe"
- "Write Recipe"
- "Load Recipe from File"
- "Save Recipe to File"
- "Create Recipe"
- "Delete Recipe"

See also

- ${ }^{4}$ Chapter 6.4.1.13.2.4 "Changing Values with Recipes" on page 2003
- ${ }^{\bullet}$, Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration'" on page 3370

## Example: <br> Loading recipes by means of visualization elements <br> Requirement: The "Visualization" object is added to the project. <br> 

1. Create a recipe according to the instructions in the section "Changing Values with Recipes - Creating Recipes".

Assign the following names:

- Recipe definition: "Recipes"
- Recipes: "Recipe1" and "Recipe2"
- Variables: iValue1 and iValue2

Type in different variable values of both recipes.
2. Open the "Visualization" object in the editor.
3. Drag a "Button" element to the visualization. Label it "Load Recipe 1". You can specify the text by double-clicking the element or in the "Texts $\rightarrow$ Text" property.
4. Click the value field of the "Input configuration": "OnMouseDown" property.
$\Rightarrow$ The "Input Configuration" dialog box opens.
5. Select "Execute command" in the left of the left side and click the button ${ }_{2}$
$\Rightarrow$ The configuration of the "Internal command" opens on the right side of the dialog.
6. Select the "Write Recipe" command from the drop-down list.
7. Click the $+{ }_{+}$button.
$\Rightarrow$ The "WriteRecipe" command is added to the list.
8. Specify the first parameter as Recipes and the second parameter as Recipe1.
9. Click "OK" to close the dialog box.
10. Drag a second button to the visualization, name it "Load Recipe 2", and repeat steps 4 to 8. For step 7, specify Recipe 2 as the second parameter.
11. Load the program to the controller and start it Click the "Load Recipe 1" and "Load Recipe 2", and monitor the variables iValue1 and iValue2.

The other recipe commands are assigned to visualization elements as described in this example. Refer to the help page of the input configuration for a description of the internal commands.

### 6.4.5.17 Creating a structured user interface

### 6.4.5.17.1 General

You can reference visualizations that are available or exist in the project in another visualization and thus reuse them. You obtain a structured user interface that consists of several visualizations. In principle you have the following possibilities to reference visualizations.
On the one hand you can display visualizations within a main visualization and toggle between them. The element "Frame" or "Tabs" serves here as a window area element that defines the display area for the referenced visualizations.
On the other hand you can configure a user input for a visualization that causes another visualization to open as a dialog. The requirements for this is that it has the visualization type "Dialog". A dialog is used to collect inputs from the user.
In addition, you can declare an interface for a visualization that is to be referenced in order to vary the display of the visualization at runtime. A visualization is thereby instanced with different data and executed.

- ${ }^{*}>$ Chapter 6.4.5.20.1.6 "Visualization Element 'Frame'" on page 3053
- «y Chapter 6.4.5.20.1.10 "Visualization Element 'Tabs'" on page 3084

### 6.4.5.17.2 Displaying Multiple Visualizations in One Visualization

You can reference other visualizations within a main visualization either in a "Frame" or a "Tabs" element, and then display them in the window pane of the element.

In the case of the "Frame" element, you can freely program which of the visualizations is displayed at which time. One option is to use the switch frame variable of the "Frame" element, which automatically triggers a switch according to its value. You can also program additional controls which, after user input, trigger input actions that result in switching a visualization.

## NOTICE!

Visualizations can be nested at any depth by means of "Frame" elements. In order to use the "Switch to any visualization" frame selection type without any problems, a "Frame" must not contain more than 21 referenced visualizations.
For more information, see also the description for the "Input configuration" of an element: Action "Switch frame visualization".

Moreover, you can use the "Tabs" to reference visualizations. It is easy and advantageous that the "Tabs" element provides preconfigured control of the visualization switch.

In CODESYS Forge, you will find the sample project "Visualization Switching". There you will see a visualization that displays other visualizations in a frame area one after another at runtime. The visualization switch is controlled either by the user, programmatically, or via the FrameManager.

Switching frame visualizations by means of a variable

Connecting frame visualizations with a radio buttons element

In the main visualization, the "Frame" element displays one of the referenced frame visualizations at runtime. The user can select the "Radio Buttons" element which is displayed in the frame.

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
3. In the "Add Visualization" dialog, specify the name VisuMain and click "Add" to close the dialog.
4. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
5. In the "Add Visualization" dialog, specify the name Visu1 and click "Add" to close the dialog.
6. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
7. In the "Add Visualization" dialog, specify the name Visu2 and click "Add" to close the dialog.
8. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
9. In the "Add Visualization" dialog, specify the name Visu3 and click "Add" to close the dialog.
$\Rightarrow$ In addition to the main visualization, there are three more visualization objects.
10. Open the Visul object.
11. In the "Visualization Toolbox", in the "Basic" category, select and drag the "Radio Buttons" element to the visualization editor.
$\Rightarrow$ The "Properties" view of the element opens.
12. Configure the properties of the rectangle as follows:

- Property "Texts", "Text" = Visu1
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Light gray"

13. Program the object Visu2 accordingly.

Properties of the rectangle:

- Property "Texts", "Text" = Visu2
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Gray"

14. Program the object Visu3 accordingly.

Properties of the rectangle:

- Property "Texts", "Text" = Visu3
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Dark gray"

15. Open the VisuMain object.
16. In the "Visualization Toolbox", in the "Basic" category, select and drag the "Frame" element to the visualization editor.
$\Rightarrow$ The "Frame Configuration" dialog opens.
17. In the "Available Visualizations" window area, on the "By Visualization Name" tab, select the object Visu1. In "Selected Visualizations", click "Add".
18. Then select the object Visu2 and click "Add" in "Selected Visualizations".
19. Then select the object Visu3 and click "Add" in "Selected Visualizations".
20. Click "OK" to exit the dialog.
$\Rightarrow$ Now the "Frame" element references the three selected visualizations. The references (1) are listed in the "References" property in the element properties of the "Frame" element. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog when you click the "Configure" button in the value field of the "References" property. See (3). You can influence the index by means of the visualization order in the "Selected Visualizations" list.
21. In the "Visualization Toolbox", in the "Common Controls" category, drag the "Radio Buttons" element to the visualization editor.
$\Rightarrow$ The "Properties" view of the element opens.
22. In the "Radio button settings", "Radio button", click the "Create new" button.
$\Rightarrow$ This element has three switches to select from.
23. Configure the properties of the radio button as follows:

- Property "Radio button settings", "Areas", "[0]", "Text" = Visu1
- Property "Radio button settings", "Areas", "[1]", "Text" = Visu2
- Property "Radio button settings", "Areas", "[2]", "Text" = Visu3

| Typ | $X$ | $Y$ | Breite | Höhe |
| :---: | :--- | :--- | :--- | :--- |
| $\langle$ \#0 Frame | 10 | 10 | 160 | 110 |
| \#1 Radiobutton | 200 | 20 | 100 | 100 |

24. In the PLC_PRG program, declare a local variable for the number of the visualization that is active.

```
=>
    VAR
        iActiveVisu : INT; // Index of visu activated by the user
    END_VAR
```

25. Select the "Radio Buttons" element. In the value field of the "Variable" property, click $\qquad$
26. In the "Input Assistant" dialog, select the recently declared variable. Then exit the dialog. $\Rightarrow$ Property of the "Radio Buttons" element:

- Property "Variable" = PLC_PRG. iActiveVisu

27. Select the "Frame" element. Click in the value field of the "Switch frame variable", "Variable" property. Specify the recently declared variable here as well.
$\Rightarrow$ Property of the "Frame" element:

- Property "Switch frame variable", "Variable" = PLC_PRG.iActiveVisu

The control variable of the "Radio Buttons" element is also the switch frame variable of the "Frame" element. User input for the "Radio Buttons"element switches the frame visualization.
28. Click "Build $\rightarrow$ Generate Code".
29. Click "Online $\rightarrow$ Login" and start the application.
$\Rightarrow$ The visualization starts. One of the referenced visualizations is running in the frame. When you click an unselected option of the "Radio Buttons" element, the visualization switches the contents in the frame to the desired visualization.

In the example, the switch frame variable is connected to an input variable. Instead, you can also set the switch frame variable programmatically in the IEC code.

## Switching frame visualizations by means of a follow-up action <br> Programming a visualization

In the main visualization, the "Frame" element displays one of the frame visualizations at runtime. The user can use buttons to control the display in the frame. The user input triggers the "Switch frame visualization" input action.

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
3. In the "Add Visualization" dialog, specify the name VisuMain and click "Add" to close the dialog.
4. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
5. In the "Add Visualization" dialog, specify the name Visu1 and click "Add" to close the dialog.
6. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
7. In the "Add Visualization" dialog, specify the name Visu2 and click "Add" to close the dialog.
8. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
9. In the "Add Visualization" dialog, specify the name Visu3 and click "Add" to close the dialog.
$\Rightarrow$ In addition to the main visualization, there are three more visualization objects.
10. Open the Visul object.
11. In the "Visualization Toolbox", in the "Basic" category, select and drag the "Rectangle" element to the visualization editor.
$\Rightarrow$ The "Properties" view of the element opens.
12. Configure the properties of the rectangle as follows:

- Property "Texts", "Text" = Visu1
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Light gray"

13. Program the object Visu2 accordingly.
$\Rightarrow$ Properties of the rectangle:

- Property "Texts", "Text" = Visu2
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Gray"

14. Program the object Visu3 accordingly.
$\Rightarrow$ Properties of the rectangle:

- Property "Texts", "Text" = Visu3
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Dark gray"

15. Open the VisuMain object.
16. In the "Visualization Toolbox", in the "Basic" category, select and drag the "Frame" element to the visualization editor.
$\Rightarrow$ The "Frame Configuration" dialog opens.
17. In the "Available Visualizations" window area, on the "By Visualization Name" tab, select the object Visu1. In "Selected Visualizations", click "Add".
18. Then select the object Visu2 and click "Add" in "Selected Visualizations".
19. Then select the object Visu3 and click "Add" in "Selected Visualizations".
20. Click "OK" to exit the dialog.
$\Rightarrow$ Now the "Frame" element references the three selected visualizations. The references (1) are listed in the "References" property in the element properties of the "Frame" element. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog independently when you click the "Configure" button in the value field of the "References" property. See (3). You can influence the index by means of the visualization order in the "Selected Visualizations" list.
21. In the "Visualization Toolbox", in the "Common Controls" category, drag the "Button" element to the visualization editor.
$\Rightarrow$ The element is selected and its properties are visible in the "Properties" view.
22. Configure the "Texts", "Text" property with Visu1.
23. In the "Input configuration""OnMouseDown" property, click "Configure".
$\Rightarrow$ The "Input Configuration" dialog opens.
24. Select the "Switch frame visualization" action and click $\square$.
$\Rightarrow$ The action is displayed in the window on the right.
25. Configure the action:

- Select the "Switch local visualization" option.
- Set the "Visualization selection" to Visu1.
- Click "OK" to exit the dialog.
$\Rightarrow$ The follow-up action is configured in the "Input configuration" property.
Property "Input configuration", "OnMouseDown", "Switch frame visualization" $=0$

26. Drag another "Button" element to the visualization editor. Configure the button accordingly. $\Rightarrow$ Properties of the button:

- Property "Texts", "Text" = Visu2
- Property "Input configuration", "OnMouseDown", "Switch frame visualization" = 1

27. Drag another "Button" element to the visualization editor. Configure the button accordingly. $\Rightarrow$ Properties of the button:

- Property "Texts", "Text" = Visu3
- Property "Input configuration", "OnMouseDown", "Switch frame visualization" = 2

28. Click "Build $\rightarrow$ Generate Code".
29. Click "Online $\rightarrow$ Login" for the device and start the application.
$\Rightarrow$ The visualization starts. One of the referenced visualizations is running in the frame. When you click one of the buttons, the visualization switches the contents in the frame to the respective visualization.

Displaying visu- For the "Tabs", the navigation of the referenced visualizations is provided automatically. The first tabs element
Configuring a tabs element
alizations on a of the referenced visualizations is in the foreground, while the others are hidden behind it. The user can navigate between them by means of the tabs which are provided automatically.

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
3. In the "Add Visualization" dialog, specify the name VisuMain and click "Add" to close the dialog.
4. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
5. In the "Add Visualization" dialog, specify the name Visul and click "Add" to close the dialog.
6. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
7. In the "Add Visualization" dialog, specify the name Visu2 and click "Add" to close the dialog.
8. Select the application in the device tree and click "Add Object $\rightarrow$ Visualization".
9. In the "Add Visualization" dialog, specify the name Visu3 and click "Add" to close the dialog.
$\Rightarrow$ In addition to the main visualization, there are three more visualization objects.
10. Open the Visul object.
11. Drag a "Rectangle" element to the visualization editor.
$\Rightarrow$ The "Properties" view of the element opens.
12. Configure the properties of the rectangle as follows:

- Property "Texts", "Text" = Visu1
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Light gray"

13. Program the object Visu2 accordingly.
$\Rightarrow$ Properties of the rectangle:

- Property "Texts", "Text" = Visu2
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Gray"

14. Program the object Visu3 accordingly.
$\Rightarrow$ Properties of the rectangle:

- Property "Texts", "Text" = Visu3
- Property "Text properties", "Font" = "Title"
- Property "Colors", "Normal state", "Fill color" = "Dark gray"

15. Open the VisuMain object.
16. In the "Visualization Toolbox", in the "Basic" category, select and drag the "Frame" element to the visualization editor.
$\Rightarrow$ The "Frame Configuration" dialog opens.
17. In the "Available Visualizations" window area, on the "By Visualization Name" tab, select the object Visu1. In "Selected Visualizations", click "Add".
18. Then select the object Visu2 and click "Add" in "Selected Visualizations".
19. Then select the object Visu3 and click "Add" in "Selected Visualizations".
20. Click "OK" to exit the dialog.
$\Rightarrow$ Now the "Tabs" element references the three selected visualizations. The references (1) are listed in the "References" property in the element properties of the "Frame" element. In addition to the visualization name, the corresponding index value (2) is also displayed.

Note: You can open the dialog "Frame Configuration" dialog independently when you click the "Configure" button in the value field of the "References" property. See (3). You can influence the index by means of the visualization order in the "Selected Visualizations" list.
21. In the "Visualization Toolbox", in the "Common Controls" category, drag the "Tabs" element to the visualization editor.
$\Rightarrow$ The "Properties" view of the element opens.
22. Configure the properties of the tab as follows:

- Property "Tab width": 40
- Property "References", Visu1, "Header" = Visu1
- Property "References", Visu2, "Header" = Visu2
- Property "References", Visu3, "Header" = Visu3

| Type | $X$ | $Y$ | Width | Height |
| ---: | :--- | :--- | :--- | :--- |
| $\square$ \#0 Tab control | 10 | 10 | 250 | 150 |

## Visu1 $\mid$ Visu2 $\mid$ Visu3 $\mid$

23. Click "Build $\rightarrow$ Generate Code".
24. Click "Online $\rightarrow$ Login" for the device and start the application.
$\Rightarrow$ The visualization starts. One of the referenced visualizations is running in the "Tabs" element. Click the tab to switch to the respective visualization.

### 6.4.5.17.3 Calling a Visualization with an Interface

You can declare an interface for parameters for a visualization that is to be referenced. The actual parameters are passed to the interface (similar as in the case of a function block) when the visualization is called at runtime.

First of all, declare the interface variables in the visualization interface editor. Then configure the parameters that are transferred to the interface by assigning a data-type-compliant application variable to each interface variable. The assignment is configured in the "References" property in the case of a "Frame" or a "Tabs".

Depending on the display variant, the parameter transfer of local variables (with the VAR scope) is limited. If you execute the visualization as an integrated visualization, you can only transfer local variables having a basic data type as parameters. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then you can also transfer parameters with a user-defined data type.

| User-controlled | If you have configured visualization references and then save a change to the variable dec- <br> update of the <br> laration for one of these visualizations in an interface editor, then the "Updating the Frame |
| :--- | :--- |
| transfer parame- | Parameters" dialog appears automatically. The dialog prompts you to edit the references. A |
| ters | list of all the visualizations affected is displayed there, so that the parameter transfers can be <br> reassigned at the changed interface. |
|  | When the dialog is closed, the changes are accepted and the elements affected are displayed in |
| the "References" property. |  |

## Calling visualization with interface <br> (VAR_IN_OUT)

$\checkmark$ Requirement: The project contains a visualization and a main visualization. The main visualization contains an element that the visualization references.

1. Open the visualization.
2. Click "Visualization $\rightarrow$ Interface Editor".
3. Declare a variable in the interface editor.
$\Rightarrow$ The visualization has an interface and the "Updating the Frame Parameters" dialog appears.
4. Assign a type-compliant transfer parameter to the interface variables in all calls by entering an application variable in "Value". Close the dialog.
$\Rightarrow$ A transfer parameter is assigned at the points where the visualization is to be referenced. These now appear in the main visualization in the "References" property.

```

Main visualization visMain at runtime:

Printing the instance name of a transfer parameter

In order to obtain and output the instance name of a transfer parameter, you can implement an interface variable (data type STRING) with the pragma \{attribute 'parameterstringof'\} in the VAR_INPUT scope.
\(\checkmark \quad\) The project contains a visualization and a main visualization. The main visualization contains elements that the visualization references.
1. Open the visualization.
2. Click "Visualization \(\rightarrow\) Interface Editor".
3. Declare an interface variable (VAR_IN_OUT).
\[
\Rightarrow \text { pieToDisplay : DATAPIE; }
\]
4. In the interface editor, declare a variable (VAR_INPUT) with attribute \{attribute
'parameterstringof'\}.
```

=> {attribute 'parameterstringof' := 'pieToDisplay'}
sNameToDisplay : STRING;

```
5. Save the changes.
\(\Rightarrow\) The "Updating the Frame Parameters" dialog does not open.
6. Insert a "Text Field" element.
7. In the "Texts", "Text" property, assign an output text to the text field.
```

=> Visualization of %s

```
8. In the "Text variables""Text variable" property, assign the interface variable to the text field.
```

g sNameToDisplay
visPie has a heading.

```

Example The visPie visualization consists of one pie until now. The visMain main visualization calls visPie in a "Tabs" control three times with different transfer parameters.

The visPie is extended with a text field that outputs the name of the parameters actually passed to the visualization. For this, the interface of visPie is extended with a string variable that contains the instance name of the specified transfer parameter. At runtime, each pie is overwritten.

Table 624: Properties of the "Text field" element:
\begin{tabular}{|l|l|}
\hline "Texts", "Text" & Visualization of \%s \\
\hline "Text variables", "Text variable" & sNameToDisplay \\
\hline
\end{tabular}

Interface of the 'visPie' visualization:
```

VAR_INPUT
{attribute 'parameterstringof' := 'pieToDisplay'}
sNameToDisplay : STRING;
END VAR
VAR IN OUT
piēToDisplay : DATAPIE;
END_VAR

```

- \(\quad \stackrel{y}{c}\) Chapter 6.4.5.21.3.3 "Dialog 'Update Frame Parameters'" on page 3367

\subsection*{6.4.5.17.4 Calling a dialog in a visualization}

You can configure a user input for a visualization that causes a referenced visualization to open as a dialog. For example, a user clicks on a button, whereupon a dialog opens requesting the input of values. A dialog is used to collect user inputs and, if it is modal, it can lead to inputs outside the dialog being blocked.

Only visualizations with the visualization type "Dialog" can be opened as dialog. The visualization type is configured in the dialog "Properties" of a visualization object.
Basic procedure:
\(\checkmark\) Requirement: The project contains a main visualization and a dialog.
1. Configure a user input for the main visualization with the action "OpenDialog" for the dialog.
\(\Rightarrow\) The opening of the dialog is configured.
2. Configure a user input for an element of the dialog with the action "CloseDialog".

Hint: in the case of non-modal dialogs you can also configure the user input for closing outside the dialog.
\(\Rightarrow\) The closing of the dialog is configured.

You can also use dialogs from the library instead of self-made dialogs. For example, if the library VisuDialogs is integrated in the project, you can use the dialogs VisuDialogs. Login or VisuDialogs. FileOpenSave contained in it.

See also
- \(\Rightarrow\) Chapter 6.4.5.6 "Configuring user inputs" on page 2885
- \({ }^{\bullet} \boldsymbol{y}\) Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration'" on page 3370
- ② Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

\section*{Configuring a}
visualization
object as a
dialog
1. Select the object in the view "Devices", open the context menu and select the command "Properties".
2. Select the tab "Visualization".
3. Activate the option "Dialog" and close the dialog with "OK".
\(\Rightarrow\) The visualization has the visualization type "Dialog" and can be called as such.

\section*{Configuring a dialog call}

When calling a dialog, a user normally clicks on a button, whereupon a dialog opens requesting an input.

In the following example, a dialog representing a calendar enables a date to be entered.
\(\checkmark\) Requirement: The project contains the visualizations visMain and dlgCalender.
1. Set the visualization type of dlgCalender to Dialog.
2. Drag a rectangle into the visualization visMain.
3. Configure the property "Texts \(\rightarrow\) Text" with the text Due Date: \%t [yyyy-MM-dd]. Configure the property "Text variables \(\rightarrow\) Text variable" with PLC_PRG. dateDue.
4. Drag a button into the visualization.
5. Configure the property "Texts \(\rightarrow\) Text" with the text Open dialog.

Configure the property "Input configuration \(\rightarrow\) OnMouseClick" for the action "Open Dialog" with dlgCalender.
\(\Rightarrow\) The user input for the opening of the dialog is configured.
6. Double-click on the dialog dlgCalender.
7. Drag the element "Date picker" into the visualization editor.
8. Configure the property "Texts \(\rightarrow\) Text" with Due Date: \%t [yyyy-MM-dd]. Configure the property "Variable" with PLC_PRG. dateCalender. \(\Rightarrow\) The element is configured.
9. Drag a button into the visualization editor.
10. Configure the property "Texts \(\rightarrow\) Text" with OK:
11. Configure the property "Input configuration \(\rightarrow\) OnMouseClick"for the action "Close Dialog "with dlgCalender, Result: OK.
12. Configure a further property "Input configuration \(\rightarrow\) OnMouseClick" for the action "Execute ST-Code" with PLC_PRG.dateDue := PLC_PRG.dateCalendar;
\(\Rightarrow\) The user input for the closing of the dialog is configured.
13. Drag a further button into the visualization editor.
14. Configure the property "Texts \(\rightarrow\) Text" with Cancel:
15. Configure the property "Input configuration \(\rightarrow\) OnMouseClick" for the action "Close Dialog "with dlgCalender, Result: Cancel.
\(\Rightarrow\) The user input for the cancellation of the dialog is configured.
17. Compile, load and start the application.

\section*{Due date: 2016-04-21}

Variable decla- PROGRAM PLC_PRG

\section*{ration:}
```

VAR
dateDue : DATE := DATE\#2000-01-01;
dateCalendar : DATE;
END_VAR

```

Opening a Normally a dialog appears only on the display variant on which the user has executed the dialog globally triggering event.
However, you can configure the opening of the dialog in such a way that the dialog appears simultaneously on all active display variants configured under the visualization manager. This way, for example, an input request can appear simultaneously on all display variants although a user only entered something on the CODESYS TargetVisu.

If a user closes the dialog on a CODESYS TargetVisu display variant, it will be closed on all display variants.

Implementing an application access to a dialog

Implementing an application access to the dialog Login from the library VisuDialogs:

In the application code you can implement the access to a dialog that is managed in the dialog manager. The dialog manager automatically instances and manages all visualizations of the type "Dialog". The access takes place via the internal visualization manager.
First of all, implement the access to the dialog manager by calling the GetDialogManager () method of the internal visualization manager. You can then use the methods of the dialog manager to program the program sequence of a dialog.
In the following example a button is configured so that it opens the preconfigured dialog Login when clicked on. The user can enter a name and a password in the dialog. The dialog Login is contained in the library VisuDialogs. You can also call a self-made dialog in the same way.
\(\checkmark\) Requirement: The library VisuDialogs is integrated in the project.
1. Insert a new visualization visMain under the application.
\(\Rightarrow\) The visualization editor opens.
2. Drag a button into the visualization editor.
3. Enter in its property "Text"Login.
\(\Rightarrow\) The button is labelled.
4. Click on "Configure "in the property "Input configuration \(\rightarrow\) OnMouseDown".
5. Select the input action "Execute ST-Code" and click on \(\triangle\).
6. Enter the following function call in the ST editor: OpenLoginDialog (pClientData) ;
\(\Rightarrow\) The main visualization contains a button. If a user clicks on the button, the dialog Login opens and the function OpenLoginDialog() is called.
7. Click on "Configure "in the property "Input configuration \(\rightarrow\) OnDialogClosed".
8. Select the input action "Execute ST-Code" and click on \(\rightarrow\).
9. Enter the following function call in the ST editor:

OnLoginDialogClosed (pClientData);
\(\Rightarrow\) If a user closes the dialog, the function OnLoginDialogClosed () is called.

Login

Implementation of the function OpenLoginDialog():

VAR INPUT
pClíentData : POINTER TO VisuStructClientData; END_VAR

VAR
dialogMan : IDialogManager;
loginDialog : IVisualisationDialog;
pLoginInfo : POINTER TO Login_VISU_STRUCT; //
Login_VISU_STRUCT contains the parameters defined in the interface of visualizatīon "Login".
result : Visu_DialogResult;
stTitle : STRĪNG := 'Login ...';
stPasswordLabelText: STRING;
stUserLabelText: STRING;
stUsername: STRING;
END_VAR
dialogMan := g_VisuManager.GetDialogManager(); // The
DialogManager is provided via the implicitly available VisuManager
IF dialogMan <> 0 AND pClientData <> 0 THEN loginDialog :=
dialogMan.GetDialog('VisuDialogs.Login'); // Dialog to be opened is specified

IF loginDialog <> 0 THEN
pLoginInfo :=
dialogMan.GetClientInterface(loginDialog, pClientData);
IF pLoginInfo <> 0 THEN // In the following the parameters of the login dialog in the Login_VISU_STRUCT will be read pLoginInfo^.stTitle := stTitle;
pLoginInfo^.stPasswordLabelTxt := stPasswordLabelText; pLoginInfo^.stUserLabelTxt := stUserLabelText; dialogMan. OpenDialog(loginDialog, pClientData, TRUE,
\(0)\);
END_IF
END_IF
END_IF

OnLoginDialogClosed() defines the reaction to the closing of a dialog.

\section*{Implementation of the function OnLoginDialog Closed () :}
```

FUNCTION OnLoginDialogClosed : BOOL
VAR INPUT
pClientData : POINTER TO VisuStructClientData;
END_VAR
VAR
dialogMan : IDialogManager;
loginDialog : IVisualisationDialog;
pLoginInfo : POINTER TO Login_VISU_STRUCT;
result : Visu_DialogResult;
stPassword: STTRING;
stUsername: STRING;
END_VAR
dialogMan := g_VisuManager.GetDialogManager(); // The
DialogManager is provided via the implicitly available VisuManager
IF dialogMan <> 0 AND pVisuClient <> 0 THEN
loginDialog :=
dialogMan.GetDialog('VisuDialogs.Login'); // Gets the login dialog
IF loginDialog <> 0 THEN
result := loginDialog.GetResult(); // Gets the result
(OK, Cancel) of the dialog
IF result = Visu_DialogResult.OK THEN
loginDialog.SetResult(Visu_DialogResult.None); //
Reset to default (none)
pLoginInfo :=
dialogMan.GetClientInterface(loginDialog, pVisuClient); // Structure
Login_VISU_STRUCT gets read;
// In the following the structure parameters can be
set
IF pLoginInfo <> 0 THEN
stPassword :=

```
```

pLoginInfo^.stPasswordpLoginInfo^.stPassword := ''; // Reset the
passwword
stUsername := pLoginInfo^.stUsername;
END IF
ELS\overline{IF result = Visu_DialogResult.Cancel THEN}
loginDialog.SetResult(Visu_DialogResult.None); / /
React on 'Cancel'
ELSE
// nothing to do
END IF
END_IF
END_IF

```

\subsection*{6.4.5.17.5 Calling a Dialog with an Interface}

You can define an interface for a visualization that is called as a dialog.
Create a visualization for this with visualization type "Dialog" and declare an interface for the dialog. The reference the visualization in a primary visualization by means of a user input and transfer the parameters to the interface.
If you call the visualization as an integrated visualization, then the parameter that are transferred must be variables of a basic data type. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then the parameters can have user-defined data types as well.
See also
- * "Scopes" on page 3340
- © Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

\section*{Main procedure}
1. Set the visualization types of the visualization to dialog.
2. Declare variables in the interface editor of the dialog.
\(\Rightarrow\) The dialog has an interface. You can transfer parameters when calling the dialog.
3. Configure the elements of the dialog and use the interface variables.
4. Select an element in another visualization (usually the main visualization) for configuring how the dialog opens.
5. Click "Configure" in the property "Input configuration \(\rightarrow\) OnMouseDown". \(\Rightarrow\) The "Input Configuration" dialog box opens.
6. Select "Open dialog" in the list of selected input actions.
7. Select one from the "Dialog" drop-down list. \(\Rightarrow\) If the selected dialog has an interface, then the interface variables are listed below.
8. Assign a transfer parameter to the interface variables in the "Value" column.
9. Select the result for which the parameters were updated in the list "Update" "o "and" "on "Parameter in case of results".
10. Activate the option "Open dialog modal". Click "OK" to close the dialog box. \(\Rightarrow\) The dialog opening is configured.

Executing a dialog several times at the same time requires multiple instances of the dialog. These must have already been downloaded to the visualization device when downloading the application. For this purpose, set the number of instances to download in the visualization manager ("Visualizations" tab).

code PLC_PRG:
```

PROGRAM PLC_PRG
VAR
iLevel: INT;
sPwd : STRING;
END_VAR

```

After clicking " \(O K\) ", the selection is applied.

\section*{visMain \(\times\)}

The example shows the procedure for multiple return values. However, the password can be returned more easily with a local variable in the dialog.

Accessing The variables declared in the interface of a visualization are available automatically as structure parameters programmatically variables. They are identified by <Name of visualization>_VISU_STRUCT. Therefore, you can access the interface variables of visualizations that appear as a dialog. Normally you use the structure in the application code of a function that is called by a user input.
\begin{tabular}{ll} 
Passing & To pass a complex data structure, you can flag an interface variable of type VAR_IN_OUT with \\
pointers as & the pragma attribute VAR_IN_OUT_AS_POINTER and pass a pointer or reference to it as a \\
parameters & parameter.
\end{tabular}

Procedure for using references
1. Declare the user data object (DUT).
2. In the interface editor of a dialog, declare an interface variable (VAR_IN_OUT) as a reference to the data object by assigning the attribute 'VAR_IN_OUT A \(\bar{S}\) _POINTER' to the variable.
3. Program the user interface: use the dialog in a visualization or assign the dialog in the input configuration of a visualization element. Then access to the referenced data is possible.

\section*{Example: \\ Using an inter- \\ face with the \\ pragma \\ 'VAR_IN_OUT \\ AS_POINTER' \({ }^{-}\)}
```

    FUNCTION_BLOCK ControlFB
    VAR
bOk : BOOL := TRUE;
nCounter : INT;
nValue : INT;
END_VAR
nCounter := nCounter + 1;

```

Declaration of an interface variable with VAR IN OUT AS POINTER

User interface: dialog opens:

See also
- \(\Leftrightarrow\) Chapter 6.4.5.20.4 "Attribute 'VAR_IN_OUT_AS_POINTER'" on page 3337

\subsection*{6.4.5.18 Configuring and executing display variants}

\subsection*{6.4.5.18.1 General}

You can select from different variants for displaying your visualization created in CODESYS. An advantage is that you can have not only one, but multiple display variants running at the same time. During this time, the contents of the visualization are the same for all variants. This also applies to the integrated visualization: when the visualization editor is open in CODESYS, the visualization is also displayed there with the same active contents.
The following object types are available:
- "TargetVisu"

The display as a variant of CODESYS TargetVisu is possible one time. You can insert an object of this type below the Visualization Manager.
- "WebVisu"

The display as a variant of CODESYS WebVisu is possible any number of times. You can insert any number of objects.
- "Remote TargetVisu"

The display as a variant of CODESYS TargetVisu is possible any number of times. You can insert any number of objects.
When you insert a variant below the Visualization Manager, the task configuration is extended by the visualization task VISU_TASK (the flow unit of the visualizations). The task is automatically deleted when no more objects exist below the Visualization Manager or the objects below are excluded from compiling. You can set this in the "Properties" dialog of an object, on the "Compile" tab.

> If no object is inserted below the Visualization Manager, then the visualization created there is displayed automatically as an integrated visualization when the application starts.

\section*{Exception handling at runtime}

If an error or an exception occurs in a visualization at runtime, the execution of the visualization is stopped without stopping the execution of the application. An error screen appears informing you of this. In addition, the error screen (usually) enables you to restart the visualization. This exception handling takes place from visualization profile CODESYS V3.5 SP7, compiler version 3.5.7.0 and a runtime system from version 3.5.7.0.

Select the command "Stop Execution at Handled Exceptions" in order to investigate the cause of the occurrence of exceptions and the error position.
See also
- \(\sum^{4}\) Chapter 6.4.1.21.3.7.19 "Command 'Stop Execution on Handled Exceptions'" on page 2639

\section*{Identifying display variants}

In order to programmatically identify a display variant, the VisuFbClientTagDataHelper library module from the VisuElemBase library is available to you. The library itself is referenced in VisuElems. The library module is typically called with VisuElems.VisuFbClientTagDataHelper.
Further information on this library module can be found in its documentation in the library manager.

- ② Chapter 6.4.1.9.9 "Using Library POUs" on page 1890

\subsection*{6.4.5.18.2 Executing as CODESYS WebVisu}

NOTICE!
Recommendations for data security
In order to minimize the risk of breaches of data security, we recommend the following organizational and technical measures for the system on which your applications run:
As far as possible, avoid exposing the PLC and control networks to open networks and the Internet. For protection, use additional data-link layers such as a VPN for remote access and install firewall mechanisms. Limit access to authorized persons, change any existing standard passwords during the initial commissioning and continue to change them regularly.
If you nevertheless wish to publish your web visualization, it is urgently recommended that you provide it at least with simple password protection in order to prevent anyone accessing your control functionality over the Internet. (See an example in the project SimpleWebvisuLogin. project, which is provided with the standard installation of the development system).
Use the latest versions of the gateway server and the web server.

You can execute a visualization as CODESYS WebVisu.

The requirement for this is that the runtime system contains a web server with WebVisu support. This enables communication between target system and web browser. The web server on the target system is started as soon as an application with WebVisu configuration is started and runs until all applications with WebVisu are ended. The device can then display visualizations in connected HTML5-capable web browsers.
The web-based display variant of the CODESYS Visualization enables remote access to a plant as well as its remote monitoring, service and diagnosis over the Internet. A web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

\section*{Configuring and starting display variants}
\(\checkmark \quad\) An executable visualization visMain exists in the project.
1. Select the object "Visualization manager" and select the command "Add object".
2. Select the object "WebVisu" and enter the name WebVisu_A.
\(\Rightarrow\) There is a new object in the device tree underneath the object "Visualization Manager". The associated editor opens.

The visualization task VISU_TASK is automatically added under the task configuration.
3. Select the visualization visMain in the "Start Visualization".
4. In "Name of .htm file", enter the name webvisuA.
5. Click on "Show used visualizations" and check whether the selected visualization is activated for a download to the associated device.
\(\Rightarrow\) The visualization is configured. The settings under "Scaling options" determine the window size and the scaling.
6. Start a suitable runtime system with web server and WebVisu support.

Configure the communication settings for your system.
\(\Rightarrow\) The runtime system runs.
7. Compile, load and start the application.
\(\Rightarrow\) The application and the web server run.
8. Start a web browser with the following address: http://localhost:8080/ webvisuA.htm
\(\Rightarrow\) The page is displayed and you can see the data of the application and operate the application.

See also
- 出 Chapter 6.4.5.21.4.7 "Object 'TargetVisu'" on page 3408

\section*{Calling a page in the web server}
\(\square\) Requirement: A visualization with WebVisu is started.
1. Start a current browser with JavaScript and support of HTML5-Canvas, e.g. Firefox, Chrome, IE>=9.
2. Enter the following address in the web browser:
http://localhost:8080/webvisu.htm
Formal: http://<IP address of webserver>:<port of webserver>/<name of HTM-file>
<name of HTM-file> is the HTML start page of the visualization defined in the object "WebVisu".
\(\Rightarrow\) The page is displayed and you can see the data of the application and operate the application.

Identifying Web- In order to be able to identify a WebVisu with the help of the library block
Visu
VisuFbClientTagDataHelper, the WebVisu needs a name. In order to be able to specifically address it in the application, expand the URL call by the parameter ClientName=<Name>.

Example: http://localhost:8080/webvisu.htm?ClientName=VisClientxy.

See also
- ② Chapter 6.4.5.21.4.8 "Object 'WebVisu'" on page 3409

\subsection*{6.4.5.18.3 Executing as an Integrated Visualization}

You can execute the visualization as an integrated visualization. In this case a display variant of the visualization runs on the development system without the visualization code being loaded to the controller.
Use the integrated visualization for the testing and diagnosis of your application, or for the service and commissioning of a plant.

The requirement for this is that there are no objects under the visualization manager. Alternatively, any objects located there can be excluded from compilation. You can configure an individual object accordingly in its dialog "Properties" on the tab "Compile".
See also
- \({ }^{\sharp}\) Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

\section*{Configuring and starting display variants}

\section*{\(\checkmark\) A visualization project is open.}
1. Remove all objects from underneath the visualization manager or exclude the objects from compilation.
\(\Rightarrow\) The VISU_TASK has been removed from under the task configuration.
2. Load the application to the controller.
\(\Rightarrow\) Now no visualization code will be transferred on loading the application.
3. Start the application.
\(\Rightarrow\) The visualization in the visualization editor is being executed. You can operate your application.

\section*{\(\square\) \\ Use the command "Activate keyboard usage" in order to toggle between the keyboard usage of the integrated visualization and the keyboard usage of CODESYS.}

See also
- \({ }^{\text {² }}\) Chapter 6.4.5.21.2.4 "Command 'Activate Keyboard Usage"' on page 3343
- \({ }^{\text {® }}\), Chapter 6.4.5.21.1 "Keyboard Shortcuts for Default Keyboard Action" on page 3338

\section*{Restrictions in the variable output}

\section*{Data server restrictions}

\section*{Restrictions in variable types}

Numerical variable values, which are output within a text in an integrated visualization, are displayed according to the current display format. You can select the display format with the command "Debug \(\rightarrow\) Display".

See also
- 㘯 Chapter 6.4.1.21.3.8.24 "Command 'Display Mode' - 'Binary', 'Decimal', 'Hexadecimal'" on page 2654

A variable value that is transferred via the data server is not output. The integrated visualization only outputs the initialization or the last transferred value.

The integrated visualization thus only enables a passive observation of the application.

VAR_INPUT variables behave like integrated visualizations such as VAR_IN_OUT variables during execution.

Restrictions in Only the following expressions, which are also used in the monitoring mechanism of the develexpressions and opment system, are supported in an integrated visualization.
monitoring
Variable access:
- Example: PLC_PRG.myPou.nCounter

Array access:
- Access to an array of scalar data types, where a variable is used as an index

Example: a [i]
- Access to an array of complex data types (structure, function block, array), where a variable is used as an index
Example: a [i].x
- Access to a multidimensional array of all kinds of data types with one or more variable indices
Example: a[i, 1, j].x
- Access to an array with constant index

Example: a [3]
- Accesses like those described above in which simple operators are used for the calculations inside the index brackets.
Example: a [i+3]
- Nested combinations of the complex expressions listed above

Example: a[i + 4 * j].aInner[j * 3].x
Operators in index calculations:
- +, -, *, /, MOD

Restrictions in the input action "Execute STCode"

Pointer monitoring:
- Example: \(\mathrm{p}^{\wedge}\). x

Methods and function calls are not supported with the exception of the following:
- Standard string functions
- Type conversion functions Example: INT_TO_DWORD
- Operators such as SEL, MIN, etc.

\section*{Example}
```

PLC_PRG.n := 20 * PLC_PRG.m; // Don't use this!
IF P\overline{LC_PRG.n < MAX_COUNT THEN}
PLC_PR\overline{G}.n := PLC_PRGG.n + 1;
END-IF
//Usese the following!
PLC_PRG.n := MIN(MAX_COUNT, PLC_PRG.n + 1);

```

Restrictions in the interface of a visualization

No interface (INTERFACE) may be declared in the interface editor of a visualization.

\subsection*{6.4.5.18.4 Configure File Transfer Mode}

When downloading, usually files required by the visualization for displaying, are transmitted to the respective display unit. These are especially image files or text list files.

Alternatively, you can configure,that the visualization accesses local files. So no files are transferred with a download

The following configuration is required to allow the visualization access to local files:
- The file paths for image files or text files lists are relative.
- The link type for image files is "Link to file".

Using local visualization files
\(\checkmark\) Requirement: You have opened a visualization project with a image pool.
1. Open the image pool.
2. Select for each image under "Link Type" the setting "Link to file". \(\Rightarrow\) The image is linked.
3. Select the command "Project \(\rightarrow\) Project Setting" and select the category "Visualization".
4. Insert in tab "General" in "Image files" the local paths of the image files with relative path names.
\(\Rightarrow\) Example: . \; . \images \(\backslash\)
Note: When no path is specifiet, the setting in dialog box "Options", category "Visualization", tab "File Options" setting "Image files" is usesd.
5. Open the visualization manager.
6. Activate under "Extended settings" the option "Visible".
7. Activate under "File Transfer Mode" the option "Use local visualization files".
\(\Rightarrow\) When downloading, no files are transferred. When displaying the visualization, the local files are used.

\subsection*{6.4.5.19 Applying Visualization Styles}

\subsection*{6.4.5.19.1 General}

A visualization style is a collection of colors, fonts, images, and any values that are defined as style properties. When designing a visualization element, you can use these style properties only. The you have a uniform, style-dependent appearance.
An element that applies style colors and style fonts behaves according to the selected style design in each selected style. In this way, a style property, such as Element basic color, can be blue In one style and gray in another style. In contrast, if the color of an element has a fixed value, this color is fixed even when the style is switched.

All applicable styles are consistent because they define a fixed set of style properties. Therefore, you can switch smoothly between styles in order to customize your visualization. You can preview a style to get an impression of how it behaves.

CODESYS provides different styles, for example the styles Flat style and White Style. These provided styles are installed in the visualization style repository.
The selected style that applies to all visualizations in the application is set in the "Visualization Manager" object ("Settings" tab, "Style Settings" group, "Selected style"). In addition, the "Properties" view provides its style properties when designing an element. For each element, you can assign these styles instead of fixed values.

The style is applied to all visualizations that are below an application. The settings of the "Options - Visualization Styles" dialog are also considered for a library visualization or a visualization in the POUs view.

See also
- I \({ }^{\xi}\) Chapter 6.4.5.21.3.11 "Dialog 'Project Environment' - 'Visualization Styles'" on page 3386
- \(\Leftrightarrow\) Chapter 6.4.5.21.3.7 "Dialog 'Options' - 'Visualization Styles"' on page 3382
- \({ }^{\text {• }}\) Chapter 6.4.5.21.4.2 "Object 'Visualization manager'" on page 3398

Designing visu- The set style includes style properties. These are provided in the "Properties" view of an alization elements with style properties element in the drop-down list of the "Value" column. It is checked which style properties are appropriate for which property. For example, only style properties with color definitions are available for a color assignment.

A style can have directly defined visualization element properties. If this style is used in the project, then these properties are not configurable anymore.
\(\checkmark\) Requirement: A project is open with a visualization.
1. Double-click the visualization.
2. Select an element.
3. Choose "View \(\rightarrow\) Element Properties".
4. Click in the input field of a color in the window "Properties" (category "Colors").
\(\Rightarrow\) The list box opens with style properties. The style colors are based on the currently selected style.
5. Select a style property.
\(\Rightarrow\) The visualization shows the element according to the style.
```

Example
A visualization uses the style CompanyStyle 8 , which defines the colors CompanyRed, CompanyBlue, and CompanyGreen. An element is selected in the visualization. You can configure the element in the "Properties" view. By clicking into the value field of the "Color" property, you receive a drop-down list with the entries CompanyRed, CompanyBlue, and CompanyGreen.

```

\section*{Switching visualization styles}

When setting a style in the visualization manager, all complete styles in the repository are available for selection. It does not matter and it is not evident if a style have been derived from another style.
You can preview a style to get an impression of how it behaves.
How a visualization implements a style at runtime also depends on the display variant. For example, if a font that is defined in the style is not available, the display variant shows the visualization with a preset font.
\(\square\) Requirement: A project is open with a visualization.
1. Double-click the "Visualization Manager" object in the device tree.
\(\Rightarrow\) The editor opens.
2. Click in the input field of "Selected style" "Settings" tab, "Style Settings" group).
\(\Rightarrow\) All styles that are installed in the repository are listed.
3. Mouse over a style.
\(\Rightarrow\) A preview of how the style is displayed appears in a new window.
4. Select a style.
\(\Rightarrow\) The style is applied. The preview in "Style Settings" shows the new setting.
5. Double-click a visualization.
\(\Rightarrow\) The visualization appears in the new style.

\section*{Updating versions}
\(\square\) Requirement: A project is open with a visualization.
1. Click "Project \(\rightarrow\) Project Environment", "Visualization Styles" tab.
\(\Rightarrow\) CODESYS lists all new versions of the currently used styles.
2. Click "Set All to Newest".
\(\Rightarrow\) The style is updated. Visualizations and their elements apply the new style.

\subsection*{6.4.5.19.2 Editing visualization styles in the visualization style editor}

A style is an XML file with the file extension *.visustyle.xml. It contains a specific set of style properties. CODESYS checks the style properties in the consistency check.

You can create a new style or customize an existing style. The visualization style editor is available for this.

If you customize a style, then a new style is created as a hierarchy of styles. A hierarchy consists of at least two styles based on each other. The nesting depth is unrestricted. A hierarchy is identified simply with its top derived style. You can derive multiple different styles from one base style by extending the styles by differing style properties. This save memory and therefore should be your preferred method.

A base style does not have to be consistent for itself. Instead, you must identify it as an incomplete style. Only the top derived style must be consistent.

\section*{Example of a style hierarchy}

\section*{Style Petrostyle}

In a partial style, you can combine any style properties to form efficient hierarchies without having to worry about consistency. For example, you can collect all image references into one partial style. Then you derive the style and define more style properties for colors. This style is also incomplete. You derive the style again and define more style properties for its fonts. The top style is now completely.

- (1): CompanyImg is a partial style defining image references.
- (2): CompanyColor is a partial, derived style based on CompanyImg and also defines colors.
- (3): PetrolStyle is a complete, derived style based on CompanyColor and also defines a special color.
- (4): The hierarchy of styles comprises PetrolStyle, CompanyColor, and CompanyImg.

In the visualization style editor, you can open a style, define its style properties, and localize its name. If the style is consistent, then you can install it in the visualization style repository. The editor is not integrated in CODESYS. However, you can start the editor in CODESYS.

Names for style properties

Starting the editor in CODESYS

A style property is an entry for a specific color, a specific font, or a specific image reference.
If this name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. Otherwise the names can be sorted in alphabetical order or sequential order or in sequential order (as saved in the XML file). CODESYS displays the style properties in the order of names actually saved in the XML file for the style.

Example: Element-Alarm-Fill-Color

See also
- \(\quad\) y Chapter 6.4.5.22.3 "Editor 'Visualization Style Editor'" on page 3750
1. Double-click the "Visualization Manager" object.
\(\Rightarrow\) The editor opens.
2. Click the symbol 3 ("Settings" tab, "Style Settings" group).
3. Click "Open Style Editor" from the drop-down list.
\(\Rightarrow\) The "Visualization Style Editor" opens.

Starting the editor independent of CODESYS
\(\triangleright \quad\) Choose "Visualization Styles Editor" from the CODESYS install folder in the Start menu. If you have a standard installation, then this link is located in CODESYS (the program folder for CODESYS).
\(\Rightarrow\) The visualization style editor opens.

\section*{Deriving visualization styles}

This is the recommended way to create a style that combines existing style properties with new ones.

Starting the editor in CODESYS and deriving stylesRequirement: CODESYS is open with a project containing a visualization.
1. Double-click the "Visualization Manager" object in the device tree.
\(\Rightarrow\) The editor opens.
2. Click the symbol 3 ("Settings" tab, "Style Settings" group).
\(\Rightarrow\) A list of commands opens.
3. Choose "Create and Edit Derived Style".
\(\Rightarrow\) The visualization style editor starts and the "Create a New Visualization Style" dialog box opens.
4. Type a name.
5. Select a directory.
6. Select a base style. The default style is set in CODESYS. You can also select a style from the repository.
\(\Rightarrow\) The new style appears in the visualization style editor. The style properties from the base style are displayed yellow.
7. Add a new style property or modify an existing value.
8. Provide a version for the style and click "File \(\rightarrow\) Save and Install".
\(\Rightarrow\) The style is installed in the repository. The memory requirement is low because only the style property added in step 7 is saved.

\section*{Copying visualization styles}
\(\checkmark\) Requirement: CODESYS is open with a project containing a visualization.
1. Double-click the "Visualization Manager" object in the device tree.
\(\Rightarrow\) The editor opens.
2. Click the symbol 3 ("Settings" tab, "Style Settings" group).
\(\Rightarrow\) A list of commands opens.
3. Choose "Copy and Edit Style".
\(\Rightarrow\) The visualization style editor starts and the "Open Existing Style as a Copy" dialog box opens.
4. Select which style should be copied ("Style").
5. Type a directory in "Destination" and click "OK".
\(\Rightarrow\) The new style appears in the visualization style editor. All style properties are identical to those in the copied style.
6. Type a name.
7. Add a new style property or modify the value of an existing style property.
8. Provide a version for the style and click "File \(\rightarrow\) Save and Install".
\(\Rightarrow\) The style is installed in the repository and the style properties are identical to the added style property, except for the style property added in step 8. The memory requirement is high because the common style properties are defined in both styles.

\section*{Creating new visualization styles}
\(\checkmark\) Requirement: CODESYS is open with a project containing a visualization.
1. Double-click the "Visualization Manager" object in the device tree.
\(\Rightarrow\) The editor opens.
2. Click the symbol 3 ("Settings" tab, "Style Settings" group).
\(\Rightarrow\) A list of commands opens.
3. Click "Open Style Editor".
\(\Rightarrow\) The visualization style editor opens.
4. Click "File \(\rightarrow\) New Style".
\(\Rightarrow\) The "Create a New Visualization Style" dialog box opens.
5. Type a name. Specify a base style.
6. Specify a directory and click "OK" to close the dialog box.
\(\Rightarrow\) The new style appears in the visualization style editor.
7. Add a new style property.
8. Provide a version for the style and click "File \(\rightarrow\) Save and Install".
\(\Rightarrow\) The style is installed in the Visualization Styles Repository with the version number.

Adding a style property

Using the visualization style editor, you can edit a style to save and install as a new version.
\(\square\) Requirement: The visualization style editor is open with a style.
1. Select a style property and click "Styles \(\rightarrow\) New Style (Afterwards)" in the "Style Properties" tab.
\(\Rightarrow\) A new style property is added.
2. In the "General" tab, type a new version number in the "Version" setting.
3. Choose "File \(\rightarrow\) Save and Install".
\(\Rightarrow\) The changes are saved and the style is installed in the repository as the new version.

Localizing style
properties

You can assign a language-dependent name to a style property. CODESYS displays a style property by its localized name, depending on the language settings in category "International Settings" (menu "Tools \(\rightarrow\) Options").
\(\checkmark\) Requirement: The visualization style editor is open with a style.
1. Translate the name of the style property into the localized language in the "Localization" tab.
2. Provide a version for the file in the "General" tab.
3. Choose "Save and Install". \(\Rightarrow\) The edited style is installed in the repository currently selected in CODESYS.
4. Update the style.
5. Set the language settings in CODESYS to the localized language.
6. Open a visualization and select an element. The style settings in its properties are displayed in the localized language.

\subsection*{6.4.5.19.3 Managing visualization styles in repositories}

The styles that are listed in CODESYS in the drop-down lists of different dialogs and editors are all checked for consistency and installed in the visualization style repository. For derived styles, the hierarchy is checked completely and all styles of the hierarchy are installed. The repository is a version control system within the development system.

You can open a style as write-protected from the visualization style repository in the visualization style editor. The "Save" and "Save and Install" commands are not available there for read-only files. However, you can derive it as the basis for a new style or as a copy.

- \({ }^{4}\) Chapter 6.4.5.21.2.20 "Command 'Visualization Style Repository'" on page 3363
- \({ }^{\text {® }}\) Chapter 6.4.5.22.3 "Editor 'Visualization Style Editor'" on page 3750

\section*{Installing styles to repositories}
1. Click "Tools \(\rightarrow\) Visualization Style Repository". \(\Rightarrow\) The "Visualization Styles" dialog box opens.
2. Select the "System" repository in the drop-down list of "Storage location".
\(\Rightarrow\) All versions of the installed styles are listed in "Installed Visualization Styles".
3. Click on the "Install" button.
\(\Rightarrow\) The "Select Visualization style(s)" dialog box opens.
4. Select a style file and click "Open" to close the dialog box.
\(\Rightarrow\) The style is installed in the "System" repository. It appears now in the tree view below "Installed Visualization Styles".

\section*{Uninstalling}
styles
1. Click "Tools \(\rightarrow\) Visualization Style Repository". \(\Rightarrow\) The "Visualization Styles" dialog box opens.
2. Select a repository in the drop-down list of "Storage location".
\(\Rightarrow\) All versions of the installed styles are listed in "Installed Visualization Styles".
3. Select a style there.
4. Click the "Uninstall" button.
\(\Rightarrow\) The "Select Visualization Style(s)" dialog box opens.

Managing repositories
1. Click "Tools \(\rightarrow\) Visualization Style Repository".
\(\Rightarrow\) The "Visualization Styles" dialog box opens.
2. Click on the "Edit Locations" button.
\(\Rightarrow\) The dialog makes it possible to manage other repositories.

Element prop- The properties contain fixed values for the text properties.
erty 'Text prop-
erties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
: The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
: The "Color" dialog box opens.
: Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" \\
\hline " \(X "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of \(0.001 . ~ T h e ~ v a l u e ~\)
\end{tabular} 1000 returns the element \\
to its original size.
\end{tabular}

You can link the variables to a unit conversion.

Element prop- The variables allow for dynamic control of the text display.
erty 'Font varia-
bles'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px>: Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color \\
Example: PLC_PRG.dwFillColor \\
- Color literal \\
Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - 0 : Solid line \\
& - 1: Dashed line \\
& - \(2:\) Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- * "Element property 'Appearance"' on page 3002

Element prop- The variables control the element behavior dynamically.
erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(:=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

\section*{The "Invisible" property is supported by the "Client Animation" functionality.}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": З PLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Line'}

Symbol:

\section*{Category: "Basic"}

The element draws a simple line.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional. \\
Example: Separator_Header_ \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "ine" \\
\hline
\end{tabular}

Element prop- The following properties define the position and length of the element in the visualization erty 'Position' window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y -axis runs downwards.
\begin{tabular}{|c|c|}
\hline "Dots" & \begin{tabular}{l}
" \([0]\) ": Coordinates of the starting point \\
" \([1]\) ": Coordinate of the end point \\
You can also change the values by dragging the box symbols (ए) to other positions in the editor.
\end{tabular} \\
\hline "Angle" & \begin{tabular}{l}
Static angle of rotation (in degrees). \\
Example: 35 \\
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. \\
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow \(\boldsymbol{A}^{\text {, }}\), you can rotate the element about its center as a handle. \\
Example: \\
(1): Handle \\
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement \(\rightarrow\) Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.
\end{tabular} \\
\hline
\end{tabular}

\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

\section*{See also}
- ③ "Element property 'Appearance variables'" on page 3051

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses: \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

- \({ }^{\text {• }}\) Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & \begin{tabular}{l}
Example: "Default"
: The "Font" dialog box opens. \\
*: Drop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
: The "Color" dialog box opens. \\
*: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline "Use REAL values" & \begin{tabular}{l}
Note: Only available if the device supports the use of REAL coordinates. \\
\(\square\) : The properties of the absolute movement are interpreted as REAL values. The values are not rounded. \\
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. \\
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5 px in the direction of the line thickness.
\end{tabular} & \\
\hline
\end{tabular}
 erty 'Relative

Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved.
Incrementing the \(X\) value moves the element to the right. Incrementing the \(Y\) value moves the element to the down.
Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved.

Incrementing the \(X\) value moves the element to the right. Incrementing the Y value moves the element to the down.

- (3) "Element property 'Absolute movement'" on page 3003

Element prop- These properties are variables with contents that replace a format definition. erty 'Text variables'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text". \\
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC_PRG.enVar <enumeration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline "Tooltip variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
& Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip". \\
\hline
\end{tabular}

- \(\overbrace{}^{*}\) Chapter 6.4.1.20.5.18 "Enumerations" on page 2263

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.
\begin{tabular}{|l|l|}
\hline "Text list" & \begin{tabular}{l} 
Variable (string) or name of the text list as a fixed string in single straight quota- \\
tion marks. \\
Example: ' Errorlist'
\end{tabular} \\
& : Drop-down list with the dialogs available in the text lists.
\end{tabular}

See also
- \({ }^{\text {• }}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

- «ヶ "Element property 'Text properties'" on page 3003

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable in the alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element prop- The variables control the element behavior dynamically. erty 'State variables'
\begin{tabular}{|l|l|}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element. \\
& \begin{tabular}{l} 
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

Element prop- Dynamic definition of the weight of a line element using a variable. erty 'Line width variable'
\begin{tabular}{|l|l|}
\hline "Integer value" & \begin{tabular}{l} 
Variable (integer data type). Defines the line weight of the element (in pixels)., \\
This overwrites the fixed value that is defined in "Appearance \(\rightarrow\) Line weight". \\
Note: The value 0 codes the same as 1 and sets the line weight to one pixel.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Line style variable'}
\begin{tabular}{|l|l|}
\hline "Integer value"" & Variable (integer data type). Defines the appearance of the line at runtime. \\
& \(\bullet\)\begin{tabular}{ll} 
1: Solid \\
\(\bullet\) & 2: Dashes \\
\(\bullet\) & 3: Dots \\
& \(\bullet\) \\
& 4: Dash Dot \\
& \(\bullet\) \\
& 5: Dash Dot Dot \\
& 6: Invisible: The line is not drawn. \\
\hline
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Polygon', 'Polyline', 'Bézier Curve'}

Symbol:

Category: "Basic"
The "Polygon", "Polyline", and "Bézier Curve" are the same element type. They can be converted into another type by changing the "Element type" property.

Elements can be dragged to the editor. The element is then drawn with five points: [0] to [4]
Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold [Ctrl] and click the left mouse button, another point is created. You can delete a point by pressing and holding [Shift]+[Ctrl] and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional. \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list. \\
Example: Werkstueck_1
\end{tabular} \\
\hline "Type of element" & \begin{tabular}{l} 
- "Polygon" \\
- "Polyline" \\
- "Bézier Curve"
\end{tabular} \\
\hline
\end{tabular}

Element prop- The following properties define the position of the corner points in the visualization window. erty 'Position' These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|c|c|}
\hline "Dots" & \begin{tabular}{l}
[0]..[n]: Coordinates of the corner points \\
Specified in pixels \\
You can also change the values by dragging the box symbols (만) to other positions in the editor.
\end{tabular} \\
\hline "Angle" & \begin{tabular}{l}
Static angle of rotation (in degrees). \\
Example: 35 \\
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. \\
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow \(\mathcal{A}\), you can rotate the element about its center as a handle. \\
(1): Handle \\
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement \(\rightarrow\) Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.
\end{tabular} \\
\hline
\end{tabular}

- 乡y Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center'
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\Psi})\) to other positions in the editor.

\section*{Element prop- \\ erty 'Colors'}
\begin{tabular}{|l|l|}
\hline "Normal state" & \begin{tabular}{l} 
The normal state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" is \\
not defined or it has the value FALSE.
\end{tabular} \\
\hline "Frame color" & Frame and fill color for the corresponding state of the variable. \\
\hline "Fill color" & "Transparency" \\
\hline Transparency value (0 to 255) for defining the transparency of the selected color. \\
Example: \(255:\) The color is opaque. \(0:\) The color is completely transparent.
\end{tabular}\(|\)\begin{tabular}{ll} 
"Alarm state" & \begin{tabular}{l} 
The alarm state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" has \\
the value TRUE.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Use gradient color" & \(\boxed{\square}:\) The element is displayed with a gradient of two colors. \\
\hline "Gradient setting" & The "Gradient editor" dialog box opens. \\
\hline
\end{tabular}

See also
- \({ }^{\text {• }}\) Chapter 6.4.5.21.3.5 "Dialog 'Gradient Editor'" on page 3369

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Fill attributes" & \begin{tabular}{l}
The way in which the element is filled. \\
- "Filled":The element is filled with the color from property "Colors \(\boldsymbol{\rightarrow}\) Fill color". \\
- "Invisible": The fill color is invisible.
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

\section*{See also}
- « "Element property 'Appearance variables'" on page 3051

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses: \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
: The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
The "Color" dialog box opens.
Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular} erty 'Absolute movement'

Element prop- The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline " \({ }^{\text {In }}\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \begin{tabular}{l}
Variable (integer data type). Causes centric stretchi Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.00 to its original size.
\end{tabular} & The value 1000 returns the element \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline "Use REAL values" & \begin{tabular}{l}
Note: Only available if the device supports the use of REAL coordinates. \\
\(\checkmark\) : The properties of the absolute movement are interpreted as REAL values. The values are not rounded. \\
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. \\
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5 px in the direction of the line thickness.
\end{tabular} & \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

\section*{Element property 'Dynamic points'}
\begin{tabular}{|l|l|}
\hline "Array of points" & \begin{tabular}{l} 
Variable (POINTER TO). Points to an array of the structure \\
VisuElems.VisuStructPoint. The elements ix and iY of \\
VisuSt ructPoint contain the xy-coordinates of a point The current number of \\
array elements implicitly contains the variable in the property "Number of points". \\
The variable that is assigned to the property "Number of points" contains the \\
number of array elements and therefore the number of corner points. \\
Example: pPoints : PoINTER TO ARRAY [0. .100] OF \\
VisuElems.VisuStructPoint;
\end{tabular} \\
\hline "Number of points" & \begin{tabular}{l} 
Variable (integer data type): Contains the number of array elements and there- \\
fore the number of corner points for displaying the element. \\
Example: PLC_PRG. iNumberOfPoints \(:=24 ;\) \\
In the example, the element has 24 points. This definition is necessary because \\
the individual points are defined by a pointer and this does not allow control over \\
the number of points. \\
Note: In this way, it is possible to adapt the display of the element dynamically by \\
updating the number of corner points.
\end{tabular} \\
\hline
\end{tabular}

Element prop- These properties are variables with contents that replace a format definition.
erty 'Text varia-
bles'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses
\end{tabular} \\
& \begin{tabular}{l} 
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text". \\
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC_PRG. enVar <enumeration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltiable". \\
\hline
\end{tabular}

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\text {• }}\), Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
pt \\
pt \\
px \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

- «ヶ "Element property 'Text properties'" on page 3016

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- true: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value tRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color \\
Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color \\
Example: PLC_PRG.dwFillColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

\section*{See also}
- \& Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - 2: Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

\section*{See also}
- \#y "Element property 'Appearance"' on page 3043

Element prop- The variables control the element behavior dynamically. erty 'State varia-

\section*{bles'}
\begin{tabular}{|l|l|}
\hline "Invisible"" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code":
\end{tabular} \\
\hline "Onc__PRG.i_x \(:=0 ;\) \\
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseDown" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseEnter" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer to the element. \\
\hline
\end{tabular}
\(\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}\)
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329

Element prop- The properties contain fixed values for the text properties.
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & \begin{tabular}{l}
Example: "Default"
The "Font" dialog box opens. \\
マ: Drop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
The "Color" dialog box opens. \\
*: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|c|}{\begin{tabular}{l} 
"X" \\
\hline Variable (integer data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline V" & \begin{tabular}{l} 
Variable (integer data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element \\
to its original size.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (integer data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
If a static angle of rotation is specified in "Position \\
G Angle", then the static angle of rotation and the \\
angle of rotation are added.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element prop- These properties are variables with contents that replace a format definition. erty 'Text varia-
bles'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text".
\end{tabular} \\
& \begin{tabular}{l} 
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC_PRG.enVar <enumeration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip". \\
\hline
\end{tabular}

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.
\begin{tabular}{|l|l|}
\hline "Text list" & \begin{tabular}{l} 
Variable (string) or name of the text list as a fixed string in single straight quota- \\
tion marks. \\
Example: ' Errorlist'
\end{tabular} \\
& : Drop-down list with the dialogs available in the text lists.
\end{tabular}

See also
- \({ }^{\text {• }}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

- «ヶ "Element property 'Text properties'" on page 3029

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- \& Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - 2: Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- ©s "Element property 'Appearance"' on page 3043

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline FALSE: While the mouse click event exists.
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Hotkey" & \begin{tabular}{l} 
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" \\
property are triggered. In this way, it is not the input action itself that leads to this \\
input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l} 
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l} 
"None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured \\
in the "OnMouseDown" property. \\
"Mouse up": Releasing the key triggers the input actions that are configured \\
in the "OnMouseUp" property.
\end{tabular} \\
\hline "Mouse down/up": Pressing and releasing the key triggers the input actions \\
that are configured in the "OnMouseDown" property and the "OnMouseUp" \\
property.
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{See also}

\section*{Visualization Element 'Image'}

Symbol:

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. You can also change the displayed image dynamically by using a variable instead of the static ID.

With the "Background" command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category "Visualization").

\section*{Element proper-}
ties
\begin{tabular}{|c|c|}
\hline "Element name" & \begin{tabular}{l}
Example: Status bar \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the element list.
\end{tabular} \\
\hline "Type of element" & "Image" \\
\hline "Static ID" & \begin{tabular}{l}
Identifier of the image file for a static assignment \\
ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: imagepool2.button_image. \\
When a new ID is specified, a file selection dialog opens. The selected file is saved to the "GloballmagePool". \\
See also: Help for the "Image Pool" object.
\end{tabular} \\
\hline "Show frame" & \(\square\) : The image file is displayed with a frame. \\
\hline "Clipping" & Requirement: The "Scaling type" property is "Fixed".
Only part of the visualization is displayed that fits in the element frame. \\
\hline "Transparent" & The image pixels that have the "Transparent color" are displayed as transparent. \\
\hline "Transparent color" & \begin{tabular}{l}
Effective only if the "Transparent" option is activated. \\
The... button opens the color selection dialog. This is where you select the transparent color.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Scaling type" & \begin{tabular}{l}
Definition of how an image fits in the element frame. \\
- "Isotropic": The entire image is displayed in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties "Horizontal alignment" and "Vertical alignment" to "Centered". The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized. \\
- "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained. \\
- "Fixed": The image retains its original size, even if the element frame is resized. Note also that the "Clipping" option is selected. \\
For each reassignment of an image ID, the element size is adapted automatically to the image size.
\end{tabular} \\
\hline "Horizontal alignment" & \begin{tabular}{l}
Horizontal alignment of the element within the element frame: \\
- "Left" \\
- "Centered" \\
- "Right" \\
Requirement: The scaling type of the image is "Isotropic" or "Fixed". \\
Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. \\
औ: The "Variable" property is shown below this.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l}

Element prop- You can use this element property for animating a series of image files. erty 'Dynamic image'
\begin{tabular}{|l|l|}
\hline "Bitmap version" & \begin{tabular}{l} 
Variable (integer data type). Contains the version of the image. \\
If the variable changes, then the visualization re-reads the image referenced in \\
the "Image ID" property and displays it. \\
The visualization displays animations when the image file on the controller is \\
updated continuously, thus incrementing the version variable. The application \\
must be programmed for this. \\
Possible applications \\
- Displaying graphics that are generated by the application \\
- Displaying images that are refreshed by a camera
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(X\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
*: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

\footnotetext{
Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
}
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: \(16 \#\) FF888888 \\
Requirement: "Show frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Element property 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & \begin{tabular}{l} 
Variable (integer data type). Contains the line weight (in pixels). \\
Note: The values 0 and 1 both result in a line weight of one pixel. If no line \\
should be displayed, then the "Line style" property must be set to the option \\
"Invisible".
\end{tabular} \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - \(2:\) Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible: The line is not drawn. \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- « "Element property 'Appearance"' on page 3043

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(:=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- User input is a user event from the perspective of the element. figuration'

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input configuration.
A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.
Example: "Execute ST code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog box. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: A user clicks the element completely. The mouse button is clicked \\
and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: A user clicks down on the element only. \\
\hline "OnMouseEnter" & Input event: A user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: A user drags the mouse pointer away from the element. \\
\hline "OnMouseMove" & Input event: A user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & Input event: The user releases the mouse button over the element area. \\
\hline
\end{tabular}

\section*{Visualization Element 'Frame'}

Symbol:

Category: "Basic"
The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: refVisUserInfo \\
\hline "Type of element" & "Frame" \\
\hline "Clipping" & \begin{tabular}{l} 
冋: Fixed size. Only that part of the referenced visualization that fits inside the \\
frame is displayed. \\
Requirement: The "Scaling type" property is "Fixed".
\end{tabular} \\
\hline "Show frame" & \begin{tabular}{l} 
Displays the frame \\
- "No frame": The displayed area of the frame does not have borders. \\
- "Frame": The displayed area of the frame has borders. \\
- "No frame with offset": The displayed area of the frame does not have a \\
border and the displayed area of the referenced visualization is reduced \\
inwards by one pixel as compared to the frame area. The gap prevents the \\
referenced visualization from touching any adjacent elements.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Scaling type" & \begin{tabular}{l} 
The method with which the height and width of the referenced visualization are \\
scaled. \\
- "Isotropic": The visualization is scaled to the size of the element. The visuali- \\
- zation retains its proportions with a fixed height/width ratio. \\
- Anisotropic": The visualization is scaled to the size of the element. The \\
height and width are adapted to the element independently of each other. \\
- "Fixed": the visualization is displayed in its original size without taking into \\
account the size of the element. \\
- "Fixed and scrollable": The visualization is displayed fixed in the element. If it \\
is larger than the element, the element will be provided with scrollbars. \\
Please note: assign varialos to the properties "Scoll position variable \\
horizontal"" "Scroll position variable vertical". You can then edit the data \\
of the scrollbar position in the application.
\end{tabular} \\

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ( ( - ) to other positions in the editor.

See also
- * Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X "\) & X-coordinate of the point of rotation \\
\hline " \(Y\) " & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus})\) to other positions in the editor.

Element prop- The properties contain fixed values for the colors. erty 'Colors'
\begin{tabular}{|l|l|}
\hline "Color"" & \begin{tabular}{l} 
Color of the frame \\
v: Selection list with style colors appears \\
\(\ldots . .: S t a n d a r d ~ d i a l o g ~ " C o l o r " ~ o p e n s ~ f o r ~ s e l e c t i n g ~ a ~ c o l o r . ~\)
\end{tabular} \\
& \begin{tabular}{l} 
Please note: the normal state is when the boolean variable in the property \\
"Color variables \(\rightarrow\) Toggle color" is not defined or its value is FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l} 
Color with which the element is filled during the alarm state. \\
Please note: Alarm state is when the value of the boolean variable in the prop- \\
erty "Color variables \(\rightarrow\) Toggle color" is FALSE.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
Integer number (value range from 255 to 0). Specifies the transparency of the \\
associated color. \\
\(255: ~ T h e ~ c o l o r ~ i s ~ o p a q u e . ~\)
\end{tabular} \\
\(0:\) The color is fully transparent. \\
Please note: If the color is a style color and already contains a transparency \\
value, then this property is write-protected.
\end{tabular}

Element prop- The properties contain fixed values for the text properties.
erty 'Text prop-
erties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
: The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
: The "Color" dialog box opens.
: Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ "Movement" } \\
\hline " \(X "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline " \(Y\) " & \begin{tabular}{l} 
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle_1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element \\
to its original size.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

Element property 'Relative movement'

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts'
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
v: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. Example: ' 1 ' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\circ}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px>: Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the Frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Requirement: "Show Frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the Frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element prop- The properties contain variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & \begin{tabular}{l} 
Variable (integer data type). Contains the line weight (in pixels). \\
Note: The values 0 and 1 both result in a line weight of one pixel. If no line \\
should be displayed, then the "Line style" property must be set to the option \\
"Invisible".
\end{tabular} \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - 2: Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible: The line is not drawn. \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- © "Element property 'Appearance"' on page 3057

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.
\begin{tabular}{|c|c|}
\hline "Variable" & \begin{tabular}{l}
- Variable (integer data type) that contains the index of the active visualization Example: PLC_PRG.uiIndexVisu \\
Hint: The "Frame Configuration" dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. \\
Note: This variant of switching usually affects all connected display variants. \\
- Array element (integer data type) for index access via CURRENTCLIENTID Example: PLC_PRG.aIndexVisu [CURRENTCLIENTID] \\
Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).
\end{tabular} \\
\hline
\end{tabular}

- * Chapter 6.4.5.21.2.9 "Command 'Frame Selection"' on page 3348

\footnotetext{
Element prop- The variables control the element behavior dynamically.
erty 'State varia-
bles'
}
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(:=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
\\
\\
\begin{tabular}{l} 
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.
Example: "Execute ST Code": 3 PLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
\hline
\end{tabular}
\end{tabular}
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.
Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for "OnMouseDown" and ends the action for "OnMouseUp".
Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because "OnMouseUp" is triggered.
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist. \\
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline "Tap on enter if captured"" & \begin{tabular}{l} 
V: During user input, it is also taken into consideration whether the mouse \\
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\

Element prop-
erty 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (■-) to other positions in the editor.

See also
- Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline " \(Y\) " & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
The "Font" dialog box opens.
: Drop-down list with style fonts. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Font color" & \begin{tabular}{l} 
Example: "Black" \\
\\
\\
\hline... : The "Color" dialog box opens. \\
マ: Drop-down list with style colors.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Whole number (value range from 0 to 255 ). This determines the transparency of \\
the respective color. \\
Example: \(255:\) The color is opaque. \\
\(0:\) The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, \\
then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element property 'Columns'

The "Combo box - Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Twodimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the "Data array" property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index \([<n>]\).
\begin{tabular}{|c|c|}
\hline \begin{tabular}{l}
"Columns" \\
- [<n>]
\end{tabular} & \begin{tabular}{l}
Due to the structure of the variable that is defined in "Data array", CODESYS determines the number of columns and defines them with the index <n>. \\
Example: StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW','Audi','Mercedes','VW','Fiat', \\
'150','150','150','150','100','blue','gray','silver','blue' \\
, 'red'];: three columns are formed [0], [1] and [2].
\end{tabular} \\
\hline "Max. array index" & Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed. \\
\hline "Row height" & Height of the rows (in pixels). \\
\hline "Number visible rows" & Optional. If the array is larger than the number of visible rows, then a scrollbar is included. \\
\hline "Scrollbar size" & Width of the vertical scrollbar (in pixels). \\
\hline
\end{tabular}

Table 629: "Element property 'Columns: Column [<n>]""
\begin{tabular}{|l|l|}
\hline "Width" & Column width (in pixels). \\
\hline "Image column" & \begin{tabular}{l} 
V: Images can be displayed in the column. Images are used from the global \\
image pool or user-defined image pools. The image IDs are shown in the cells of \\
the table as defined in the image pool.
\end{tabular} \\
\hline \multicolumn{4}{|l|}{ "Image configuration" } & \begin{tabular}{l} 
- "Fill cell" \\
\begin{tabular}{l} 
The image resizes to the dimensions of the cell without fixing the height/ \\
width ratio. \\
"Centered" \\
The image is centered in the cell and retains its proportions (height-width \\
ratio).
\end{tabular} \\
\hline "Fill mode" \\
\hline "V: The color that is specified in "Transparent color" is displayed as transparent.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
When the "Transparent" property is enabled, the color specified here is not \\
displayed. Pixels with this color are transparent.
\end{tabular} \\
\hline "Text alignment in column" & \begin{tabular}{l} 
- "Left" \\
- "Centered" \\
- "Right"
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop-}
erty 'Texts'
\begin{tabular}{|l|l|}
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element in runtime mode \\
Example: Products of customer A \\
Hint: The text is accepted automatically into the "GlobalTextList" text list and can \\
be localized there.
\end{tabular} \\
\hline
\end{tabular}

- "Individual settings": The "Individual text properties" property group is shown The values can be customized here.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{"Individual text properties"} \\
\hline \multicolumn{2}{|l|}{Requirement: The "Individual settings" text property is defined.} \\
\hline \multirow[t]{3}{*}{"Font"} & Example: "Default" \\
\hline & ...): The "Font" dialog opens. \\
\hline & - : List box with style fonts \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Font color" & \begin{tabular}{l} 
Example: "Black" \\
\\
\\
\hline... : The "Color" dialog opens. \\
マ: List box with style colors
\end{tabular} \\
\hline & \begin{tabular}{l} 
Integer (value range from 0 to 255). This determines the transparency of the \\
respective color. \\
\(255:\) The color is opaque. \\
\(0:\) The color is completely transparent. \\
Note: If the color is a style color and already has a transparency value, then this \\
property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

\section*{You can link the variables to a unit conversion.}

X, "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element prop- The variables control the element behavior dynamically. erty 'State variables'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

\section*{Visualization Element 'Tabs'}

Symbol:

\section*{Category: "Common Controls"}

The element displays selected visualizations in tabs. The tabs can be used by means of the tab header without having to configure an input configuration. A visualization user switches between visualizations by clicking the tab header.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Example: Assembly A \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Tabs" \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tab width" & \begin{tabular}{l} 
Width of the tab (in pixels). If there is not space for all tab headers, then a scroll \\
bar is added. \\
Example: 30
\end{tabular} \\
\hline "Tab height" & \begin{tabular}{l} 
Height of the tab (in pixels) \\
- Integer literal \\
Example: 15 \\
- "From style"
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Scaling type" & \begin{tabular}{l} 
The method with which the height and width of the referenced visualization are \\
scaled. \\
- "Isotropic": The visualization is scaled to the size of the element. The visuali- \\
- zation retains its proportions with a fixed height/width ratio. \\
- "Anisotropic": The visualization is scaled to the size of the element. The \\
height and width are adapted to the element independently of each other. \\
- "Fixed": the visualization is displayed in its original size without taking into \\
account the size of the element. \\
- "Fixed and scrollable": The visualization is displayed fixed in the element. If it \\
is larger than the element, the element will be provided with scrollbars. \\
Please note: assign variables to the properties ""croll position variable \\
horizontal": "Scroll position variable vertical". You can then edit the data \\
of the scrollbar position in the application.
\end{tabular} \\
\hline
\end{tabular}

\section*{"Deactivate background drawing"}
\(\square\) : The non-animated elements of the referenced visualization are displayed as
background images in order to optimize the performance of the visualization.
Result: At runtime, the elements can be displayed in any order, for example
when an element moves behind the frame at runtime.
包: Deactivates the background display in order to prevent the behavior
described above
The property is not available for the following settings:
- The "Scaling type" property is set to "Fixed and scrollable"
- The client animation functionality is enabled.

Element prop- The properties include variables for the position of the scroll boxes in the scroll bars. You can erty 'Scroll bar process the data for the scroll box position in the application.
settings'
\begin{tabular}{|l|l|}
\hline Requirement: The "Scaling type" property is "Fixed and scrollable". \\
\hline \begin{tabular}{ll}
\hline "Scroll position variable \\
horizontal"
\end{tabular} & \begin{tabular}{l} 
Variable (integer data type, also array). Includes the position of the horizontal or \\
vertical scroll box. The array contains the position for each display variant. If the \\
vertical" \\
\hline "Scroll position variable, \\
visualization is running on multiple display variants, then the position changes \\
are disconnected from each other. \\
Example:
\end{tabular} \\
& PLC_PRG.iScrollHor [CURRENTCLIENTID] \\
& PLC_PRG.iScrollVer[CURRENTCLIENTID] \\
In this example, the variable is declared as an array: \\
& \begin{tabular}{l} 
iScrollHor: ARRAY [0..20] OF INT; \\
iScrollVer: ARRAY [0..20] OF INT;
\end{tabular} \\
& CURRENTCLIENTID indicates the current display variant. \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X "\) & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (ए.) to other positions in the editor.

See also
- \({ }^{*}>\) Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline\(" X "\) & X-coordinate of the point of rotation \\
\hline\(" Y "\) & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

\section*{Element property 'Switch frame variable'}
\begin{tabular}{|l|l|}
\hline "Variable" & Variable (integer data type). Specifies the index of the active visualization. \\
& Example: PLC_PRG. uiActiveVisuID. \\
& Tip: The "Frame Configuration" dialog box includes a list of selected visualiza- \\
tions. The visualizations are ordered automatically in numeric order in the list. \\
\hline
\end{tabular}

Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular} \\
\hline
\end{tabular}

\section*{You can link the variables to a unit conversion.}

Element property 'Relative movement'

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

\section*{See also}
\begin{tabular}{|l|l|}
\hline "Movement top-left" & \\
\hline "X" & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the left edge \\
is moved horizontally. Incrementing the value moves the element to the right. \\
Example: PLC_PRG. iDeltax
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline " \(Y\) " & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the top edge \\
is moved vertically. Incrementing the value moves the element to the down. \\
Example: PLC_PRG. ideltaY
\end{tabular} \\
\hline "Movement bottom-right" & \\
\hline\(" X "\) & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the right edge \\
is moved horizontally. Incrementing the value moves the element to the right. \\
Example: PLC_PRG.iDeltaWidth
\end{tabular} \\
\hline\(Y "\) & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the bottom \\
edge is moved vertically. Incrementing the value moves the element to the down. \\
Example: PLC_PRG.iDeltaHeight
\end{tabular} \\
\hline
\end{tabular}

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px>: Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the Frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Requirement: "Show Frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the Frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- H Chapter 6.4.5.20.1.5 "Visualization Element 'Image"' on page 3038
- \({ }^{\text {• }}\), Chapter 6.4.1.21.2.15 "Object 'Image Pool'" on page 2468

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. } \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code": 3 PLC_PRG.i_x \(:=0 ;\) \\
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\(\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}\)
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action. \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & \(\square\) : Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Group Box'}

Symbol:

\section*{Category: "Common Controls"}

The element provides a visual grouping of visualization elements. The group box can have multiple levels of nesting.

You can also use drag\&drop to add elements to a "Group Box". To do this, drag the element to the window area of the "Group Box". The appearance of the cursor changes (a small plus sign is displayed). When you click the [Shift] key at the same time, the element is not added.
You can remove elements from the "Group Box" by dragging them out of the window area.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: Parameter axis 1 \\
& \begin{tabular}{l} 
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Group Box" \\
\hline "Clipping" & \(\boxed{\square}:\) Elements that protrude beyond the size of the group box are clipped. \\
\hline
\end{tabular}

Element prop- The position defines the location and size of the element in the visualization window. These erty 'Position' are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X\) " & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (ए-) to other positions in the editor.

See also
- 出 Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\epsilon}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

Element prop- The properties contains character strings for labeling the element.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. \\
Example: Axis 1.
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Parameters of Axis 1.
\end{tabular} \\
\hline
\end{tabular}

See also
- \(\xi^{4}\) Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

Element prop- The properties contain fixed values for the text properties.
erty 'Text properties'
\begin{tabular}{|l|l|}
\hline "Font" & \begin{tabular}{l} 
Example: "Default" \\
\(\ldots . .:\) The "Font" dialog box opens. \\
v: Drop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l} 
Example: "Black" \\
\(\ldots . .\). The "Color" dialog box opens. \\
v: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
Whole number (value range from 0 to 255 ). This determines the transparency of \\
the respective color. \\
Example: \(255:\) The color is opaque. \\
\(0:\) The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, \\
then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

\section*{Visualization Element 'Table'}

\section*{Symbol:}

\section*{Category: "Common Controls"}

The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

\section*{Element proper-}
ties
\begin{tabular}{|c|c|}
\hline "Element name" & \begin{tabular}{l}
Example: Data set component 1 \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the element list.
\end{tabular} \\
\hline "Type of element" & Table \\
\hline "Data array" & \begin{tabular}{l}
Array whose data is visualized as a table \\
Variable (ARRAY) whose data type determines the number of columns and rows in the table \\
Array types \\
- One-dimensional array: The table has one column. \\
- Two-dimensional array: The second dimension determines the number of columns. \\
- Array of an array: The number of array elements of the back array determines the number of columns. \\
- Array of a structure: The number of structure members determines the number of columns. \\
- Array of a function block: The number of local variables determines the number of columns. \\
Example: PLC_PRG.aiTable \\
Declaration: aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)]; \\
Hint: If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the [Enter] key.
\end{tabular} \\
\hline "Max. array index" & \begin{tabular}{l}
Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0 . \\
- Variable (integer data type) \\
Example: PLC_PRG.iUpperIndexBoundToDisplay \\
- Integer literal \\
Example: 4 is displayed as 5 in the row of the table.
\end{tabular} \\
\hline
\end{tabular}

- Data Type 'ARRAY'

Element property 'Columns'

The "Table" element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the "Data array" property. When a variable is assigned there, you can specify the display of the Table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [ \(<n>\) ].
\begin{tabular}{|l|l|}
\hline "Show row header" & \begin{tabular}{l} 
: The row header is visible. \\
\\
Example: For an array, the index of the array element is displayed in the header.
\end{tabular} \\
\hline "Show column header" & \(\boxed{\square}:\) The column label is visible. \\
\hline "Row height" & Height of the rows (in pixels) \\
\hline "Row header width" & Width of the row label \\
\hline "Scroll bar size" " & Size of the scroll bar (in pixels) \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ "Movement" } & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline\(" Y "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PPRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular}
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " "", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime.

\section*{bles'}
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle colo"" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: 16\#FF888888
\end{tabular} \\
\hline
\end{tabular}

- \({ }^{4}\) Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|l|}{\begin{tabular}{|l|}
\hline Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline " \(Y\) " & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\mp\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

-

Element prop- The variables control the element behavior dynamically.
erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\hline TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Selection and caret configuration'

The "Invisible" property is supported by the "Client Animation" functionality.

The variables allow for controlling the caret position and the selection of the text.

\begin{tabular}{|l|l|}
\hline "Caret position" & Variable (integer data type). Contains the position of the cursor. \\
\hline "Selection start" & \begin{tabular}{l} 
Variable (integer data type). Contains the position of the first selected character. \\
Example: PLC_PRG. iSelStart
\end{tabular} \\
\hline "Selection end" & \begin{tabular}{l} 
Variable (integer data type). Contains the position of the last selected character. \\
Example: PLC_PRG.iSelEnd
\end{tabular} \\
\hline "All selected" & \begin{tabular}{l} 
Variable (BOOL). Toggles the selection of the entered text. \\
TRUE: The text in the text field is selected.
\end{tabular} \\
\begin{tabular}{l} 
FALSE: The selection starts with the value in "Selection start" and ends with \\
"Selection end".
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.
Example: "Execute ST Code": ЗPLC_PRG.i_x := 0;
\begin{tabular}{|l|l}
\hline "OnDialogClosed" & Input event: The user closes the dialog.
\end{tabular}
\begin{tabular}{|l|l|}
\hline ＂OnMouseClick＂ & \begin{tabular}{l} 
Input event：The user clicks the mouse button completely in the element area． \\
The mouse button is clicked and released．
\end{tabular} \\
\hline ＂OnMouseDown＂ & Input event：The user clicks down on the mouse button． \\
\hline ＂OnMouseEnter＂ & Input event：The user drags the mouse pointer to the element． \\
\hline ＂OnMouseLeave＂ & Input event：The user drags the mouse pointer away from the element． \\
\hline ＂OnMouseMove＂ & \begin{tabular}{l} 
Input event：The user moves the mouse pointer over the element area． \\
－The user releases the mouse button within the element area．It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area． \\
－The user presses the mouse button within the element area，leaves the \\
element area，and then releases the mouse button．
\end{tabular} \\
\hline ＂OnMouseUp＂ & \begin{tabular}{l} 
Note：This CODESYS－specific triggering behavior guarantees that actions for \\
key elements are completed．A key element starts an action for＂OnMouseDown＂ \\
and ends the action for＂OnMouseUp＂． \\
Example：A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area．The action is ended anyway because＂OnMouseUp＂is triggered．
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline ＂Tap＂ & \begin{tabular}{l} 
When a mouse click event occurs，the variable defined in＂Variable＂is described \\
in the application．The coding depends on the＂Tap FALSE＂and＂Tap on enter if \\
captured＂options．
\end{tabular} \\
\hline ＂Variable＂ & \begin{tabular}{l} 
Variable（BOOL）that is set on mouse click event． \\
Example：PLC＿PRG．bIsTapped \\
TRUE：A mouse click event exists．It lasts as long as the user presses the mouse \\
button over the element．It ends when the button is released． \\
FALSE：A mouse click event does not exist． \\
Requirement：The＂Tap FALSE＂option is not activated．
\end{tabular} \\
\hline ＂Tap FALSE＂ & \begin{tabular}{l} 
⿴囗 ：The mouse click event leads to a complementary value in＂Variable＂． \\
TRUE：A mouse click event does not exist． \\
FALSE：While the mouse click event exists．
\end{tabular} \\
\hline ＂Tap on enter if captured＂ & \begin{tabular}{l} 
⿴囗：During user input，it is also taken into consideration whether the mouse \\
pointer is dragged within the element area or not while the mouse button is \\
pressed． \\
TRUE：While the mouse click event exists and the mouse pointer is moved over \\
the element area． \\
FALSE：A mouse click event does not exist．Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed． \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area．The mouse is then captured．
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOoL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: [AIt]+[T]. \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Scroll Bar'}

Symbol:

\section*{Category: "Common Controls"}

The element sets the value of a variable, depending on the position of the scroll bar.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: Speed Conveyor Belt 1 \\
Optional \\
& \begin{tabular}{l} 
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Scroll Bar" \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.
\begin{tabular}{|l|l|}
\hline "Value" & Variable as type integer that includes the position of the scroll bar. \\
\hline "Minimum value" & Smallest value of the scroll bar (fixed value or variable). \\
\hline "Maximum value" & Largest value of the scroll bar (fixed value or variable). \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Page size" & Page size \\
& - As a fixed value, for example 10 \\
& - As a variable of data type integer \\
Requirement: Visible when the "Move to click" property is not selected. \\
\hline "Move to click" & \begin{tabular}{l} 
Behavior of the scroll bar at visualization runtime when it is clicked: \\
\\
\\
\\
\\
\\
\(\square\) \\
\(\square:\) : The scrollbar moves to the clicked position.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The position defines the location and size of the element in the visualization window. These erty 'Position' are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X\) " & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (吊) to other positions in the editor.

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Font" & Example: "Default"
The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
: The "Color" dialog box opens. \\
- : Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element prop- These properties are variables with contents that replace a format definition. erty 'Text variables'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses
\end{tabular} \\
& \begin{tabular}{l} 
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text". \\
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC PRG. enVar <enume ration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline "Tooltip variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip".
\end{tabular}.

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\text {• }}\), Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
pt \\
pt \\
px \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

See also
- « "Element property 'Text properties'" on page 3116

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- true: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value tRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color \\
Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color \\
Example: PLC_PRG.dwFillColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\boldsymbol{\oplus}\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Slider'}

\section*{Symbol:}

\section*{Category: "Common Controls"}

The element changes the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Example: Speed controller conveyor belt 1 \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Slider" \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ( ( \(^{-}\)) to other positions in the editor.

- \({ }^{*}\) ) Chapter 6.4.5.21.3.6 "Dialog 'Input Configuration'" on page 3370
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the options "Tap FALSE" and "Tap on \\
enter if captured".
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Contains the information whether a mouse click event exists. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts while the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline FALSE: While the mouse click event exists.
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Shift" & \begin{tabular}{l} 
When a mouse click event occurs, the variable here is described in the applica- \\
tion. When the mouse click event ends, its value is toggled with the "Toggle on \\
up if captured" option.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Tip: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkeys" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Event(s)" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Event(s)" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\

\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties.
erty 'Text properties'
\begin{tabular}{|l|l|}
\hline "Usage of" & \begin{tabular}{l} 
- "Default style values": The values of the visualization style are used. \\
- "Indiviviual settings": The "Individual text properties" property group is shown \\
The values can be customized here.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Individual text properties" \\
Requirement: The "Individual settings" text property is defined.
\end{tabular} \\
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l} 
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line brek": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Example: "Default" \\
"..: The "Font" dialog box opens. \\
v: Drop-down list with style fonts.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline \multirow[t]{3}{*}{"Font color"} & Example: "Black" \\
\hline & ...): The "Color" dialog box opens. \\
\hline & - Drop-down list with style colors. \\
\hline \multirow[t]{4}{*}{"Transparency"} & Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
\hline & Example: 255: The color is opaque. \\
\hline & 0 : The color is completely transparent. \\
\hline & Please note: If the color is a style color and already has a transparency value, then this property is write-protected. \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.
"X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Alarm Table'}

Symbol:

\section*{Category: "Alarm Manager"}

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column - even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

If an alarm history has been created, then you can programmatically delete it at runtime. The recording starts again from the time of deletion. See the help page for "Visualizing Alarm Management".

\section*{Element proper- \\ ties}
\begin{tabular}{|c|c|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Alarm Table" \\
\hline "Data source" & \begin{tabular}{l}
Selection of the device and the application where the data to be visualized and the alarms are generated \\
- Remote data source which accesses a remote device, accesses a remote application, and then transfers the data to the alarm configuration \\
Example: DataSource_A \\
Below the (now visible) "Application" property, the remote application is displayed as configured in the data source. \\
Example: App_A \\
Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder. \\
- Local application below which the alarm configuration is located Example: ©<local application>"
\end{tabular} \\
\hline
\end{tabular}

- Object 'Data Source'

Element prop-
erty 'Alarm con-
figuration'
\begin{tabular}{|l|l|}
\hline "Alarm groups" & \begin{tabular}{l} 
Opens the "Select Alarm Group" dialog where you define the alarm groups that \\
you want to display.
\end{tabular} \\
\hline "Priority from" & Least priority for alarm display. (0 to 255). \\
\hline "Priority to" & Greatest priority for alarm display. (0 to 255). \\
\hline "Alarm classes" & \begin{tabular}{l} 
Opens the "Select Class Group" dialog where you define the alarm classes that \\
you want to display.
\end{tabular} \\
\hline "Filter criterion" & \begin{tabular}{l} 
For the "Alarm Banner" element only \\
- "Most important": The alarm with the highest priority (lowest value) is dis- \\
played. \\
- "Newest": The most recent alarm is displayed.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Filter by latch 1" & \begin{tabular}{l}
The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value. \\
- "Filter variable": Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples:PLC_PRG.strFilterVariable, 'STRING'. \\
- "Filter type": Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2). \\
Possible values: \\
- 0: No filtering \\
- 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1 ' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed. \\
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T\#1h2s, DINT\#15, REAL\#1.5, FALSE \\
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of \(9,223,372,036,854,775,808\) to 9,223,372,036,854,775,807. \\
- All other values: The behavior is not defined and can change in the future.
\end{tabular} \\
\hline "Filter by time range" & \begin{tabular}{l}
The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled. \\
- "Filter variable, from": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed. \\
- "Filter variable, to": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed. \\
- "Filter type": Variable of integer data type that determines whether "Filter by time range" is enabled or disabled. \\
Possible values: \\
- 1: Filtering is enabled \\
- 0 : Filtering is disabled
\end{tabular} \\
\hline
\end{tabular}

- *y Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline " \(Y\) " & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\Psi}\) ) to other positions in the editor.

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Font" & Example: "Default"
The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
The "Color" dialog box opens. \\
- : Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Selection'
\begin{tabular}{|c|c|}
\hline "Selection color" & Fill color of the selected row \\
\hline "Selection font color" & Font color of the selected row \\
\hline "Frame around selected cells" & \(\square\) : A frame is drawn around the selected cells at runtime. \\
\hline "Variable for selected alarm group" & Name of the affected alarm group; type: STRING, WSTRING \\
\hline "Variable for selected alarm ID" & Alarm ID of the affected alarm group; type: STRING, WSTRING \\
\hline "Variable for selected line" & Index of the selected alarm line (0-based). The index can be read and written; integer data type \\
\hline "Variable for valid selection" & \begin{tabular}{l}
TRUE: An alarm line is selected. \\
FALSE: The selection is invalid. For example, for an empty alarm table or when an alarm is not selected yet.
\end{tabular} \\
\hline "Variable for selected alarm information" & \begin{tabular}{l}
Information about the selected alarm. Type AlarmSelectionInfo \\
For easy usage, the function block AlarmSelectionInfoDefault is provided. This FB fills the structure with the memory for 10 messages and 10 latch variables. \\
Example: myAlarmSelectionInfoDefault.AlarmSelectionInfo \\
The following information is available: \\
- sAlarmgroup \\
- uialarmID \\
- timeStampActive \\
- timeStampInactive \\
- timeStampAcknowledge \\
- timeStampLast \\
- paLatchVariables \\
- iLatchVariablesCount \\
- papwsAlarmMessages \\
- dwAlarmMessageTextBufferSize \\
- iAlarmMessagesCount \\
- iSelectionChangedCounter
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop- Boolean variables are defined here for executing specific actions in the table can be executed at erty 'Control runtime. \\ variables'}
\begin{tabular}{|c|c|}
\hline "Acknowledge selected" & \begin{tabular}{l}
Variable (BOOL) \\
Example: PLC_PRG.bAckSelectedAlarms \\
If the assigned variable is TRUE, then the selected alarm is acknowledged.
\end{tabular} \\
\hline "Acknowledge all visible" & \begin{tabular}{l}
Variable (BOOL) \\
Example: PLC_PRG.bAckVisibleAlarms \\
If the assigned variable is TRUE, then all alarms are acknowledged that are visible in the alarm table.
\end{tabular} \\
\hline "History" & \begin{tabular}{l}
Variable (BOOL) \\
Example: PLC_PRG.bShowHistory \\
If the assigned variable is TRUE, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. \\
Note: Acknowledgment is not possible in this view.
\end{tabular} \\
\hline "Freeze scroll position" & \begin{tabular}{l}
Variable (BOOL) \\
Example: PLC_PRG.bFreezeScrollPosition \\
If the assigned variable is TRUE, then the scroll position set in the "History" view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).
\end{tabular} \\
\hline "Count alarms" & \begin{tabular}{l}
Variable (integer data type) \\
Example: PLC_PRG.iNumberOfAlarms. \\
Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.
\end{tabular} \\
\hline "Count visible rows" & \begin{tabular}{l}
Variable (integer data type) \\
Example: PLC_PRG.iNumberVisibleLines \\
Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.
\end{tabular} \\
\hline "Current scroll index" & \begin{tabular}{l}
Variable (integer data type) \\
Example: PLC_PRG.iScrollIndex \\
The index of the first visible row if the alarm table (0-based). The variable can be read and written.
\end{tabular} \\
\hline "Current column sorting" & \begin{tabular}{l}
Variable (integer data type) \\
Example: PLC_PRG.iColSort \\
The variable contains a value of the enumeration "VisuElemsAlarm.VisuEnumAlarmDataType". This value determines the column that sorts the alarm table.
\end{tabular} \\
\hline "Variable for sorting direction" & \begin{tabular}{l}
Variable (BOOL) \\
Example: PLC_PRG.xSortAscending \\
The variable determines the sort order for the entries in the alarm table (TRUE: ascending; FALSE: descending).
\end{tabular} \\
\hline
\end{tabular}

You can also use the "Insert Elements for Acknowledging Alarms" command to define buttons with predefined control variables.

See also

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

See also

Element prop- The variables control the element behavior dynamically. erty 'State variables'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
TRUE: The element is not visible at runtime.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

\section*{Visualization Element 'Alarm Banner'}

Symbol:

\section*{Category: "Alarm Manager"}

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElem Inst_1 \\
\hline "Type of element" & "Alarm Banner" \\
\hline "Data source" & \begin{tabular}{l} 
If you intend to use a remote alarm configuration, then you have to specify the \\
name of the remote application here. If you do not specify anything, the alarm \\
configuration will be located locally.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop- \\ erty 'Alarm con- \\ figuration'}
\begin{tabular}{|l|l|}
\hline "Alarm groups" & \begin{tabular}{l} 
Opens the "Select Alarm Group" dialog where you define the alarm groups that \\
you want to display.
\end{tabular} \\
\hline "Priority from" & Least priority for alarm display. (0 to 255). \\
\hline "Priority to" & Greatest priority for alarm display. (0 to 255). \\
\hline "Alarm classes" & \begin{tabular}{l} 
Opens the "Select Class Group" dialog where you define the alarm classes that \\
you want to display.
\end{tabular} \\
\hline "Filter criterion" & \begin{tabular}{l} 
For the "Alarm Banner" element only \\
- "Most important": The alarm with the highest priority (lowest value) is dis- \\
played. \\
- "Newest": The most recent alarm is displayed.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Filter by latch 1" & \begin{tabular}{l}
The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value. \\
- "Filter variable": Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples:PLC_PRG.strFilterVariable, 'STRING'. \\
- "Filter type": Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2). \\
Possible values: \\
- 0: No filtering \\
- 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1 ' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed. \\
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T\#1h2s, DINT\#15, REAL\#1.5, FALSE \\
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of \(9,223,372,036,854,775,808\) to 9,223,372,036,854,775,807. \\
- All other values: The behavior is not defined and can change in the future.
\end{tabular} \\
\hline "Filter by time range" & \begin{tabular}{l}
The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled. \\
- "Filter variable, from": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed. \\
- "Filter variable, to": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed. \\
- "Filter type": Variable of integer data type that determines whether "Filter by time range" is enabled or disabled. \\
Possible values: \\
- 1: Filtering is enabled \\
- 0 : Filtering is disabled
\end{tabular} \\
\hline
\end{tabular}

- \(\Rightarrow\) Chapter 6.4.5.21.3.16 "Dialog 'Selected Alarm Class'" on page 3389

Element prop- By default, columns [0] and [1] are preconfigured: "Time stamp" and "Message text". You create erty 'Columns: Column [<n>]'

Animations (dynamic text, font variables), texts, and tooltips are not supported.
\begin{tabular}{|c|c|}
\hline "Width" & Width of the column (in pixels) \\
\hline "Type of data" & \begin{tabular}{l}
About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library Alarmmanager.library: AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM.yyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm'). \\
Here you define the information to be displayed in the column. \\
- "Bitmap" \\
- "Time stamp": Date and time of the last status change of the alarm \\
- "Time stamp active": Date and time of the last activation of the alarm \\
- "Time stamp inactive": Date and time of the last deactivation of the alarm \\
- "Time stamp acknowledge": Date and time of the last acknowledgement \\
- "Value": Actual value of the expression \\
- "Message": Output of the message text \\
- "Priority": Alarm priority \\
- "Class": Alarm class \\
- "State": Alarm state \\
- "Latch Variable <n>". Value of the selected latch variables
\end{tabular} \\
\hline "Text alignment" & \begin{tabular}{l}
Alignment of the contents in the column \\
- "Left" \\
- "Centered" \\
- "Right"
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (品) to other positions in the editor.

\hline "Begin of area" & Start value of the color area \\
\hline "End of area" & End value of the color area \\
\hline "Color" & Color that is used for displaying the area. \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline "Movement" & & \\
\hline " \(X\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \begin{tabular}{l}
Variable (numeric data type). Defines the Y position Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the el
\end{tabular} & \begin{tabular}{l}
in pixels). \\
nent downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Meter 90'}

Symbol:

\section*{Category: "Measurement Controls"}

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Meter 90"" \\
\hline "Value" & \begin{tabular}{l} 
Variable (numeric data type) \\
The variable value determines the pointer direction of the element.
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline

\section*{Visualization Element 'Meter'}

Symbol:

\section*{Category: "Measurement Controls"}

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Meter" \\
\hline "Value" & \begin{tabular}{l} 
Variable (numeric data type). \\
The variable value determines the pointer direction of the element.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X "\) & X-coordinate of the point of rotation \\
\hline\(" Y "\) & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X\) " & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ([『) to other positions in the editor.

\section*{Visualization Element 'Potentiometer'}

Symbol:

Category: "Measurement Controls"
The element displays the value of a variable as a setting on the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

See also
- ⓨ Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Potentiometer" \\
\hline "Variable" & \begin{tabular}{l} 
Variable (numeric data type). Contains the position of the pointer for the potenti- \\
ometer. \\
A visualization user can modify the value by dragging the pointer to another \\
position.
\end{tabular} \\
\hline
\end{tabular}

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline\(" Y\) " & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\Psi})\) to other positions in the editor.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The position defines the location and size of the element in the visualization window. These erty 'Position' are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (■-) to other positions in the editor.

Length of the tick marks (in pixels) \\
Requirement: A customer image is selected as "Background".
\end{tabular} \\
\hline "Label offset": & Distance from the labels to the tick marks (in pixels) \\
\hline "Unit offset": & Distance of the unit text "Label \(\rightarrow\) Unit" from the upper scale edge (in pixels) \\
\hline "Origin offset" & \begin{tabular}{l}
Offset of the element (in pixels) \\
Requirement: For the elements "Meter \(180^{\circ}\) " and "Meter \(90^{\circ}\) ", this property is displayed only if a custom image is selected as "Background".
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop- \\ erty 'Colors'}
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{"Color areas"} \\
\hline "Durable color areas" & All color areas are visible, regardless of the current value.
Only the color area is visible that includes the current value. \\
\hline "Use colors for scale" & 回: Colors in the color area are used only for the scale and frame. \\
\hline "Color areas" & \\
\hline "Create new" & A new color area is added to the "Elements" view. \\
\hline "Delete" & The color area is removed from the list and the list is refreshed. \\
\hline "Begin of area" & \begin{tabular}{l}
Start value of the color area \\
Example: 20 \\
*: The property "Variable" is shown below.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l}
Variable (integer data type). Contains the start value. \\
Example: PLC_PRG.iColorAreaStart0 \\
Declaration:
```

PROGRAM PLC_PRG
VAR
iColorAreaStart0 : INT := 80;
END_VAR

```
\end{tabular} \\
\hline "End of area" & \begin{tabular}{l}
End value of the color area \\
Example: 120 \\
: The property "Variable" is shown below.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Variable" & \begin{tabular}{l} 
Variable (integer data type). Contains the end value. \\
Example: iColorAreaEnd0 \\
Declaration: \\
\\
\\
\\
\\
\hline PROGRAM PLC_PRG \\
VAR iColorAreaEndo : INT \(:=100 ;\) \\
END_VAR \(\quad\) Color that is used for displaying the area. \\
\hline
\end{tabular} \\
\hline
\end{tabular}

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
\\
\\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" \\
\hline "X" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PPRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular}
\end{tabular}

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Element property 'Access rights'}
\begin{tabular}{|l|l|}
\hline "Access rights" & \begin{tabular}{l} 
Opens the "Access rights" dialog. There you can edit the access privileges for \\
the element. \\
Status messages: \\
- "Not set. Full rights.". Access rights for all user groups : "operable" \\
\(\bullet\) \\
- "Rights are set: Limited rights": Access is restricted for at least one group.
\end{tabular} \\

\end{tabular}
\end{tabular}

\section*{Visualization Element 'Histogram'}

\section*{Symbol:}

\section*{Category: "Measurement Controls"}

The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.
See also
- \({ }^{\leftrightarrows}\) Chapter 6.4.5.2.4 "Displaying Array Data in a Histogram" on page 2862

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_35 \\
\hline "Type of element" & "Histogram" \\
\hline "Data array" & \begin{tabular}{l} 
One-dimensional array with data displayed in this histogram. \\
Example: PLC_PRG.arr1
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Subrange of array'}
\begin{tabular}{|l|l|}
\hline "Use subrange" & \(\boxed{\square}\) : Only part of the array is displayed in the histogram. \\
\hline "Start index" & \begin{tabular}{l} 
First array index with a displayed value. \\
Requirement: "Use subrange" is activated.
\end{tabular} \\
\hline "End index" & \begin{tabular}{l} 
Last array index with a displayed value. \\
Requirement: "Use subrange" is activated.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Display type" & \begin{tabular}{l} 
- "Bars": Data is displayed as bars. \\
- "Lines": Data is displayed as lines. \\
- "Curve": Interpolation of data into a curve.
\end{tabular} \\
\hline "Line width" & \begin{tabular}{l} 
Specified in pixels \\
Requirement: "Curve" is selected as the "Display type".
\end{tabular} \\
\hline "Show horizontal lines" & \begin{tabular}{l} 
: Horizontal lines are drawn on the main scale. \\
Note: Not all visualization styles have this property. This element property is not \\
available for visualization styles that have striped backgrounds (example: "Flat \\
style").
\end{tabular} \\
\hline "Relative bar width" & \begin{tabular}{l} 
Integer value between 1 and 100 \\
- 1: The bars are drawn as lines. \\
- 100: The entire width of the histogram is filled with the bars.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (■-) to other positions in the editor.

See also
- Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center'
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline\(~ Y "\) & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols \((\boldsymbol{\oplus})\) to other positions in the editor.

Element property 'Scale'
\begin{tabular}{|l|l|}
\hline "Scale start" & \begin{tabular}{l} 
Least value of the scale and the lower limit of the value range for the element. \\
Example: 0 \\
0: The property "Variable" is shown below.

\hline "Font color" & Selection from the drop-down list or by clicking the .... button. \\
\hline
\end{tabular}

Element property 'Colors'
\begin{tabular}{|l|l|}
\hline "Graph color" & \begin{tabular}{l} 
Color of the bar in normal state. \\
Note: The normal state is in effect when the current value of the array compo- \\
nent does not fulfill the alarm condition.
\end{tabular} \\
\hline "Alarm value" & Threshold for the alarm \\
\hline "Alarm condition" & \begin{tabular}{l} 
If the current value of the array component fulfills the alarm condition, then the \\
alarm condition is set. \\
- "Less": The current value is less than the "Alarm value" \\
- "More": The current value is greater than the "Alarm value"
\end{tabular} \\
\hline "Alarm color" & Color of the bar in alarm state. \\
\hline "Use color areas" & ": The color areas defined in this element are used. \\
\hline "Color areas" & A new color area is added. \\
\hline "Create new" & The color area is removed from the list. \\
\hline "Delete" & The start value on the "Scale" of the Histogram where the color area begins. \\
\hline "Begin of area" & The end value on the "Scale" of the Histogram where the color area ends. \\
\hline "End of area" & Color that is used for displaying the area. \\
\hline "Color" &
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|l|}{\begin{tabular}{|l|}
\hline Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(₫\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center"according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
systen of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
-

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|l|l|}

\section*{Visualization Element 'Image Switcher'}

Symbol:

\section*{Category: "Lamps/Switches/Bitmaps"}

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the "Image settings" element properties. The effects of mouse clicks are defined in the "Element behavior" property.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name"" & \begin{tabular}{l} 
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list. \\
Example: ImageSwitcher_1
\end{tabular} \\
\hline "Type of element" & "Image Switcher" \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X\) " & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (파) to other positions in the editor.

\begin{tabular}{|l|l|}
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). \\
The value of the variable changes according to user input and it is independent \\
of the "Element behavior" element property.
\end{tabular} \\
\hline
\end{tabular}

Image settings
\begin{tabular}{|l|l|}
\hline "Image "on"" & \begin{tabular}{l} 
Image ID from an image pool. The image can be selected using the input assis- \\
tant. \\
The image is used if the variable of the "Variable" property has the value TRUE.
\end{tabular} \\
\hline "Image "off"" & \begin{tabular}{l} 
Image ID from an image pool. The image can be selected using the input assis- \\
tant. \\
The image is used if the variable of the "Variable" property has the value FALSE.
\end{tabular} \\
\hline "Image "clicked""" & \begin{tabular}{l} 
Image ID from an image pool. The image is selected using the input assistant. \\
In runtime mode, the visualization displays the referenced image when the ele- \\
ment is clicked (and the mouse button is held down). \\
Requirement: The "Element behavior" is "Image toggler".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Transparency" & 冋: The "Transparent color" is selected. \\
\hline "Transparent color" & \begin{tabular}{l}
The image pixels that have the transparent color are displayed as transparent. \\
Requirement: "Transparency" is activated. \\
- ...The "Color" dialog box opens. \\
- \(\quad\) : A drop-down list with color names opens.
\end{tabular} \\
\hline "Scaling type" & \begin{tabular}{l}
Defines how an image fits in the element frame. \\
- "Fixed": The original size of the image is retained, regardless of the dimensions of the element. \\
- "Isotropic": The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. \\
- "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.
\end{tabular} \\
\hline "Horizontal alignment" & \begin{tabular}{l}
Horizontal alignment of the image within the element frame or element \\
- Left \\
- Centered \\
- Right \\
Requirement: "Scaling type" is "lsotropic".
\end{tabular} \\
\hline "Vertical alignment" & \begin{tabular}{l}
Vertical alignment of the image within the element frame or element \\
- Top \\
- Centered \\
- Bottom \\
Requirement: "Scaling type" is "lsotropic".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Element behavior" & \begin{tabular}{l} 
- "Image toggler": Every mouse click switches the image. \\
- "Image tapper"" While a visualization user holds down the mouse button, the \\
image of the "Image on" property is displayed. At the same time, the value \\
TRUE is assigned to the "Variable" property.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: While the mouse button is pressed, the image of the "Image" property is \\
displayed and the "Variable" property gets the value FALSE instead of the value \\
TRUE, and back. \\
Requirement: "Image tapper" is selected in the "Element behavior" property.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\oplus\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline\(Y "\) & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus})\) to other positions in the editor.

\section*{Element property 'Texts'}
\begin{tabular}{|l|l|}
\hline "Tooltip" & \begin{tabular}{l} 
String display as tooltip for the element \\
Example: Valid access.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\hline "Tooltip" & \begin{tabular}{l} 
String display as tooltip for the element \\
Example: Valid access.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Trend'}

Symbol:

\section*{Category: "Special Controls"}

The element displays the curve of variable values as a trend diagram. The trend diagram is suitable for representing a long-term data curve because the data is read from a trend recording and hence from a database. Moreover, you can run the "Trend" element together with the "Date Range Picker", "Legend", and "Time Range Picker" operating elements so that the user can navigate conveniently in the diagram.

You can programmatically delete the recorded trend curve at runtime. The recording starts again from the time of deletion. See the help page for "Programming a Trend Visualization".

Behavior at runtime: As soon as the graph is drawn, the user can move the cursor along the time axis in order to mark a specific time. Then the variable value belonging to the cursor position is displayed in the legend above the graph. \\
\hline &  \\
\hline &  \\
\hline "Show tooltip" & \begin{tabular}{l}
Requirement: "Show cursor" is activated. \\
: A tooltip opens at the cursor. \\
Behavior at runtime: The variable value belonging to the cursor position is displayed as a tooltip.
\end{tabular} \\
\hline "Show frame" & - The trend diagram is drawn with a frame. \\
\hline "Number format" & \begin{tabular}{l}
Format specification in printf syntax, which determines how the values are displayed in the tooltip and in the legend \\
Example: \%d (integer variable) or \(\% 5.2 \mathrm{f}\) (floating-point number)
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Tick mark labels'}

The time stored in the trend recording are in the UTC time zone. If the time is displayed in the trend of the visualization element, then the time stamps are converted to the local time zone of the operating system of the PLC.

Change the time zone in the operating system if the times in the trend diagram are not in the zone that you need.
\begin{tabular}{|c|c|}
\hline "Time stamps" & \begin{tabular}{l}
X-value of the trend diagram \\
- "Absolute time stamps" \\
The absolute time with date and time is displayed at each tick mark on the time axis. \\
Example: 03/18/2016 12h30m50s \\
- "Relative time stamps" \\
The time period from the start of the recording \((=0)\) is displayed at each tick mark. \\
Example: 5m30s
\end{tabular} \\
\hline "Draw labels on two lines" & The time stamps are displayed on two lines (for example, the date is displayed on the first line and the time on the second line).
The time stamp is displayed on one line. Example: 2019-11-01-12:30:50. \\
\hline " Omit irrelevant information in timestamps" & The time stamps are displayed in a truncated form (without insignificant information). For example, the date is displayed at the first tick mark, and only the time is displayed at the following tick marks. The "Internationalization (format strings)" property is not visible and is ignored.
\(\square\) The time stamps are displayed with all information. This takes into consideration the "Internationalization (format strings)" property which contains the format specification for the date and time display. \\
\hline "Internationalization (format strings)" & \begin{tabular}{l}
Format specification for the date and time display of the time stamp (when it is displayed in full) \\
Note: The property is visible only if the "Omit irrelevant information in timestamps" option is not selected.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Date" & \begin{tabular}{l}
Format string that returns the date display according to the defined format. The operating system locale is used as the default setting. \\
Defined format strings for the date: \\
- Year: yyyy, yy, y \\
- Month: MM, M \\
- Day: dd, d \\
- Recommended separator: - . / \\
Example: \\
yyyy-MM-d displays 2019-10-25 \\
Yyyy-MM-dd displays 2019-10-25 \\
dd.MM. yyyy displays 25.10. 2019 \\
dd/MM/yyyy displays 25/10/2019
\end{tabular} \\
\hline "Time" & \begin{tabular}{l}
Format string that returns the time (or time of day) display according to the defined format. The operating system locale is used as the default setting. \\
Defined format strings for the time: \\
- 24-hour time definition: HH, H \\
- 12-hour time definition: hh, h \\
- AM/PM for 12-hour time definition: \(t t\) \\
- Minutes: mm, m \\
- Seconds: ss, s \\
- Milliseconds: ms \\
- Microseconds: us \\
- Recommended separator: : or space character \\
Example: \\
HH:mm:ss:ms displays \(15: 30: 59: 123\) \\
\(\mathrm{h}: \mathrm{mm}\) :ss tt displays 3:30:59 PM
\end{tabular} \\
\hline
\end{tabular}

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline\(" Y "\) & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

```

You can also change the values by dragging the symbols ( $\boldsymbol{\oplus}$ ) to other positions in the editor.

```

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the "Position \(\rightarrow\) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X "\) & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ( ( (T) \(^{-}\)) to other positions in the editor.

Variable (integer data type). Contains the line number that is selected \\
Note: The selection is controlled by the variables in the "Trigger selection" prop- \\
erty.
\end{tabular} \\
\hline "Set selection" & \begin{tabular}{l} 
Variable (BOOL). Controls the selection of a line. \\
Example: bSetSelection: BooL;
\end{tabular} \\
\begin{tabular}{l} 
TRUE: The line from the "Line to select" property is selected and highlighted in \\
the Text Editor. \\
if the line is not in the current text segment of the Text Editor, then the text \\
segment is moved to this line. \\
Note: The variable is used as the control variable for an input event triggered \\
by a visualization user. The control variable is not reset automatically. You are \\
responsible for this to occur in the visualization.
\end{tabular} \\
\hline
\end{tabular}

Table 635: Element property "Control variables --> Error handling"
\begin{tabular}{|l|l|}
\hline "Variable for error code" & \begin{tabular}{l} 
Variable (integer data type). Contains the error code when an error occurs \\
\\
\\
\\
\\
\\
\\
\\
\\
\\
\end{tabular} \begin{tabular}{l} 
The error codes are declared in GVL Errorcodes in the \\
VisuElemTextEditor library. To display the error text, the \\
VisuFctTextEditorGetErrorText () function of the library must be called. \\
\hline
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Variable for content changed" & \begin{tabular}{l} 
Variable (BOOL). Shows whether the contents have changed \\
Example: bIsContentEdited: BOOL; \\
TRUE: The contents of the Text Editor have changed.
\end{tabular} \\
\hline "Variable for access mode" & \begin{tabular}{l} 
Variable (BOOL). Controls the access privileges to the file \\
Example: bIsReadOnly: BOOL;
\end{tabular} \\
& \begin{tabular}{l} 
TRUE: A visualization user has read-only permission. At runtime, the file contents \\
are highlighted in gray in the Text Editor. \\
FALSE: A visualization user has read/write permission. \\
\\
Note: The variable overwrites the setting in the "Editor mode" property.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Maximum line length" & Maximum number of characters per line \\
\hline "Editor mode" & \begin{tabular}{l} 
- "Read-only": A visualization user has read-only permissions to the file. At \\
- runtime, the file contents are highlighted in gray in the text editor.
\end{tabular} \\
\hline
\end{tabular}

\section*{Visualization Element 'Path3D'}

Symbol:

Path3D

\section*{Category: "Special Controls"}

The "Path3D" visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application 3D Path Generator, which is available in CODESYS Forge, shows how these data can be generated.
If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.
- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker

A description of the function blocks can be found in the Library Manager in the library SM3_CNC_Visu.

The element does not work with the CODESYS HMI display variant.

Element proper-
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Path3D" \\
\hline
\end{tabular}

\section*{Element property 'Position'}

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

- Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Path description
\begin{tabular}{|l|l|}
\hline "Path data \\
(VisuStruct3DTrack)" & \begin{tabular}{l} 
Variable of the type VisuSt ruct 3DTrack, which is declared in the IEC code. \\
Example: PLC_PRG.pc. vs 3dt. A description of the structure can be found in \\
the library manager in the library VisuElem3DPath. Iibrary. \\
The data structure describes a path or track through a certain number of points. \\
The points are determined and buffered by the application. The track typically \\
displays the last n positions, so that only a certain part of them is ever displayed \\
at any one time. VisuStruct 3DTrack. pProjection is a variable that is \\
set by the visualization element and contains information about the path/track \\
projection. It can be read (only) by the application. In addition, the methods \\
Projection. Apply or .Appl yV can be used in order to see whether the \\
transformed position lies inside or outside the visualization display area, which is \\
defined by Project ion. ElementRect.
\end{tabular} \\
\hline Color of the path drawn \\
\hline "Path color" & Path line width in pixels, e.g.: "2" \\
\hline "Style of boundary points" & \begin{tabular}{l} 
Display of the points between two successive objects in the path \\
- End points are not displayed
\end{tabular} \\
\hline
\end{tabular}

Track descrip- The track data are structured in exactly the same way as the path data: VisuStruct3DTrack tion
\begin{tabular}{|l|l|}
\hline "Track data \\
(VisuStruct3DTrack)" & \begin{tabular}{l} 
Variable of the type VisuStruct 3DTrack, which is declared in the IEC code. \\
Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in \\
the library manager in the library VisuElem3DPath.library.
\end{tabular} \\
\hline "Track color" & Color of the track drawn \\
\hline "Track line width" & Track line width in pixels, e.g.: "2" \\
\hline
\end{tabular}

Camera control The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:
- Shifting to the left/to the right/upwards/downwards
- Rotation around the \(X / Y / Z\) axis
- Resetting of the view at \(X / Y, Y / Z\) or \(Z / X\) level, so that the path and the track are completely visible.
\begin{tabular}{|l|l|}
\hline "Control data \\
(VisuStruct3DControl)" & \begin{tabular}{l} 
Variable of the type VisuStruct3DControl, which is declared in the IEC \\
code. Example: PLC_PRG.pc.vs3dc. \\
A description of the structure can be found in the library manager in the library \\
VisuElem3DPath.
\end{tabular} \\
& \begin{tabular}{l} 
The values can be set via the application itself or via the visualization element \\
"ControlPanel". The library VisuElem3DPath contains ready-to-use visualiza- \\
tion frames that provide a possible user interface for these data.
\end{tabular} \\
\hline
\end{tabular}

\section*{Additional}
aspects
\begin{tabular}{|l|l|}
\hline "Coordinate system" & \(\boxed{ }:\) : The coordinate system is displayed \\
\hline "Grid" & \(\boxed{\square}:\) Grid lines are displayed \\
\hline "Grid color" & Color of the grid lines \\
\hline
\end{tabular}

Highlighting Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.
\begin{tabular}{|l|l|}
\hline Highlight mode & \begin{tabular}{l} 
Select one of the following highlight modes: \\
\(\bullet \quad\) Only the element whose ID corresponds to the value of the variable is high- \\
lighted. \\
All elements whose ID (linked with the object ID in the case of a CNC editor) \\
is smaller than or equal to the value in Variable are highlighted.
\end{tabular} \\
\hline Variable & \begin{tabular}{l} 
Project variable that specifies the ID of an element. Example: \\
PLC_PRG. iVarElement ID. This "highlight ID" is taken into account for the \\
setting of the highlight mode. The variable must be set in the IEC application.
\end{tabular} \\
\hline Highlight color & \\
\hline
\end{tabular}

\section*{Element look}
\begin{tabular}{|c|c|}
\hline "Frame line width" & Width of the frame around the element, in pixels, for example: "1" \\
\hline "Frame line style" & \begin{tabular}{l}
Select one of these style types for the frame line: \\
- Solid \\
- Dashes \\
- Dots \\
- Dash Dot \\
- Dash Dot Dot \\
- Hollow
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Transparent background" & \begin{tabular}{l}
\(\square:\) The background of the element is displayed transparently. \\
\(\square\)
\end{tabular} \\
\hline : The background of the element is displayed in the defined background color.
\end{tabular} \begin{tabular}{l} 
"Background color" \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example:bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- Requirement: User management is set up for the visualization.
erty 'Access
rights'
\begin{tabular}{|l|l|}
\hline "Access rights" & \begin{tabular}{l} 
Opens the "Access rights" dialog. There you can edit the access privileges for \\
the element. \\
Status messages:
\end{tabular} \\
& - "Not set. Full rights." Access rights for all user groups : "operable"" \\
- "Rights are set: Limited rights": Access is restricted for at least one group. \\
\hline
\end{tabular}

See also
- \& Chapter 6.4.5.21.3.1 "Dialog 'Access Rights"' on page 3366

\section*{Visualization Element 'Control Panel'}

Symbol:

\section*{Category: "Special Controls"}

This visualization element is used in connection with the "Path3D" visualization element. It is used for changing the position and orientation to the CNC path shown with "Path3D".
See also
- * \({ }^{2}\) Chapter 6.4.5.20.1.42 "Visualization Element 'Path3D'" on page 3279

\section*{Element proper- \\ ties}
\begin{tabular}{|c|c|}
\hline "Element name" & \begin{tabular}{l}
Optional. \\
Hint: Assign individual names for elements so that they are found faster in the element list. \\
Example: Camera_Path_1
\end{tabular} \\
\hline "Type of element" & "Frame" \\
\hline "Clipping" & If you have set the "Scaling type" to "Fixed", then only that part of the visualization is displayed that fits in the frame. \\
\hline "Show frame" & \begin{tabular}{l}
Displays the frame \\
- "No frame": The displayed area of the frame does not have borders. \\
- "Frame": The displayed area of the frame has borders. \\
- "No frame with offset": The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. \\
The resulting gap prevents the referenced visualization from touching any adjacent elements.
\end{tabular} \\
\hline "Scaling type" & \begin{tabular}{l}
Describes how the frame reacts when the visualization is resized: \\
- "/sotropic": The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately. \\
- "Anisotropic": The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately. \\
- "Fixed": The original size of the frame is retained, regardless of the visualization size. If you have also selected the "Clipping" option, then only the fitting part is displayed. \\
- "Fixed and scrollable": The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the "Scroll position variable horizontal" or "Scroll position variable vertical" property.
\end{tabular} \\
\hline "Deactivation of the background drawing" & \begin{tabular}{l}
To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order. \\
Deactivation of the background drawing. This can prevent the behavior described above.
\end{tabular} \\
\hline
\end{tabular}

\footnotetext{
Element prop- Contains the currently configured visualization references as a subnode erty 'References'
}
\begin{tabular}{|l|l|}
\hline "References" & \begin{tabular}{l} 
Clicking "Configure" opens the "Frame Configuration" dialog. This is used to \\
manage the referenced visualizations. \\
Caution: Visualizations can be nested at any depth by means of Frame ele- \\
ments. In order to use the "Switch to any visualization" Frame selection type \\
without any problems, a Frame must not contain more than 21 referenced \\
visualizations. For more information, see also the description for the "Input \\
configuration" of an element: Action "Switch Frame visualization".
\end{tabular} \\
\hline \begin{tabular}{ll} 
List of the currently referenced \\
visualizations
\end{tabular} & \begin{tabular}{l} 
Visualizations that have a button also have this displayed as a subnode. Each \\
interface variable is listed with the currently assigned transfer parameters. \\
Example: \\
vis_FormA
\end{tabular} \\
& \begin{tabular}{l} 
- iDataToDisplay_1 : PLC_PRG. iVar1 \\
iDataToDisplay_2 : PLC_PRG. iVar2 \\
Hint: You can change the assignment of the variables to an interface variable \\
here and edit the value field. Or click the "Configure" button instead.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & \begin{tabular}{l}
Example: "Default"
: The "Font" dialog box opens. \\
- : Drop-down list with style fonts.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Font color" & \begin{tabular}{l} 
Example: "Black" \\
\\
\hline... : The "Color" dialog box opens. \\
-: Drop-down list with style colors.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Whole number (value range from 0 to 255 ). This determines the transparency of \\
the respective color. \\
Example: \(255:\) The color is opaque.
\end{tabular} \\
& \begin{tabular}{l} 
0: The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, \\
then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{"Movement"} \\
\hline "X" & \begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
property "Position \(\rightarrow\) Angle", then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline \multicolumn{2}{|r|}{\begin{tabular}{l}
See also \\
- \(\boldsymbol{y y}^{4}\) Chapter 6.4.1.21.2.28 "Object 'Text List"" on page 2532
\end{tabular}} \\
\hline Element property 'Font variables' & allow for dynamic control of the text display. \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime.

\section*{bles'}
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle colo"" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: 16\#FF888888
\end{tabular} \\
\hline
\end{tabular}

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code": उPLC_PRG.i_x \(:=0 ;\)
\end{tabular} \\
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [CtrI]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: [AIt]+[T]. \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Cartesian XY Chart'}

Symbol:

\section*{Category: "Special Controls"}

The element displays the curve of array values graphically as a line or bar chart in the Cartesian coordinate system. The chart can display multiple curves at one time.

\section*{NOTICE!}

\section*{Constraint}

The element can be used with controller with V3.5 SP11 and higher.

\section*{in CODESYS Forge, you will find a sample project for using "Cartesian XY} Chart" elements in visualizations.

Table 636: "Zoom"
\begin{tabular}{|l|l|}
\hline & \begin{tabular}{l} 
Zooming the displayed curve is done by means of the mouse, or the pinch \\
gesture on a multitouch device. It also applies to all axes. \\
At runtime when "Enable" is TRUE, you can draw a box with the mouse by \\
holding down the left mouse button. When you release the mouse button, the \\
display zooms in on the box and the curve is magnified. To zoom in and out \\
on a multitouch device, move two fingers together or away from each other, \\
respectively. \\
Zooming and panning can work together.
\end{tabular} \\
\hline "Enable" & \begin{tabular}{l} 
Variable (BOOL) that enables or disables zooming. \\
TRUE: Enables zooming \\
Example: PLC_PRG. xZoomEnable
\end{tabular} \\
\hline "Home" & \begin{tabular}{l} 
Variable (BOOL) \\
Rising edge: Reset the displayed curve to the initial state after the display has \\
changed due to zooming. \\
Example: PLC_PRG.xZoomHome
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Undo" & \begin{tabular}{l} 
Variable (BOOL) \\
Rising edge: Reset the displayed curve to the previous position after the display \\
has changed due to zooming. \\
Example: PLC_PRG. xZoomUndo
\end{tabular} \\
\hline "Is zoomed" & \begin{tabular}{l} 
Variable (BOOL) that indicates whether or not the displayed curve was modified \\
due to zooming. \\
TRUE: Curve setting was zoomed. \\
Example: PLC_PRG.xIsZoomed
\end{tabular} \\
\hline
\end{tabular}

Table 637: "Pan"
\begin{tabular}{|l|l|}
\hline & \begin{tabular}{l} 
Panning the displayed curve is done by means of the mouse or the pinch ges- \\
ture on a multitouch device. It also applies to all axes. \\
At runtime if "Enable" is TRUE, then you can drag the displayed curve to another \\
position by holding down the left mouse button. To pan the displayed curve on a \\
multitouch device, drag it with one finger to another position.
\end{tabular} \\
\hline "Enable" & \begin{tabular}{l} 
Variable (BOOL) to enable or disable panning. \\
TRUE: Enables panning \\
Example: PLC_PRG. xPanEnable
\end{tabular} \\
\hline "Home" & \begin{tabular}{l} 
Variable (BOOL) \\
Rising edge: Reset the displayed curve to the initial position after the display has \\
changed due to panning. \\
Example: PLC_PRG.xPanHome
\end{tabular} \\
\hline "Is panned" & \begin{tabular}{l} 
Variable (BOOL) whose state indicates whether or not the displayed curve was \\
modified due to zooming. \\
TRUE: Curve setting was panned. \\
Example: PLC_PRG.xIsPanned
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|l|}{\begin{tabular}{|l|l|}
\hline Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the "Position \(\rightarrow\) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " "", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Element prop- The variables control the element behavior dynamically. erty 'State variables'}
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- Requirement: User management is set up for the visualization. erty 'Access rights'
\begin{tabular}{|l|l|}
\hline "Access rights" & \begin{tabular}{l} 
Opens the "Access rights" dialog. There you can edit the access privileges for \\
the element. \\

\hline "Font color" & \begin{tabular}{l}
Example: "Black"
The "Color" dialog box opens. \\
*: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Additional buttons'}
\begin{tabular}{|c|c|}
\hline "Jump to the largest possible time stamp" & \(\checkmark\) : An additional button ( \(\quad\) ) is displayed for jumping to the last time stamp. \\
\hline "Jump to the smallest possible time stamp" & \(\checkmark\) : An additional button (14) is displayed for jumping to the first time stamp. \\
\hline "Zoom out" & An additional button ( \(\sigma\) ) is displayed for setting the current min./max. range to the maximum range. The selected range is left. \\
\hline
\end{tabular} erty 'Absolute movement'

Element prop- The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the "Position \(\rightarrow\) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Date Picker'}

\section*{Symbol:}

\section*{Category: "Date/Time Controls"}

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Languagedependent texts of the element

The element contains language-dependent texts that are managed in the system text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

Example System text list
\begin{tabular}{|l|l|}
\hline ID & Default \\
\hline Apr & Apr \\
\hline April & April \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the ele
\end{tabular} & \begin{tabular}{l}
(in pixels). \\
ment downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
property "Position \(\rightarrow\) Angle", then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

The properties " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

\footnotetext{
Element prop- The variables control the element behavior dynamically. erty 'State variables'
}
\begin{tabular}{|l|l|}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element. \\
& \begin{tabular}{l} 
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
\\
\\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

\subsection*{6.4.5.20.2 Placeholders with Format Definition in the Output Text}

A character string which is output in the visualization can include the placeholder \% for a variable. At runtime, the placeholder is replaced by the actual value of the variable in the defined format. The data type in the format definition and of the variable have to be identical. A character string can contain a maximum of one placeholder.
Character strings for output are listed in the "Text" property. The assigned variable is listed in the "Text variable" property.

\end{tabular} & \begin{tabular}{l}
Code: rWeight : REAL := 12.1 \\
Property "Text": Weight: \%2.3f \\
Property "Text variable": PLC_PRG.rWeight \\
Output: Weight: 12.100
\end{tabular} \\
\hline \%e & Output of floating-point number (REAL or LREAL) in exponential notation of base 10 & \begin{tabular}{l}
Code: rValue : REAL := 1.234567\%e-003; \\
Property "Text": Value: \%E \\
Property "Text variable": PLC_PRG.rValue \\
Output: Value: 1.23E-6
\end{tabular} \\
\hline \% E & & \begin{tabular}{l}
Code: rValue : REAL := 1.234567\%e-003; \\
Property "Text": Value: \%e \\
Property "Text variable": PLC_PRG.rValue \\
Output: Value: 1.23e-6
\end{tabular} \\
\hline
\end{tabular}

For the output of text
\begin{tabular}{|l|l|l|}
\hline\(\% \mathrm{c}\) & \begin{tabular}{l} 
Output of single character \\
in ASCII character set
\end{tabular} & \begin{tabular}{l} 
Code: bChar := 16\#41; \\
Property "Text": Key: \%c \\
Property "Text variable": PLC_PRG.bChar \\
Output: Key: A
\end{tabular} \\
\hline\(\% \mathrm{~s}\) & Output of character string & \begin{tabular}{l} 
Code: strName : = 'Paul Smith'; \\
Property "Text": Name : \%s \\
Property "Text variable": PLC_PRG.strName \\
Output: Name: Paul Smith
\end{tabular} \\
\hline
\end{tabular}

For the output of the percent sign
\begin{tabular}{|l|l|l|}
\hline\(\% \%\) & \begin{tabular}{l} 
Output of percent sign in \\
character string
\end{tabular} & \begin{tabular}{l} 
Property "Text": Valid until 90\%\% \\
Output: Valid until 90\%
\end{tabular} \\
\cline { 3 - 6 } & \begin{tabular}{l} 
Code: iPercentage : INT : \(=80 ;\) \\
Property "Text": Valid until \%d\%\%. \\
Property "Text variable": \\
PLC_PRG.iPercentage \(:=80 ;\) \\
Output: Valid until 80\%
\end{tabular} \\
\hline
\end{tabular}

For the output of the date and time

If the output text in the element "Text" property contains the placeholder "\%t", then a date and/or time is output. If a variable is not specified in the "Text variable" property, then the system time is output; otherwise it is the value of the variable.

By default, the names of the days and months are displayed in English. If localized texts are used, then the text list System has to be supplemented. This text list is created automatically in the "POUs" view when the placeholder \%t is used. The English terms have to be used as the ID here. The localization can be done for both the abbreviated names and full names.
Time data types include LTIME, TIME, TIME_OF_DAY, TOD, DATE, DATE_AND_TIME, and DT.

\section*{Compatibility Notice}

In order to get the usual display, in V3.5 SP17 and higher, as a rule three digits are used for the output of fractions of a second ( \(\mathrm{ms} / \mu \mathrm{s} / \mathrm{ns}\) ). Example: In \%t [dd-HH:mm:ss:ms], ms is specified with three digits for the milliseconds. For this purpose, the two-digit ms number is prepended with a zero. If a two-digit output is desired (like before V3.5 SP17), then a special compiler define has to be set in the compiler properties of the application:
VISU_MILLISEC_NOLEADING_ZERO.

\begin{tabular}{|c|c|c|}
\hline \%t [MMMM] & Month as full name & \begin{tabular}{l}
Code: dateMonth : DATE := DATE\#2016-1-1; \\
Property "Text": Month: \%t [MMMM] \\

\subsection*{6.4.5.20.3 Methods of the Dialog Manager}

Visualizations that are a "Dialog" visualization type and are used to prompt an input are instantiated automatically and managed by the internal dialog manager.
In the application, the dialog manager can be accessed via the also internal Visualization Manager by calling the method GetDialogManager.
The dialog manager is provided with the following methods for handling a dialog.

\section*{NOTICE!}

You can program the method calls in function blocks or functions which are themselves called from the visualization by the action Execute ST Code.
Moreover, you can program the method calls in the application code. Make sure that the call runs in VISU_TASK. If this is not the case, then the behavior is undefined.

Method 'GetDia- Returns the instance (IVisualisationDialog) of the dialog whose name is passed. log' \(^{\prime}\)

Table 646: Inputs (VAR_INPUT)

\subsection*{6.4.5.20.4 Attribute 'VAR_IN_OUT_AS_POINTER'}

Function: The pragma \{attribute 'VAR IN OUT AS POINTER'\} allows for the passing of a reference to a data object to the interface variable of a visualization.

Requirement: The referenced visualization must be used as a dialog.

\section*{Syntax:}
```

{attribute 'VAR IN OUT AS POINTER'}

```

\section*{NOTICE!}

Uppercase and lowercase characters must be maintained.

Example: Declaration of an interface
```

VAR_IN_OUT
_{a\overline{trribute 'VAR_IN_OUT AS_POINTER'}}
itfController : - Con}tro\overline{lFB;
END_VAR

```

See also
- 出 Chapter 6.4.5.17.5 "Calling a Dialog with an Interface" on page 2962
- « Chapter 6.4.5.21.2.1 "Command 'Interface Editor'" on page 3340

\subsection*{6.4.5.20.5 Attribute 'parameterstringof'}

The pragma \{attribute 'parameterstringof'\} allows that the instance name of the specified parameter is made accessible for the referenced visualization. An interface variable (STRING) will contain the instance name of the specified parameter. The interface variable is visible within the referenced visualization and can for example be used in a text output.

\section*{Syntax:}
\{attribute 'parameterstringof' := '<variable>'\}
```

Example: decla-
ration of a inter- VAR_INPUT
face {attribute 'parameterstringof' := 'iftDut_A'}
sItfNameDut_A: STRING;
END VAR
VAR_IN_OUT
i\overline{f}tDut_A : DUT_A;
END_VAR

```

\subsection*{6.4.5.21.1 Keyboard Shortcuts for Default Keyboard Action}

Requirement: The "Activate default keyboard handling" option is activated in the "Visualization Manager" object.

The keyboard shortcuts for default keyboard action make it possible for users to operate the visualization with the keyboard only. Elements that respond to user input can process a keyboard event instead of a mouse event. You do not have to change their input configuration for this purpose. The universal keyboard shortcuts are supported by all devices and are available on all display variants when needed.
\begin{tabular}{|l|l|}
\hline Keyboard shortcuts & \\
\hline [Tab] & \begin{tabular}{l} 
Focus jumps to the next element. \\
The next element that responds to a configured or preconfigured user input receives the \\
focus. The order of elements corresponds to the order that the elements were added to the \\
editor. \\
If the focused element is a table, then the upper left cell in the table is the next focus. After \\
that, each next cell until all cells have been focused. It also applies here that only cells that \\
require input are focused. \\
If the focused element is a frame, then an element of the referenced visualization is set \\
next in focus in the frame. After that, each next element until all elements have been \\
focused. It also applies here that only elements that require input are focused.
\end{tabular} \\
\hline [Shift]+[Tab] & \begin{tabular}{l} 
Focus jumps to the previous element. \\
The element is focused that is before the currently focused element in the added order. \\
Therefore, the order is the opposite as for "Tab".
\end{tabular} \\
\hline [Arrow] & The focus jumps to the element that is in the direction as indicated by the arrow. \\
\hline [Input] & The visualization detects the input at the focused element and triggers the input action. \\
\hline
\end{tabular}

\section*{Command 'Interface Editor'}

Symbol: ه; keyboard shortcut: [Alt]+[F6].
Function: The command opens and closes the "Interface Editor" tab above the visualization editor.

Call: Menu bar: "Visualization \(\rightarrow\) Interface Editor" Also by clicking on the small down arrow at the top of the visualization editor

\section*{Tab 'Interface}

Symbol:
Editor'
The tab contains an editor for the declaration of interface variables. The editor behaves in a similar way to the declaration editor of a function block, however interface variables are not initialized.

\section*{Syntax}
```

<scope>
( {attribute '<attribute name>' ( := '<expression>' )? } )?
<identifier> : <data type>;
END_VAR
<scope> : VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT
// (...)? : Optional

```

\section*{Example}

Declaration in
the interface
```

VAR_INPUT

```
editor - \{attribute 'parameterstringof'\}
    sIdentifier : STRING; // String for instance name
            iCounter : INT;
END_VAR
VAR_IN_OUT
            \{ātribute 'VAR_IN_OUT_AS_POINTER'\}
            fbController: \(F \bar{B}\) _Controllér;
END_VAR

Scopes Possible scopes for interfaces of visualizations or dialogs
\begin{tabular}{|l|l|}
\hline VAR_IN_OUT & \begin{tabular}{l}
\(\bullet\)\begin{tabular}{l} 
When transferring a structure \\
When the visualization is instanced, it gets a reference to the current applica- \\
tion data. \\
When transferring a control variable, if the variable is written to when a user \\
input is made. Only then can the visualization write to it. \\
Note: In the case of dialogs, the data is written back only when the dialog is \\
closed. \\
Hint: We strongly recommend that you use this scope so that the return of values \\
is possible. Moreover, no data needs to be copied.
\end{tabular} \\
\hline \begin{tabular}{l} 
PVAR_IN_OUT \\
Pragma \{attribute \\
'VAR_IN_OUT_AS_POINTER
\end{tabular} \\
\hline When transferring a pointer to a data object \\
In contrast to the VAR_IN_OUT scope (without an attribute), the variable \\
changes are effective immediately and not just when the dialog is closed. \\
Note: Use this scope only if the visualization implements a Dialog.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline VAR_INPUT & \begin{tabular}{l} 
When transferring data that will only be read \\
Note:
\end{tabular} \\
\hline \begin{tabular}{l} 
•If the visualization is executed as an integrated visualization, then only input \\
variables of a basic data type (scalar type) are permitted to be transferred. \\
If the visualization is executed as a CODESYS TargetVisu or a CODESYS \\
Wragma \{attribute \\
WebVisu, then input variables of any data type (including POUs) can also be \\
transferred.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Keyboard Configuration'}

Symbol: \&; keyboard shortcut: [AIt]+[F6].
Function: This command opens and closes the "Keyboard Configuration" tab above the visualization editor.

Call: Menu bar: "Visualization".
Requirement: A visualization is open and active in the visualization editor.
See also
- \({ }^{\Perp}\) Chapter 6.4.5.21.4.2 "Object 'Visualization manager'" on page 3398

\section*{Tab 'Keyboard configuration'}

Symbol:
This tab contains a list of keyboard shortcuts with an editing option.
A keyboard shortcut can refer specifically to an element. Then the configuration appears here and in the "Input configuration" property of the associated element.
A keyboard shortcut can also have several configurations. If a keyboard shortcut has multiple keyboard configurations, then its input actions are executed in the order listed here.

Keyboard shortcuts of the default keyboard action are not listed here.
\begin{tabular}{|c|c|}
\hline "Key" & \begin{tabular}{l}
Key that a keyboard configuration is defined. Example: [M] \\
Note: You can combine the key with [Ctrl], [Alt], and/or [Shift].
\end{tabular} \\
\hline "Key down" & \begin{tabular}{l}
The input action is executed when the user presses the key.
: The input action is executed when the user releases the key. \\
Double-click: Drop-down list of all keys. \\
Note: If the input action should be executed for both pressing the key (KeyDown) and releasing the key (KeyUp), then you must define a keyboard configuration for both input actions.
\end{tabular} \\
\hline "Shift" & \(\checkmark\) : The input event is triggered for [Shift]+[key]. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Ctrl" & \(\boxed{\square}\) : The input event is triggered for [Ctrl]+[key]. \\
\hline "Alt" & \(\boxed{\square}:\) The input event is triggered for \([\) Alt \(]+[k e y]\). \\
\hline "Action type" & \begin{tabular}{l} 
input action \\
Double-click: Drop-down list of input actions. \\
Tip: For a description of input actions, refer to the "Input configuration" dialog \\
box.
\end{tabular} \\
\hline "Action" & \begin{tabular}{l} 
Configuration of the input action that was selected next. \\
Double-click: A dialog box opens that varies according to the input action. It \\
allows the user-prompted customization of the settings. \\
Tip: For a description of dialog boxes, refer to the "Input configuration" dialog \\
box. The input action is configured in the same way here.
\end{tabular} \\
\hline "Element ID" & \begin{tabular}{l} 
ID of the visualization element where the user can execute the key event. The ID \\
is relevant only if the event is also assigned to an element. \\
Tip: The assignment of ID to element name is listed in the "Element list".
\end{tabular} \\
\hline "Access rights" & \begin{tabular}{l} 
Access privileges of the action per user group \\
Requirement: The visualization has a user management.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline\(\downarrow\) & Clicking the symbol on the right of the list moves the selected row one line down. \\
\hline \(\boldsymbol{\uparrow}\) & Clicking the symbol on the right of the list moves the selected row one line up. \\
\hline Blank line & Allows adding a new keyboard configuration. \\
\hline
\end{tabular}

\section*{Command 'Visualization Element List'}

Symbol: 四
Function: The command opens the "Visualization Element List" tab for the current visualization. It is displayed in the upper part of the visualization editor.

Call: Menu bar: "Visualization"
Requirement: A visualization is open in the editor.

Tab 'Visualiza- This view contains a list of the visualization elements in the open visualization. Grouped tion Element List' elements are displayed in a tree structure and have their own order within the group (other hierarchy level).

The current selection in the list is always synchronized with the selection in the main window of the editor.

The order in the element list from top to bottom describes the order of the elements on the display layers of the visualization from back to front. When you insert elements consecutively, they are arranged starting from the back (position 0 ) on one layer forward. When you use the commands in the menu "Visualization \(\rightarrow\) Order" to move an element from front to back in the editor window, the element list refreshes accordingly.
\(\left.\begin{array}{|l|l|}\hline \text { "Type" } & \begin{array}{l}\text { Element type and symbol, as used in the "Visualization Toolbox" view, as well as } \\ \text { the element number that specifies the display layer. \# } 0 \\ = \\ \hline \text { "X", layer furthest back. }\end{array} \\ \hline \text { "Y" } & \begin{array}{l}\text { Position of the upper left corner of the element }(0,0=\text { upper left corner of the } \\ \text { visualization area). }\end{array} \\ \hline \text { "Width" } & \text { Dimensions of the element (in pixels). } \\ \hline \text { "Height" } & \text { "ID" } \\ \hline \text { "Name" } & \text { Internally assigned element identifier } \\ \hline \text { "Access Rights" } & \text { Element name as defined in "Properties } \rightarrow \text { Element name". } \\ \hline \text { "Tab Order" } & \begin{array}{l}\text { The lock symbol B indicates the restricted behavior of an element for some user } \\ \text { groups. }\end{array} \\ \hline \begin{array}{l}\text { Position within the order in which you can jump from element to element in the } \\ \text { editor by means of the tab key when the default keyboard usage is activated. } \\ \text { The activation is done in the visualization manager, on the settings tab. Note that } \\ \text { elements within a group or group box have their own order (different hierarchy } \\ \text { level). } \\ \text { The tab order initially corresponds to the order in which the elements are }\end{array} \\ \text { arranged on the layers from back to front ("Type" above). To change the position } \\ \text { in the order for an element, you can specify a different number directly in the } \\ \text { table field. You can also use the "Move to Position" context menu command to } \\ \text { open a dialog for specifying a new position. } \\ \text { Bold fonts indicate changed position specifications. } \\ \text { By removing the displayed value, you exclude the element from the selection } \\ \text { using tab or arrow keys. } \\ \text { You can use the "Reset to Default" context menu command to reset a changed } \\ \text { position to the original position. This can be done simultaneously for a multise- } \\ \text { lection of elements when they do not belong to different hierarchy levels (group- } \\ \text { ings). }\end{array}\right\}\)

- (3) "Moving the visualization element forward and back" on page 2875

\section*{Command 'Activate Keyboard Usage'}

Symbol:
Function: This command activates and deactivates the keyboard usage when a visualization is executed in online mode (integrated in CODESYS).

Call: Menu bar: "Visualization"; context menu.
Requirement: A visualization is open.
When this command is active, the visualization executes the keyboard events that you specified as a visualization user.
When the command is inactive, CODESYS executes the keyboard events that you specify.
See also
- \({ }^{\leftrightarrows}\) Chapter 6.4.5.6.5 "Configuring Keyboard Shortcuts" on page 2892

\section*{Command＇Order＇}

Function：The command makes further commands available．They are for specifying the order of the elements in levels，since elements in the rear levels are concealed by those in the front levels．

Call：Menu＂Visualization＂，context menu
Requirement：The visualization elements are positioned behind one another．
See also
－\({ }^{〔}\) Chapter 6．4．5．5．3＂Positioning the Element，Adapting Size and Layer＂on page 2874

\section*{Command
＇Bring to Front＇}

Symbol：
Function：The command positions the selected visualization element in the front level．The element becomes completely visible．

Call：Menu＂Visualization \(\rightarrow\) Order＂，context menu
\begin{tabular}{ll} 
Command & Symbol：\(\square\) \\
＇Bring One to & Function：The command positions the selected visualization element one level further forwards． \\
Front＇ & Call：Menu＂Visualization \(\rightarrow\) Order＂，context menu
\end{tabular}

\section*{Command＇Send Symbol：喕 \\ to Back＇}

Function：The command positions the selected visualization element in the back level．
Call：Menu＂Visualization \(\rightarrow\) Order＂，context menu

\section*{Command＇Send Symbol：咟}

One to Back＇
Function：The command positions the selected visualization element one level further back－ wards．

Call：Menu＂Visualization \(\rightarrow\) Order＂，context menu

\section*{Command＇Alignment＇}

Function：the command makes further commands available．It is used for the alignment of visualization elements in the window area of the visualization．

Call：Menu＂Visualization＂，context menu
See also
－\({ }^{\Perp}\) Chapter 6．4．5．5．3＂Positioning the Element，Adapting Size and Layer＂on page 2874

\section*{Command＇Align Symbol：唈 \\ Left＇}

Function：the command aligns the selected visualization elements along a line through the left－hand edge of the element that is positioned furthest left．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

\footnotetext{
Command＇Align Symbol：可
Top＇
Function：the command aligns the selected visualization elements along a line through the upper edge of the element that is positioned highest．
}

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇Align Symbol：\＃
Right＇
Function：the command aligns the selected visualization elements along a line through the right－hand edge of the element that is positioned furthest right．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇Align Symbol：颌
Bottom＇
Function：the command aligns the selected visualization elements along a line through the lower edge of the element that is positioned lowest．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇Align Symbol：串
Function：the command aligns the selected visualization elements to their common vertical center．
Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇Align Symbol：吗
Horizontal Cen－ ter＇

Function：The command aligns the selected visualization elements to their common horizontal center．
Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇Make Symbol：哳
Horizontal
Spacing Equal＇
Function：The command aligns the selected visualization elements so that the elements posi－ tioned furthest left and furthest right retain their position and the elements between them are positioned with the same horizontal spacing．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement： 3 or more elements are selected．The first element is blue，while the other elements are displayed in grey．

Command＇In－Symbol：
crease Hori－
zontal Spacing＇
Function：The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger horizontal spacing．The spacing increases by 1 pixel each time．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇De－Symbol：\(\underset{++\infty}{\square 0}\) crease Hori－ zontal Spacing＇

Function：The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller horizontal spacing．The spacing decreases by 1 pixel each time．
Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．
\begin{tabular}{ll}
\begin{tabular}{ll} 
Command＇Re－ \\
move Horizontal & Symbol：\(\stackrel{\text { on }}{++}\) \\

retains its position and the other elements are positioned with no horizontal spacing between \\
them．
\end{tabular} \\
& Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu \\
& Requirement：Several elements are selected．
\end{tabular}
\begin{tabular}{ll} 
Command＇Make & Symbol：宮 \\
Vertical Spacing & Function：The command aligns the selected visualization elements so that the uppermost and \\
Equal＇ & \\
& \begin{tabular}{ll} 
lowermost elements retain their position and the elements between them are positioned with the \\
& same vertical spacing．
\end{tabular} \\
& Call：Menu＂Visualization＂，context menu
\end{tabular}

Call：Menu＂Visualization＂，context menu
Requirement： 3 or more elements are selected．The first element is blue，while the other elements are displayed in grey．

Command＇In－ crease Vertical Spacing＇

Symbol：品 \(\downarrow\)
Function：The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger vertical spacing．The spacing increases by 1 pixel each time．
Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．

Command＇De－ crease Vertical Spacing＇

Symbol：㗊 \(\ddagger\)
Function：The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller vertical spacing．The spacing decreases by 1 pixel each time．
Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
Requirement：Several elements are selected．
\begin{tabular}{ll} 
Command＇Re－ & Symbol：\(g_{\uparrow}^{*}\) \\
move Vertical & \begin{tabular}{l} 
Function：The command aligns the selected visualization elements so that the blue element \\
Spacing＇ \\
retains its position and the other elements are positioned with no horizontal spacing between \\
them．
\end{tabular} \\
& Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu
\end{tabular}

Requirement：Several elements are selected．

\section*{Command＇Make Symbol：：}

Same Width＇
Function：The command makes the width of the selected visualization elements the same as the width of the blue selected element．

Call：Menu＂Visualization \(\rightarrow\) Alignment＂，context menu

Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

The command does not work with lines or polygons.

\section*{Command 'Make Symbol:}

\section*{Same Height'}

Function: The command makes the height of the selected visualization elements the same as the height of the blue selected element.
Call: Menu "Visualization \(\rightarrow\) Alignment", context menu
Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

The command does not work with lines or polygons.

\section*{Command 'Make Symbol: 䩿}

Same Size'
Function: The command makes the size of the selected visualization elements the same as the size of the blue selected element.

Call: Menu "Visualization \(\rightarrow\) Alignment", context menu
Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

The command does not work with lines or polygons.

Command 'Size Symbol: 学
to Grid'
Function: The command aligns the size and position of the selected visualization elements to the grid.

Call: Menu "Visualization \(\rightarrow\) Alignment", context menu
Requirement: Several elements are selected.

The command does not work with lines or polygons.

\section*{Command 'Group'}

Symbol:
Function: The command groups the selected visualization elements and displays them as one.
Call: Menu "Visualization", context menu

Requirement: At least 2 elements are selected.
To select more elements you can drag a window around the desired elements with the mouse. Alternatively you can click on the desired elements while keeping the [Shift] key pressed.

To select all elements you can open the context menu of the visualization editor and choose the "Select All" command.

You can also drag and drop elements to a group. For that, press the [Shift] key while dragging the element to the group. Meanwhile the cursor changes its appearance (display a small plus sign).

- \(\Leftrightarrow\) Chapter 6.4.5.21.2.22 "Command 'Select None'" on page 3365

\section*{Command 'Ungroup'}

Symbol: 迹
Function: The command ungroups elements again.
Call: Menu "Visualization", context menu
Requirement: A grouping is selected.
See also
- \({ }^{\text {® }}\) Chapter 6.4.5.21.2.7 "Command 'Group'" on page 3347

\section*{Command 'Frame Selection'}

Function: The command opens the "Frame Configuration" dialog.

\section*{Call:}
- Menu bar: "Visualization"
- Click the "Configure" button in the "References" property.

Requirement: A "Frame" element or "Tabs" element is selected in the editor. The "Element Properties" view is open.

Dialog 'Frame
Configuration'
The dialog allows you to select one or more of all available visualizations. The selected visualizations are displayed at runtime in the window area of the "Frame" element or "Tabs" element.

\section*{NOTICE!}

Visualizations can be nested at any depth by means of "Frame" elements. In order to use the "Switch to any visualization" frame selection type without any problems, a "Frame" must not contain more than 21 referenced visualizations.
For more information, see also the description for the "Input configuration" of an element: Action "Switch frame visualization".

Table 656：＂Available Visualizations＂
\begin{tabular}{|l|l|}

\end{tabular}

\section*{Command 'Multiply Visu Element'}

Symbol:
Function: The command opens the "Multiply Visu Element" dialog, which contains a configuration derived from the template element and the array declaration. You can rearrange the elements here, as well as their quantity and the index access to the array data. When you exit the dialog, a field of similar elements is created from the template element. In the properties of the new elements, array variables are now configured with precise array indexes. These new elements are those in which you have configured an array variable with index access placeholders in the template.

Call: Menu bar: "Visualization"; context menu
Requirement: The visualization is active and a configured template element is selected.

Dialog 'Multiply
Visu Element'
Table 660: Tab "Basic Settings"
\begin{tabular}{|c|c|}
\hline "Total number of elements" & The total number is determined by the index range of the placeholders, including the setting on the "Advanced Settings" tab. The layout of the elements can be one-dimensional (as a column or row) or two-dimensional (as a table field). \\
\hline "Horizontal" & \begin{tabular}{l}
Number of elements per row \\
Default: Number of array components (index range) of the placeholder \$FIRSTDIM\$ \\
Example for array: axLampIsOn: ARRAY[0..4] OF BOOL; = 5
\end{tabular} \\
\hline "Vertical" & \begin{tabular}{l}
Number of rows required for the layout of all elements \\
Default \\
- When using index access placeholder \$FIRSTDIM\$: If the index range of the placeholder is less than five, then the layout of elements is horizontal. If the index range is greater than five, then the layout the elements is quadratic whenever possible. \\
- When using index access placeholders \$FIRSTDIM\$ and \$SECONDDIM\$: The number of horizontal elements is equal to the number of index ranges specified by the placeholder \$FIRSTDIM\$. The number of vertical elements is equal to the number of index ranges specified by the placeholder \$SECONDDIM\$.
\end{tabular} \\
\hline "Offset between elements" & \begin{tabular}{l}
Distance between the new elements; affects the positions of the new elements \\
- " 0 ": The frames of the elements overlap by one pixel. \\
- "1": The elements touch. \\
- " \(<n>\) ": A distance of \(n-1\) pixel is visible between the elements.
\end{tabular} \\
\hline "Horizontal" & \begin{tabular}{l}
Distance between the elements within a row (in pixels) \\
Example: 2 for a distance of one pixel
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Vertical" & \begin{tabular}{l} 
Distance between the elements within the columns (in pixels) \\
Example for a distance of three pixels: 4
\end{tabular} \\
\hline "Arrangement of elements" & \begin{tabular}{l} 
Origin from which the new elements are positioned and arranged \\
If "Vertical" or "Horizontal" <> 1 \\
- "From top left" \\
- "From top right" \\
- "From bottom left" \\
- "From bottom right" \\
If "Horizontal" or "Vertical" \(=1\) \\
- "From top" \\
- "From bottom"
\end{tabular} \\
\hline "Orientation" & \begin{tabular}{l} 
Determines the layout of the elements in the field (row by row, or column by \\
column) \\
- "Line by line" \\
- "Column by column"
\end{tabular} \\
\hline & \begin{tabular}{l} 
"Preview"
\end{tabular} \\
\hline
\end{tabular}

Table 661: Tab "Advanced Settings"
\begin{tabular}{|l|l|}
\hline "Array access" & \begin{tabular}{l} 
Based on the template element, the precise index for accessing the array vari- \\
able is calculated for each new element. The calculation is based on the array \\
index limits as specified in the array declaration. The settings are also taken into \\
account here.
\end{tabular} \\
\hline "1st dimension" & \begin{tabular}{l} 
Calculation guideline for the index of the first dimension that replaces \\
\$FIRSTDIMS \\
The first new element gets the value specified below in "Start index" in the first \\
dimension. The other elements each get an index incremented by "Increment" \\
until an index is calculated for all elements. \\
Example \\
- "Start index": 1 \\
- "Increment": 1
\end{tabular} \\
\hline "2nd dimension" & \begin{tabular}{l} 
Calculation guideline for the index of the second dimension that replaces \\
\$SECONDDIM\$ \\
The first new element gets the value specified below in "Start index" in the \\
second dimension. The other elements each get an index incremented by \\
"Increment". \\
Example \\
- "Start index": 1 \\
- "Increment": 1
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OK" & \begin{tabular}{l} 
First, it is validated whether the calculated indices are in the index range of the \\
array variable. If so, then the elements that match the template element are \\
created and arranged as a field (row, column, or table). The placeholder indexes \\
are replaced by the calculated indexes.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Configure Display Settings of Trend'}

Symbol:
Function: When you execute this command in "Visualization" or in the context menu, the "Edit Display Settings" dialog opens

\section*{Call:}
- Menu bar: "Visualization"
- Context menu of a "Trend" element in the visualization editor
- Property "Diagram"

Requirement: A trend is selected in the active visualization editor.

Tab "X Axis"
\begin{tabular}{|l|l|}
\hline "Grid" & \(\boxed{\square}\) : Trend diagram with grid lines in the X-direction in the selected color \\
\hline "Font" & Font for the axis label \\
\hline
\end{tabular}

\section*{Tab "Y axis"}

Table 663: "Display mode"
\begin{tabular}{|c|c|}
\hline - "Auto": & O: The visualization scales automatically. \\
\hline - "Fixed" & O: Fixed range from "Minimum" to "Maximum" \\
\hline "Minimum" & \begin{tabular}{l}
Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The "Display Mode" is "Fixed". \\
Examples: 20,PLC_PRG.iLimit_Min, GVL.c_iLimit_Min \\
Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: iLimit_Min : INT := 20
\end{tabular} \\
\hline "Maximum" & \begin{tabular}{l}
Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The "Display Mode" is "Fixed". \\
Examples: 80, PLC_PRG.iLimit_Max, GVL.c_iLimit_Max \\
Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: iLimit_Max : INT := 80
\end{tabular} \\
\hline "Grid" & V: Trend diagram with grid lines in the Y-direction in the selected color \\
\hline "Description" & V: Text for labeling the Y -axis (for example, \(\mathrm{DC} / \mathrm{mA}\) ) \\
\hline
\end{tabular}

Table 664: "Tick marks"
\begin{tabular}{|l|l|}
\hline "Fixed spacing" & : Axis scale with tick marks for "Distance" and "Subdivisions" \\
\hline "Distance" & Distance between the tick marks (example: 2) \\
\hline "Subdivisions" & Number of subdivisions between tick marks (example: 4) \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Font" & Font for the axis label \\
\hline
\end{tabular}

Table 665: "Background"
\begin{tabular}{|l|l|}
\hline "From visualization style" & Background color as defined in the visualization style \\
\hline "Draw background" & Background color which is selected in the lower input field \\
\hline "No background" & Trend diagram with transparent background \\
\hline \begin{tabular}{l} 
Background color of the trend \\
diagram
\end{tabular} & Requirement: "Draw background" is activated. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Reset" & Resets the settings to the default settings \\
\hline "Use as default" & Saves the settings as default \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Add Y-axis" & \begin{tabular}{l} 
Extends the trend diagram by one Y-axis \\
Result: The "Trend Recording" editor contains an extended selection of Y-axes in \\
the "Additional axes" option of the "Variable Settings".
\end{tabular} \\
\hline "Delete Y-axis" & Deletes the Y-axis of the visible tab. \\
\hline
\end{tabular}

- Editor 'Trend Recording'

\section*{Command 'Configure Trace'}

Symbol:
Function: This command opens the "Trace Configuration" dialog box.
Call: Context menu of the visualization element; "Trace" property of the visualization element.
Requirement: An element of type "Trace" is open in the editor.

Dialog box
'Trace Configuration'

The tree view shows the trace configuration and allows navigation.
The top entry contains the trace name. When this entry is selected, the "Record Settings" group appears in the adjacent view.

An entry is located here for each variable that data was recorded continuously. When a variable is selected, the "Variable Settings" group appears in the adjacent view.
\begin{tabular}{|l|l|}
\hline "Add variable" & \begin{tabular}{l} 
Adds a new entry to the trace configuration. \\
Result: A blank configuration appears next to the new variable under "Variable \\
Settings". You configure the variable there.
\end{tabular} \\
\hline "Delete variable" & Removes the selected variable. \\
\hline
\end{tabular}

\section*{'Recording Set- \\ tings'}
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ A trigger can be configured in the trace only. } \\
\hline "Task" & Task where data was recorded. \\
\hline "Record condition" & \begin{tabular}{l} 
Recording condition for which the application records data in runtime mode: \\
Variable (BOOL)
\end{tabular} \\
\hline "Comment" & Example: Acquiring data only when all conditions are true. \\
\hline "Resolution" & \begin{tabular}{l} 
Measure for the time stamp that is recorded per data set. \\
- "ms": Time stamp (in milliseconds). \\
\(\bullet \quad " \mu s ": ~ T i m e ~ s t a m p ~(i n ~ m i c r o s e c o n d s) ~ f o r ~ a ~ t a s k ~ c y c l e ~ t i m e ~ o f ~\)
\end{tabular} 1 ms or less
\end{tabular}\(|\)\begin{tabular}{ll} 
"Automatic restart" & \begin{tabular}{l} 
Vecording starts automatically as soon as the trace has been started one \\
time and then the controller was restarted. The trace configuration and the con- \\
tents of the trace buffer are saved persistently to a file on the target system. \\
Format: . trace. csv
\end{tabular} \\
\hline "Display" & The "Edit Appearance" dialog box opens. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Advanced" & The "Advanced Trace Settings" dialog box opens. \\
\hline "Copy from Trace" & \begin{tabular}{l} 
The "Copy Settings from Trace Instance" dialog box opens. If you have already \\
created an existing trace configuration from a trace object, then you can copy the \\
configuration data to the visualization element. To do this, select the respective \\
object.
\end{tabular} \\
\hline
\end{tabular}
'Variable Settings'
\begin{tabular}{|c|c|}
\hline "Variable" & \begin{tabular}{l}
Variable for recorded value. \\
- Variable (valid data type) \\
- property \\
- Reference \\
- Contents of the pointer \\
- Array element (base type with valid data type) \\
- Enumeration (base type with valid data type) \\
Valid data types are all standard types, except STRING, WSTRING, and ARRAY.
\end{tabular} \\
\hline "Parameters" & \begin{tabular}{l}
Parameter whose value is acquired. \\
...: Input assistance lists ale valid parameters of the PLC.
\end{tabular} \\
\hline \(\checkmark\) & Enables toggling between "Variable" and "Parameter" \\
\hline "Attached axis" & \begin{tabular}{l}
Y -axis of the trace diagram for the "Variable". \\
Selection of the standard \(y\)-axis and the additional configured \(y\)-axes \\
Note: The additional configured y -axes are configured in the "Edit Display Settings" dialog box.
\end{tabular} \\
\hline "Display variable name" & \begin{tabular}{l}
The trace graphs are displayed in tooltip with their variable names. \\
If a text is also specified in "Description", then the text is displayed first with the variable names in parentheses. \\
Example: Sensor A (PLC_PRG.iSensor_A) \\
If "Description" does not contain any text, then the "Display Variable Name" property is activated automatically. Then only the name is displayed (example: PLC_PRG.iSensor_A).
\(\qquad\) The trace graphs are displayed in tooltip without their variable names. Only the text in "Description" is displayed.
\end{tabular} \\
\hline "Description" & \begin{tabular}{l}
Text for the tooltip. It is displayed when a visualization user moves the cursor in the trace diagram. \\
Example: Sensor A \\
The text is also entered into the "GlobalTextList" object and can be translated there.
\end{tabular} \\
\hline "Color" & Color of the graph in the diagram. \\
\hline "Line type" & \begin{tabular}{l}
Representation of the graph as a line chart \\
- "Line": Values are linked to form a line. \\
- "Step": Values are linked in the form of steps. \\
- "None": Values are not linked.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Line width" & \begin{tabular}{l} 
In pixels \\
Example: 1
\end{tabular} \\
\hline "Line style" & The display of the line is solid, dash, dot, dash-dot, or dash-dot-dot. \\
\hline "Dot type" & \begin{tabular}{l} 
Representation of the graph as a scatter chart. This configuration entry with the \\
"Line type" determines the appearance of the graph. \\
- "Dot": Each value as a dot. \\
- "Cross": Each value as a cross. \\
- "None" \\
Note: For "Dot" or "Cross", a paint buffer overflow can result from many recorded \\
variables.
\end{tabular} \\
\hline "Warning at minimum" & \begin{tabular}{l} 
V: When below the lower limit, the visualization shows the trace graphs in the \\
alert color.
\end{tabular} \\
\hline "Critical lower limit" & \begin{tabular}{l} 
Minimum Value \\
Example: 10.
\end{tabular} \\
\hline "Color" & Warning color on falling below the limit \\
\hline "Warning at maximum" & \begin{tabular}{l} 
V: When above the upper limit, the visualization shows the trace graphs in the \\
alert color.
\end{tabular} \\
\hline "Critical upper limit" & \begin{tabular}{l} 
Maximum value \\
Example: 90
\end{tabular} \\
\hline "Color" & Warning color on exceeding the limit \\
\hline "Dynamic appearance options" & \begin{tabular}{l} 
Variable (Bool) or as bit access. This controls the visibility of the variables in the \\
trace diagram. \\
- TRUE: Visible \\
- FALSE: Invisible
\end{tabular} \\
\hline "Variable for visibility" & \\
\hline
\end{tabular}

\section*{Command 'Export Trace Configuration'}

Function: This command opens the "Export Trace Configuration" dialog box.
Call: context menu (right-click) the upper node in the tree view of the trace configuration.
Requirement: The dialog box "Trace Configuration" is active and the name of the trace configuration is selected in the tree view (example: Visu_Trace1).

Dialog box 'Ex- This dialog is used for saving the trace configuration to a text file that can be read by the port Trace Con- runtime system. figuration'
\begin{tabular}{|l|l|}
\hline "File name" & Name of text file to be created. \\
\hline "File type" & \begin{tabular}{l} 
"Trace file \({ }^{*}\).trace)": Format that the runtime system component CmpTraceMgr \\
expects for reading.
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{*} \boldsymbol{y}\) Chapter 6.4.5.21.2.13 "Command 'Configure Trace"" on page 3355

\section*{Command 'Insert Elements for Controlling Trace'}

Symbol: 松
Function: The command opens the "Trace Wizard" dialog. In this dialog, you select predefined visualization elements for controlling the trace recording. These elements are then inserted as configured into the visualization editor.
Call: Menu bar: "Visualization"; context menu of the trace element.
Requirement: The view is active and a trace element is selected.

Dialog 'Trace wizard'
\begin{tabular}{|l|l|}
\hline "Control variable" & \begin{tabular}{l} 
Corresponds to the "Control variables" property that is available in the element \\
properties of the trace element. \\
V: The control element for this trace control variable is created in the visualiza- \\
tion editor.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Project variables that are assigned to the control element below the "Input \\
configuration" property. In addition, the project variables are declared as local \\
variables in the visualization when needed (in the interface editor). \\
This list corresponds to the assignments that are defined in the element proper- \\
ties of the trace element. If nothing is configured in the properties of the trace \\
element (no project variables assigned as control variables), then a pre-alloca- \\
tion is offered with default variable names.
\end{tabular} \\
\hline "Type of element to insert" & \begin{tabular}{l} 
For a Boolean variable, this element can be inserted as a button or rectangle. \\
For a string variable, a rectangle or a text field is provided.
\end{tabular} \\
\hline "OK" & \begin{tabular}{l} 
At the closing of the dialog, the selected control elements are inserted into \\
the visualization editor and (when needed) its control variables are created as \\
local variables of the visualization. They are declared in the interface editor and \\
they are used by the control element (property "Input configuration \(\rightarrow\) Toggle \\
G Variable") and by the trace element ("Control variables" property). The control \\
element writes to the variable and the trace element reads the variable.
\end{tabular} \\
\hline
\end{tabular}
```

Example
Standard con-
trol variables: VAR
bResetTrigger : BOOL;
bStart : BOOL;
bStop : BOOL;
bStore : BOOL;
sStoreFilename : STRING;
bRestore : BOOL;
sRestoreFilename : STRING;
END_VAR

```

\section*{Command 'Visualization Element Repository'}

Symbol: 田
Function: This command opens the "Visualization Element Repository" dialog box opens for editing the storage location and visualization profile.
Call: Menu bar: "Tools".
Requirement: No project is open.

\section*{NOTICE!}
1. Only an empty directory can be selected as a new storage location for a repository.
2. The "System" repository cannot be modified. This is indicated by the entry in italics in the repository list.

Currently only a single version of an element can be installed.

Dialog box 'Vi-
sualization Ele-
ment Reposi-
tory'
Table 669: Editing the repository
\begin{tabular}{|l|l|}
\hline "Location" & \begin{tabular}{l} 
Storage location for the repository in the file system. The drop-down list contains \\
the configured repositories for visualization elements.
\end{tabular} \\
\hline "Edit locations" & \begin{tabular}{l} 
Opens the "Edit Repositories" dialog box for modifying the repository currently \\
selected in "Location" or for creating a new repository.
\end{tabular} \\
\hline
\end{tabular}

Table 670: "Profile or extension selection"
A profile is a collection of visualization elements in a specific version. These elements originate from one or more libraries. They are available in the toolbox of the visualization editor when the profile is used in the project. You can use an extension to add a specific selection of elements to an existing profile.
Creating and editing a profile is possible only if the CODESYS VisuElement Toolkit is installed. In this case, the buttons on the right side of the dialog box can be used.
\begin{tabular}{|l|l|}
\hline "Create or update profile" & \begin{tabular}{l} 
You can configure a new profile in the dialog or modify an existing one. Then, \\
the "New", "Copy", and "Delete" buttons are operable, as well as the "Installed \\
Elements" and "Available Elements" views.
\end{tabular} \\
\hline "Create or update extension" & \begin{tabular}{l} 
In the dialog, you can configure an extension for the selected profile. Another \\
drop-down list "Extension" appears with all currently available extensions. \\
To configure a new extension, use the "New" or "Copy" buttons (see below). \\
In both cases, the "Specify Visualization Extension" dialog box opens for you \\
to define a new extension. In this dialog box, the "Name", "Company", and \\
"Version" of the extension are displayed. Version syntax: Sequence of numbers \\
and points with a number at the end.
\end{tabular} \\
\hline "Profile" & \begin{tabular}{l} 
Currently selected profile. The drop-down list provides all profiles available in the \\
repository set above.
\end{tabular} \\
\hline "Extension" & \begin{tabular}{l} 
The extension that is currently selected for the specified profile. The drop-down \\
list provides all extensions available for the profile.
\end{tabular} \\
\hline "New" & \begin{tabular}{l} 
Pressing the button opens the "Specify Name of Visualization Profile" dialog or \\
the "Specify Visualization Extension" dialog. Specify a unique name for the new \\
profile, or for an extension also the company name and the version. CODESYS \\
automatically enters the previously used name, appended with "_0". \\
The "Installed elements" list is empty.
\end{tabular} \\
\hline "Copy" & \begin{tabular}{l} 
Pressing the button opens the "Specify Name of Visualization Profile" dialog or \\
the "Specify Visualization Extension" dialog (see above: "New"). \\
The elements of the selected profile are accepted and they appear in the
\end{tabular} \\
"Installed elements" view.
\end{tabular}

Table 671: "Installed Elements"
\begin{tabular}{|l|l|}
\hline "Name, Vendor, Library" & Elements that are assigned to the selected profile. \\
\hline "Uninstall" & \begin{tabular}{l} 
All elements currently selected in the list are uninstalled and removed from the \\
"Available Elements" list.
\end{tabular} \\
\hline "Update code" & \begin{tabular}{l} 
The list is refreshed with any changes in the implementation code of the library \\
POUs.
\end{tabular} \\
\hline "Update all" & \begin{tabular}{l} 
The list is refreshed with any changes in the implementation code and in the \\
interfaces (declaration part) of the library POUs.
\end{tabular} \\
\hline
\end{tabular}

Table 672: "Available Elements"
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Elements that are available in the system and can be installed into the current \\
profile or extension. The selection depends on the installed element libraries and \\
element packages. \\
"Library"
\end{tabular} \\
"Vendor" & \begin{tabular}{l} 
The tree structure displays the libraries with the contained elements below them. \\
Elements display in green are already installed for the specified profile or exten- \\
sion. "Profiles"s shows the elements installed for the profiles.
\end{tabular} \\
"Version" & "Repositories" \\
"Profiles" & \begin{tabular}{l} 
The elements selected in the list are added to the "Installed Elements" view. \\
Existing elements are overwritten.
\end{tabular} \\
\hline "Install element" & \begin{tabular}{l} 
The "Library Repository" dialog box opens where another library can be installed \\
in order to accept its elements in the "Available Elements" view.
\end{tabular} \\
\hline "Install library" &
\end{tabular}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Note current library versions \\
only"
\end{tabular} & \begin{tabular}{l} 
When refreshing the list, only the most current version of the library is \\
searched, not all libraries.
\end{tabular} \\
\hline \begin{tabular}{l} 
"Overwrite profiles without \\
prompting"
\end{tabular} & \begin{tabular}{l} 
: For actions that change the profile, the usual prompt does not appear for \\
confirming the change.
\end{tabular} \\
\hline
\end{tabular}

Dialog box 'Edit Repositories'
\begin{tabular}{|l|l|}
\hline "Storage location, Name" & \begin{tabular}{l} 
For managing the visualization elements, one or more repositories can be used. \\
All currently defined storage locations are listed here with file path and name. \\
The order from top to bottom is also the search order for the visualization ele- \\
ments. \\
File path and name of the storage location selected previously in the "Repository \\
for Visualization Elements" dialog. \\
Note: A storage location "System" is always defined automatically, which cannot \\
be modified or deleted.
\end{tabular} \\
\hline "Add" & \begin{tabular}{l} 
Opens the "Storage Location for Repository" dialog for creating a new storage \\
location or for editing the current storage location. \\
Specify: "Storage location" (file path of an empty directory) and "Name". The \\
name is symbolic (example: "Elements category 1").
\end{tabular} \\
\hline "Remove" & Deletes the repository currently selected in the repository list. \\
\hline "Move Up, Move Down" & \begin{tabular}{l} 
Moves the entries within the list. Note: The repositories are searched from top to \\
bottom.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Visualization Style Repository'}

Symbol:
Function: This command opens the "Visualization Styles" dialog box. It makes it possible to edit visualization style repositories.
Call: Menu bar: "Tools".

Dialog Box 'Vi-

\section*{sualization}

Styles'
\begin{tabular}{|l|l|}
\hline "Storage location" & \begin{tabular}{l} 
Name of the currently selected repository Preset: "System" \\
v: Lists the repositories installed in the development system.
\end{tabular} \\
\hline "(...)" & \begin{tabular}{l} 
Storage location of the repository \\
Example: (C: \(\backslash\) ProgramData \(\backslash\) CODESYS \(\backslash V i s u a l i z a t i o n ~ S t y l e s) ~\)
\end{tabular} \\
\hline "Edit locations" & The "Edit Repository Locations" dialog box opens. \\
\hline
\end{tabular}

Table 673: "Installed Visualization Styles"
\begin{tabular}{|c|c|}
\hline "Company" & \begin{tabular}{l}
When a company name is specified here, the tree view is filtered and only the styles of the selected company are listed. \\
Preset: "(All companies)". It is not filtered. \\
: Lists all companies that are specified in the styles.
\end{tabular} \\
\hline Windows with styles & Tree view of all versions of the installed visualization styles in the selected repository \\
\hline "Display localized names" & The style name is localized and displayed in the language that is set in CODESYS.
\(\square\) : The style is display as the source name. \\
\hline "Install" & The "Select Visualization Style(s)" dialog box opens. \\
\hline "Uninstall" & The selected style version is removed from the repository. \\
\hline "Preview" & The windows closes. A preview is displayed of the selected style in the selected version. Specific elements are displayed in the style. \\
\hline
\end{tabular}

\section*{Dialog box 'Edit \\ Repository \\ Locations'}

Table 674: "Repositories (elements are searched in that order)"
\begin{tabular}{|l|l|}
\hline "Location" & \begin{tabular}{l} 
Storage location of the configured repository on the development system \\
Example: C : \ProgramData \CODESYS \(\backslash\) Visualization Styles
\end{tabular} \\
\hline "Name" & Preset: System \\
\hline "Add" & \begin{tabular}{l} 
The "Repository Locations" dialog box opens. It makes it possible to manage \\
other repositories.
\end{tabular} \\
\hline "Edit" & \\
\hline "Remove" & \begin{tabular}{l} 
The order in the list of repositories is adapted. It defines the processing order \\
when searching for elements.
\end{tabular} \\
\hline "Move Up" & "Move Down"
\end{tabular}

\section*{Command 'Add Visual Element'}

Function: The command opens a menu containing all available visualization elements as menu items.
Requirement: You have configured the command in the dialog box "Customize" in a way that you have a call in a (any) menu.

When you select an element in the menu, the element is added in the visualization editor in the upper left corner.
See also
- \(\Leftrightarrow\) Chapter 6.4.5.5.2 "Select Element" on page 2873
- \(\#\) Chapter 6.4.1.21.3.9.16 "Command 'Customize"' on page 2667

\section*{Command 'Select None'}

Function: The command cancels at once any selection in the current visualization editor.
Requirement: You have configured the command in the dialog box "Customize" in a way that you have a call in a (any) menu.
See also
- \({ }^{4}\) Chapter 6.4.5.5.2 "Select Element" on page 2873

\section*{Command 'Add Elements for Alarm Acknowledgement'}

Symbol: \(\Delta\)
Function: This command adds buttons automatically to the visualization for acknowledging alarms. It opens an assistant for inserting controls below the table.
Call: Menu bar: "Visualization"; context menu of visualization element "Alarm table"
Requirement: An "Alarm table" visualization element is selected.

Dialog box
'Alarm Table
Wizard'
\begin{tabular}{|l|l|}
\hline "Type of element(s) to insert" & \begin{tabular}{l}
\(\bullet\) "Button" \\
- "Rectangle"
\end{tabular} \\
\hline "Action" & \begin{tabular}{l} 
Ø: A button or a rectangle with the selected function is added to the visualiza- \\
tion.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
If you have already specified a variable for an action, then this is displayed here \\
in the "Variable" column. If you have not defined a variable yet, then a local \\
visualization variable is created automatically.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Access Rights'}

Function: This dialog defines the permissions of user groups for a visualization element.
Call: Click in the "Value" field of the "Access Rights" element property of a visualization element.
Requirement: A visualization element is selected in a visualization element and the "Properties" is open.
\begin{tabular}{|l|l|}
\hline "User Groups" & \begin{tabular}{l} 
Groups that were configured in the "Visualization Manager" (tab \\
"User Management \(\rightarrow\) Groups").
\end{tabular} \\
\hline "Operable" & \(\boxed{\square}:\) The visualization element is available with full functionality. \\
\hline "Only Visible" & \begin{tabular}{l} 
■: The visualization element is visible only and does not provide any function- \\
ality.
\end{tabular} \\
\hline "Invisible" & ■: The visualization element is not displayed. \\
\hline "Group hierarchy is used" & \begin{tabular}{l} 
Display whether the option "Use group hierarchy" is activated in the \\
"Visualization Manager" (tab "User Management \(\rightarrow\) Settings"). \\
A group of a higher hierarchy cannot have fewer permissions for an element \\
than an element of a lower hierarchy.
\end{tabular} \\
\hline
\end{tabular}

If no user is logged in, then the permissions apply for the visualization elements that are configured for the user group "None". If the permissions for a visualization element is restricted, then the group "None" should be granted the lowest permissions.

\section*{Dialog 'Add Visualization'}

Function: The dialog is used to create a new object of type "Visualization".
Call: Menu bar: "Project \(\rightarrow\) Add Object \(\rightarrow\) Visualization"; context menu of an application
Requirement: An application is selected in the device tree.
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Name of the visualization \\
Example: Visu_A
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline The following settings are displayed only when you add a "Visualization" object to the project for the first time. \\
\hline "Symbol library" & List of all installed symbol libraries \\
\hline "Assigned" & \begin{tabular}{l} 
: Symbol library is selected \\
\\
\\
Hint: CODESYS manages this setting in the project settings.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Add" & \begin{tabular}{l} 
CODESYS creates a new visualization, assigns the selected symbol libraries to \\
the project, and lists them in the "Visualization Toolbox" view.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Update Frame Parameters'}

Function: The dialog requests you, after changing an interface in the visualization references concerned, to re-assign the variables for the parameter transfer.
Call: The dialog appears automatically.
Requirement: You have changed the interface of a visualization, for example by adding an additional variable. After that, you have clicked either "File \(\boldsymbol{\rightarrow}\) Save Project" or "Build \(\rightarrow\) Generate Code", or opened a visualization.
\begin{tabular}{|l|l|}
\hline "Parameter" & Hierarchical structure of the interface parameters as a tree view \\
\hline (T) & \begin{tabular}{l} 
Top node of the visualization hierarchy with the name of the visualization. This \\
contains an element of type "Frame" or "Tabs".
\end{tabular} \\
\hline Name of the element ("Frame" or "Tabs" type) \\
\hline " & Name of the referenced visualization \\
\hline <name> & \begin{tabular}{l} 
Interface of the referenced visualization with the new parameters \\
You can edit the parameter transfer here.
\end{tabular} \\
\hline <name> & \begin{tabular}{l} 
Interface of the referenced visualization with the previously valid parameters. \\
You cannot edit the parameter transfer, but you can use it as a template.
\end{tabular} \\
\hline & Variable for the parameter transfer (VAR_INPUT scope) \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Type" & \begin{tabular}{l} 
Data type of the variable \\
Example: InTt
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable that is transferred as a parameter and with whose value the visualiza- \\
tion is initialized during instantiation. \\
Example: PLC_PRG. iVisNr \\
If the variable lies under the current interface, which is marked in the tree view \\
with "(Current)", then you can edit the parameter transfer. \\
- Click in the field to open the input field.
\end{tabular} \\
& \begin{tabular}{l} 
- Double-click in the field to open the Input Assistant. \\
- Accept the settings by copying assignments in the "Value" column and \\
pasting them into another cell. Use the "Copy" and "Paste"links to do this.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Copy" & \begin{tabular}{l} 
Link for copying an assignment from the "Value" column. \\
Requirement: An assignment is selected.
\end{tabular} \\
\hline "Paste" & \begin{tabular}{l} 
Link for inserting an assignment \\
Requirement: You have copied an assignment.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OK" & \begin{tabular}{l} 
Click the button to close the dialog and confirm the changes made under \\
"(Recent)". \\
Result: The assignment is entered in the "References" property and on the \\
"Interface Editor" tab.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Configure Categories and Items'}

Function: The dialog is used to manage the categories in a tree view. The assigned elements are listed below a category. You can create custom categories and edit the assignment to the visualization elements. The name of the category is displayed in the "Visualization Toolbox" view as a label of the button to open the element selection.

Call: Click the 国 symbol in the "Visualization Toolbox" view.

Name of the category \\
Example: tagA
\end{tabular} \\
\hline "Description" & Example: Tagged with A \\
\hline
\end{tabular}

\section*{Dialog 'Gradient Editor'}

Function: The dialog is for setting the color gradient of visualization elements. If you define two colors, the color graduates between them. If you only select 1 color, the color graduates within this color through its brightness. The detailed settings are for a special specification of the initial position and the angle of the color gradient.
Call: Click in the value field of the property "Gradient settings"
Requirement: You have selected a visualization element in the editor that has the property "Gradient settings".
\begin{tabular}{|l|l|}
\hline "Gradient type" & \begin{tabular}{l}
\(\bullet\) \\
\(\bullet\) "Linear" \\
"Radial" \\
\(\bullet \quad\) "Axial": The color gradient runs along an axis, with the colors extending \\
perpendicular to the axis on both sides.
\end{tabular} \\
\hline "Color 1" & First color of the gradient. \\
\hline "Color 2" & Second color of the gradient. \\
\hline "Transparency" & \begin{tabular}{l} 
Transparency of the associated color. Permissible values: Integers in the range \\
of values from 255 to 0. 255: The color is opaque. 0: The color is fully trans- \\
parent.
\end{tabular} \\
\hline "Standard linear" & \begin{tabular}{l} 
Requirement: "Linear" color gradient. \\
Standard direction of the linear color gradient.
\end{tabular} \\
\hline "Standard radial" & \begin{tabular}{l} 
Requirement: "Radial" color gradient. \\
Standard setting.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Standard axial" & \begin{tabular}{l} 
Requirement: "Axial" color gradient. \\
Direction of the color gradient
\end{tabular} \\
\hline "Angle (degrees)": & Requirement: "Linear" or "Axial" color gradient. \\
\hline "Center X (\%):" & \begin{tabular}{l} 
Requirement: "Radial" color gradient. \\
X-position of the center point (0 - 100\%)
\end{tabular} \\
\hline "Center Y (\%):" & \begin{tabular}{l} 
Requirement: "Radial" color gradient. \\
Y-position of the center point (0 - 100\%)
\end{tabular} \\
\hline "Use one color" & Color gradient between "Color 1" and the same color with a different brightness. \\
\hline "Brightness" & \begin{tabular}{l} 
Requirement: The option "Use one color" is selected. \\
Setting from 0 (black) to 100 (white)
\end{tabular} \\
\hline "Use two colors" & Color gradient between the two selected colors "Color 1" and "Color 2". \\
\hline
\end{tabular}

\section*{Dialog 'Input Configuration'}

Symbol:
Function: The dialog is used to assign input actions to specific input events. It also includes specific settings for the selected input action.

Call: In the "Input configuration" property, click "Configure".
Requirement: An element is selected in the editor.

Input action
'User Manage-
ment'
\begin{tabular}{|l|l|}
\hline "Dialogs and actions" & \begin{tabular}{l} 
Configures which one of the possible user management dialogs or which action \\
follows the input event \\
Note: The dialog used at runtime is configured in the "Dialog Settings" tab of the \\
Visualization Manager. \\
See also \\
- "Login dialog" \\
- "Change password dialog" \\
- "Change configuration dialog" \\
Default: Dialogs from the VisuUserManagement library
\end{tabular} \\
\hline "Login" & \begin{tabular}{l} 
The login prompt opens. \\
Default: VisuUserManagement. Vum_Login in "Login dialog"
\end{tabular} \\
\hline "Logout" & The current user is logged out. \\
\hline "Change User Password" & \begin{tabular}{l} 
The dialog for changing the password opens. \\
Default: VisuUserManagement. VUM_Change Password in "Change password \\
dialog"
\end{tabular} \\
\hline "Open User Configuration" & \begin{tabular}{l} 
The dialog opens for changing the configuration. \\
Default: VisuUserManagement. VUM_UserManagement in "Change \\
configuration dialog"
\end{tabular} \\
\hline
\end{tabular}

Input action
'Close Dialog'
\begin{tabular}{|c|c|}
\hline "Dialog" & \begin{tabular}{l}
The visualization of type "Dialog" that will be closed. \\
\(\nabla\) : List box with all "Dialog" type visualizations available in the project. \\
Example: \\
Default dialogs of the VisuDialogs library, which is usually integrated in the project. \\
- FileOpenSave \\
- Keypad \\
- Login \\
- Numpad \\
- NumpadExtended \\
- TextinputWithLimits \\
Note: The setting in the object property ("Visualization" tab) of a visualization determines whether or not a visualization can be used as a dialog.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Result" & \begin{tabular}{l} 
Return value for closing the dialog. \\
Note: If there are more input actions after closing, then they configured in the \\
"Input configuration \(\rightarrow\) OnDialogClosed" property of the element.
\end{tabular} \\
\hline "None" & \(\boxed{\square}:\) No return value
\end{tabular}

See also
- " Chapter 6.4.5.21.3.15 "Dialog 'Properties' of Visualization Objects" on page 3388

Input action
'Open Dialog'
\begin{tabular}{|l|l|}
\hline "Dialog" & Visualization (type "Dialog"). The dialog opens. \\
& \(\square:\) List box with all dialogs available in the project. \\
& Note: The "VisuDialogs" library provides visualizations (type "Dialog"). \\
& - VisuDialogs. FileOpenSave \\
& - VisuDialogs. Login \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Transfer parameters of the dialog \\
\hline "Parameter" & \begin{tabular}{l} 
Interface parameter as declared in the interface editor of the visualization \\
Example: filelistProvider
\end{tabular} \\
\hline "Type" & \begin{tabular}{l} 
Data type of the parameter as declared in the interface editor of the visualization. \\
Example: VISU_FBFILELISTPRoVIDER
\end{tabular} \\
\hline "Value" & \begin{tabular}{l} 
Variable (data type corresponds to the data type of the parameter). The value of \\
the variable is read when the dialog opens and passed to the parameter. \\
Example: PLC_PRG.fileListProvider // Instance of function \\
block VisuDialogs.Visu_FbFileListProvider \\
l.a: The input assistance offers all variables available in the entire project.
\end{tabular} \\
\hline
\end{tabular}

Here the return value of the dialog is activated for which the Var_OUTPUT variable and VAR_IN_OUT variable are written. The dialog closes afterwards.
\begin{tabular}{|c|c|}
\hline "Update" "and" w "parameter in case of result" & Note: The parameters are updated before the dialog is closed. Until then, the values are stored temporarily. They are stored as a copy, not as a reference. \\
\hline "None" & V: No return value \\
\hline "OK" & 凹: Defines the return value for which the transfer parameter is written \\

\hline \begin{tabular}{l}
The visualization navigates to the web page of the URL. \\
Requirement: The visualization is executed as a CODESYS WebVisu.
\end{tabular} & \begin{tabular}{l}
URL \\
- As a literal in single straight quotation marks \\
- As a variable (STRING)
\end{tabular} & \begin{tabular}{l}
If a parameter is not specified, then the web page is displayed in a new window or a new tab. \\
If 'replace' is specified, then the CODESYS WebVisu is replaced by the web page.
\end{tabular} \\
\hline
\end{tabular}

Table 679: Command "Read Recipe"
\begin{tabular}{|l|l|l|}
\hline "Command" & "1st parameter" & "2nd parameter" \\
\hline ReadRecipe & \begin{tabular}{l} 
'RecipeDefinitionForModule \\
s'
\end{tabular} & 'RecipeModuleA' \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|}
\hline & \begin{tabular}{l} 
Name of the recipe definition \\
\(\bullet\) \\
\(\bullet\) \\
\(\bullet\)
\end{tabular} As a literal & Name of the recipe \\
\(\bullet \quad\) As a literal \\
\hline •
\end{tabular}

At visualization runtime, the controller reads the actual values from the variables of the recipe definition and writes them to the specified recipe. The values are saved implicitly (to a file on the controller) and shown in the recipe definition in the Recipe Manager of CODESYS. In other words, the recipe that is managed in CODESYS is updated with values from the controller.

Table 680: Command "Write Recipe"
\begin{tabular}{|l|l|l|}
\hline "Command" & "1st parameter" & "2nd parameter" \\
\hline WriteRecipe & PLC_PRG.stRecipeDef & PLC_PRG.stRecipe \\
\hline & \begin{tabular}{l} 
Name of the affected recipe defini- \\
tion
\end{tabular} & \begin{tabular}{l} 
Name of the recipe (from \\
the recipe definition)
\end{tabular} \\
& \(\bullet\) As a literal & • As a literal \\
& \(\bullet\) As a variable (STRING) & \(\bullet\) As a variable (STRING) \\
\hline
\end{tabular}

At visualization runtime, the values of the recipe are written to the variables on the controller as they are in the Recipe Manager.

Table 681: Command "Save Recipe in File"
\begin{tabular}{|l|l|l|}
\hline "Command" & "1st parameter" & "2nd parameter" \\
\hline SaveRecipeAs & PLC_PRG.stRecipeDef & PLC_PRG.stRecipe \\
\hline & \begin{tabular}{l} 
Name of the affected recipe defini- \\
tion \\
\(\bullet \quad\) As a literal \\
\(\bullet \quad\) As a variable (STRING)
\end{tabular} & \begin{tabular}{l} 
Name of the affected recipe \\
that is updated and saved \\
to a file
\end{tabular} \\
\(\bullet \quad\) As a literal \\
\(\bullet \quad\) As a variable (STRING) \\
Optional parameter: If you \\
do not specify a transfer \\
parameter here, then the \\
values from the recipe vari- \\
ables are saved only the file \\
that is specified later. The \\
implicit recipe files are not \\
updated.
\end{tabular}

At visualization runtime, the "Save Recipe as" dialog opens and prompts the user for a file name and a storage location on the controller. The file name must not be <recipe>.<recipe definition>. The file extension is .txtrecipe.

The user can then save the file that includes the actual values from the recipe variables. If a transfer parameter is not specified in the 2nd parameter, then the file is saved without changing an implicit recipe file. If a transfer parameter is given in the 2nd parameter, then the implicit recipe file is also updated.

Note: If the "Save recipe changes to recipe files automatically" option is selected in the "Recipe Manager - General" tab, then the recipe definition in CODESYS and the implicit recipe files are kept the same automatically.
Note: Implicit (automatically generated) recipe files exist on the controller with names in the following syntax: <recipe>. <recipe definition>.txtrecipe. These are typically used in the application as a buffer when reading and writing recipe variables.

Table 682: Command "Load Recipe from File"
\begin{tabular}{|l|l|l|}
\hline "Command" & "1st parameter" & "2nd parameter" \\
\hline LoadRecipeFrom & PLC_PRG.stRecipeDef & PLC_PRG.stRecipe \\
\hline & \begin{tabular}{l} 
Name of the affected recipe defini- \\
tion \\
\(\bullet ~ A s ~ a ~ l i t e r a l ~\)
\end{tabular} & Name of the affected recipe \\
- As a variable (STRING) & • As a literal \\
\(\bullet\) • As a variable (STRING) \\
\hline \begin{tabular}{l} 
At visualization runtime, the "Load Recipe" dialog opens. It provides the visualization user \\
with a file list that is located in the file system of the controller and filters by the extension \\
txtrecipe. The selected file is downloaded. Then the recipes from the file are written to the \\
implicit files and read to the given recipe in the recipe definition of the Recipe Manager. \\
Requirement: The file was created with the SaveRecipeAs command.
\end{tabular} \\
\hline
\end{tabular}

Table 683: Command "Create Recipe"
\begin{tabular}{|c|c|c|}
\hline "Command" & "1st parameter" & "2nd parameter" \\
\hline CreateRecipe & PLC_PRG.stRecipeDef & PLC_PRG.stRecipe_New \\

Input action 'Write Variable'

The configuration of the input action defines how a visualization user specifies a value and to which variable the value is written.

Check all inputs for there validity. Be sure that only values within the range can be added to a numeric field. Depending on the datatype of the input value, the limitations can be different.
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{\begin{tabular}{l} 
"Input type" \\
How the input is prompted.
\end{tabular}} \\
\hline "Default": & \begin{tabular}{l} 
An input field also opens, or if necessary a virtual keyboard (when the display \\
variant does not have a physical keyboard). \\
Note: The default option for text input at runtime is set in the Visualization \\
Manager: "Dialog Settings" tab, "Settings for Default Text Input".
\end{tabular} \\
\hline "Text input" & \begin{tabular}{l} 
An input field appears. You use the keyboard to specify a number or a text. \\
Requirement: The display variant has a keyboard as input device.
\end{tabular} \\
\hline "Text input with limits" & \begin{tabular}{l} 
An input field appears. You use the keyboard to specify a number or a text. The \\
field also shows the range of values for the input. When a limit is passed, the \\
input value is displayed in red. \\
Requirement: The display variant has a keyboard as input device.
\end{tabular} \\
\hline "VisuDialogs.Keypad" & A virtual keyboard opens. You use it to specify a number or a text. \\
\hline "VisuDialogs.Numpad" & A virtual keyboard opens. You use it to specify a number. \\
\hline "VisuDialogs.NumpadExtended & \begin{tabular}{l} 
A virtual keyboard opens. You use it to specify a number. Hexadecimal and \\
exponential notation are also permitted here.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ "Choose variable to edit" } \\
\hline "Use text output variable" & \begin{tabular}{l} 
O: The input value is written to the text output variable of the element. This is \\
the variable that is assigned in the "Text variable \(\rightarrow\) Text" property.
\end{tabular} \\
\hline "Use another variable" & \begin{tabular}{l} 
O: Variable where the input value is written. \\
Example: PLC_PRG. iVariable
\end{tabular} \\
\hline "Initial display format" & \begin{tabular}{l} 
Placeholder with format definition. It defines the output format for the variable \\
value and the input limits. \\
Example: \(\% 2.3 \mathrm{f}\) for displaying the value as a decimal fraction.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Min" & \begin{tabular}{l} 
Minimum value of the input limit. If a user specifies a lesser value, then it is not \\
accepted. \\
- As a fixed value \\
- As a variable (data type corresponds to selected variable)
\end{tabular} \\
\hline "Max" & \begin{tabular}{l} 
Maximum value of the input limit. If a user specifies a greater value, then it is not \\
accepted. \\
- As a fixed value \\
- As a variable (data type corresponds to selected variable)
\end{tabular} \\
\hline "Dialog title" & \begin{tabular}{l} 
Text displayed in the title bar of the dialog. Optional. \\

Input action 'Ex-
ecute ST Code'
\begin{tabular}{|l|l|}
\hline Input field & Editor for code as Structured Text \\
\hline
\end{tabular}

Input action
'Toggle Variable'
\begin{tabular}{|l|l|}
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). It toggles between TRUE and FALSE for an input event. \\
Example: PLC_PRG.bSwitch
\end{tabular} \\
\hline
\end{tabular}

Input action 'File With the "File Transfer" input action, a file can be transferred from an operating variant (target or Transfer' web visualization) to the PLC as well as to and from the PLC. This works either by means of a file transfer ("Type": "File") or streaming ("Type": "Streaming").

The action has the effect that a file selection dialog is displayed in the visualization at runtime. There the visualization user can select a file which will be transferred either to or from the PLC: For a transfer from a PLC to the visualization, the "Save File" dialog opens. For the transfer from the visualization to the PLC, the "Open File" dialog opens.

\section*{"Transfer"}
\begin{tabular}{|l|l|}
\hline "Direction" & Direction of file transfer \\
\hline "From PLC to Visualization" & \begin{tabular}{l} 
The object specified in "File name" or "Streaming instance name" is transferred \\
from the PLC to the visualization. \\
The "Save File" file selection dialog is displayed in the visualization at runtime.
\end{tabular} \\
\hline "From Visualization to PLC" & \begin{tabular}{l} 
The file specified by the visualization user is transferred to the PLC and saved in \\
the file path specified in "File name" or "Streaming instance name". \\
The "Open File" file selection dialog is displayed in the visualization at runtime.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Type" & \begin{tabular}{l} 
Determines how the file is transferred \\
\\
\\
\(\bullet\) \\
•Transfer type "File": By file transfer \\
\\
\hline
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Type" & \begin{tabular}{l}
"File" \\
The data transfer is done by file transfer.
\end{tabular} \\
\hline "File name" & \begin{tabular}{l}
File path (type STRING) which describes the file in the file system \\
- Variable \\
Example: strTransferFile: STRING; \\
- Literal with relative path \\
Example: '/Recipes/Recipe_1.txt' saves the file in the directory Recipes. \\
- Literal with placeholder \$PLCLOGIC\$ \\
PlcLogic is the default resolution for the directory placeholder \$PLCLOGIC\$. \\
Example: ' \(\$ \$\) PLCLOGIC\$\$/test.txt' saves the file in the directory PlcLogic. \\
Example: ' \(\$\) PLCLOGIC\$\$/MyData/test.txt' saves the file in the directory PlcLogic/MyData. \\
- Literal with placeholder \$VISU\$ visu is the default resolution for the placeholder \$VISU\$. \\
Example: ' \(\$\) SVISU\$\$/test.txt' save the file in the subdirectory PlcLogic/visu. Alternatively, 'visu/test.txt' can also be specified. \\
- Literal with absolute path \\
Example: 'E: \temp\test.txt' \\
Note: These kinds of file paths are not always supported. \\
Note: If a user specifies the file path in the visualization by means of a "Text Field" element, the masking character \$ must not be included: \$VISU\$ / dummy.txt \\
Note: In the case that the file path is specified by the user, it should be checked by the application in order to prevent files from being read or overwritten accidentally.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Type" & "Streaming" \\
The data transfer is done by streaming.
\end{tabular}\(|\)\begin{tabular}{ll|}
\hline "Streaming instance name" & \begin{tabular}{l} 
Instance path (type IVisuStreamWriter or IVisuStreamReader) which \\
describes the object in the file system of the controller \\
Type IVisuStreamReader for transfer direction "From PLC to Visualization" \\
Type IVisuStreamWriter for transfer direction "From Visualization to PLC"
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Control flags" & \begin{tabular}{l}
Note: The variable is evaluated only for transfer direction "From Visualization to PLC". \\
Variable (type DWORD) \\
Determines how the object (file or instance object) is handled on the file system of the PLC. Two flags are provided for this with which the variable can be set. \\
- Flag 1: \\
VisuElems.VisuEnumFileTransferControlFlags.UseOriginalFi leName \\
- Flag 2 : \\
VisuElems.VisuEnumFileTransferControlFlags.ConfirmFileOv erwriteInPlc \\
Options \\
- No flag set: \\
The user selects a file which is saved in the path specified in "File name" or "Streaming instance name". \\
- Flag 1 is set: \\
The path, which is specified by the user at visualization runtime, is applied and used as the path in the PLC file system. \\
- Both flags are set: \\
The path is also checked. If an object already exists in the path specified on the client side, then a message prompt is displayed in the visualization. There the visualization user can confirm that the file will be overwritten. \\
Example: dwControlFlag
\end{tabular} \\
\hline
\end{tabular}
```

Example The transfer direction is "From Visualization to PLC" (write).
Example: A new recipe file Recipes/Recipe_2021.txt has been created in the visualiza-
tion device. The visualization user selects this file and wants to save the file on the PLC under
the same name. Because the control flags are set accordingly, a message window opens and
the visualization user can confirm that the file will be overwritten.

\section*{Dialog 'Project Environment' - 'Visualization Profile'}

Function: The dialog displays the current visualization profile of the project. The profile can be updated here.
Call: Main menu "Project \(\rightarrow\) Project Environment", Tab "Visualization Profile".
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Current visualization profile in \\
project"
\end{tabular} & The currently set visualization profile of the opened project. \\
\hline \begin{tabular}{l} 
"Recommended, newest \\
profile"
\end{tabular} & The newest profile \\
\hline "Action" & \\
\hline "Do not update" & The visualization profile of the project remains unchanged. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Update to x.x.x.X" & CODESYS updates the project to the chosen visualization profile. \\
\hline \begin{tabular}{l} 
"Check for updates when \\
loading this project"
\end{tabular} & \begin{tabular}{l} 
: CODESYS checks for new profiles when the project is opened. If there are \\
updates available an update dialog opens automatically. \\
\(\square\) \\
open automatically any longer.
\end{tabular} \\
\hline "Set All to Newest" & CODESYS updates the profile. \\
\hline
\end{tabular}

\section*{Dialog 'Project Environment' - 'Visualization Styles'}

Function: The dialog displays the currently used visualization style of the project. The visualization style can be updated here.
Call: Main menu "Project \(\rightarrow\) Project Environment", tab "Visualization Styles"
\begin{tabular}{|l|l|}
\hline "For the following visualization styles currently in use, newer versions are available:" \\
\hline "Visualization Styles" & Version of the currently set visualization style of the opened project. \\
\hline "Current" & Current version of the visualization style, for example 3.5.6.0 \\
\hline "Recommended" & Recommenden version of the visualization style, for example 3.5.7.0 \\
\hline "Action" & The visualization style of the project remains unchanged. \\
\hline "Do not update" & CODESYS updates the project to the version of the chosen visualization style. \\
\hline "Update to x.x.x.x" & \begin{tabular}{l} 
"Check for updates when \\
loading the project"
\end{tabular} \\
\begin{tabular}{l} 
updates available an update dialog opens automatically. \\
and \\
: No check of the version. The update dialogs do not open automatically any \\
longer.
\end{tabular} \\
\hline "Set All to Newest" & CODESYS updates the version. \\
\hline
\end{tabular}

\end{tabular}

\section*{Dialog 'Project Settings' - 'Visualization Profile'}

Symbol: 田
Function: The dialog box enables the setting of the visualization profile.
Call: Menu "Project \(\rightarrow\) Project Settings", category "Visualization Profile"
Requirement: A project is open.

Table 694: "Visualization Profile"
\begin{tabular}{|l|l|}
\hline "Specific profile" & \begin{tabular}{l} 
Profile that CODESYS uses in the project and that determines the visualization \\
elements that are available in the project. \\
The selection list contains all the profiles installed so far.
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Properties' of Visualization Objects}

Function: This dialog is used for configuring object-dependent properties.
Call: Menu bar: "View"; context menu of the visualization object in the "Devices" view or " POUs" view.

Tab 'General'
\begin{tabular}{|l|l|}
\hline "Name" & Example: visMain \\
\hline "Object type" & visualization \\
\hline "Open with" & visualization \\
\hline
\end{tabular}

See also
- \(\Leftrightarrow\) Chapter 6.4.1.21.4.11.2 "Dialog Box 'Properties' - 'Common"' on page 2753

Tab 'Access This tab is used for defining which user group can execute which actions on the object. Control' See also
- \(\boldsymbol{y y}^{\boldsymbol{y}}\) Chapter 6.4.1.21.4.11.7 "Dialog 'Properties' - 'Access Control"" on page 2757

Tab 'Visualiza- This tab assigns a visualization type to a visualization.
tion'
In addition, it includes settings for window size that are used at runtime.

Table 695: "Use visualization as"
\begin{tabular}{|l|l|}
\hline "Visualization" & Visualization type for an ordinary or referenced visualization. Preset. \\
\hline "Dialog" & \begin{tabular}{l} 
Visualization type for a visualization that opens as a dialog in its own window for \\
an input event. The input action for this is "Open dialog". The "Close dialog" input \\
action closes the window. \\
Tip: A dialog usually includes an "OK" button or "Cancel" button at the bottom \\
edge for confirming or rejecting user input, and for closing the dialog. A simple \\
dialog or a dialog prompt includes only a question or information and buttons for \\
closing the dialog with either "Yes" or "No". A dialog is part of a user interface. \\
While a dialog is open, the rest of the user interface is usually disabled.
\end{tabular} \\
\hline "Numpad / keypad / dialog for \\
input configuration" & \begin{tabular}{l} 
Visualization type for a visualization that displays a virtual numeric keypad or a \\
virtual keyboard. It appears when the user is prompted to specify text. The input \\
action for this is "Write variable". \\
Note: The interface of this visualization must also conform with the interfaces \\
for the standard visualizations for the numeric keypad or that keyboard that \\
provides the VisuDialogs library: Numpad, Keypad, NumpadExtended, or \\
TextinputwithLimits. \\
Tip: The VisuDialogs library contains templates for virtual keyboards or \\
numeric keypads.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Dialog is opaque" & \begin{tabular}{l}
\(\boxed{\square}\) \\
positive effect on the character and input performance. \\
Use this option when your drawn dialog is rectangular and opaque, containing no \\
transparent parts.
\end{tabular} \\
\hline "Use automatic detected & o: The size is determined so that all visualization elements are enclosed. \\
visualization size" & "Include background image" \\
\hline \begin{tabular}{l} 
: All elements and the background image are completely visible. \\
\(\square\)
\end{tabular} \\
\hline \begin{tabular}{l} 
"Use specified visualization elements are visible, but a larger background image is truncated. \\
size"
\end{tabular} & \begin{tabular}{l} 
o: The values "Height" and "Width" define the window size of the visualization \\
(in pixels).
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Internal" & \begin{tabular}{l} 
: The visualization is internal. It is used exclusively as an internal module of a \\
complete visualization in a library. \\
\\
\\
\\
\\
\\
When editing as a library project while the project is open in CODESYS, an \\
internal visualization is handled like all visualizations. The internal visualization \\
appears in drop-down lists. Or in the visualization manager ("Visualizations" tab). \\
The internal visualizations that include a linked library are not visible to you.
\end{tabular} \\
\hline
\end{tabular}

- \({ }^{4}\), Chapter 6.4.5.9 "Visualizing alarm management" on page 2909

\section*{Dialog 'Advanced Trace Settings'}

Function: The recording rate of the "Trace" visualization element is configured in this dialog box.

Call
- Properties: "Trace" as, "Advanced"
- Context menu: "Configure trace", "Advanced"

Requirement: A trace is selected in the active visualization editor.

Table 696
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Measurement in every nth \\
cycle"
\end{tabular} & \begin{tabular}{l} 
The task where the trace is running is the basis for the measurement. The \\
measurement interval is a multiple of the trace task according to the selected \\
value. The measurement interval is displayed on the right side.
\end{tabular} \\
\hline "Buffer size (samples)". & \begin{tabular}{l} 
The number of measurements is calculated according to the time range of the \\
x-axis.
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{*}\), Chapter 6.4.5.21.2.13 "Command 'Configure Trace'" on page 3355

\section*{Dialog 'Display Settings'}

Function: The dialog includes the configuration for the display settings of the trace diagram (for both the X -axis and Y -axis) and provides a preview in the trace diagram.
Call: "Display" button in "Trace Configuration" dialog.
\begin{tabular}{|l|l|}
\hline "Add Y-Axis" & \begin{tabular}{l} 
Extends the trace diagram by one Y-axis. \\
Result: The "Trace Configuration" dialog contains an extended selection of Y- \\
axes in the "Additional axes" option of the variable settings.
\end{tabular} \\
\hline "Delete Y-axis" & Deletes the Y-axis with the visible tab. \\
\hline
\end{tabular}

Tab 'X-axis'
\begin{tabular}{|c|c|}
\hline "Display Mode" & \begin{tabular}{l}
Scaling \\
- "Auto": \(\boxtimes\) : CODESYS Scales automatically. \\
- "Fixed length": \(\downarrow\) : CODESYS displays a segment of constant "Length". \\
- "Fixed": \(\boxed{\square}\) : CODESYS displays a segment from "Minimum" to "Maximum".
\end{tabular} \\
\hline "Minimum" & Initial value of the segment. Requirement: The "Display Mode" is "Fixed". \\
\hline "Maximum" & End value of the segment. Requirement: The "Display Mode" is "Fixed". \\
\hline "Length" & Constant length of the segment. \\
\hline "Grid" & Diagram with vertical grid lines. Select the line color from the list box of colors. \\
\hline
\end{tabular}

Table 697: "Tick marks"
\begin{tabular}{|l|l|}
\hline "Fixed spacing" & \(\boxed{\square}:\) CODESYS draws tick marks with "Distance" and "Subdivisions". \\
\hline "Distance" & Distance between tick marks \\
\hline "Subdivisions" & Number of subdivisions between two tick marks \\
\hline
\end{tabular}
\begin{tabular}{|l|l}
\hline "Font" & Font for the X-axis
\end{tabular}

Tab 'Y-Axis'
\begin{tabular}{|c|c|}
\hline "Display Mode" & \begin{tabular}{l}
Scaling \\
- "Auto": \(\square\) : CODESYS Scales automatically. \\
- "Fixed": \(\checkmark\) : CODESYS displays a segment from "Minimum" to "Maximum".
\end{tabular} \\
\hline "Minimum" & \begin{tabular}{l}
Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The "Display Mode" is "Fixed". \\
Examples: 20,PLC_PRG.iLimit_Min, GVL.c_iLimit_Min \\
Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: iLimit_Min : INT := 20
\end{tabular} \\
\hline "Maximum" & \begin{tabular}{l}
Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The "Display Mode" is "Fixed". \\
Examples: 80,PLC_PRG.iLimit_Max, GVL.c_iLimit_Max \\
Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: \(\qquad\)
\end{tabular} \\

- \(\Leftrightarrow\) Chapter 6.4.5.21.4.1.1 "Visualization Editor" on page 3393

\section*{Visualization Editor}

The visualization editor opens when you double-click a visualization object.

- (1) Graphical editor: Here you create the visualization from the visualization elements which are provided in the visualization toolbox view.
- (2) View "Visualization Toolbox": available visualization elements
- (3) View "Properties": Configuration editor for the visualization element currently selected in the editor area
- (4) Menu "Visualization": Commands for working in the visualization editor

The "Visualization" menu contains, for example, commands for opening additional editors.
- (5) "Interface Editor": Declaration of variables which can be used to parameterize references of the visualization.
- (6) "Hotkeys Configuration": Definition of keyboard shortcuts for inputs on the visualization in online mode.
- (7) "Element List": List of all elements used in the visualization; possibility to change their position on the Z-axis.

\(\square:\) The table includes all properties. The menu command "Filter \\
\(\rightarrow\) Show all categories" is enabled at the same time.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element proper-}
ties display in a
table
\begin{tabular}{|l|l|}
\hline Column "Property" & Element properties of the selected element \\
\hline Column "Value" & The assigned value is applied in the editor view. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
Double-click in the "Value" \\
column
\end{tabular} & \begin{tabular}{l} 
A line editor, drop-down list, or dialog opens for editing the value. \\
\(\ldots\) \\
\hline opens the "Input Assistant" dialog for help, for example when assigning
\end{tabular} \\
\hline Single-click for a selected field & variables or image references.
\end{tabular}
\[
\begin{aligned}
& \text { A style selected in the visualization manager can include single, predefined } \\
& \text { element properties. As a result, these do not appear in this view because a } \\
& \text { fixed value is already assigned to them. They do not have to be configured } \\
& \text { anymore. }
\end{aligned}
\]

Visualizations can be configured with device-specific restrictions that block the availability of element properties.

Device-specific restrictions :
- Elements with restricted availability
- Fonts with restricted availability
- Colors with restricted display
- Image formats with restricted display
- Maximum number of visualization elements
- Maximum number of visualizations below the device

\section*{Object 'Visualization manager'}

Symbol:
The visualization manager manages the configuration settings for all display variants of the visualizations of the current application.
The object is automatically inserted when a visualization object is inserted below the application. On a double-click the configuration dialog opens with several tabs.

If the device employed supports display variants of the visualization, the visualization manager automatically brings along the corresponding objects (CODESYS WebVisu, CODESYS TargetVisu).
If the device employed supports CODESYS TargetVisu, the visualization manager automatically brings along the corresponding object CODESYS TargetVisu.

Tab 'Visualization manager' 'Settings'

Symbol: 囲
Function: the tab contains settings for all visualizations that are available application-wide.
'General set-
tings'
\begin{tabular}{|c|c|}
\hline "Use unicode strings" & \(\checkmark\) : The visualization codes character strings as Unicode. \\
\hline "Use CurrentVisu variable" & \begin{tabular}{l}
the application knows and uses the global variable VisuElems.CurrentVisu of the type STRING. It contains the name of the currently active visualization at the runtime of the application. The application can read from the variable in order to obtain the name of the currently active visualization. The application can cause a visualization change by a write access. \\
Requirement: the application contains a visualization that calls further visualizations. \\
Example \\
- Variable assignment: VisuElems.CurrentVisu:=strVisuName; \\
- Visualization name assignment: VisuElems.CurrentVisu:='visu1';
\end{tabular} \\
\hline
\end{tabular}
'Style settings'
The "Visualization Style Editor" enables new styles to be generated, checked and installed in the visualization styles repository.
\begin{tabular}{|l|l|}
\hline "Selected style" & \begin{tabular}{l} 
- \\
- Style from the visualization styles repository that every visualization in the \\
application uses, for example "Flat Style". \\
"<None>": The visualization displays its elements without style or according \\
to the internal default. A standard dialog appears instead of a selection list \\
for selection in the element properties "Color" und "Font".
\end{tabular} \\
\hline ⿴ & \begin{tabular}{l} 
Opens a selection list with styles that are installed in the visualization styles \\
repository.
\end{tabular} \\
\hline "Display all versions (for \\
experts only)" & \begin{tabular}{l} 
all The selection list contains only the latest version of each selected style and \\
displayed. \\
a: The selection list contains all versions of all installed styles.
\end{tabular} \\
\hline Button 3 & \begin{tabular}{l} 
Opens a selection list with commands for the use of the "Visualization Styles \\
Editor".
\end{tabular} \\
\hline "Open Style Editor" & The "Visualization Styles Editor" opens. \\
\hline "Create and edit derived style" & \begin{tabular}{l} 
The "Visualization Styles Editor" opens with the dialog "Create a new \\
visualization style". The dialog contains the settings for the first configuration \\
step. \\
Requirement: a style is selected in "Selected style".
\end{tabular} \\
\hline "Copy and edit the selected \\
style" & \begin{tabular}{l} 
The "Visualization Style Editor" opens with the dialog "Open existing style as a \\
copy". The dialog contains the settings for the first configuration step. \\
Requirement: a style is selected in "Selected style".
\end{tabular} \\
\hline "Preview" & The elements displayed represent the style specified in "Selected style". \\
\hline
\end{tabular}

\end{tabular}} \\
\hline
\end{tabular}

\section*{'Settings for user management dialogs'}

You can configure your visualization with a user management. To do this, configure an input to an element that causes a user management dialog to appear. The VisuUserManagement library contains ready-to-use dialog visualizations for this purpose. The library is located in the installation directory, for example in \(\mathrm{C}: \backslash\) Program Files (x86) \3S CODESYS \(\backslash C O D E S Y S \backslash P r o j e c t s \backslash V i s u \backslash D i a l o g s \backslash V i s u U s e r M g m t D i a l o g s . l i b r a r y . ~\)

You can also use other visualizations as user management dialogs. To do that you have to change the defaults here.
\begin{tabular}{|l|l|}
\hline "Login dialog" & \begin{tabular}{l} 
User management dialog that enables logging in; typically a request to enter a \\
username and a password. It appears upon an input event on an element that \\
executes as a consequential action "User management", action "Login". \\
Preset: VisuUserManagement. VUM_Login
\end{tabular} \\
\hline "Change password dialog" & \begin{tabular}{l} 
User management dialog that enables a password to be changed; typically \\
a request to enter the current password and a new one. It appears upon \\
an input event on an element that executes as a consequential action "User \\
management", action "Change user password". \\
Preset: VisuUserManagement. ChangePassword
\end{tabular} \\
\hline "Change configuration dialog" & \begin{tabular}{l} 
User management dialog that enables a configuration change of the user man- \\
agement, i.e. typically a display of the current user configuration and a possibility \\
to change it. It appears upon an input event on an element that executes as a \\
consequential action "User management", action "Open user configuration". \\
Preset: VisuUserManagement. vum_UserManagement
\end{tabular} \\
\hline
\end{tabular}

\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Size of memory for \\
visualization"
\end{tabular} & Memory size in bytes allocated by the visualization at runtime. Preset: "400000" \\
\hline \begin{tabular}{l} 
"Size of the paintbuffer (per \\
client)"
\end{tabular} & \begin{tabular}{l} 
Memory size in bytes allocated by the visualization per display variant and used \\
for painting actions. Preset: "50000"
\end{tabular} \\
\hline
\end{tabular}

Table 704: "File transfer mode"
\begin{tabular}{|l|l|}
\hline "Transfer visualization files to \\
the PLC"
\end{tabular} \begin{tabular}{l} 
O: When downloading the application from the visualization directories to the \\
controller, CODESYS copies image files and text list files that the visualization \\
references. A CODESYS TargetVisu needs the files on the PLC and similarly the \\
dialogs that support a numerical input or a keyboard input.
\end{tabular}\(|\)\begin{tabular}{ll} 
Use local visualization files & \begin{tabular}{l} 
O: The visualization uses image files and text list files from local directories \\
Note: In order to achieve that the visualization can access the files stored locally, \\
it is necessary thatthat the file paths are relative. The paths are given in dialog \\
box "Project \(\rightarrow\) Project settings" in tab "Visualization". \\
Note: It is also necessary that the link type of a image is "Link to file". The link \\
type is specified in the image pool.
\end{tabular} \\
\hline
\end{tabular}

Table 705: "Client settings"
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Maximum number of \\
visualization clients"
\end{tabular} & \begin{tabular}{l} 
Limits the number of visualization clients that are executed at the same time. \\
If you configure the elements so that they vary depending on the display var- \\
iant, then you have to limit the number of display variants. A visualization is \\
given an ID at runtime that identifies the display variant and then processes \\
data accordingly. CODESYS can the query the ID using the system variable \\
CURRENTCLIENTID and thus obtains the information as to which of the running \\
variants is concerned. \\
Example: arr [CURRENTCLIENTID] . dwColor \\
Requirement: VisuGlobalClientManager library is integrated in the project. \\
\\
Tip: You can find in the CODESYS store. example "Global Client Manager"
\end{tabular} \\
\hline
\end{tabular}
"Transfer both svg images and This option is visible only if both a WebVisu and a TargetVisu exist. It concerns converted images" images in svg format only.
The option is available if the device description for the controller of the TargetVisu does not support the svg (full) format.
\(\square\) : The images are transmitted in the png or bmp formats (for TargetVisu) and additionally in svg format (for WebVisu).

Not all settings are available with an integrated CODESYS visualization.

\section*{Tab 'Visualization Manager' - 'Default Hotkeys'}

Symbol:
The tab includes a list of configured keyboard shortcuts that are valid for all visualizations available throughout the application. Therefore, the tab is the central location for defining keyboard shortcuts for all visualizations that are below an application.
Keyboard shortcuts of the default keyboard action are not listed here.
The tab is similar to the "Keyboard Configuration" tab and provides the same editing options.
See also
- «2"Tab 'Keyboard configuration"' on page 3341

Tab 'Visualization manager' - 'Visualizations'
Symbol: 田

Function: The tab lists all visualizations that are available project-wide and enables an assignment of the visualizations for the loading behaviour, depending on the display variants.

\section*{Tab 'Flags'}
\begin{tabular}{|l|l|}
\hline "Standard behaviour" & \begin{tabular}{l}
\(\square:\) The visualizations of the application and the actually referenced visualiza- \\
tions are automatically loaded to the target system. The activated checkboxes \\
show which one that is. \\
\(\square:\) The loading behaviour is explicitly defined for each visualization. \\
Hint: use the explicit selection if you reference visualizations indirectly via IEC \\
variables.
\end{tabular} \\
\hline "Visualizations" & \begin{tabular}{l} 
The list contains all created visualizations from the device tree and the POU \\
view.
\end{tabular} \\
\hline "Dialogs" & \begin{tabular}{l} 
The list contains all the referenceable visualizations that are available via the \\
libraries of the library management.
\end{tabular} \\
\hline
\end{tabular}

Only those visualizations selected here using checkboxes are loaded.
"Remote target visualization, \(\quad\) The column settings affect the loading behaviour for the display variants "remote target visualization, web target visualization", "target visualization" and "web visualization". visualization,"

\section*{Tab 'Visualization manager' - 'User management'}

\section*{Symbol:}

The "User management" tab is used for creating and configuring the user management for visualizations and their users and groups.
\begin{tabular}{|l|l|}
\hline If a user management has not been configured yet, then the following buttons are available: \\
\hline \begin{tabular}{l} 
"Create empty user \\
management"
\end{tabular} & The user management opens. The "None" group is created. \\
\hline "Create user management with \\
default groups and users" & The user management opens. The following groups and users are created: \\
& \begin{tabular}{l} 
- "Admin" group with "Admin" user \\
- "Service" group with "Service" user \\
- "Operator" group "Operator" user \\
\\
\\
- "None" group
\end{tabular} \\
\hline
\end{tabular}

\section*{Project with multiple visualization user managements}

Table 706: "Choose between local and remote user management"
\begin{tabular}{|l|l|}
\hline Requirement: The project includes several devices with a visualization user management. \\
\hline "Use local user management" & The user management of this visualization manager is used for the visualization. \\
\hline \begin{tabular}{l|l} 
"Use remote user \\
management"
\end{tabular} & \begin{tabular}{l} 
Drop-down list with all devices of the project that have their own visualization \\
user management.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{ll} 
Visualization & Even if there are no display variants of the visualization in the application, it may be required \\
user manage- & that the visualization user management is located on the controller. This is the case, for \\
ment on the & example, when HMIs connect to the controller. \\
controller for a & \\
visualization & \\
without dis- \\
play variant
\end{tabular}

Requirement: The visualization does not have any display variants. This means that the objects "Web visualization", "Target visualization", or "Remote target visualization" are inserted below the visualization manager.

\end{tabular}

Tab 'User'
\begin{tabular}{|l|l|}
\hline "Login name" & \begin{tabular}{l} 
Name for the user to log in to the visualization at runtime. \\
This name is unique.
\end{tabular} \\
\hline "Full name" & This name may exist more than one time in the user management. \\
\hline "Password" & \begin{tabular}{l} 
Encrypted by CODESYS. By default, the "Login name" is displayed here. \\
If you click the "Password" field of a selected line, then the "Change password" \\
dialog box opens.
\end{tabular} \\
\hline "User group" & \begin{tabular}{l} 
Group(s) that the user belongs to. \\
Clicking the "User group" field of a selected user opens the dialog box "User \\
groups the user belongs to". \\
- "Groups" \\
- "Assigned":
\end{tabular} \\
\hline "V: The user is assigned to this group.
\end{tabular}

Table 709: Buttons
\begin{tabular}{|l|l|}
\hline "Upload user from device" & \begin{tabular}{l} 
The data of the user management is uploaded from the controller. \\
If user data is already configured. then it is overwritten.
\end{tabular} \\
\hline "Download user to device" & \begin{tabular}{l} 
The data of the user management is downloaded to the controller. \\
The existing user management on the controller is overwritten.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Export user management" & The drop-down list opens. \\
& \begin{tabular}{l}
\(\bullet \quad\) "Before V3.5 SP6" \\
•V3.5 SP6 and later" \\
A standard dialog opens for saving the user management as a CSV file with any \\
name in any directory.
\end{tabular} \\
\hline "Import user management" & \begin{tabular}{l} 
A standard dialog opens for selecting the user management (in CSV format) \\
from the file system.
\end{tabular} \\
\hline
\end{tabular}

Tab 'Settings'
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{"Settings for download of user data"} \\
\hline "Download user data on every login" & The data of the user management is downloaded to the controller at login. Existing data is overwritten. \\
\hline "Never download user data on login" & The data of the user management is never downloaded to the controller, even if it changes. \\
\hline "Allow decision on every download" & A "Warning" dialog box opens for you to accept or refuse the download. \\
\hline \multicolumn{2}{|l|}{"Access rights for elements"} \\
\hline "Use group hierarchy" & \begin{tabular}{l}
The permissions can be granted to the group hierarchy of the "Groups" tab only. \\
The group in the first line of the "Group" list is the highest in the hierarchy. A group of a higher hierarchy cannot have fewer permissions for an element than a group of a lower hierarchy.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{"Logout behavior"} \\
\hline "Change to start visualization at logout" & Switches at logout to the visualization that is configured as the "Start visualization" in the respective display variant. \\
\hline
\end{tabular}

CSV file with the The data for user management is saved to a CSV file in the following format:
data for user management
- User groups: ID;group name; automatic logoff TRUE/FALSE; logoff time; unit logoff time;permission to change user date TRUE/FALSE
- Users: login name; full name;password encrypt TRUE/ FALSE;password;group ID;user deactivated TRUE/FALSE

Use this format when you want to edit data for user management by means of any tool. If you set password encrypt to FALSE, then an unencrypted password can be used. In the example, the unencrypted password Yellow was specified for the user Hugo. If you import the CSV file with the command "Import user management", then the password is encrypted automatically.

\section*{Example}
```

V1.0.0.1
Usergroups:
1;Admin;TRUE;1;Minute;TRUE
3;Operator;FALSE;1;Minute;FALSE
7;Service;FALSE;1;Minute;FALSE
0;None;FALSE;1;Minute;FALSE
4;Early and late shift;FALSE;1;Minute;FALSE
2;Early shift;TRUE;1;Minute;FALSE
6;Late shift;FALSE;1;Minute;FALSE
User:
Service;Service;TRUE;C08298D42A35732CFFB7DF43771B7607;2;FALSE
Operator;Operator;TRUE;3D94AB9540B025B07773DE7037F19837;3;FALSE
John;Blue;TRUE;62ED5DE29E5DD4164A01F3AF1B81EFA0;4;FALSE
