## 1 Preface

### 1.1 Documentation guide

Where to find information about:

- PLC system
- $y^{2}$ Chapter 4.1 "System overview" on page 85
- $y^{\Perp}$ Chapter 3 "Getting started with example projects" on page 16
- Starter kit: Introduction to PLC programming and visualization, including all needed hardware components
- Safety user manual for safety PLCs
- Devices
- Data sheets
- Installation instructions
- ${ }^{3}$ Chapter 5.2 "Device specifications" on page 175
- Safety user manual for safety PLCs
- Control panels
- Software and programming
- ${ }^{\text {® }}$ Chapter 6 "Configuration and programming" on page 1339
- Programming examples available for download
- Programming examples available in the engineering suite: Open Automation Builder menu "Help $\rightarrow$ Project examples"
- Application descriptions for specific features and use cases
- Release notes for the latest version of the engineering suite Automation Builder

### 1.2 Do I use AC500 V2 or AC500 V3?

This document describes AC500 V3 products.
We offer different ranges of the processor modules (V2, V3). You can easily find out which ones are used in your system. Either have a look at your used modules or your configuration.

Fig. 1: Hardware: Processor modules

| Written type on the module | Example | Range | Relevant manual |
| :--- | :--- | :--- | :--- |
| Processor module type PM + <br> $\mathbf{3}$ digits | PM595 | V2 | AC500 V2 |
| Processor module type PM + <br> 4 digits | PM5670 | V3 | AC500 V3 (this manual) |

Fig. 2: Software: Configuration in engineering software Automation Builder

| Written type in brackets | Example | Range | Relevant manual |
| :--- | :--- | :--- | :--- |
| Processor module type PM + <br> $\mathbf{3}$ digits | PM595 | V2 | AC500 V2 |
| Processor module type PM + <br> $\mathbf{4}$ digits | PM5670 | V3 | AC500 V3 (this manual) |

### 1.3 Your tasks - documentation from the user's point of view

All information about AC500, AC500-XC and AC500-eCo is available in this manual.
All information about AC500-S and AC500-S-XC is available online in the safety user manual.

As a specialist for PLCs, new to AC500 PLC

## 1．4 Regulations

Planning and installation of the electrical system

The planning and installation of the electrical system must be carried out in compliance with the applicable regulations and standards．Hazards due to malfunctions must be prevented by taking appropriate measures．
The suitability of the products for the respective application is proven by declarations of con－ formity and certificates．

The PLC Automation catalog contains an overview of the available declarations of conformity and certificates．

Qualified per－Both the AC500 control system and other components in the vicinity are operated with dan－ sonnel
gerous touch voltages．Touching live components can lead to serious health implications or even death．

To avoid such risks and the occurrence of property damage，persons involved in the installation， commissioning and maintenance must have relevant knowledge about：
－Automation technology
－Handling of hazardous voltages
－Application of relevant standards and regulations，accident prevention regulations and reg－ ulations on special environmental conditions（e．g．，hazardous areas due to explosive sub－ stances，heavy soiling or corrosive influences）．

### 1.6 Structure of safety notices

Throughout the documentation we use the following types of safety and information notices. They make you aware of safety considerations or give advice on AC500 products usage.

1 Safety alert symbol indicates the danger.
2 Signal word classifies the danger.
3 Type and source of the risk are mentioned and possible consequences are described.
4 Measures to avoid these consequences (enumerations).

Signal words

## DANGER!

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.
Ensure to take measures to prevent the described impending danger.

## WARNING!

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.
Ensure to take measures to prevent the described dangerous situation.

## CAUTION!

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
Ensure to take measures to prevent the described dangerous situation.

## NOTICE!

NOTICE is used to address practices not related to physical injury but might lead to property damage for example damage of the product.
Ensure to take measures to prevent the described dangerous situation.

NOTE provides additional information on the product, e.g., advices for configuration or best practice scenarios.

## 2 Safety instructions

Relevant standards and regulations, accident prevention regulations and regulations on special environmental conditions must be observed (e.g., hazardous areas due to explosive substances, heavy soiling or corrosive influences).

The devices must be handled and operated within the specified technical data and system data.
The devices contain no serviceable parts and must not be opened.
Removable covers must be closed during operation unless otherwise specified.
Any liability for the consequences of incorrect use or unauthorized repairs is rejected.

Qualified per- Both the AC500 control system and other components in the vicinity are operated with dansonnel gerous touch voltages. Touching live components can lead to serious health implications or even death.

To avoid such risks and the occurrence of property damage, persons involved in the installation, commissioning and maintenance must have relevant knowledge about:

- Automation technology
- Handling of hazardous voltages
- Application of relevant standards and regulations, accident prevention regulations and regulations on special environmental conditions (e.g., hazardous areas due to explosive substances, heavy soiling or corrosive influences).

Functional The AC500-S safety user manual must be read and understood before using the safety configusafety ration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

General infor- The examples and diagrams in this manual are included solely for illustrative purposes. mation Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.
The PLC was developed according to the relevant standards. Any module-specific measures are described in the individual descriptions of the modules.

## PLC-specific safety notices

The product family AC500 control system is designed according to the EN 61131-2 and IEC 61131-2 standards. Any data that differs from IEC 61131-2, is due to the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

## NOTICE!

## Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

## NOTICE!

## Use of suitable enclosure

The devices must be mounted in a control cabinet that ensures compliance with the specified environmental conditions.

## Cleaning instructions

Do not use cleaning agent for cleaning the device.
Use a damp cloth instead.

Connection plans and a user program must be created so that no dangerous situations can occur during normal operation or failure.

The application must be tested to ensure that no dangerous situations can occur during operation.

Do not operate devices outside of the specified, technical data!
Trouble-free functioning cannot be ensured outside of the specified data.

## NOTICE!

PLC damage due to missing grounding

- Make sure to ground the devices.
- The grounding (switch cabinet grounding) is supplied both by the mains connection (or 24 V supply voltage) and via the DIN rail. The DIN rail must be connected to ground before power is supplied to the device. The grounding may be removed only if it is certain that no more power is being supplied to the control system.
- In case of screw mounting, use metal screws for grounding.

## CAUTION!

## Do not obstruct the ventilation for cooling!

The ventilation slots on the upper and lower sides of the devices must not be covered.

## Run signal and power wiring separately!

CAUTION!

Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

## WARNING!

Warning sign on the module!
This indicates that dangerous voltages may be present or that surfaces may have dangerous temperatures.

## WARNING!

## Splaying of strands can cause hazards!

Avoid splayed strands when wiring terminals with stranded conductors.

- Ferrules can be used to prevent splaying.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

๕ Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

Information on batteries

## CAUTION!

## Use only ABB approved lithium battery modules!

At the end of the battery's lifetime, always replace it only with a genuine battery module.

## CAUTION!

## Risk of explosion!

Do not open, re-charge or disassemble lithium batteries. Attempting to charge lithium batteries will lead to overheating and can cause explosions.

Protect them from heat and fire and store them in a dry place.
Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid unintentional short circuiting do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

## Environment considerations

Recycle exhausted batteries. Dispose of batteries in an environmentally conscious manner in accordance with regulations issued by the local authorities.

## 3 Getting started with example projects

### 3.1 Introduction

This document gives an overview of the steps for the first use of a PLC with AC500 V3 processor module and describes:

- installation of the engineering software ${ }^{4}$ Chapter 3.2 "Engineering software Automation Builder" on page 16
- hardware needed for example projects $\Longleftrightarrow$ Chapter 3.3 "Hardware AC500 V3" on page 21
- setting up a first, simple project for a stand-alone CPU with central I/O expansion, including visualization and web visualization ${ }^{\aleph}$ Chapter 3.4 "Example project for central I/O expansion" on page 24
- commissioning a project for remote I/O expansion with PROFINET $\Leftrightarrow$ Chapter 3.5 "Example project for remote I/O expansion with PROFINET" on page 71

Getting started with an AC500-eCo V3 processor module: Starter kit smart guide

### 3.2 Engineering software Automation Builder

### 3.2.1 Purpose

For configuring and programming of any AC500 CPU you need the engineering software suite Automation Builder. Automation Builder is available for download.

Further information on page 16

### 3.2.2 Installation of the Automation Builder

Preconditions You must have admininstrator rights on your PC to install Automation Builder. In case of an update installation:

Create a project archive before upgrading Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.
ⓨ Chapter 6.3.1.1.8.2 "Creation of an archive " on page 1408

Installation 1. Go to abb.com/automationbuilder to access the homepage of Automation Builder.
2. In the "Downloads" section, select "Download Automation Builder".
3. In the "Latest Automation Builder" section, select "Automation Builder x.x. Download" (x.x $=$ latest version). This downloads the installer on your PC.
4. Open the downloaded installer and follow the instructions of the installation manager.

5. Keep the default type of installation to "Premium Edition" if available.
6. Select software packages to be installed:

Enable the check box "PLC - AC500 V3" to activate installation of all options for AC500 V3.
7. Click "Download and install" and follow the instructions of the setup.

### 3.2.3 Licensing procedure

When you start Automation Builder software for the first time, you will be asked to choose a license option.
See also:

- Details about the license model, the features of the editions and the latest license information
- Detailed description of the installation and the licensing possibilities of Automation Builder

## Activate a trial

 licenseAutomation Builder software must be installed successfully.PC is connected to the internet.1. Start Automation Builder. $\Rightarrow$ A licensing wizard starts and guides you through the licensing procedure.
2. Enter user information.

In case of future support requests, your registration details enable $A B B$ support team to handle your questions quickly.
3. Select "OK".

4. Enable the trial license.
5. Select "Next".

6. Enable the single PC license and select "Next".

7. Enable online activation and select "Next".
$\Rightarrow$ License activation procedure starts. A successfully ended licensing procedure ends with a success message.
8. Select "OK" to end the wizard.
$\Rightarrow$ Automation Builder license is activated and starts.

### 3.2.4 Setting up of communication parameters in Windows

Setting up of communication parameters

To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.

The IP address of your PC must be in the same class as the IP address of the CPU.
The factory setting of the IP address of the CPU is 192.168.0.10.
The IP address of your PC should be 192.168.0.X. Avoid X = 10 in order to prevent an IP conflict with the CPU.

Subnet mask should be 255.255.255.0.

## Changing of the 1. Open Windows control panel. Click "Network and Internet IP address <br> $\rightarrow$ Network and Sharing Center".

2. Click "Change adapter settings".
$\Rightarrow$
If using existing network with several devices, please pay attention on given network rules or contact your system administrator.
3. Right-click "Local Area Connection (Ethernet)" and select [Properties].

4. Double-click "Internet Protocol Version 4 (TCP/IPv4)".

5. Enter your desired IP address and subnet mask.

### 3.3 Hardware AC500 V3

### 3.3.1 Configuration for example projects

The example projects require a small PLC configuration with I/O devices, e.g., as available in the training case TA5450-CASE.

Table 1: Modules for example projects to get started with AC500 V3 PLC

| Product name | Type | First project <br> (\% Chapter 3.4 <br> "Example project for <br> central I/O expan- <br> sion" on page 24 | Second project <br> 乡 Chapter 3.5 <br> "Example project <br> for remote <br> I/O expansion <br> with PROFINET" <br> on page 71 |
| :--- | :--- | :--- | :--- |
| PM5630-2ETH | AC500 V3 CPU | x | x |
| TB5620-2ETH | terminal base for CPU | x | x |
| DA501 | analog/digital mixed <br> input/output (I/O) <br> module | x | x |
| TU516-H | terminal unit for I/O <br> module | x | x |

| Product name | Type | First project <br> ( Chapter 3.4 <br> "Example project for <br> central I/O expan- <br> sion" on page 24 | Second project <br> ( Chapter 3.5 <br> "Example project <br> for remote <br> I/O expansion <br> with PROFINET" <br> on page 71 |
| :--- | :--- | :--- | :--- |
| CM579-PNIO | PROFINET communi- <br> cation module | -- | x |
| CI502-PNIO | PROFINET commu- <br> nication interface <br> module | -- | x |
| TU508-ETH | terminal unit for com- <br> munication interface <br> module | -- | x |
| TA524 | blind cap for terminal <br> base | x | x |

## Connections

Fig. 3: Training case TA5450

In the training case, the control panel CP6607 is included. A control panel is not needed for the example projects.

For testing the example project some inputs require to be connected as follows:

Fig. 4: Wiring of training case

For the example projects, not all input switches and none of the potentiometers included in training case are necessary.
You will need switch I1 for the example project for central I/O expansion.
You will need switch 15 for the example project for remote I/O expansion.

### 3.3.2 System assembly, construction and connection

## - NOTICE! <br> Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

You can mount AC500 PLC either to DIN rail or to a metal plate. Here, we recommend to mount on DIN rail.

1. Snap the terminal base onto DIN rail.
2. Snap the additional terminal units for I/O modules onto DIN rail.
3. Make the sensor/actuator wire connections according to the dedicated electronic module you want to use. Provide external process power supply as required.
4. If required, make the fieldbus connections according to the dedicated master communication module you want to use.
5. Plug the appropriate electronic and I/O modules in the correct locations (processor module, communication modules on terminal base, and eventually also communication interface modules and I/O modules onto dedicated terminal units).
6. Connect a programming cable (Ethernet cable between ETH port of CPU and PC with engineering software).

### 3.4 Example project for central I/O expansion

### 3.4.1 Purpose

The following steps show how to set-up an application project and configure the hardware. A simple logic is used as example to introduce in programming and commissioning of the PLC. The workflow for creation of a visualization is explained, as well as how to set-up a web server for visualization.

### 3.4.2 Preconditions

- Automation Builder is installed and licensed as, at least, basic edition ${ }^{\wedge}$ Chapter 6.2.4 "Managing your licenses" on page 1350.
- AC500 V3 CPU is assembled and connected to the PC $\Leftrightarrow$ Chapter 3.3 "Hardware AC500 V3" on page 21.

### 3.4.3 Creation, setting up and saving of your AC500 V3 project

### 3.4.3.1 Creation of a project

1. Launch Automation Builder either out of the desktop icon or out of the Windows menu.

2. Select "New Project" or go to menu "File $\rightarrow$ New Project".

3. Select "Projects".
4. Select "AC500 project".
5. Fill in project name.
6. Choose a location to save the project to.
7. Select [OK].
8. Select "PLC - AC500 V3".
9. Select the CPU according to your hardware set-up.

10. Select [Add PLC] to add the CPU to your application.

## 3．4．3．2 Configuration of your processor module

|  | 30-2ETH - TB5620-2ETH) |  |  |
| :---: | :---: | :---: | :---: |
| Devices | －$\square^{\text {x }}$ | ［1］PLC＿AC500＿V3 $\times$ |  |
| －-9 ACSOO V3 Basic Project <br> －国 PLCLogic <br> $=0$ Application值 Libracy Manager目 PLCPRG（PRG） <br> －Task Configuration $=$ es Task <br> （1）PLCPRG <br> 10 Bus <br> －Interfaces <br> $-\mathrm{COM}_{2} 1\left(\mathrm{COM}_{1}\right)$ <br>  1．CAN（\＆Emptr＞） <br> $=$ 㗊 Ethernet <br> － 0 EाH1（PP Settings） （10）NetConfg（Vet <br> － 0 ETH2（IP Settings） （11）NetConfg＿1 10 （13）Protocols（Clent Pro <br> －㽧 Extension＿bus K．Slot＿1（＜Empty＞） <br> K． $\operatorname{slot} 2$（＜Enotr＞） | 620－2ETH） <br> Serial（Com） <br> 9） <br> nfig） <br> （s） | Communication Settings <br> PLC Settings <br> Version information <br> Statistic <br> Files <br> Log <br> PLC Shell <br> Users and Groups <br> Access Rights <br> Symbol Rights <br> PM5630－2ETH Hardware <br> CPU Parameters |  |
| Parameter <br> Error LED | Type <br> Enumeration of BYTE | Value On | Default Value On |
| －Check battery | Enumeration of BYTE | On | On |
| －Stop on error class | Enumeration of BYTE | Diagnosis of at least error class 2 | Diagnosis of at least error dass 2 |

1．Double－click＂PLC＿AC500＿V3＂．
$\Rightarrow A$ tab opens in the editor view．
2．Select＂CPU Parameters＂．
3．Under parameter＂Check battery＂，choose the value＂Off＂since there is no battery present inside the CPU module．

4．Keep the default values for all other parameters．

## 3．4．3．3 Creation of folders in the device tree

To optimize the project readability，you will create different folders to group similar objects．The folder names are exemplary．Because the device tree view follows an alphabetical order，we use number prefixes to determine the order．

1. Right-click "Application".
2. Select "Add Folder".

3. Type in "10 POUs". This is a name example. Here, the intention is to see this folder as a last one.

The folder "10 POUs" is for program organization units (POU). POUs are objects of type program, function or function block that are used to create a user program.

### 3.4.3.4 Saving the project

de Project.project** - Automation Builder

| File | Edit View | Project | Build | Online | Debug |
| :---: | :---: | :---: | :---: | :---: | :---: |
| , | New Project... |  |  | Ctr |  |
| 2 | Open Project... |  |  | Ctrl +O |  |
|  | Close Project |  |  |  |  |
| - | Save Project |  |  |  |  |
|  | Save Project As... |  |  |  |  |
|  | Project Archive |  |  |  | * |
|  | Source Upload... |  |  |  |  |
|  | Print... |  |  |  |  |
|  | Page Setup... |  |  |  |  |
|  | Recent Projects |  |  |  | * |
|  | Exit |  |  | Alt + F4 |  |

$\triangleright \quad$ Select menu "File $\rightarrow$ Save Project".
Alternatively, select the save icon 回 in the tool bar.
Alternatively, press [Ctrl] + [S].

### 3.4.4 Configuration of the I/O module

### 3.4.4.1 General

- The types and order of modules in the Automation Builder project must match the real hardware configuration.
- The position of the modules in the device tree can be changed by drag and drop.

### 3.4.4.2 Adding an I/O bus module

1. Right-click "IO_Bus" in the device tree.
2. Select "Add object".

| Add object below ：IO＿Bus |  |  |  | $\times$ |
| :---: | :---: | :---: | :---: | :---: |
| Object path： |  |  |  |  |
| PLC＿AC500＿V310＿Bus |  |  |  |  |
| Object name：DA501 |  |  |  |  |
| Categories | Search object name．．． |  |  |  |
| $\$ 500 \mathrm{eCo}$／／O modules <br> S500 I／O modules <br> Scripting <br> Uncategorized | Name Short Description |  | Version | Order $\mathrm{N}^{\wedge}$ |

|  | $<$ |  |  | ＞ |
| $\square$ Close this dialog after each transaction $\square$ Display all versions |  |  |  |  |
| Reset filter |  | Add object |  | Close |

3．Select＂S500 I／O modules＂．
4．Select＂DA501＂module．
5．Select［Add object］to add the module to the I／O bus．

### 3.4.4.3 Variable mapping of the DA501

| (6) DAS01 $\times$ |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Diagnosis <br> DA501 Parameters | Find | Filter Show all |  | - + Add F | r 10 chann | ${ }^{+}$Go | Stance |  |  |
|  | $\begin{aligned} & \text { Variable } \\ & +* p \end{aligned}$ |  | Mapping | Channel <br> Digital inputs DI0 - D17 | Address \%IBO | Type BYTE | Default Value | Unit | Description |
| DA501 I/O Mapping | $\begin{aligned} & +x \\ & +x \end{aligned}$ |  |  | Digital inputs DI8 - DI15 | \%181 | bite |  |  |  |
|  |  |  |  | Analog input Al0+ | \%IW1 | $\mathbb{I N T}^{\text {I }}$ |  |  |  |
| DA501 IEC Objects | + * |  |  | Analog input AI1+ | \%IW2 | $\mathrm{INT}^{\text {N }}$ |  |  |  |
|  | $\pm *$ |  |  | Analog input AI2+ | \%w3 | $\mathbb{I N T}^{\text {d }}$ |  |  |  |
| I/O mapping list | + \% |  |  | Analog input AI3+ | \%1w4 | INT |  |  |  |
| Information | 曾 |  |  | Analog output AOO + | \%Qwo | $\mathbb{I N T}^{\text {N }}$ |  |  |  |
|  |  |  |  | Anslog output AO1+ | \%QW1 | INT |  |  |  |
|  | $\begin{aligned} & +x_{0} \\ & +x_{0} \end{aligned}$ |  |  | Digital inputs DC16-DC23 | \%1810 | bite |  |  |  |
|  |  |  |  | Digital outputs DC16-DC23 | \%Q86 | BMTE |  |  |  |
|  | - Fast counter |  |  |  |  |  |  |  |  |

1. Double-click "DA501" in the device tree.
$\Rightarrow$ A tab opens in the editor view.
2. Select "DA501 I/O Mapping"
$\Rightarrow$ Here, you will map variable names (symbols) for the channels you will need in the program.

The suggested name convention is based on "Hungarian notation". A name prefix is describing variable type: e.g., "x" = variable of type BOOL, "w" = WORD, "i" = INT (integer) etc. This increases the code readability and is helpful for program analysis.

### 3.4.4.4 Handling the digital input variables

1. Open the list of the digital inputs.
2. Fill in the variable names:

| Channel | Type | Variable |
| :--- | :--- | :--- |
| Digital input DI8 | BOOL | xDI_08_DA501_I1 |

### 3.4.4.5 Handling the digital output variables

| (0) DA501 $\times$ |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Diagnosis <br> DA501 Parameters | Find | Filter Show all |  |  | - \# Add FB for 10 channel... + Go to instance |  |  |  |
|  | Variable $\pm *$ | Mapping | Channel <br> Digital inputs DIO - DI7 | Address <br> \%IB0 | Type <br> BYTE | Default Value | Unit | Description |
| DA501 I/O Mapping | $\begin{aligned} & f=x \\ & t \quad x, \end{aligned}$ |  | Digital inputs DI8 - DI15 | \%IB1 | brte |  |  |  |
|  |  |  | Analog input AIO+ | \%W1 | INT |  |  |  |
| DA501 IEC Objects | + $x^{0}$ |  | Analog input Al1+ | \%w2 | INT |  |  |  |
|  | + ${ }^{\circ}$ |  | Analog input A12+ | \%rw3 | INT |  |  |  |
| I/O mapping list | + |  | Analog input A13+ | \%IW4 | INT |  |  |  |
|  | $*$ |  | Analog output AOO+ | \%QW0 | INT |  |  |  |
| Information |  |  |  | \%QW1 | INT |  |  |  |
|  | $\begin{array}{r} k \\ +\quad x_{p} \\ \hline \end{array}$ |  | Digital inputs DC16-DC23 | \%IB10 | BYTE |  |  |  |
|  | $\frac{+x}{0 *}$ |  | Digital outputs DC16 - DC23 | \%QB6 | BYTE |  |  |  |
|  | * xStartDrillinal | - | Digital output DC16 | \%Qx6.0 | BOOL |  |  |  |

1. Open the list of the digital outputs.
2. Fill in the variable names:

| Channel | Type | Variable |
| :--- | :--- | :--- |
| Digital output DC16 | BOOL | xStartDrilling1 |

### 3.4.5 Programming and compilation

### 3.4.5.1 Task configuration

A task is a time unit in the processing of a user program (IEC application), which defines by parameters the way and the speed the CPU is executing the user program.
For this project you will use only one cycling task.

In the device tree, you see the objects "Task configuration" and "Task". Both created automatically with the project.
For this project you will use only one cycling task.

- Double-click "Task" in the device tree.
$\Rightarrow A$ tab opens in the editor view.
For this project you will use only one cyclic task. Keep the default settings for the task.

Priority This is how the CPU prioritizes the task, when more than one task is defined. Priority $0 \ldots 15=$ real time tasks, priority $16=$ non-real time task.
Type In the CPU you can run tasks dependent on the demands of the process
Interval For cyclic tasks you can set the cyclical execution time. It is usually set in milliseconds with IEC time syntax
Watchdog To keep track of the time it takes to complete the task
Calls You can call in one or more program POUs in one single task

### 3.4.5.2 Main program PLC_PRG

In the default task configuration, there is one call of a POU (program organization unit) i.e. "PLC_PRG" $\Downarrow y$ (shown in chapter 3.4.5.1 Task configuration on page 33).
In your project the "PLC_PRG" will become a main program containing calls to other programs (POUs) which you will create one by one.

The PLC_PRG POU has been defined by default in ST (Structured Text) editor. Keep this setting because of good visibility of the instructions at a glance and good handling for troubleshooting.

To optimize the project readability, you will work with the previously created folder "10 POUs" and add the created subroutines (POUs) to this folder. The subroutines will be created in FBD (Function Block Diagram) editor.

### 3.4.5.3 Boolean logic "NOT"

### 3.4.5.3.1 Application example "driller"

Recognizing of a driller by a photo sensor. "TRUE" input signal from sensor indicates that a driller is broken. If driller has been found correct, then start drilling.

Table 2: Required behavior

| Signal from photo sensor | Required signal of motor ON |
| :--- | :--- |
| FALSE | TRUE |
| TRUE | FALSE |

Table 3: Hardware set-up

| Element | HW channel | Symbol | Description |
| :--- | :--- | :--- | :--- |
| Switch I1 | DA501 DI8 | xDI_08_DA501_I1 | Photo sensor |
| LED output DC16 | DA501 DC16 | xStartDrilling1 | Motor on |

### 3.4.5.3.2 Implementation

## Creation of a new program POU in the project

1. Right-click " 10 POUs".
2. Select "Add object".
3. Select "POU".
4. Select [Add object].

5. Enter "_01_Assignment_NOT".
6. Select "Program".
7. Select "Function Block Diagram (FBD)".
8. Select [Add].
$\Rightarrow$ POU has been added.

## Assigning the hardware DI signals to local variables

1. Double-click POU"_01_Assignement_NOT" in the device tree.

2. Select "Assignment" from the ToolBox.
3. Drag and drop "Assignment" into the "Start here" field in network "1".

4. Select "???" on the left side of the assignment, then select "...".
5. Open the "lo Config_Globals_Mapping" mapping list and select "xDI_08_DA501_I1".
6. Select $[O K]$ to add this variable to the left side of the assignment connector.

7. Select "???" on the right side of the assignment connector and mark the "???".
8. Create a new local variable by typing in "xDrillerBroken1" which will replace the "???".
9. Press [Enter].
$\Rightarrow$ "Auto Declare" opens.
You see the written variable name and the data type BOOL. The scope is "VAR". It means it is a local variable within this POU.
10. Select $[O K]$ to accept the entries.

11. Drag and drop "Network" from the ToolBox to the down-arrow of network 1.
$\Rightarrow$ You added a network "2" below network 1.

## Adding assignments and a Boolean NOT to the DO signals

1. Add an assingment from the ToolBox.
2. Type in or copy \& paste "xDrillerBroken1" to the left side of the instruction line.
3. Select "???" on the right side of the instruction line, then select "...".
$\Rightarrow$ "Input Assistant" opens.

4. In the "IoConfig_Globals_ Mapping" variable list, select "xStartDrilling1".
5. Select $[O K]$ to close the dialog.

```
xDrillerBroken1 __xStartDrilling1
```

6. Right-click the center of assignment PIN.
7. Select "Negation" to add a negation to the assignment.

```
xDrillerBroken1 -- xStartDrilling1
```

## Calling the POU in the PLC_PRG

1. Double-click "PLC_PRG".
2. Select the first line in "PLC_PRG" and press [F2].
$\Rightarrow$ "Input Assistant" opens.

3. Select "Module Calls".
4. Open "Application".
5. Open "10 POUs" and select "_01_Assignment_NOT".
6. Select $[O K]$ to close the dialog.

## 3．4．5．3．3 Compilation of the project

Before logging－in to the CPU，you need to compile the complete code without any errors．

$\triangleright$ Select menu＂Build $\rightarrow$ Generate code＂．
$\Rightarrow$ The result of the compiling is shown in the＂Messages＂field at the bottom of the screen．

If you skip the compiling and select＂Login＂，the Automation Builder will automatically trigger compiling in advance to logging－in．

## 3．4．5．3．4 Saving the project

能 Project．project＊－Automation Builder

Alternatively，press［Ctrl］＋［S］．

## 3．4．6 Setting up the communication gateway

Setting up of To set up the communication between the PC and the PLC，e．g．，for downloading the compiled communication parameters program，you have to set up the communication parameters．

The IP address of your PC must be in the same class as the IP address of the CPU． The factory setting of the IP address of the CPU is 192．168．0．10．

The IP address of your PC should be 192.168.0.X. Avoid $X=10$ in order to prevent an IP conflict with the CPU.
Subnet mask should be 255.255.255.0.

## Changing of the

 IP address1. Open Windows control panel. Click "Network and Internet
$\rightarrow$ Network and Sharing Center".
2. Click "Change adapter settings".

3. Right-click "Local Area Connection (Ethernet)" and select [Properties].

4. Double-click "Internet Protocol Version 4 (TCP/IPv4)".

5. Enter your desired IP address and subnet mask.

## Setting up the communication gateway

CPU and PC are connected with an Ethernet cable.

1. In the Automation Builder device tree right-click "PLC_AC500_V3".
2. Select "Communication Settings".

3. Keep the default value in the IP address of the CPU or type in the current IP address, if differs.

The standard (default) IP address of the port ETH1 is: 192.168.0.10
4. Select $[O K]$ to implement the IP address.

Network scan If you need to scan the network for the CPU or if you have multiple CPUs on the same network.

1. Right-click "PLC_AC500_V3" in the device tree.
2. Select "Communication Settings".

3. Select "..."
$\Rightarrow$ "Pick IP Address for PLC_AC500_V3" opens.

| Pick IP Address for 'PLC_AC500_V3'.... | - |  |
| :--- | :--- | :--- | :--- | :--- |
| Abort scan $\square$ Extended Scan     <br> MAC address Device name Port Serial number Device ID IP Address <br>  Config. IP Address Device Type    <br>       <br>       |  |  |
| Scarning |  |  |

The automatic scan runs.
The results will appear in this field.
4. Select the CPU in the field and select $[O K]$ to implement the needed communications gateway.

Checking the communication settings

If you need to check the communications settings or if you want to see more information about the current selected CPU.

1. Double-click "PLC_AC500_V3" in the device tree.
2. Select "Communication Settings".
$\Rightarrow$ The selected IP address is shown.
3. If the IP address is not visible, enter the IP address manually.
4. To test the connection and/or to see the CPU information press [Enter] or click on the black dot next to the PLC figure.

### 3.4.7 Installation and update of the AC500 V3 firmware

The multi download tool can be used to update multiple PLCs with firmware or an application at the same time.
« Chapter 6.6.4 "Multi download tool" on page 4306

Firmware The PLC user management will remain also after a firmware update or downgrade.
Due to a structural change in the PLC user management in firmware version 3.5 there are some limitations when updating the PLC firmware from a version 3.4 or lower to 3.5 or higher with activated user management.

If you update the PLC firmware from version 3.4 or lower to version 3.6 or higher this must be done in two steps. First an update to 3.5 must be done via Automation Builder. Afterwards the firmware can be updated to any later firmware version - either via Automation Builder or via memory card.

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

An Automation Builder project with an AC500 V3 CPU is open.
$\checkmark \quad$ CPU is in "stop" mode or shows uPdAtE (update) on the display.
$\checkmark \quad$ After update the CPU shows either donE or StoP on the display
$\checkmark \quad$ For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU "PLC_AC500_V3".
2. Select "Version information".

## 3. Select "Update Firmware".

$\Rightarrow$ While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.
4. Wait for the PLC to finish the update.

A completed update is indicated by a message on the display. Either donE, or StoP.

## NOTICE!

Do not disconnect the power supply during the update process! The PLC could be damaged.
$\Rightarrow$ StoP indicates a restart has been performed by the CPU. When donE is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

The CPU display shows StoP after re-boot. The update process is finished.
5. If necessary, refresh the version information by switching to another tab and back. $\Rightarrow$ Successful firmware update:

Behavior of LEDs during firmware update

| LED | LED flashes | Status |
| :--- | :--- | :--- |
| RUN and ERR | Toggling | Update pending |
| RUN | Flashing slow | Done successful |
| ERR | Flashing slow | Done failed |

### 3.4.8 Logging in to CPU and downloading the program

Logging-in to the CPU will load the project into the AC500 V3 CPU. The first log-in will also load the hardware set-up.

1. In the Automation Builder menu select "Online $\rightarrow$ Login [PLC_AC500_V3]". $\Rightarrow$ A pop-up will appear.
2. Select [Yes] to download the application to the AC500V3 CPU.

$\Rightarrow$ PLC is in "stop" mode.
3. Start the PLC $\triangleq$ Chapter 3.4.9.1 "Starting the program execution" on page 51.

Generally, if the CPU is in RUN mode, i.e. in program execution mode, a download will always cause the mode change to "stop". In stop mode the CPU is not controlling the system!
Always, after selecting the "Login" command, read carefully the dialog box text to ensure that you are aware of the CPU's behavior after the command confirmation.

By default, a download generates following actions in the CPU:

- The project is stored in the RAM memory.
- The project is stored in the flash EEPROM, if boot application was created.

### 3.4.9 Testing the program

### 3.4.9.1 Starting the program execution

$\checkmark \quad$ You are logged in the CPU.An executable project is loaded to the CPU.The CPU is in "stop" mode.

| Debug Iools Window Help |  |
| :--- | :--- | :--- |
| 1 Start [PLC_AC500_V3] | F5 |

$\triangleright \quad$ Select menu "Debug $\rightarrow$ Start [PLC_AC500_V3]".
Alternatively, select the "start" icon in the tool bar.
Alternatively, press [F5].

### 3.4.9.2 Testing the function

$\triangleright \quad$ Operate the switch 11 and observe:

- The LEDs of the relevant DA501 inputs and outputs.
- The online status of inputs and outputs within the POU.

### 3.4.9.3 Stopping the program execution

You are logged in the CPU.An executable project is loaded to the CPU.$v$
The CPU is in RUN mode.

Help

$\triangleright \quad$ Select menu "Debug $\rightarrow$ Stop [PLC_AC500_V3]"
Alternatively, select the "stop" icon in the tool bar.
Alternatively, press [Shift] + [F8].

### 3.4.10 Setting up a visualization

### 3.4.10.1 General

If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

### 3.4.10.2 Adding the VisualizationManager

1. Right-click "Application" in the device tree.
2. Select "Add object".
3. Select "VisualizationManager".
4. Select [Add object] to add the VisualizationManager to the project.
$\Rightarrow$ Dialog "Add Visualization Manager" opens.

| Add Visualization Manager |
| :--- |
| Name: |
| VisualizationManager |
| Symbol libraries $\quad$ Active |
| VisualizationManager |
| A visualization symbol library is a CODESYS library with <br> graphics and graphical objects. If the visualization symbol <br> library is assigned the library is added into the POUs library <br> manager. The graphics and graphical objects are shown in the <br> toolboxwhen a visualization editor is the active editor. |

5. Select [Add].

$\Rightarrow$ You added the objects "VisualizationManager" and "VISU-TASK" to the device tree.

### 3.4.10.3 Settin up the VisualizationManager

1. Double-click VisualizationManager in the device tree.
$\Rightarrow A$ tab opens in the editor view.

2．Select＂Settings＂．
3．Open the drop－down menu＂Selected style＂．
4．Select＂Default，x．x．x＂（exemplary）．
5．Open the drop－down menu＂Selected language＂．
6．Select＂en＂for English language in the visualization．
7．Enable＂Visible＂for advanced settings．
8．Keep the file transfer to enable the visualization on the PLC（mandatory for web server function）« Chapter 3．4．12＂Enabling a web visualization＂on page 65.

## 3．4．10．4 Saving the project

能 Project．project＊－Automation Builder

| File | Edit View | Project | Build | Online | Debug |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 洤 | New Project．．． |  |  | $\mathrm{Ctrl}+\mathrm{N}$ |  |
| 年 | Open Project．．． |  |  | $\mathrm{Ctrl}+\mathrm{O}$ |  |
|  | Close Project |  |  |  |  |
| ［ | Save Project |  |  | Ctrl + S |  |
|  | Save Project As．．． |  |  |  |  |
|  | Project Archive |  |  |  | ＊ |
|  | Source Upload．．． |  |  |  |  |
|  | Print．．． |  |  |  |  |
|  | Page Setup．．． |  |  |  |  |
|  | Recent Projects |  |  |  | － |
|  | Exit |  |  | Alt＋F4 |  |

$\triangleright \quad$ Select menu＂File $\rightarrow$ Save Project＂．
Alternatively，select the save icon 回 in the tool bar．
Alternatively，press［CtrI］＋［S］．

### 3.4.11 Creation of a visualization

### 3.4.11.1 General

If you are not yet familiar with CODESYS visualization, we recommend you to start with the application example First steps with CODESYS visualization. The example demonstrates the main features of visualization and provides insights into possible use cases.

To use the Edge browser for CODESYS visualization of AC500 PLCs, follow the steps described in the application note Usage in the Edge browser.

### 3.4.11.2 Adding a folder for visualization screens

1. Right-click "Application" in the device tree.
2. Select "Add Folder".

3. Type in "02 VISUs".
4. Select $[O K]$ to add the folder.

### 3.4.11.3 Adding a screen for "_01_Assignment_NOT" POU

1. Right-click "02 VISUs".
2. Select "Add object".
3. Select object "Visualization".
4. Select [OK].

5. Type in "PLC_VISU".
6. Select [Add].
$\Rightarrow A$ tab opens in the editor view.

Fig. 5: PLC_VISU_tab

The name "PLC_VISU" has been chosen, because it is the default name for a home screen in a web visualization.
If you have more than one visualization object in your project, it will be useful to choose another name, e.g. "_01_Assignment_NOT_v". And to choose "PLC_VISU" as a home screen to access all available visualization screens.
The name of a visualization object can be modified afterwards.

### 3.4.11.4 Creation and configuration of a visualization

### 3.4.11.4.1 Changing the background color

1. Double-click "PLC_VISU" in the device tree.
$\Rightarrow A$ tab opens in the editor view.

2. Right-click anywhere on the "PLC_VISU" editor page.
3. Select "Background".

4. Enable the check box "Use Color".
$\Rightarrow$ This enables the drop-down menu.
5. Select a color, e.g., "Lightgray".
6. Select $[O K]$ to add the color to "PLC_VISU".

### 3.4.11.4.2 Adding a screen title

1. Double-click on "PLC_VISU" in the device tree.

2. Select "ToolBox".

3. Select "Common controls".
4. Drag and drop "Label" to the page.

5. Type in "Start drilling condition".

### 3.4.11.4.3 Further lines and labels

1. Double-click on "PLC_VISU" in the device tree.

2. Select "ToolBox".
3. Select "Basic".
4. Drag and drop the line. Then drag the line to the needed length.

5. Follow the same procedure to create the other shapes and labels.

### 3.4.11.4.4 Lamp element for signal indication

1. Double-click on "PLC_VISU" in the device tree.

2. Select "ToolBox".
3. Select "Lamps/Switches/Bitmaps".
4. Drag and drop "Lamp" to the screen.
5. Adapt the size, if required.

6. Under "Image", select "Gray".

| Property <br> Element name | Value <br> GenElemInst_2 |
| :--- | :--- |
| Type of element | Lamp |

7. Double-click on "Variable" and select "..." to select a variable from the list.

8. Under "loConfig_Globals_Mapping", select "xStartDrilling1".
9. Select [OK].

### 3.4.11.4.5 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.

$\triangleright$ Select menu＂Build $\rightarrow$ Generate code＂．
$\Rightarrow$ The result of the compiling is shown in the＂Messages＂field at the bottom of the screen．

If you skip the compiling and select＂Login＂，the Automation Builder will automatically trigger compiling in advance to logging－in．

## 3．4．11．4．6 Saving the project

能 Project．project＊－Automation Builder

| File | Edit View | Project | Build | Online | Debug |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 脜 | New Project．．． |  |  |  |  |
| － | Open Project．．． |  |  | Ctrl＋ 0 |  |
|  | Close Project |  |  |  |  |
| ［ | Save Project |  |  |  |  |
|  | Save Project As．．． |  |  |  |  |
|  | Project Archive |  |  |  | － |
|  | Source Upload．．． |  |  |  |  |
|  | Print．．． |  |  |  |  |
|  | Page Setup．．． |  |  |  |  |
|  | Recent Projects |  |  |  | ＊ |
|  | Exit |  | Alt＋F4 |  |  |

$\triangleright \quad$ Select menu＂File $\rightarrow$ Save Project＂．
Alternatively，select the save icon 回 in the tool bar．
Alternatively，press［Ctrl］＋［S］．

## 3．4．11．5 Loading the project to the CPU

1．Download the project to the CPU $\Longleftrightarrow$ ，as described in Chapter 3．4．8，on page 50.
2．Check the notification window at the end of the download．In case of message＂Boot parameters were changed．These changes will be applied after reboot＂，a reboot of the CPU is required after creation of the boot project．

### 3.4.11.6 Testing the program

$\triangleright \quad$ Operate the switches and observe the visualization screen.

### 3.4.12 Enabling a web visualization

### 3.4.12.1 Adding a web server object to the device tree

Ethernet ports can be configured for web server protocol. This description deals with ETH1 configuration for the web server

1. Right-click "ETH1" in the device tree.
2. Select "Add object".
3. Select "Web Server".
4. Select [Add object].
$\Rightarrow$ You added and activated a web server on Ethernet port 1 on the AC500 V3 CPU.

### 3.4.12.2 Setting up the web server

1. Double-click "WebVisu" in the device tree.

2. Under "Start Visualization", select "...".
$\Rightarrow$ A list opens.
3. Select the "PLC_VISU" screen from the list.
4. Keep all further settings with default values.

5. Select the link "Show used visualizations".

$\Rightarrow$ The VisualizationManager editor and there the tab "Visualizations" opens. All screens and dialog elements created in the project are visible.
Here, you can select which screens are enabled or disabled for web visualization.

If you want to select another screen as a start visualization, you must modify the adequate parameter in the webvisu.htm file: <param name="STARTVISU" value="PLC_VISU">

### 3.4.12.3 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.

$\triangleright$ Select menu＂Build $\rightarrow$ Generate code＂．
$\Rightarrow$ The result of the compiling is shown in the＂Messages＂field at the bottom of the screen．

If you skip the compiling and select＂Login＂，the Automation Builder will automatically trigger compiling in advance to logging－in．

## 3．4．12．4 Saving the project

能 Project．project＊－Automation Builder

| File | Edit View | Project | Build | Online | Debug |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 脜 | New Project．．． |  |  |  |  |
| － | Open Project．．． |  |  | Ctrl＋ 0 |  |
|  | Close Project |  |  |  |  |
| ［ | Save Project |  |  |  |  |
|  | Save Project As．．． |  |  |  |  |
|  | Project Archive |  |  |  | － |
|  | Source Upload．．． |  |  |  |  |
|  | Print．．． |  |  |  |  |
|  | Page Setup．．． |  |  |  |  |
|  | Recent Projects |  |  |  | ＊ |
|  | Exit |  | Alt＋F4 |  |  |

－Select menu＂File $\rightarrow$ Save Project＂．
Alternatively，select the save icon 回 in the tool bar．
Alternatively，press［Ctrl］＋［S］．

## 3．4．12．5 Loading the project to the CPU

1．Download the project to the CPU $\leftrightarrows$ as described in Chapter 3.4 .8 ，on page 50.
2．Check the notification window at the end of the download．In case of message＂Boot parameters were changed．These changes will be applied after reboot＂，a reboot of the CPU is required after creation of the boot project．

## Automation Builder

Notification from target:
Notification from target:
"Boot parameters were changed. These changes will be applied after reboot. CAUTION: Please create boot project before !!!"

### 3.4.12.6 Creation of a boot project

By default, after project download, the boot project is created automatically.

### 3.4.12.7 Reboot of the CPU

$\triangleright \quad$ Reboot the CPU by switching OFF and ON the power supply. (The parameter for web server activation is a boot pamater which is loaded during boot of the CPU)

### 3.4.12.8 Testing the web visualization

$\checkmark$ You have downloaded the project and created the boot project.
$\checkmark$ The CPU has been rebooted.You are logged in.CPU is in "stop" mode.

1. Start the project execution, e.g., from the tool bar.
2. Launch an internet browser.
3. Type in the URL field: http://192.168.0.10/webvisu.htm. 192.168.0.10 is the IP address of CPU's ETH1 port.
/webvisu.htm is the default htm file.
$\Rightarrow$ Web visualization will be loaded.

The start screen "PLC_VISU" is displayed in a responsive view.

4. Test the function by operating switch I1.
5. Test the results for responsive view by changing the web browser window size.

### 3.4.13 Reset the CPU

Reset values and parameters

In some cases, it could be required to do a CPU reset, e.g., for resetting of counter values, parameters etc.

| Online | e Debug Iools Window | Help |
| :---: | :---: | :---: |
| 08 | Login [PLC_AC500_V3] | Alt+F8 |
| ¢ | Logout [PLC_AC500_V3] | Ctri+F8 |
|  | Create boot application [PLC_AC500_V3] |  |
| $\otimes$ | Logoff current device user |  |
|  | Download |  |
|  | Online Change |  |
|  | Source download to connected device |  |
| ***ㅜํ) | Download Manager... |  |
|  | Reset warm [PLC_AC500_V3] |  |
|  | Reset cold [PLC_AC500_V3] |  |
|  | Reset origin [PLC_AC500_V3] |  |

Fig. 6: Reset commands in "Online" menu
Reset All variables are reset, except RETAIN PERSISTENT variables.
warm
Reset cold Causes initialization of all variables, except PERSISTENT variables. By recommended creation of remanent variables always with both properties: PERSISITENT and RETAIN, this command resets all variables, except PERSISTENT RETAIN variables.
Reset All variables and the application project are reset.
origin

Table 4: Behavior of variables of type VAR (local or global) and variables of type PERSISTENT RETAIN

|  | VAR | VAR PERSISTENT RETAIN |
| :--- | :--- | :--- |
| After online command 'Online change' | no change | no change |
| After online command 'Download' | initialization | no change |
| After online command 'Reset warm' | initialization | no change |
| After online command 'Reset cold' | initialization | no change |
| After online command 'Reset origin' | initialization | initialization |
| After power supply off | initialization | no change |

[^1]

1. Right-click the station object "PLC_AC500_V3" in the device tree.
2. Select "Reset origin device [station name]".
$\Rightarrow$ The application is completely erased from the CPU (complete project from all memory areas).

### 3.5 Example project for remote I/O expansion with PROFINET

### 3.5.1 Purpose

This example introduces the configuration of the PLC with remote I/O. The use of I/O channels in a program and commissioning of the configuration is shown.

### 3.5.2 Preconditions

- Automation Builder is installed and licensed as, at least, standard edition $\Leftrightarrow$ Chapter 6.2.4 "Managing your licenses" on page 1350.
- AC500 V3 CPU is assembled and connected to the PC $\Leftrightarrow$ Chapter 3.3 "Hardware AC500 V3" on page 21.
- Configuration and programming of this example project will be made in the existing example project for central I/O expansion $\stackrel{y}{ }$ Chapter 3.4 "Example project for central I/O expansion" on page 24.
- CM579-PNIO communication module is inserted in terminal base and connected to the PLC (7) Chapter 3.3 "Hardware AC500 V3" on page 21.
- CI502-PNIO communication interface module is inserted in terminal unit and connected to the PLC ${ }^{\circledR}$ Chapter 3.3 "Hardware AC500 V3" on page 21.

## 3．5．3 Set－up PROFINET controller

## 3．5．3．1 Add the CM579－PNIO to the device tree

1．In the Automation Builder device tree under＂Extension＿Bus＂，right－click＂Slot＿1＂．
2．Select＂Add object＂．
3．Select＂CM579－PNIO＂．
4．Select［Replace object］to add the CM579－PNIO．

3．5．3．2 Set－up the general behavior

```
Devices
- 目 AC500 V3 Basic Project
    - -T. PLC_AC500_V3 (PM5630-2ETH - TB5620-2ETH)
        filf PLC Logic
    + [酉 IO_Bus
```

```
    邱拃 Extension_Bus
        - [5] CM579_PNIO (CM579-PNIO)
        &40] PNIO_Controller (PROFINET-IO-Controller)
    L Slot_2 (<Empty>)
```

1．Under＂Extension＿Bus＂，double－click＂CM579＿PNIO＂in the device tree．
$\Rightarrow A$ tab opens in the editor view．

## 2．Select＂CM579－PNIO Parameters＂．

Run on configuration This parameter will prohibit the PLC from running if the CM579－PNIO fault has a configuration error．
Bus behavior This parameter sets how the data from the bus flows in／out of the CM579－PNIO．

3．Select＂Status＂．
$\Rightarrow$ This opens the bus controller status and gives a basic status overview．
4．Select＂Information＂．
$\Rightarrow$ This page contains general information about the CM579－PNIO．
5．For the example project，you can keep the default settings．

## 3．5．3．3 Set－up the PROFINET IO controller

$\checkmark \quad$ To edit settings for the controller，you must not be logged－in to the PLC．

```
Devices
- FT AC500 v3 Basic Project
    - FI PLC_AC500_V3 (PM5630-2ETH - TB5620-2ETH)
        + 自! PLC Logic
        + 目 IO_Bus
        + 垍昷 Interfaces
        40] Extension_Bus
        - 朁 CM579_PNIO (CM579-PNIO)
```

```
            {. Slot_2 (<Empty>)
```

1．Under＂CM579＿PNIO＂，double－click＂PNIO＿Controller＂in the device tree．
$\Rightarrow A$ tab opens in the editor view．
2．Select＂PROFINET IO CONTROLLER＂

3. Select "General".
4. Here, you can set-up the way, IP addresses are distributed out to the industrial bus network. You can even set, what IP-address and DNS name (station name) the PROFINET controller has.
For the example project, keep the default settings.

### 3.5.4 Set-up PROFINET device

### 3.5.4.1 Hardware preparation

1. Switch off the power supply of your PLC.

2. Use a screw driver to set the Cl 502 module address to "02" by positioning of the upper rotary switch to "0" and lower switch to "2". Note, that the numbers have hexadecimal format.
3. Switch on the power supply.

### 3.5.4.2 Add the CI502-PNIO to the device tree

1. Right-click "PNIO_Controller" in the device tree.
2. Select "Add object".
3. Select "CI502-PNIO-Device".

4．Select［Add object］to add the device．

## 3．5．4．3 Configure the CI502－PNIO device

## 3．5．4．3．1 Configure the CI502－PNIO PROFINET IO device

## Devices

－－ 5 AC500 v3 Basic Project
－- II PLC＿AC500＿V3（PM5630－2ETH－TB5620－2ETH）

+ 目折 PLC Logic
＋ －i0＿Bus
$\pm$ Interfaces
－蚼 Extension＿Bus
－ 4 C0 0 CM579＿PNIO（CM579－PNIO）
- 铇 PNIO＿Controller（PROFINET－IO－Controller）
- 中D CI502＿PNIO＿Device（CI502－PNIO－Device）

CI502＿IO（CI502－IO）
K．Slot＿2（＜Empty＞）
1．Double－click＂Cl502＿PNIO＿Device＂．
$\Rightarrow A$ tab opens in the editor view．

## 2. Select "General".

## User-Defined Parameters

In Set all default values

| Parameters | Value | Datatype | Allowed values | Description |  |
| :--- | :--- | :--- | :--- | :--- | :--- |

Station name Default station name
IP Parameter IP-addressing parameters of the node. If modifications are required for "IP Parameter", they must be done also for CM579-PNIO and all other devices in this PROFINET line.
Communication Communication time set-up
VLAN Virtual local area network ID
RT Class PROFINET IO RT (real time) type settings

3. Set station name to e.g. "ci502-pn-0b" according to hardware settings.

The last two values of the node's "Station Name" in Automation Builder correspond to the position of module's rotary switches (hexadecimal values): e.g., "ci502-pn-0a" or "ci502-pn-10".
$\Rightarrow$
Use small letters for the station name and not large ones.
4. Leave the default settings for "IP Parameter".
5. Adjust the communication time settings to get a Watchdog (ms) 24:

- "Send clock (ms)": 4
- "Reduction ratio": 2
- "Phase": 1

6. Leave the default settings for "VLAN ID".
7. Leave the default settings for "RT Class".

If the node has the same device address (the last two digits of the device name) as set by means of the rotary switches on the module, all the node parameters will be loaded automatically upon initialization scan of the Cl50x module. This allows, e.g., the module exchange without an engineering tool.

### 3.5.4.3.2 Create CI502-PNIO I/O mapping to symbols

1. Double-click "CI502_IO".

| (11) CI502_IO $\times$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| General <br> PNIO Module I/O Mapping | Find |  | Filter Show all |  | $\checkmark$ |
|  | Variable $\pm *$ | Mapping | Channel <br> 8 -bit digital input | Address <br> \%IB24 | Type USINT |
| I/O mapping list | - |  | 8 -bit digital input | \%IB25 | USINT |
|  | * XDI_08_CI502_I5 | * | Channel 8 | \%IX25.0 | BOOL |
| Information | ${ }^{*}$ |  | Channel 9 | \%IX25.1 | BOOL |
|  | 4 |  | Channel 10 | \%IX25.2 | BOOL |
|  | * |  | Channel 11 | \%IX25.3 | BOOL |
|  | 4 |  | Channel 12 | \%IX25.4 | BOOL |
|  | ${ }^{4}$ |  | Channel 13 | \%IX25.5 | BOOL |
|  | * |  | Channel 14 | \%IX25.6 | BOOL |
|  | ${ }^{4}$ |  | Channel 15 | \%IX25.7 | BOOL |
|  | * |  | Fast Counter: Actual value 1 | \%ID7 | UDINT |
|  | * |  | Fast Counter: Actual value 2 | \%ID8 | UDINT |
|  | ${ }^{*}$ |  | Fast Counter: State byte 1 | \%IB36 | USINT |
|  | 企 |  | Fast Counter: State byte 2 | \%IB37 | USINT |
|  | $\pm{ }^{ \pm}$ |  | 8-bit digital output | \%QB28 | USINT |
|  | - ${ }^{*}$ |  | 8 -bit digital output | \%QB29 | USINT |
|  | * xDO_08_CI502 | * | Channel 8 | \%QX29.0 | BOOL |
|  |  |  | Channel 9 | \%QX29.1 | BOOL |
|  | * |  | Channel 10 | \%QX29.2 | BOOL |

2. Select "PNIO Module I/O Mapping".
3. Fill in the variable names:

| Element | Hardware channel | Symbol |
| :--- | :--- | :--- |
| Switch I5 | Cl502 DI8 | xDI_08_CI502_I5 |
| LED output DO8 | Cl502 DO 8 | xDO_08_CI502 |

### 3.5.5 Add remote I/O expansion to project

### 3.5.5.1 Add a program POU to the project

1. Right-click "01-POUs" in the device tree.
2. Select "Add object".
3. Select "POU".
4. Select [Add object].

5. Fill in "_30_PNIO_test".
6. Select "Program".
7. Select "Function Block Diagram".
8. Select [Add] to add the POU.

### 3.5.5.2 Create a POU logic

1. Double-click "30_PNIO_test" in the device tree.

2. In the ToolBox, select "Assignment".
3. Drag and drop "Assignment" into the "Start here" field in network "1".

4. Select "???" on the left side of the assignment, then select "...".
5. In "loConfig_Globals_Mapping" list, select "xDI_08_C/502_I5".
6. Select $[O K]$ to add this variable to the left side of the assignment connector.

7. Select "???" on the right side of the assignment, then select "..."
8. In "loConfig_Globals_Mapping" list, select "xDO_08_CI502".
9. Select [OK].

### 3.5.5.3 Call the POU in PLC_PRG

1. Double-click "PLC_PRG".
2. Select the next free line in "PLC_PRG" and press [F2].
$\Rightarrow$ "Input Assistent" opens.
3. Select "Module Calls".
4. Open "Application".
5. Open "10 POUs" and select "_30_PNIO test".
6. Select $[O K]$ to close the dialog.

### 3.5.5.4 Compilation of the project

Before logging-in to the CPU, you need to compile the complete code without any errors.

$\triangleright$ Select menu＂Build $\rightarrow$ Generate code＂．
$\Rightarrow$ The result of the compiling is shown in the＂Messages＂field at the bottom of the screen．

If you skip the compiling and select＂Login＂，the Automation Builder will automatically trigger compiling in advance to logging－in．

## 3．5．5．5 Saving the project

能 Project．project＊－Automation Builder

| File | Edit View | Project | Build | Online | Debug |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 推 | New Project．．． |  |  | Ctrl |  |
| E） | Open Project．．． |  |  | $\mathrm{Ctrl}+\mathrm{O}$ |  |

|  | Exit |  |  | Alt＋F4 |  |

$\triangleright \quad$ Select menu＂File $\rightarrow$ Save Project＂．
Alternatively，select the save icon 回 in the tool bar．
Alternatively，press［Ctrl］＋［S］．

## 3．5．5．6 Loading the project to the CPU

1．Download the project to the CPU $\leftrightarrows$ as described in Chapter 3.4 .8 ，on page 50.
2．Check the notification window at the end of the download．In case of message＂Boot parameters were changed．These changes will be applied after reboot＂，a reboot of the CPU is required after creation of the boot project．

### 3.5.6 Test the program

### 3.5.6.1 Starting the program execution

$\square \quad$ You are logged in the CPU.An executable project is loaded to the CPU.The CPU is in "stop" mode.
Debug Iools Window Help

| Start [PLC_AC500_V3] | F5 |
| :--- | :--- | :--- |

$\triangleright \quad$ Select menu "Debug $\rightarrow$ Start [PLC_AC500_V3]".
Alternatively, select the "start" icon in the tool bar.
Alternatively, press [F5].

### 3.5.6.2 Test the function

$\triangleright \quad$ Operate the switch I5 and observe:

- The LEDs of the relevant CI 502 inputs and outputs.
- The online status of inputs and outputs within the POU.

### 3.5.7 Reset the CPU

Reset values and parameters

In some cases, it could be required to do a CPU reset, e.g., for resetting of counter values, parameters etc.

| Online | Debug Iools Window | Help |
| :---: | :---: | :---: |
| ¢ | Login [PLLC_AC500_V3] | Alt+F8 |
|  | Logout [PLC_AC500_V3] | Ctrl+F8 |
|  | Create boot application [PLC_A | C500_V3] |
| $\otimes$ | Logoff current device user |  |
|  | Download |  |
|  | Online Change |  |
|  | Source download to connected device |  |
| 눙) | Download Manager... |  |

| After online command 'Reset cold' | initialization | no change |
| After online command 'Reset origin' | initialization | initialization |
| After power supply off | initialization | no change |

[^2]

1. Right-click the station object "PLC_AC500_V3" in the device tree.
2. Select "Reset origin device [station name]".
$\Rightarrow$ The application is completely erased from the CPU (complete project from all memory areas).

## 4 System overview, planning and operation

### 4.1 System overview

### 4.1.1 AC500 PLC product family

AC500 program- The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide mable logic con- solutions for small, medium and high-end applications. Our AC500 platform offers different trollers (PLCs) performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

## Features of AC500 PLCs

- Scalable and consistently expandable system
- Different performance classes of processor modules (CPUs) available
- Several fieldbusses available
- Parallel connection to several fieldbusses which can be combined arbitrarily

The AC500 product family consists of the product groups:

- AC500 (Standard):

AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- AC500-eCo:

AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free buffering of remanent data. All I/O modules can be freely connected in a simple, stable and reliable manner.

- AC500-S:

AC500-S PLCs are designed for safety applications in factory, process or machine automation.

- AC500-XC:

AC500 (Standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid conditions. The devices also provids a high level of resistance to vibration and corrosive gases. The AC500-XC series is consistent with standard devices concerning the overall dimensions, the control function and the software compatibility $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (Standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be flexibly combined with devices of the AC500 product family.

### 4.1.2 AC500/S500 system structure

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the processor module with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

## Centralized I/O extension

01 Terminal base for processor module and 0 to 6 communication modules, with serial and Ethernet interfaces
02 Communication module for, e.g., PROFIBUS, EtherCAT, and for support of safety solution
03 Processor module with integrated communication
04 I/O module, up to 10 I/O modules can be connected
05 Terminal unit for I/O modules, also for decentralized extension

## Decentralized

I/O extension

1 Terminal unit for communication interface modules
2 Communication interface module with up to 24 integrated I/Os
3 I/O bus
4 Terminal unit for I/O modules, with screw or spring connection
5 Terminal unit for hot swap of I/O modules to exchange of I/O modules while the system is running
6 S500 I/O modules with up to 32 channels for analog and/or digital signals
7 Compact S500-eCo I/O modules with up to 16 channels for analog and/or digital signals
8 Removable terminal blocks

### 4.1.3 AC500-eCo/S500-eCo system structure

AC500-eCo/S500-eCo series is compatible with AC500/S500.
The compact AC500-eCo processor module can be used for small applications with the integrated I/O channels.
The functionality of the processor modules can be extended with option boards, e.g., for additional I/O channels.

For larger applications, I/O modules can be connected centralized or decentralized.

1 AC500-eCo processor module with option boards, different memory sizes, inputs and outputs available
2 S500-eCo I/O module, up to 10 I/O modules can be connected, also for decentralized extension
3 Terminal blocks in different variants available

Centralized I/O extension

Processor modules with an I/O bus interface on the right side can be expanded by up to 10 I/O modules to increase the number of the I/O channels.

---------.

Fig. 8: I/O modules (S500-eCo) directly connected to an AC500-eCo processor module

Up to 10 I/O modules can be connected remotely with the onboard Ethernet interface. Usually, a Modbus/TCP communication interface module or a processor module is used for the decentralized I/O extension.

Fig. 9: I/O modules (S500-eCo) connected to an AC500-eCo processor module via Modbus/TCP network, using a Modbus/TCP communication interface module or a processor module as client.

### 4.1.4 AC500/S500: Short description hardware

## Processor

 modules

AC500 processor modules contain the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via the system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the application program to command the PLC for operation.

It has the following functions:

- To receive user programs and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax errors in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user programs in the memory one by one and execute them after interpretation
- To updating the state of the associated flag bits and the contents of the shadow register according to the execution results and providing output control using the output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.
There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.
If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).

## Communication modules

AC500 communication modules are required for

- a connection to standard fieldbus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different fieldbuses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.

## Terminal bases

The terminal base is needed for mounting and connecting the processor module and the communication modules. The modules are plugged on the terminal base.

On AC500-eCo processor modules and special AC500 (Standard) processor modules the terminal base cannot be removed.

## I/O modules

The I/O modules are the input/output unit which connects the PLC with the process. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to execute the control.
External input equipment and output equipment needs various signal levels whereas the information processed by the processor module in the PLC can only be the standard level. In order to perform this conversion, the I/O interface generally uses optical isolation and filtering to improve the interference immunity of the PLC. In addition, the I/O interface can generally indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interfaces for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC interpret the number of input/output signals as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system has insufficient I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.
The modules can be simply plugged onto a terminal unit for a centralized or decentralized I/O extension via communication interface modules.

## Terminal units

I/O modules and function modules are plugged on a terminal unit.
Terminal units enable simple prewiring without electronics and are available for 24 V DC and 120/230 V AC, optionally for spring or screw-type terminals.

## Communication interface modules

## Function modules

Function modules extend the PLC system to perform special task control. These modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus

Function modules are connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC

Memory In the PLC, the memory is mainly used for saving system programs, user programs and work data. There are two types of memory:

- Volatile memory

All saved data will be lost after power failure of the memory but the memory can provide a high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- Nonvolatile memory:

All saved data will not be lost after power failure of the memory, but the memory is subject to a low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to protect them from power failure. The programs are exported to the volatile memory during operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access during the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of the PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains its existing state by using built-in supercapacitors or backup batteries in the event of a power failure. The memory area for data saving in the event of a power failure is called the data retention area.

Power supply The PLC is equipped with a switching power supply for the internal supply. In comparison with an ordinary power supply, the switching power supply has a higher stability and a higher noise immunity.

Some modules include a stabilized power supply for the supply of external sensors.

### 4.1.5 AC500-eCo/S500-eCo: Short description hardware

## Processor

 modules

AC500-eCo processor modules contains the CPU with the core microprocessor of the PLC. It is integrated with power supply, onboard I/Os and communication interface.
Functions:

- To download user programs
- To run the CPU
- To execute user programs in loops
- To monitor program input and output devices.

Processor modules are available in different performance classes and provide different numbers of onboard I/Os.

Only one processor module is required for a valid system architecture.

## Option boards

AC500-eCo processor modules can be extended with option boards. Option boards provide specific functionality. According to the processor module type, up to three option board slots are available for extension. Each option board slot supports most existing types of option board module. The option board modules provide the following functionality for processor module extension:

- Serial interface RS232 (isolated) or RS485 (isolated or not isolated)
- Digital I/O channels extension (digital inputs, digital outputs, or mixed type)
- Analog I/O channels extension (analog inputs, analog outputs) for standard signal voltage or current, but also temperature measurement with RTD/NTC or thermocouple sensors
- RTC real-time clock board for processor module PM5012 (other processor modules include RTC functionality)
- Configuration address switch board for KNX protocol, only for processor modules PM5072 and PM5082

If the number of onboard I/Os provided on the processor module is insufficient for a certain use case, the PLC can be expanded with I/O modules to meet the control requirements.

Memory In the PLC, the memory is mainly used for saving system programs, user programs and work data. There are two types of memory:

- Volatile memory:

All saved data will be lost after power failure of the memory but the memory can provide a high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- Nonvolatile memory:

All saved data will not be lost after power failure of the memory, but the memory is subject to a low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to protect them from power failure. The programs are exported to the volatile memory during PLC operation to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access during PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of the PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains its existing state by using built-in supercapacitors or backup batteries in the event of a power failure. The memory area for data saving in the event of a power failure is called the data retention area.

Power supply The PLC is equipped with a switching power supply for the internal supply. In comparison with an ordinary power supply, the switching power supply has a higher stability and a higher noise immunity.

Some modules include a stabilized power supply for the supply of external sensors.

### 4.1.6 AC500-S

Functional safety

The AC500-S safety user manual must be read and understood before using the safety configuration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S/SM560-S-FD-1/SM560-S-FD-4
- DI581-S
- DX581-S
- Al581-S
- TU582-S

### 4.1.7 CP600 control panels

CP600 control The CP600-eCo, CP600 and CP600-Pro control panels offer a wide range of features and panels platform functionalities for tailor-made visualization. Our CP600 platform offers different performance levels including control panels for economic applications, robust standard operator panels, high end multi-touch human machine interfaces (HMIs).

The easy to use engineering tool PB610 Panel Builder 600, part of Automation Builder, ensures easy scalability on the CP600 platform.

- CP600-eCo: The economical CP600-eCo control panel, with screen sizes from 4.3" to $10.1^{\prime \prime}$ widescreen, is aimed for standard functions and high usability for clear interaction with the operation process.
- CP600: The robust CP600 HMI, with screen sizes from 7" to 15 " provides up-to-date visualization performance, versatile communication and representative design for machines and systems.
- CP600-Pro: The CP600-Pro HMI, with screen sizes from 5" to 21.5 " widescreen, comes with high end visualization performance, multi-touch operation and versatile communication options
\& Further information on page 6

### 4.1.8 Automation Builder: Short description engineering software

Details about the Automation Builder license model, the features of the editions and the latest license information

## Configuration and programming

Configuration and programming of all AC500 control systems (processor modules) is done by using Automation Builder software.
Features:

- Standardized programming according to IEC 61131-3, five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), Continuous Function Chart (CFC), debugging functions for program test
- Online diagnosis
- Debugging functions for the program test: Single step, single cycle, breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, PROFIBUS, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting

Offline simula- IEC 61131-3 commands can be simulated without a PLC being connected, including the reletion vant malfunctions. After the program test, the application can be downloaded to the control system.

Sampling trace Timing diagrams for process variables and storage of data in a circular buffer with event trigger.

Recipe manage- Values of selected variables are displayed. Pre-defined values can be assigned to variables ment and watch which can then be downloaded to the control system all at once ("Write recipe"). Actual values lists from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe"). These functions are also helpful, for example, for setting and entering control parameters.

Visualization Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

Programming The Ethernet interface of the processor modules is used to connect to the engineering software for programming, debugging and diagnosis.

[^3]
### 4.2 Application planning

### 4.2.1 Safety instructions

## NOTICE!

Wiring diagrams and user programs must be designed to prevent hazardous situations from occurring during normal operation or in the event of a malfunction.

### 4.2.2 Processor module and I/O selection

How to select modules for your automation task: In our main catalog we offer a CPU selector and several comparative tables to find the modules for your application.

### 4.2.3 I/O bus - Communication within the PLC

The synchronized I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

With its fast data transmission, the I/O bus obtains very low reaction times.
Up to 10 I/O terminal units (for one I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules ${ }^{\circ} \stackrel{\text { Table }}{ } 119$ "Maximum number of I/O devices which can be connected to the I/O bus" on page 389.

1 I/O bus connection
The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals

## NOTICE!

Except when using hot swap terminal units, the I/O bus is not designed for pulling and plugging modules during operation. If a module is pulled or plugged on a terminal unit that is not hot swap capable while the bus is running, the following consequences are possible

- reset of the station or of the processor module
- system lockup
- damage of the module

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

## « Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

Profibus (master and slave) and CM589-PNIO are available since version 2.5.0 of the Automation Builder.

### 4.2.4 Fieldbus connectivity options

The PLC and control panel portfolio offers a wide range of scalable products, communication protocols and connectivity options, from the field level to the management and visualization levels.

An overview of the different connectivity options can be found below.

### 4.2.5 Power supply dimensioning

### 4.2.5.1 General

The power consumption of a complete station consists of the sum of all individual consumptions.

The two supply voltages with 24 V DC are distinguished in the AC500 platform:

- Supply of the internal logic via terminals L+ and M on the CPU module, or an the AC500 terminal base for: CPU, communication mudule(s) and I/O bus.
- Supply of the process-side input/output circuits for analog signals and 24 V DC digital signals via the ZP and UP terminals of the S500 terminal units.
The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.

### 4.2.5.2 Calculation of the total current consumption

Example In the example, the AC500 control system consists of the following devices:

- AC500 CPU with Ethernet interface
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units

Because of the high total current consumption of the digital I/O modules (from $U P=24 V D C$ ), the supply is divided up into several electric circuits fused separately.
The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A .

The total current can be calculated as follows:
$I_{\text {Total }}=I_{\text {L+ }}+I_{\text {UP }}$
with the assumptions
$I_{L+}=I_{C P U}+I_{I / O \text { bus }}+I_{C 1}+I_{C 2}+I_{C 3}+I_{C 4}$ (CPU + communication modules $+I / O$ bus $)$
$I_{I / O \text { bus }}=$ Number of expansion modules $\times$ Current consumption through the I/O bus per module
and
 $+I_{\text {LOAD7 }}$

If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

|  | $\mathrm{I}_{\text {CPU }}{ }^{*}$ ) | $\mathrm{I}_{\mathrm{Cx}}{ }^{*}$ ) | $\mathrm{I}_{\text {/O bus }}{ }^{*}$ ) | $\mathrm{I}_{\text {UPx }}{ }^{*}$ ) | $\mathrm{l}_{\text {LOADx }}{ }^{*}$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CPU/communication module part |  |  |  |  |  |
| CPU | 0.110 A | - | - | - | - |
| C1 | - | 0.050 A | - | - | - |
| C2 | - | 0.085 A | - | - | - |
| C3 | - | 0.050 A | - | - | - |
| C4 | - | 0.050 A | - | - | - |
| I/O module part |  |  |  |  |  |
| Analog1 | - | - | 0.002 A | 0.150 A | - |
| Analog2 | - | - | 0.002 A | 0.150 A | 0.160 A |
| Analog3 | - | - | 0.002 A | 0.100 A | 0.080 A |
| Analog4 | - | - | 0.002 A | 0.100 A | 0.080 A |
| Digital1 | - | - | 0.002 A | 0.050 A | 8.000 A |
| Digital2 | - | - | 0.002 A | 0.050 A | 8.000 A |
| Digital3 | - | - | 0.002 A | 0.050 A | 8.000 A |
| $\Sigma$ columns | 0.110 A | 0.235 A | 0.014 A | 0.650 A | 24.320 A |
|  | $\Sigma \mathrm{I}_{\mathrm{L}+} \approx 0.4 \mathrm{~A}$ |  |  | $\Sigma \mathrm{I}_{\mathrm{UP}} \approx 25 \mathrm{~A}$ |  |
|  | $\mathrm{l}_{\text {Total }} \approx 25.4 \mathrm{~A}$ |  |  |  |  |
| *) All values in this column are exemplary values |  |  |  |  |  |

### 4.2.5.3 Dimensioning of the fuses

To be able to select the fuses for the station correctly, both the current consumption and the inrush currents (melting integral for the series-connected fuse) must be taken into consideration.

| Fuse | for | $\sum$ of the <br> melting <br> integrals in <br> $\mathbf{A}^{2} \mathbf{s}$ | $I_{\text {L+ }}$ | $\mathbf{I}_{\text {UPx }}$ | Recommended fuse |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| F1 | CPU logic | 1.000 | $\approx 0.4$ | - | Type | Value |
| F2 | Module Dig- <br> ital1 | 0.005 | - | 8.050 | Quick | 10 A |
| F3 | Module Dig- <br> ital2 | 0.008 | - | 8.050 | Quick | 10 A |
| F4 | Module Dig- <br> ital3 | 0.007 | - | 8.050 | Quick | 10 A |
| F5 | Modules <br> Analog1 + <br> Analog2 + <br> Analog3 + <br> Analog4 | 0.130 | - | 0.820 | Quick | 10 A |

### 4.2.6 Libraries, software packages and licensed features

Many applications are included in the Automation Builder. However, there are some that need to be purchased additionally. The applications are briefly introduced here. If applicable, links lead to further information depending on the version.

## HA-Modbus TCP library

Library package adds High Availability System functionality for redundant hot standby over Ethernet field network via HA-Modbus TCP.
«2 Chapter 6.5.9.1 "HA-Modbus TCP - System technology" on page 3859

## 61850 protocol

Adds engineering tool and library for 61850 Ed. 1 MMS server and GOOSE publish and subscribe functionalities.
*) Chapter 6.3.4.2 "IEC 61850 Server" on page 1671

## KNX protocol

Engineering and protocol package that seamlessly integrates ETS and Automation Builder.

* Chapter 6.3.4.8 "KNX configurator" on page 1730

## BACnet-BC protocol

BACnet is a standardized data communication protocol for building automation and control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

② Chapter 6.3.4.9 "BACnet-BC" on page 1733

## Data logger library

The data logging function block library ("DataLogger" and "DataLoggerEco") contains 5 function blocks for the purpose of advanced time-stamped data logging for different use cases.
y Chapter 6.5.8 "Data Logger Library" on page 3849

## Motion control library

Library package for decentralized, centralized and coordinated motion according to the PLCopen standard.
« Chapter 6.5.10.3 "Motion control library" on page 3958

## EtherNet/IP

EtherNet/IP is used to connect any number of different terminals in a network, using a scanneradapter relationship.
*) Chapter 6.4.2.5.1 "Introduction" on page 2816

Table 6: AC500 runtime licenses

| For | Description | Type | Order code |
| :--- | :--- | :--- | :--- |
| all AC500 CPUs | HA-Modbus TCP run- <br> time license | PS5601-HA-MTCP | 1SAP195400R0101 |
| all AC500 V3 CPUs <br> and AC500-eCo V3 <br> PM5072 and PM5082 | IEC 61850 protocol <br> runtime license | PS5602-61850 | 1SAP195600R0101 |
| all AC500 V3 CPUs <br> and AC500-eCo V3 <br> PM5072 and PM5082 | KNX IP protocol run- <br> time license | PS5604-KNX | 1SAP195800R0101 |
| all AC500 V3 CPUs <br> and AC500-eCo V3 <br> PM5072 and PM5082 | BACnet protocol B-BC <br> runtime license | PS5607-BACnet-BC | 1SAP195550R0101 |

| For | Description | Type | Order code |
| :---: | :---: | :---: | :---: |
| all AC500 V3 CPUs | Data logger runtime license for AC500 V3 | PS5609-Log | 1SAP195002R0101 |
| $\begin{array}{\|l\|} \hline \text { AC500-eCo V3 } \\ \text { PM5072 and PM } 5082 \end{array}$ | Data logger runtime license for PM5072 and PM5082 | PS5609-Log-e | 1SAP195004R0101 |
| all AC500 V3 CPUs and AC500-eCo V3 PM5032 and higher | Motion control library runtime license | PS5611-MC | 1SAP192150R0101 |
| AC500 V3/AC500- <br> eCo V3 <br> (for PM5032, PM5052, PM5072, PM5082 and PM56xx) | EtherNet/IP scanner runtime license for AC500 V3 | PS5613-EIP-S | 1SAP196101R0101 |
| AC500-eCo V3 <br> (for PM5032, PM5052, PM5072 and PM5082) | EtherNet/IP scanner runtime license for AC500-eCo V3 V3 | PS5613-EIP-S-e | 1SAP196103R0101 |
| AC500 V3/AC500- eCo V3 <br> (for PM5032, PM5052, PM5072, PM5082 and PM56xx) | EtherNet/IP adapter runtime license for AC500 V3 | PS5613-EIP-A | 1SAP196100R0101 |
| AC500-eCo V3 <br> (for PM5032, PM5052, PM5072 and PM5082) | EtherNet/IP adapter runtime license for AC500-eCo V3 | PS5613-EIP-A-e | 1SAP196102R0101 |
| For using runtime licensed features one license per CPU is required. The license has to be installed on the AC500 V3 CPU either by connecting it to Automation Builder or via memory card that has been prepared by Automation Builder for license activation. |  |  |  |

Activating a run- The linked application note provides step-by-step instructions on how to activate the runtime time license license for the PLC.

## AC500 V3 Activating a runtime license

Additional libraries and software packages for specific use cases are available to reduce the programming effort and implement quickly your application. In our main catalog we offer an overview of the available libraries and software packages.
\# Chapter 6.5 "Libraries and solutions" on page 3773

### 4.3 Mechanical planning and installation

### 4.3.1 Control cabinet assembly (indoor use)

## NOTICE!

PLC damage due to incorrect housing
Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are only suitable for operation in closed control cabinets.

The cabinet must be suitable to protect the equipment from the following:

- unauthorized access,
- dusting and contamination,
- humidity and moisture and
- mechanical damage,

The equipment must be operated within the specified mechanical and enviromental conditions.

## Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.
It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

Fig. 11: Exemplary figure: left side AC500, right side AC500-eCO
1 Cable duct
2 Distance from cable duct $\geq 20 \mathrm{~mm}$
3 Mounting plate, grounded
4 Screw end-stop clamps recommended to avoid movement of the modules on the DIN rail

## NOTICE!

Horizontal mounting is highly recommended.
Vertical mounting is possible, then derating must be considered to avoid overheating due to poor air circulation. $\Leftrightarrow>$ Chapter 5.1.2.1 "Environmental conditions" on page 166.

When horizontal mounted, end-stop clamps are recommended to secure the modules in case of shock or vibration.

When vertically mounted, always place an end-stop clamps on the bottom and on the top of the modules to properly secure the modules.

### 4.3.2 Mounting and demounting - general information

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate steel DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

## Consider the safety instructions

In the description, special attention must be paid to designs using galvanic isolation, grounding and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family.

### 4.3.3 Mounting and demounting the terminal base

Mounting and demounting on
DIN rail

1. Mount DIN rail 7.5 mm or 15 mm .
2. Mount the terminal base/function module terminal base:

$\Rightarrow$ The terminal base is put on the DIN rail above and then snapped-in below.
3. The demounting is carried out in a reversed order.

Mounting with screws

If the terminal base should be mounted with screws, wall mounting accessories TA526 must be inserted at the rear side first $\Leftrightarrow$ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324. These plastic parts prevent bending of the terminal base while screwing on. TB560x and TB561x need one TA526, TB562x, TB564x and TB566x need two TA526.

Fig. 13: Function module terminal bases, Fastening with screws

By wall mounting, the terminal base is grounded through the screws. It is necessary that

- the screws have a conductive surface (e.g. steel zinc-plated or brass nickelplated)
- the mounting plate is grounded
- the screws have a good electrical contact to the mounting plate

Practical tip The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all modulemounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or \#8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

7. Repeat the steps for all remaining modules.

### 4.3.4 Mounting and demounting the AC500 processor module

1. After mounting the terminal base on the DIN rail, mount the processor module.

2. Press the processor module into the terminal base until it locks in place.
3. The demounting is carried out in a reversed order. Press above and below, then remove the processor module.

### 4.3.5 Mounting and demounting the communication module

Communication modules are mounted on the left side of the processor module on the same terminal base. The connection is established automatically when mounting the communication module.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the terminal base, mount the communication modules.

1. First insert the bottom nose of the communication module into the dedicated holes of the terminal base. Then, rotate the communication module on the dedicated terminal base slot until it is locked in place.

$\Rightarrow$

## NOTICE!

## Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating \& Chapter 5.2.8.2.4 "TA524 - Dummy communication module" on page 1323.
- I/O bus connectors must not be touched during operation.

2. The demounting is carried out in a reversed order.

Press above and below, then rotate the communication module and remove it.

### 4.3.6 Mounting and demounting the terminal unit <br> Mounting on <br> DIN rail

1. Mount DIN rail 7.5 mm or 15 mm .
2. Mount the terminal unit.

The terminal unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the terminal unit to the left until it fully locks into place creating a solid mechanical and connection.

When attaching the devices, make sure the bus connectors are securely locked together to ensure proper connection. Max. 10 terminal units can be attached.

3. Demounting: A screwdriver is inserted in the indicated place to separate the terminal units.

Mounting with screws

If the terminal unit should be mounted with screws, wall mounting accessories TA526 must be inserted at the rear side first ${ }^{*} \Rightarrow$ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324. These plastic parts prevent bending of the Terminal Base while screwing on.

Fig. 14: Fastening with screws

By wall mounting, the terminal unit is grounded through the screws. It is necessary that

- the screws have a conductive surface (e.g. steel zinc-plated or brass nickelplated)
- the mounting plate is grounded
- the screws have a good electrical contact to the mounting plate

Practical tip The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all modulemounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or \#8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

$$
\begin{aligned}
& \text { If mounting more modules, mount only the last one of this group and put } \\
& \text { the others aside. This reduces remounting time during drilling and tapping } \\
& \text { of the next group. }
\end{aligned}
$$

7. Repeat the steps for all remaining modules.

### 4.3.7 Mounting and demounting the I/O module

After mounting the terminal unit, mount the I/O modules.

1. Press the I/O module into the terminal unit until it locks in place.

2. The demounting is carried out in a reversed order. Press above and below, then remove the module.

### 4.3.8 Mounting and demounting the AC500-eCo processor module

4.3.8.1 Mounting and demounting the option boards

### 4.3.8.1.1 Optimized mounting of the option boards

The AC500-eCo processor modules have up to 3 slots for option boards.

Table 7: Option board slots

The best thermal circulation is given on slot 3 (bottom slot), followed by slot 2 (middle slot) and then slot 1 (top slot).
The best mounting position of the option board depends on its power dissipation.

## Rules for optimized mounting of the option boards

- The higher the power dissipation of the option board, the lower the mounting position should be selected.
- The TA5126-2AO-UI option board has the highest power dissipation and must always be mounted at the lowest option board slot.
The optimized mounting position can be easily determined with the help of this table.

Table 8: Power dissipation of the option boards

| Power dissipation of <br> the option boards | Digital | Analog | Serial interface | Accessory |
| :---: | :---: | :---: | :---: | :---: |
| very small |  |  | TA5141-RS232I(W) <br> TA5142-RS485I(W) <br> TA5142-RS485(W) | TA5130-KNXPB(W) <br> TA5131-RTC |
| small | TA5105-4DOT(W) | TA5123-2AI-RT(D/W) |  |  |
| medium | TA5110-2DI2DO(T/W) <br> TA5101-4DI(W) | TA5120-2AI-UI(W) |  |  |
| large |  | TA5126-2AO-UI(W) |  |  |

If the option boards to be mounted are in the same power dissipation level, then the slots can be freely selected.

### 4.3.8.1.2 Inserting the option board

$\triangleright$ Press the option board TA51xx (or TA5300-CVR) into the slot of the processor module PM50x2 until it locks in place.

The option board must click into the slot of the processor module.

### 4.3.8.1.3 Removing the option board

1. Push the option board on the side to release the lock.
2. At the same time, pull the option board out of the slot.

## CAUTION!

Risk of injury and damaging the product!
Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).

Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

### 4.3.8.2 Mounting and demounting of the terminal blocks

Intended pur- Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 pose processor modules PM50x2.

For option boards there are different removable terminal blocks in spring version.

For the AC500-eCo V3 Basic CPUs a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 Standard CPUs and Pro CPUs a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for l/O connectors are used.

For all CPUs there is a screw and a spring variant available.

| Basic CPU |  | Standard and Pro CPUs |  |
| :---: | :---: | :---: | :---: |
| Spring terminal TA5211-TSPF-B | Screw terminal TA5211-TSCL-B | Spring terminal TA5212-TSPF | Screw terminal TA5212-TSCL |
|  |  |  |  |

Various removable spring terminal blocks are available for option boards.
The following spare parts are available (depending on the number of pins).

| Spring terminals |  |  |  |
| :---: | :---: | :---: | :---: |
| TA5220-SPF5 | TA5220-SPF6 | TA5220-SPF7 | TA5220-SPF8 |
|  |  |  |  |

## CAUTION!

## Risk of injury and damaging the product!

Improper installation and maintenance may result in injury and can damage the product!

- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

## CAUTION!

Risk of injury and damaging the module when using unapproved terminal blocks!
Only use terminal blocks approved by ABB to avoid injury and damage to the module.

## Terminal block set for PM50x2

Processor modules PM50x2 CPU are not delivered with terminal blocks.
Screw terminal block set:

- TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH
- TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH
Spring terminal block set:
- TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH
- TA5212-TSPF (1SAP187400R0005) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH

## Assembly

## Disassembly

### 4.3.8.3 Mounting a processor module on a DIN rail

## NOTICE!

Risk of function faults!
The processor module is grounded via DIN rail.
The DIN rail must be included into the grounding conception of the plant. Use only metal screws for grounding.

Mount the processor module at the top of the DIN rail, then snap it in below.

System overview, planning and operation
Mechanical planning and installation > Mounting and demounting the AC500-eCo processor module

See hardware description of PM50xx for connection.

### 4.3.8.4 Demounting a processor module mounted on a DIN rail

1. Remove I/O modules if connected.

2. While pressing down processor module pull it away from DIN rail.

### 4.3.8.5 Mounting a processor module on a metal plate

## NOTICE!

Risk of function faults!
Missing electrical contact by isolating screws or washers!
Use metal screws on the metal plate.
The metal plate must be included into the grounding concept of the plant.
Do NOT use insulating washers!

One TA543 wall mounting accessory is needed per processor module.

1. Snap in the TA543 at the back side of the processor module.

2. Fasten the processor module with two screws (diameter: 4 mm ) to the metal plate.

System overview, planning and operation
Mechanical planning and installation > Mounting and demounting the AC500-eCo processor module

③ See hardware description of PM50xx for connection.

### 4.3.8.6 Demounting a processor module mounted on metal plate

1. Remove I/O modules if connected.

2. Remove the 2 screws.

### 4.3.8.7 Mounting of the cable fixing accessory TA5301-CFA

1 TA5301-CFA cable fixing accessory
22 openings on the PM50x2 processor module
$\triangleright \quad$ Insert the TA5301-CFA cable fixing accessory into the two openings on the PM50x2 processor module marked white in the figure.

### 4.3.9 Mounting and demounting the S500-eCo I/O module

S500-eCo I/O modules can be mounted either on a DIN rail or with screws on a metal plate.

Mounting I/O modules on a DIN rail

## NOTICE!

## Risk of function faults!

The S500-eCo I/O modules are grounded via the DIN rail.
The DIN rail must be included into the grounding concept of the plant.
Use only metal screws.

1. Mount I/O module at the top of the DIN rail, then snap it in below.

2. Attach I/O module by hand to an other module. The I/O bus is connected automatically.

Demounting I/O
modules
mounted on a
DIN rail

1. Remove I/O module by hand if connected.

2. While pressing down I/O module pull it away from DIN rail.

Demounting I/O
modules
mounted on a metal plate

1. Remove the 2 screws.

2. Remove the I/O module from the connected module by hand.

### 4.3.10 Accessories for AC500 (Standard)

### 4.3.10.1 Inserting and removing a memory card

[^4]1. Insert the memory card into the memory card slot of the processor module until locked.

2. To remove the memory card, push on the memory card until it moves forward. By this, the memory card is unlocked and can be removed.

### 4.3.10.2 Further accessories

This section only describes accessories that are frequently used for system assembly, connection and construction.
All additional accessories that can be used to supplement the AC500 system

### 4.3.11 Accessories for AC500-eCo

### 4.3.11.1 Mounting and demounting the option boards

### 4.3.11.1.1 Optimized mounting of the option boards

The AC500-eCo processor modules have up to 3 slots for option boards.

Table 9: Option board slots

The best thermal circulation is given on slot 3 (bottom slot), followed by slot 2 (middle slot) and then slot 1 (top slot).
The best mounting position of the option board depends on its power dissipation.

## Rules for optimized mounting of the option boards

- The higher the power dissipation of the option board, the lower the mounting position should be selected.
- The TA5126-2AO-UI option board has the highest power dissipation and must always be mounted at the lowest option board slot.
The optimized mounting position can be easily determined with the help of this table.

Table 10: Power dissipation of the option boards

| Power dissipation of <br> the option boards | Digital | Analog | Serial interface | Accessory |
| :---: | :---: | :---: | :---: | :---: |
| very small |  |  | TA5141-RS232I(W) <br> TA5142-RS485I(W) <br> TA5142-RS485(W) | TA5130-KNXPB(W) <br> TA5131-RTC |
| small | TA5105-4DOT(W) | TA5123-2AI-RT(D/W) |  |  |
| medium | TA5110-2DI2DO(T/W) <br> TA5101-4DI(W) | TA5120-2AI-UI(W) |  |  |
| large |  | TA5126-2AO-UI(W) |  |  |

If the option boards to be mounted are in the same power dissipation level, then the slots can be freely selected.

### 4.3.11.1.2 Inserting the option board

$\triangleright$ Press the option board TA51xx (or TA5300-CVR) into the slot of the processor module PM50x2 until it locks in place.

The option board must click into the slot of the processor module.

### 4.3.11.1.3

Removing the option board

1. Push the option board on the side to release the lock.
2. At the same time, pull the option board out of the slot.

## CAUTION!

## Risk of injury and damaging the product!

Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

### 4.3.11.2 Inserting and removing a memory card

AC500-eCo V3

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

## NOTICE!

## Disturbed PLC operation

Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- Remove the memory card only when no black square ( $\square$ ) is shown next to MC in the display.

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

### 4.3.11.3 Further accessories

This section only describes accessories that are frequently used for system assembly, connection and construction.
«4 All additional accessories that can be used to supplement the AC500 system

### 4.3.12 Control panels CP600

Refer to the installation instructions delivered with each control panel and to the operating instructions.

### 4.4 Wiring

### 4.4.1 Grounding concept

NOTICE!

## PLC damage due to missing grounding

- Make sure to ground the devices.
- The grounding (switch cabinet grounding) is supplied both by the mains connection (or 24 V supply voltage) and via the DIN rail. The DIN rail must be connected to ground before power is supplied to the device. The grounding may be removed only if it is certain that no more power is being supplied to the control system.
- In case of screw mounting, use metal screws for grounding.

Block diagram:
Digital I/O
modules

Block diagram:
Analog I/O modules

### 4.4.2 EMC-conforming assembly and construction

### 4.4.2.1 General principles

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.
For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.

Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

General consid- Electric and electronical devices have to work correctly on site. This is also valid when electroerations magnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.
Advant controller components have a very high noise immunity.

When the wiring and grounding instructions are met, an error-free operation is given.
High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.

In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.

## There are three important principles to be especially considered:

- Keep all connections as short as possible (in particular the grounding conductors)
- Use large conductor cross sections (in particular for the grounding conductors)
- Create low-impedance, i.e. good and large-sized contacts (in particular for the grounding conductors)

```
Pay attention to the following:
- Use vibration-resistant connections
- Clean metallic contact areas
- Use solid plug and screw-type connections
- Use earth cable shields with clips on a well-grounded metallic surface
- Do not use aluminium parts
- Do not use sheath wires
- Do not use toothed lock washers under screw connections
```

Fig. 15: Assembly: wrong

Fig. 16: Assembly: correct
Make a connection between the DIN rails and PE (Protective Earth). For this, use an grounding wire with a minimum conductor cross section of $10 \mathrm{~mm}^{2}$.

The wire is connected to the DIN rail with an M6 screw.
A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behavior significantly, as the disturbances can be discharged more effective.

### 4.4.2.2 Cable routing

- Route cables meeting the standards.
- Sort the cables into cable groups:
- Power current cables
- Power supply cables
- Signal cables
- Data cables
- Route signal cables and data cables separately from the power cables.
- Separate cable ducts or cable bundles.
- The distance should be 20 cm or greater.
- Lay signal and data cables close to earthed surfaces.

### 4.4.2.3 Cable shields

- Use only shielded data cables. The shield should be grounded at both ends.

A cable shield only grounded at one end can only protect from capacitively coupled interference and low-frequency disturbances ( 50 Hz hum).

- Avoid parasitic currents flowing through the cable shields.

This can be done by installing current-carrying equipotential bondings.

- Use only cables with braided shields.

Foil shields are not robust enough, cannot be contacted well and have poor HF properties.

- Use only metallic or [metal]-plated plugs for shielded data cables.
- Use only shielded cables for analog signals.

For small signals ground the shield only at one end.

- Ground the cable shield directly with a clip when entering the control cabinet. Do not cut the shield until the cable reaches the module connected.

The connection between the PE bar and the shield bar must have a low impedance.

### 4.4.2.4 Control cabinet

> Installation of configurations in shielded cabinet can be required in shipping applications. Follow specific instructions in the applicable type approval certificate.

Available certificates can be found in the internet

1. Open landing page of the product e.g. DO526
2. In the middle of the page, click on [Downloads].
$\Rightarrow$ A two-column window opens on the page with all available documents.
3. In the left column of the downloads page click on [Certificate].
$\Rightarrow$ All available certificates are listed in the right column.

In the list of certificates, the maritime certificates can be identified by the title. The title consists of the abbreviation of the maritime classification society followed by the words: Type Approval Certificate. E.g. "DNV Type Approval Certificate: ...".

Connections The connections between the control cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

Grounding Ground the control cabinet doors with short and highly flexible conductors.

Control cabinet Only use lighting with interference suppression.
lighting

For supplying Use the mains socket which is located inside the control cabinet. the PC

### 4.4.2.5 Reference potential

- Provide a uniform reference potential in the entire installation and ground all electrical appliances if possible.
- Route your grounding conductors in a star configuration so that no ground loops can occur.

### 4.4.2.6 Equipotential bonding

The Installation of equipotential bondings are necessary if there are present or expected potential differences between parts of your application.

- The impedance of equipotential bonding must be equal or lower than $10 \%$ of the shield impedance of the shielded signal cables between the same points.
- The conductor cross section of a equipotential bonding must be $16 \mathrm{~mm}^{2}$ to withstand the maximum possible compensating current.
- Equipotential bondings and shielded signal cables should be laid close to each other.
- Equipotential bondings must be connected to PE with low impedance.

13 Fieldbus connection (e.g. Ethernet)

### 4.4.3 Connection and wiring of the PLC platform

### 4.4.3.1 Safety instructions

## - NOTICE! <br> Attention: <br> The devices should be installed by experts who are trained in wiring electronic devices. In case of bad wiring, the following problems could occur: <br> - On the terminal base, the terminals $L+$ and $M$ are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the terminal base itself might be destroyed. <br> - The terminal bases and all electronic modules and terminal units are protected against reverse polarity. <br> - All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## NOTICE!

## Attention:

Due to possible loss of communcation, the communication cables should be fixed with cable duct or bracket or clamp during application.

### 4.4.3.2 AC500

### 4.4.3.2.1 Power supply for AC500 system

The system is powered by two different power circuits:

- The power supply for the processor module is provided through the terminals $\mathrm{L}+/ \mathrm{M}$.
- The power supply for the I/O modules is provided through the terminals UP/ZP.

The power supply for the processor module is galvanic isolated from the power supply for the I/O modules.
As soon as the power supply for the processor module is present, the processor module starts. The power supply of the processor module and the I/O modules should be powered on the same time, otherwise the processor module will not switch to run mode after startup.
When during operation the power supply falls below the minimum process and supply voltage for more than 10 ms , the processor module switches to safe mode. A restart of the processor module only occurs by switching the power supply off and on again.
If an I/O module is disconnected during operation from the power supply while the processor module is still powered, the processor module will continue its normal operation on all other powered peripherals (other I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of the power supply of the affected I/O module it will continue normal operation and inputs and outputs will be updated.
«Chapter 5.1.2.1 "Environmental conditions" on page 166
As power supply for the AC500 system, the ABB power supplies series CP can be used
« Chapter 5.2.8.3.1 "CP-E - Economic range" on page 1325 \& Chapter 5.2.8.3.2 "CP-C. 1 - High performance range" on page 1327.

### 4.4.3.2.2 Power supply for processor modules

The supply voltage of 24 V DC is connected to a removable 5 -pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with $1.5 \mathrm{~mm}^{2}$ conductor) via these terminals.

| Pin assignment | Pin Assignment |  | Label | Function | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Terminal block removed |  | L+ | +24 V DC | Positive pin of the power supply voltage |
|  |  |  | L+ | +24 V DC | Positive pin of the power supply voltage |
|  |  |  | M | 0 V | Negative pin of the power supply voltage |
|  |  | inserted | M | 0 V | Negative pin of the power supply voltage |
|  |  |  | $\stackrel{1}{\square}$ | FE | Functional earth |

### 4.4.3.2.3 Connection of wires at the spring terminals

## Connection

Fig. 18: Connect the wire to the spring terminal (steps 1 ... 3)

Fig. 19: Connect the wire to the spring terminal (steps $4 \ldots 7$ )

1. Side view (open terminal drawn for illustration)
2. The top view shows the openings for wire and screwdriver
3. Insert screwdriver ( $2.5 \times 0.4$ to $3.5 \times 0.5 \mathrm{~mm}$ ) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
4. While erecting the screwdriver, insert it until the stop (requires a little strength)
5. Screwdriver inserted - terminal open
6. Strip the wire for 7 mm (and put on wire-end ferrule)
7. Insert wire into the open terminal
8. Done

## Disconnection

Fig. 20: Disconnect wire from the spring terminal (steps 1 ... 3)

Fig. 21: Disconnect wire from the spring terminal (steps 4 ... 6)

1. Terminal with wire connected
2. Insert screwdriver ( $2.5 \times 0.4 \ldots 3.5 \times 0.5 \mathrm{~mm}$ ) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
3. While erecting the screwdriver, insert it until the stop (requires a little strength) - terminal is now open
4. Remove wire from the open terminal
5. Done

### 4.4.3.2.4 Terminals for CANopen communication modules

Fig. 22: Combicon, 5-pole, female, removable plug with spring terminals

Terminal type: Spring terminal

| Number of cores <br> per terminal | Conductor type | Cross section | Stripped conductor <br> end |
| :--- | :--- | :--- | :--- |
| 1 | solid | $0.2 \mathrm{~mm}^{2} \ldots 2.5 \mathrm{~mm}^{2}$ | 10 mm |
| 1 | flexible | $0.2 \mathrm{~mm}^{2} \ldots 2.5 \mathrm{~mm}^{2}$ | 10 mm |
| 1 with wire-end fer- <br> rule (without plastic <br> sleeve) | flexible | $0.25 \mathrm{~mm}^{2} \ldots 2.5 \mathrm{~mm}^{2}$ | 10 mm |
| 1 with wire-end fer- <br> rule (with plastic <br> sleeve) | flexible | $0.25 \mathrm{~mm}^{2} \ldots 2.5 \mathrm{~mm}^{2}$ | 10 mm |

### 4.4.3.2.5 Ethernet connection details

## Ethernet interface

Ethernet is also used for PROFINET, EtherCAT and Modbus TCP connection.

| Pin assignment | Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | TxD+ | Transmit data + |
|  |  | 2 | TxD- | Transmit data - |
|  |  | 3 | RxD+ | Receive data + |
|  |  | 4 | NU | Not used |
|  |  | 5 | NU | Not used |
|  |  | 6 | RxD- | Receive data - |
|  |  | 7 | NU | Not used |
|  |  | 8 | NU | Not used |
|  |  | Shield | Cable shield | Functional earth |

${ }^{\Downarrow}$ Supported protocols and used Ethernet ports
(4) Communication via Modbus TCP/IP
${ }^{〔}$ Communication via Modbus RTU

## Wiring

Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for $10 \mathrm{Mbit} / \mathrm{s}$ Ethernet (10Base-T) as well as for $100 \mathrm{Mbit} / \mathrm{s}$ (Fast) Ethernet (100Base-TX). For a transmission rate of $10 \mathrm{Mbit} / \mathrm{s}$, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of $100 \mathrm{Mbit} / \mathrm{s}$, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes ( 512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of $10 \mathrm{Mbit} / \mathrm{s}$ and 200 m for $100 \mathrm{Mbit} / \mathrm{s}$. In addition, the bit delay times caused by the passed network components also have to be considered.

Table 11: Specified cable properties of the respective cable types per 100 m :

| Parameter | 10Base-T [10 MHz] | 100Base-TX [100 MHz] |
| :--- | :--- | :--- |
| Attenuation [dB/100m] | 10.7 | 23.2 |
| NEXT [dB/100m] | 23 | 24 |
| ACR [dB/100m] | N/A | 4 |
| Return loss [dB/100m] | 18 | 10 |
| Wave impedance $[\mathrm{Ohms}]$ | 100 | 100 |
| Category | 3 or higher | 5 |
| Class | C or higher | D or higher |

TP cable The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

Table 12: Color coding of TP cables:

| Pairs | EIA/TIA 568 <br> Version 1 |  | EIA/TIA 568 <br> Version 2 |  | DIN 47100 |  | IEC 189.2 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Pair 1 | white/ <br> blue | blue | green | red | white | brown | white | blue |
| Pair 2 | white/ <br> orange | orange | black | yellow | green | yellow | white | orange |
| Pair 3 | white/ <br> green | green | blue | orange | grey | pink | white | green |
| Pair 4 | white/ <br> brown | brown | brown | slate | blue | red | white | brown |

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version $B$ is the one most commonly used.

Fig. 24: Pin assignment of RJ45 sockets

## Cable types

## Crossover cable

## Particular use

Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase "Classic".

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.

Fig. 25: Wiring of a crossover cable

Straight-through For networks with more than two subscribers, hubs or switches have to be used additionally for cable distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

Fig. 26: Wiring of a straight-through cable

## CAUTION!

## Risk of communication faults!

When using inappropriate cables, malfunctions in communication may occur.
Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

### 4.4.3.3 AC500-eCo

### 4.4.3.3.1 Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 13: Removable terminal block for the supply voltage 24 V DC

| 3-pin spring terminal block | 3-pin screw terminal block |
| :---: | :---: |
|  |  |

The terminal block is available as a set for AC500-eCo V3 processor modules.

| Basic CPU (PM5012) |  | Standard CPUs (PM5032, PM5052) and <br> Pro CPUs (PM5072, PM5082) |  |
| :--- | :--- | :--- | :--- |
| Spring type | Screw type | Spring type | Screw type |
| TA5211-TSPF-B | TA5211-TSCL-B | TA5212-TSPF | TA5212-TSCL |

Further information on power supply and onboard inputs/outputs of the terminal blocks

| Pin assignment | Pin Assignment | Pin | Label | Function | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | $\stackrel{1}{=}$ | FE | Functional earth |
|  | $123$ | 2 | L+ | +24 V DC | Positive pin of the power supply voltage |
|  | $๑ \bigcirc \bigcirc$ | 3 | M | 0 V | Negative pin of the power supply voltage |
|  | Terminal block inserted |  |  |  |  |

## NOTICE!

## Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data and the technical data of the used module.
» Chapter 5.1.1 "System data AC500-eCo" on page 159

### 4.4.3.3.2 Ethernet

Ethernet interface

Ethernet is also used for Modbus TCP connection.

The Ethernet interface is carried out via a RJ45 jack. The pin assignment of the Ethernet interface:

| Interface | Pin | Description |  |
| :---: | :---: | :---: | :---: |
|  | 1 | Tx+ | Transmit Data + |
|  | 2 | Tx- | Transmit Data - |
|  | 3 | Rx+ | Receive data + |
|  | 4 | NC | Not connected |
|  | 5 | NC | Not connected |
|  | 6 | Rx- | Receive data - |
|  | 7 | NC | Not connected |
|  | 8 | NC | Not connected |
|  | Shield | Cable shield | Functional earth |

③ Supported protocols and used Ethernet ports
② Communication via Modbus TCP/IP
ⓨ Communication via Modbus RTU

### 4.4.3.4 Control panels CP600

Refer to the installation instructions delivered with each control panel and to the operating instructions.

### 4.4.4 Connection and wiring of the modules

Specific information about the connections of the modules and the wiring is available in the installation instructions.

- Installation instructions of AC500 PLC product family
- Installation instructions of CP600 control panels

### 4.5 Configuration and programming

| Advanced installation of engineering suite | Detailed information is available in the installation and licensing document. |
| :---: | :---: |
| Programming for PLC system | « Chapter 6.3 "Configuration in Automation Builder for AC500 V3 products" on page 1398 |

### 4.6 Commissioning

Commissioning Preconditions: the PLC

- All PLC modules are installed and wired according to the configuration in Automation Builder.
- The PLC is connected to the power supply.
- The application and the necessary licenses are available.

## WARNING!

## Risk of injury or damage to equipment

To avoid endangering persons or equipment, check before commissioning:

- Mechanical and electrical installation
- Electrical safety of the installation
- Safety functions

1. Switch on the power supply.
$\Rightarrow$ The green PWR LED goes on.
$\Rightarrow$ Processor modules with display: Wait until the processor module displays "Update".

2. Install the firmware and the application on the processor module.

Installing the firmware and the application on a very new processor module is the same process than updating a firmware and an application on a CPU.
\& Chapter 4.7.4 "PLC firmware/application update" on page 148
$\Rightarrow$ The PLC starts with the new firmware and the new application.

Commissioning Preconditions:
the control panel

## WARNING!

## Risk of injury or damage to equipment

To avoid endangering persons or equipment, a functional test of the application must be performed before the final commissioning of the system.

- The control panel is installed and wired.
- The control panel is connected to the power supply.
- The project file and the necessary licenses are available.

1. Start the control panel.
2. Set the IP address of the control panel.
3. Download the project file to the control panel.
4. Connect the PLC and the control panel with an Ethernet cable.

## Commis- Step-by-step instructions using the example of the AC500-eCo starter kit with a control panel sioning example included

Protect your data, provide your projects with passwords and access restrictions.
« Chapter 6.4.1.6 "Protecting and Saving Projects" on page 1819

* Chapter 6.3.1.2.1 "User and access rights" on page 1409

The PLC has an integrated diagnosis system to output diagnosis messages, e.g., parameter setting is wrong or battery low. A diagnosis message is indicated by ERR LED $=$ on.
をy Chapter 4.8 "Troubleshooting" on page 149

### 4.7 Operation

### 4.7.1 Operating modes

The common operating mode is called run mode.

Table 14: Run mode

| LED | Display | Description |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { PWR LED }=\text { on } \\ & \text { RUN LED }=\text { on } \\ & \text { ERR LED }=\text { off } \end{aligned}$ |  | Power supply is present. PLC is in run mode. |

If the PLC is connected to the power supply, but does not operate, it is in stop mode. In stop mode, the processor module does not control the system.

Table 15: Stop mode

| LED | Display | Description |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { PWR LED = on } \\ & \text { RUN LED }=\text { off } \\ & \text { ERR LED }=\text { off/on } \end{aligned}$ |  | E.g., after the download of an application, after a firmware update, an error occured or the PLC was stopped by the user, etc. |

### 4.7.2 Diagnosis system

The PLC has an integrated diagnosis system to output diagnosis messages, e.g., parameter setting is wrong or battery low. A diagnosis message is indicated by ERR LED = on.
*) Chapter 4.8 "Troubleshooting" on page 149

### 4.7.3 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.
Operating elements:

- Status LEDs:

Indicates the availability of devices and components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- I/O LEDs:

Displays the status of the inputs and outputs.

- Display:

Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.

* Chapter 6.8.2.5 "Display, LEDs and function keys on the front panel" on page 4452
\& Chapter 6.9.1.3 "Diagnosis in CPU display" on page 4607
\& Chapter 4.8 "Troubleshooting" on page 149
- Function keys and switches:

Allows to change the current operating modes/status manually Chapter 6.8.2.5.5
"Description of the function keys" on page 4457.

### 4.7.4 PLC firmware/application update

During runtime it might be necessary to update the firmware of the modules, e.g., for security reasons.
Updating the firmware and the application on a processor module is the same process than installing a firmware and an application on a very new processor module.
The installation can be performed either via a PC (recommended) or via a memory card.

* Chapter 6.3.1.4 "Firmware identification and update" on page 1419

Fig. 27: The "Version information" tab of a device in the Automation Builder

### 4.7.5 Control panel firmware/application update

The system components can be updated via Panel Builder software or via USB flash drive. Refer to the Panel Builder manual for a detailed description.

### 4.7.6 Reset Warm

## PLC

$\square$ PLC is in STOP mode.

1. Press and hold ( $>5 \mathrm{sec}$ ) $[R U N]$.

$$
\Rightarrow \text { RUN LED }=0 N .
$$

"Reset" is displayed.
2. Press $[O K]$ to reset ${ }^{+}$the PLC.

Control panel The factory restore of a control panel is described in the Panel Builder manual.

### 4.8 Troubleshooting

### 4.8.1 General

Diagnosis messages are shown in the engineering suite Automation Builder. The diagnosis information can be accessed in the IEC application and can be forwarded to, e.g., a web server or a control panel. $y^{\Perp}$ Chapter 6.9.1.5 "Diagnosis in IEC application" on page 4615
Diagnosis messages can also be read out from the display of the PLC. ${ }^{\circ}$ Chapter 6.9.3 "Diagnosis messages" on page 4655

Some diagnosis messages need to be acknowledged by the user (alarms ${ }^{+}$), others do not require acknowledgment (events ${ }^{+}$). The diagnosis system stores alarms and events in a diagnosis history.
Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC.

### 4.8.2 Possible malfunctions

## Possible mal-

functions

| Fault description | Cause | Remedy |
| :---: | :---: | :---: |
| A processor module, a communication interface module or an I/O module can not be plugged on the corresponding terminal base or terminal unit. | Terminal bases and terminal units have a mechanical encoding. The encoding makes it impossible to insert a module to the wrong place to prevent dangerous voltages or destroyed modules. | Check the given design scheme of your control cabinet. <br> Get in touch with the planner of the design scheme. <br> Check the terminal base compatibility and the terminal unit compatibility. |
| An AC500-eCo V3 processor module does not start. | Configuration error due to wrong firmware of the option boards. | Update the option boards TA5141-RS232I, TA5142RS485I and TA5142-RS485 at least to system firmware 3.5.0_HF-7 and boot firmware 3.5.1 or higher. Use Automation Builder 2.5.2 or higher. <br> * Chapter 5.2.1.1.3.9 "TA5141-RS232I - Option board for COMx serial communication" on page 285 <br> « Chapter 5.2.1.1.3.10 "TA5142-RS485I - Option board for COMx serial communication" on page 289 <br> * Chapter 5.2.1.1.3.11 "TA5142-RS485- Option board for COMx serial communication" on page 296 |
| The module does not respond and is not available for online connection. | Module is not connected to the power supply. Or module is not functional any more. | Check power supply. <br> Replace the module or HMI . |

| Fault description | Cause | Remedy |
| :---: | :---: | :---: |
| The module does not respond and is not available for online connection. | Module is not connected to the power supply. Or module is not functional any more. | ② Chapter 4.9.2 "Replace an AC500 module" on page 152 |
| I/O module on a hot swap terminal unit does not respond and is not available for online connection. | I/O module is not plugged or damaged. | As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start. <br> « Hot swap behavior of I/O modules <br> H Hot swap behavior of remote I/O modules |
| After hot swap of a (remote) I/O module, the system and/or I/O module does not start. | Wrong I/O module type plugged. The type must be the same as of the replaced module. | Plug the correct I/O module type. |
| The display of the control panel is black. | Control panel is not connected to the power supply. Or control panel is not functional any more. | Check power supply. <br> Replace the control panel. |
| ERR LED of the processor module flashes fast. The display shows "AC500". | A fatal system error occured. | Contact ABB technical support |
| ERR LED of the processor module flashes. RUN LED is off. The display shows "FAIL". | Installation or update of firmware, boot project or application failed. | Restart the device. Perform the installation or update again. <br> Chapter 4.7.4 "PLC firmware/application update" on page 148 |
| ERR LED is on. | PLC with event ${ }^{+}$or unacknowledged alarm ${ }^{+}$. | - Use Automation Builder, IEC application or other external access available in your project, e.g., a control panel, to read out and acknowledge the diagnosis messages. <br> In Automation Builder, double-click on a device and select the "Diagnosis" tab to access the diagnosis messages. <br> Or: <br> - Read out the diagnosis data on the display of the processor module. <br> ⓨ Chapter 6.9.3 "Diagnosis messages" on page 4655 |
| The display of the processor module shows "Demo" for 5 min at every license check. (For processor modules without display only visible when logged in with Automation Builder.) | PLC runs in demo mode because at least one feature license is missing. The demo license is valid for 10 days PLC in run. After this time, PLC will go to stop mode. | You can buy the missing license or extend the demo license via Automation Builder. The PLC will not switch back to run mode until a new license is activated or the licensed features are removed from the PLC application. <br> ²) Chapter 6.2.4 "Managing your licenses" on page 1350 <br> ²) Chapter 6.3.2.2.2 "PLC runtime licensing" on page 1446 |
| Every 10 min , the display of the processor module shows "Grace" for 5 min. | PLC runs in grace mode because at least one feature license which has been available disappeared. If the grace time expires, PLC will go to stop mode. | You need to buy or activate the missing. We recommend to use the Automation Builder for activation. After the PLC is in stop mode, it will not switch back to run mode until a new license is activated or the licensed features are removed from the PLC application. <br> « Chapter 6.2.4 "Managing your licenses" on page 1350 |

| Fault description | Cause | Remedy |
| :--- | :--- | :--- |
| Every 10 min, the display <br> of the processor module <br> shows "Grace" for 5 min. | PLC runs in grace mode <br> because at least one feature <br> license which has been avail- <br> able disappeared. II the grace <br> time expires, PLC will go to <br> stop mode. | on page 1446 6.3.2.2.2 "PLC runtime licensing" |
| The CPU displays <br> "noConn" (no connection). | No communication between <br> CPU and display is possible <br> Cue do very high CPU load <br> (e.g., endless loop in user <br> program and not activated <br> task watchdog). | Check the application for loops and operations <br> they need time. For example file handling. Wait for <br> response from other device who will block the exe- <br> cution from other code. |

If a problem persists, contact ABB technical support. In order to be able to solve your problem as soon as possible, please provide the affected Automation Builder project or Panel Builder project, the log files and the firmware versions. How to read out log files is described in the application note How to get log information.

### 4.8.3 Execution of a hotfix

Updates (also hotfixes) are displayed at every system start, if available. $\Leftrightarrow$ Chapter 6.2.2 "Automation Builder updates" on page 1350

Hotfixes can be in different files - *.exe, *.package or Linux (for communication interface modules).

Hotfix file via
A hotfix PLC firmware file (*.exe) can be installed via a memory card. ${ }^{*} \Rightarrow$ Chapter 6.3.1.4.5.2.3 memory card "Execution of update via memory card" on page 1430

Communication The firmware of AC500 communication interface modules can be updated with the IP configurainterface (CI) module firmware

Advanced: Manual installation in
Automation Builder
tion tool.

1. Download the current firmware hotfix from the PLC website.
2. Save and unpack the .zip file at any location of your hard disc.
3. Save and close open projects in Automation Builder.
4. In the menu bar of the Automation Builder open the "Package Manager". "Tools $\rightarrow$ Package Manager" $\Rightarrow$ The "Package Manager" opens.
5. Follow the instructions. ${ }^{4}$ Chapter 6.4.1.21.3.9.4 "Command 'Package Manager'" on page 2655

### 4.9 Maintenance

### 4.9.1 Maintenance intervals

| Interval | Maintenance work |
| :--- | :--- |
| After 3 years of utilisation or as soon as pos- <br> sible after the PLC diagnosis message "low <br> battery warning" | Replace battery of the CPU. |
| Regularly or when the faceplate of the control <br> panel is dusty. | Keep the faceplate of the control panel clean. <br> Refer to the panel's operating instruction. |

### 4.9.2 Replace an AC500 module

## CAUTION!

## Risk of injury and damaging the product!

Improper installation and maintenance may result in injury and can damage the product!

- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Only by qualified personnel.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

All modules of the AC500 range are maintenance free. Spare parts are not available and repair is not allowed. If a module is not functional any more, you have to replace the whole module.
If an I/O module is installed on a hot swap terminal unit, it is possible to replace it with the same type during runtime.

* Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

If an I/O module is installed on a terminal unit that does not support hot swap and for all other AC500 modules, proceed as follows.

1. Disconnect the power supply.
2. For processor modules, insert the memory card into the new module.
3. For communciation modules, adjust the position of the rotary switches on the new module.
4. For terminal units and terminal bases, disconnect the connectors from the old module.
5. Demount the module to be replaced as described in the installation instructions.
6. Mount the new module as described in the installation instructions.
7. For terminal units and terminal bases, connect the connectors.
8. Reconnect the power supply.
$\Rightarrow$ System boots up again.
9. If necessary, update module firmware ${ }^{\star y}$ Chapter 4.7.4 "PLC firmware/application update" on page 148.

If a processor module is replaced, you must install the firmware, the application, the licenses, passwords and the certificates on the new processor module.

If a problem persists, contact $A B B$ technical support.

### 4.9.3 Replace an I/O module with hot swap

### 4.9.3.1 Preconditions for using hot swap

## Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

## Hot swap

## WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

## WARNING!

## Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

## NOTICE!

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

## NOTICE!

Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

## NOTICE!

## Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

| Device | Min. required device index for I/O module as of <br> FW Version 3.0.14 |
| :--- | :--- |
| AC522(-XC) | F0 |
| Al523 (-XC) | D2 |
| A1531 | D4 |
| A1531-XC | D2 |
| A1561 | B2 |

| FM562 | A1 |

### 4.9.3.2 Compatibility of hot swap

Hot swap is not supported by AC500-eCo V3 CPU!

|  | Central I/O on V3 CPU |
| :--- | :--- |
| I/O module on TU5xx-H connected to I/O bus <br> master | AC500 V3 CPU types: <br> PM56xx-2ETH |
| Required version of I/O bus master | Firmware as of V3.2.0 |
| Fieldbus master when used as remote I/O with <br> AC500 V3 | - |
| When used as remote I/O on third party <br> controller (PLC or DCS) | - |

### 4.9.3.3 Hot swap behavior

| Hot swap behavior | Central I/O on V3 CPU |
| :--- | :--- |
| Start-up behavior with unplugged or damaged <br> I/O module on hot swap terminal unit TU5xx-H | System and I/O modules attached to the CPU <br> are starting (except unplugged or damaged <br> module when plugged on hot swap terminal <br> unit). <br> As soon as the correct and operational I/O <br> module is plugged on the terminal unit, the <br> module is configured and ready to start. <br> No specific setting needed. |
| Start-up behavior with wrong I/O module type <br> on any terminal unit | System and I/O modules are not starting |
| Diagnosis of presence of hot swap terminal <br> unit | Diagnosis using PLC browser command "io- <br> bus desc" in Automation Builder V3. <br> The PLC browser then provides an overview <br> of the modules on the I/O bus including the <br> position of hot swap terminal units in the <br> I/O bus. <br> In the application program this |
| can be detected with a func- |  |
| tion block "IoModuleHotSwapInfo" |  |
| (Library: AC500_lo/Function Blocks/I/O-Bus). |  |
| One instance of function block is needed per |  |
| terminal unit on the I/O bus. The function |  |
| block provides five outputs delivering infor- |  |
| mation about slut number, hot swap capa- |  |
| bility and plugged/unplugged state of the I/O |  |
| module |  |$|$| If module is pulled then diagnosis Err 9480 |
| :--- |
| "Module removed from Hot Swap Terminal |
| Unit" is generated |

### 4.9.4 Replace a CP600 control panel

Control panels are maintenance free. Spare parts are not available and repair is not permitted. If a control panel becomes inoperable, it must be replaced. An operation manual is included with the new unit.

For instructions on how to transfer the runtime to a new control panel and how to load projects to a new control panel, refer to the Panel Builder manual.

The procedure for changing from a CP600 device to a CP600 device of the 2nd generation is described in the application example Converting a CP600 project. A description of the differences between both device variants can also be found in this application example.

### 4.10 Decommissioning

1. Delete the runtime licenses from the device by returning the licenses.
ⓨ Chapter 6.3.2.2.2.5 "Returning a license" on page 1452
2. Delete certificates available on the CPU.
※ Chapter 6.6.2.4.1 "View 'Security Screen' - 'Devices'" on page 4205
3. Delete applications.

* Chapter 6.4.1.21.3.7.12 "Command 'Reset Origin"' on page 2635
*s Chapter 6.4.1.21.3.7.13 "Command 'Reset Origin Device"' on page 2636

4. Delete applications from memory card, if available.

* Chapter 6.4.1.15 "Copying files to/from PLC" on page 2027

5. If available, remove memory card and battery from CPU.
6. Delete all user accounts and user data.

* "Tab 'User"' on page 2593

7. Demount and dispose the hardware modules.
\& Demount AC500, AC500-XC and AC500-S
« Chapter 4.11 "Recycling" on page 158

If you can not access the data stored in the CPU, e.g., because the CPU is not functional any more, then physically destroy the device.
This ensures that the credentials that are stored in the device, can not be misused.

### 4.11 Recycling

## Disposal and recycling information

This symbol on the product (and on its packaging) is in accordance with the European Union's Waste Electrical and Electronic Equipment (WEEE) Directive.

The symbol indicates that this product must be recycled/disposed of separately from other household waste.
It is the end user's responsibility to dispose of this product by taking it to a designated WEEE collection facility for the proper collection and recycling of the waste equipment.
The separate collection and recycling of waste equipment will help to conserve natural resources and protect human health and the environment.
For more information about recycling, please contact your local environmental office, an electrical/electronic waste disposal company or the store where you purchased the product.

## 5 Hardware descriptions

### 5.1 Technical data of the system

### 5.1.1 System data AC500-eCo

### 5.1.1.1 Environmental conditions

Table 16: Process and supply voltages

| Parameter | Value |
| :---: | :---: |
| 24 V DC |  |
| Voltage | 24 V (-15 \%, +20 \%) |
| Protection against reverse polarity | Yes |
| 24 V AC |  |
| Voltage | 24 V (-15 \%, +10 \%) |
| Frequency | 50/60 Hz (-6 \%, +4 \%) |
| 100 V AC ... 240 V AC wide-range supply |  |
| Voltage | 100 V .. 240 V (-15 \%, +10 \%) |
| Frequency | 50/60 Hz (-6 \%, +4 \%) |
| Allowed interruptions of power supply, according to EN 61131-2 |  |
| DC supply | Interruption < 10 ms , time between 2 interruptions $>1$ s, PS2 |
| DC supply (only for analog option boards TA512x) | Interruption < 1 ms , time between 2 interruptions $>1 \mathrm{~s}, \mathrm{PS} 1$ |

## NOTICE!

Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data and the technical data of the used module.
Chapter 5.1.1 "System data AC500-eCo" on page 159

## NOTICE!

Improper voltage level or frequency range which cause damage of $A C$ inputs:

- AC voltage above 264 V
- Frenquency below 47 Hz or above 62.4 Hz

## NOTICE!

Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

CPUs

### 5.1.1.2 Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2 .

### 5.1.1.3 Power supply units

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.
For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.
Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

## Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 $V$ DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

## WARNING!

Improper installation can lead to death by touching hazardous voltages!
To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

### 5.1.1.4 Electromagnetic compatibility

### 5.1.1.6 Approvals and certifications

The PLC Automation catalog contains an overview of the available approvals and certifications.

### 5.1.2 System data AC500

### 5.1.2.1 Environmental conditions

Table 23: Process and supply voltages

| Parameter | Value |
| :---: | :---: |
| 24 V DC |  |
| Voltage | 24 V (-15 \%, +20 \%) |
| Protection against reverse polarity | Yes |
| 100 V AC... 240 V AC wide-range supply |  |
| Voltage | 100 V ... 240 V (-15 \%, +10 \%) |
| Frequency | $50 / 60 \mathrm{~Hz}$ (-6 \%, +4 \%) |
| Allowed interruptions of power supply, according to EN 61131-2 |  |
| DC supply | Interruption < 10 ms , time between 2 interruptions > $1 \mathrm{~s}, \mathrm{PS} 2$ |
| AC supply | Interruption < 0.5 periods, time between 2 interruptions $>1 \mathrm{~s}$ |

## NOTICE!

## Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data * Chapter 5.1.2 "System data AC500" on page 166 and the technical data of the module used.

NOTICE!
Improper voltage level or frequency range which cause damage of AC inputs:

- AC voltage above 264 V
- Frenquency below 47 Hz or above 62.4 Hz

## NOTICE!

Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

| Parameter | Value |
| :--- | :--- |
| Temperature |  |
|  | Operating |
|  | $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}:$ Horizontal mounting of modules. |

| DC supply | Interruption < 10 ms , time between 2 interruptions > $1 \mathrm{~s}, \mathrm{PS} 2$ |
| AC supply | Interruption < 0.5 periods, time between 2 interruptions > 1 s |

## NOTICE!

## Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data ${ }^{\circledR}$ Chapter 5.1.2 "System data AC500" on page 166 and the technical data of the module used.

## NOTICE!

Improper voltage level or frequency range which cause damage of $A C$ inputs:

- AC voltage above 264 V
- Frenquency below 47 Hz or above 62.4 Hz

## NOTICE!

Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

| Parameter | Value |

| Temperature |  |
| Operating | $-40^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ <br> $-40^{\circ} \mathrm{C} \ldots 0^{\circ} \mathrm{C}$ : Due to the LCD technology, the display might respond very slowly. <br> $-40^{\circ} \mathrm{C} \ldots+40^{\circ} \mathrm{C}$ : Vertical mounting of modules possible, output load limited to $50 \%$ per group $+60^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ with the following deratings: <br> - System is limited to max. 2 communication modules per terminal base <br> - Digital inputs: maximum number of simultaneously switched on input channels limited to $75 \%$ per group (e.g. 8 channels => 6 channels) <br> - Digital outputs: output current maximum value (all channels together) limited to 75 \% per group (e.g. $8 \mathrm{~A}=>6 \mathrm{~A}$ ) <br> - Analog outputs only if configured as voltage output: maximum total output current per group is limited to $75 \%$ (e.g. $40 \mathrm{~mA}=>30 \mathrm{~mA}$ ) <br> - Analog outputs only if configured as current output: maximum number of simultaneously used output channels limited to $75 \%$ per group (e.g. 4 channels $=>3$ channels) |
| Storage / Transport | $-40^{\circ} \mathrm{C} \ldots+85^{\circ} \mathrm{C}$ |
| Humidity | Operating / Storage: 100 \% r. H. with condensation |

| Parameter | Value |
| :---: | :---: |
| Air pressure | Operating: $\begin{aligned} & \text {-1000 m .... } 5000 \mathrm{~m}(1080 \mathrm{hPa} \ldots 620 \mathrm{hPa}) \\ & >2000 \mathrm{~m}(<795 \mathrm{hPa}): \end{aligned}$ <br> - Max. operating temperature must be reducted by 10 K for each 1000 m exceeding 2000 m <br> - I/O module relay contacts must be operated with 24 V nominal only |
| Immunity to corrosive gases | Yes, according to: <br> ISA S71.04.1985 Harsh group A, G3/GX IEC60068-2-60 <br> Method 4 with following concentrations: <br> - H2S $100 \pm 10 \mathrm{ppb}$ <br> - NO2 $1250 \pm 20 \mathrm{ppb}$ <br> - CL2 $100 \pm 10 \mathrm{ppb}$ <br> - SO2 $300 \pm 20 \mathrm{ppb}$ |
| Immunity to salt mist | Yes, horizontal mounting only, according to IEC 60068-2-52 severity level: 1 |

## NOTICE!

Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices ² Chapter 5.2.8.3.6 "TA535 - Protective caps for XC devices" on page 1332.

## NOTICE!

## Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating $\Longleftrightarrow$ Chapter 5.2.8.2.4 "TA524
- Dummy communication module" on page 1323.
- I/O bus connectors must not be touched during operation.

### 5.1.3.2 Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

### 5.1.3.3 Power supply units

AC500 and AC500-eCo PLC devices are Class II/Class III devices and do not require a Protective Earth (PE) connection.
For proper EMC performance, all metal parts, DIN rails, mounting screws, and cable shield connection terminals are connected to a common ground and provide Functional Earth (FE). This is typically connected to a common reference potential, such as equipotential bonding rails.
Signal Grounds (SGND or GND) are used for signal reference and must not be connected to cable shields, FE or other signals unless otherwise specified in the specific device description.

Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)
To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 $V$ DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

## WARNING!

Improper installation can lead to death by touching hazardous voltages!
To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

### 5.1.3.6 Approvals and certifications

The PLC Automation catalog contains an overview of the available approvals and certifications.

### 5.1.4 AC500-S

Functional The AC500-S safety user manual must be read and understood before using the safety configusafety ration and programming tools of Automation Builder/PS501 Control Builder Plus. Only qualified personnel are permitted to work with AC500-S safety PLCs.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S/SM560-S-FD-1/SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

### 5.1.5 CP600

The technical data of the CP600 control panels are included in the CP600 data sheets.

### 5.2 Device specifications

### 5.2.1 Processor modules

### 5.2.1.1 AC500-eCo

5.2.1.1.1 PM50x2

Features

Fig. 28: Example: PM5072-T-2ETH
1 Micro memory card slot
25 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
3 RUN button
4 RJ45 female connector for Ethernet1 connection
5 RJ45 female connector for Ethernet2 connection (available for PM50x2-T-2ETH)
6 3-pin terminal block for power supply 24 V DC
72 holes for screw mounting
8 Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9 Cable fixing
10 13-pin terminal block for onboard I/Os
11 12-pin terminal block for onboard I/Os (not available on PM5012-x-ETH)
1212 LEDs to display the states of the signals
1310 LED s to display the states of the signals
14 Cable fixing accessory TA5301-CFA on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable fixing accessory on the top of the housing is optional.
Please use TA5301-CFA cable fixing accessory to provide strain relief.
It can also be used for AC500-eCo I/O modules.

The PM50x2 processor modules are supplied with option board slot covers as standard.

There are various TA51xx option boards for the processor modules that can be ordered separately.
Which and how many option boards can be plugged, depends on the respective processor module.

Table 27: AC500-eCo V3 CPUs with their most important properties

## Short description

The processor modules PM50x2 series are the central units of AC500-eCo V3 PLC. Their main characteristics are:

- Power supply 24 V DC
- I/O bus (not for PM5012-x-ETH)
- Real-time clock (PM5012-x-ETH needs additional RTC option board)
- Option board slots for extension on the CPU (1 for PM5012-x-ETH, 2 for PM5032-x-ETH, 3 for PM5052-x-ETH and PM50x2-T-2ETH)
- 6 digital inputs (PM5012-x-ETH), 12 digital inputs (PM5032-x-ETH, PM5052-x-ETH, PM50x2-T-2ETH)
- 4 transistor outputs (PM5012-T-ETH), 8 transistor outputs (PM5032-T-ETH, PM5052-T-ETH, PM50x2-T-2ETH)
- 4 relay outputs (PM5012-R-ETH), 6 relay outputs (PM5032-R-ETH, PM5052-R-ETH)
- 2 configurable digital inputs/outputs (not for PM5012-x-ETH)

The various processor module variants differ in the following characteristics:

- Type of the digital outputs (transistor or relays)
- Ethernet interface one or two independent interfaces

All processor module variants include a micro memory card slot.
Details and technical data are provided in the technical data section $\Leftrightarrow$ Chapter 5 .2.1.1.1.8
"Technical data" on page 188.

## Connections and interfaces

## General

I/O bus

Option board slot interface

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128 Bytes input/ 128 Bytes output variables) and 10 I/O modules for PM5052-x-ETH and PM50x2-T-2ETH can be added.

Depending on the processor module variants, an additional option board can be connected to the option board slot to extend the feature of the processor module.
② Chapter 5.2.1.1.3 "Option boards" on page 218

Serial interface RS-232 communication interface is available by using option board:

- TA5141-RS232I (isolated)

② Chapter 5.2.1.1.3.9 "TA5141-RS232I - Option board for COMx serial communication" on page 285

RS-485 communication interface is available by using option boards:

- TA5142-RS485I (isolated)
(4) Chapter 5.2.1.1.3.10 "TA5142-RS485I - Option board for COMx serial communication" on page 289
- TA5142-RS485 (non isolated)

## Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 processor modules.
Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).
Available serial interfaces can work as Modbus interfaces simultaneously.
The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

## Technical data Table 29: Description of the Modbus protocol

| Parameter | Value |
| :--- | :--- |
| Supported standard | Modbus RTU Server, Modbus RTU Client <br> ( Chapter 6.3.2.14.2 "Configuring Modbus <br> RTU on serial interface" on page 1588 |

Bus topology
Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.
凶 Chapter 6.8.2.9 "Communication with Modbus RTU" on page 4506

## Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 30: Removable terminal block for the supply voltage 24 V DC

| 3-pin spring terminal block | 3-pin screw terminal block |

|  |  |  |  |  |  |

## NOTICE!

## Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data and the technical data of the used module.

## State LEDs and operating elements

RUN/STOP The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

State LEDs The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

| LED | State | Color | LED = ON | LED = OFF | LED flashing |
| :--- | :--- | :--- | :--- | :--- | :--- |
| PWR | Power supply | Green | Power supply <br> present | Power supply <br> missing | - |

|  |  |  |  |  |  |

User configurable LEDs

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.
The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

I/O LEDs
The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH,

PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH) to display the states of the inputs and outputs.

| Processor <br> module | LED | State | Color | LED = ON | LED = OFF |
| :--- | :--- | :--- | :--- | :--- | :--- |

## Ethernet state LEDs

Table 31: State LEDs at Ethernet connector

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| Activity | Yellow | No activity | --- | Activity |
| Link | Green | No link | Link | --- |

## Diagnosis

The AC500 processor module can display various errors according to the error classes. The following error classes are possible. The reaction of the processor module is different for each type of error.

| Error class | Type | Description | Example |
| :--- | :--- | :--- | :--- |
| E1 <br> ERR-LED is ON | Fatal error | A safe function of the operating <br> system is no longer guaranteed. | Checksum error in the system <br> Flash or RAM error |
| ERR-LED is ON | Severe error | The operating system is func- <br> tioning without problems, but the <br> error-free processing of the user <br> program is no longer guaranteed. | Checksum error in the user <br> Flash, independent of the task <br> duration |
| E3 <br> ERR-LED is ON/OFF <br> $*$ | Light error | It depends on the application <br> if the user program should be <br> stopped by the operating system <br> or not. The user should deter- <br> mine which reaction is necessary. | Flash could not be pro- <br> grammed, I/O module has <br> failed |
| E4 <br> ERR-LED is ON/OFF <br> $*$ | Warning | Error in the periphery (e.g. I/O) <br> which may show an impact in <br> the future. The user should deter- <br> mine which reaction is necessary. | Short-circuit at an I/O module, <br> the battery is run down or not <br> inserted |
| *) The behaviour if the ERR-LED lights up at error classes E3 or E4 is configurable. |  |  |  |

Occurred errors can be displayed with the commands diagshow all in the PLC-Browser of
Automation Builder software.

## Technical data

The system data of AC500-eCo V3 apply ${ }^{\Perp}$ Chapter 5.1.1 "System data AC500-eCo" on page 159

Only additional details are therefore documented below.

| General data | Parameter | Value |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | PM5012 | PM5032 | PM5052 | PM5072 | PM5082 |
|  | Power supply | 24 V DC |  |  |  |  |
|  | Connection of power supply | Via removable 3-pin terminal |  |  |  |  |
|  | Current consumption from power supply (max.) |  |  |  |  |  |
|  | Transistor version | 200 mA | 340 mA | 400 mA | 420 mA | 420 mA |
|  | Relay version | 200 mA | 340 mA | 400 mA | - | - |
|  | Melting integral of a fuse at 24 V DC | $0.9 \mathrm{~A}^{2} \mathrm{~s}$ |  |  |  |  |
|  | Peak inrush current from 24 V DC | 65 A |  |  |  |  |
|  | Max. power dissipation within the processor module |  |  |  |  |  |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering Data

Processor modules for AC500-eCo V3 products

To enable better product availability into the production and to provide some new features, a revision of the existing AC500-eCo V3 processor module was necessary. The existing AC500eCo V3 processor module with rubric R007x will move to classic and will be replaced by compatible new AC500-eCo V3 processor module revision 1 with rubric R017x.

For example: The processor module revision 1 PM5012-T-ETH (1SAP122 600 R0172) replaces the existing processor module PM5012-T-ETH (1SAP 122600 R0072) and provides the same features or functionality of the previous ones.

Following points must be considered with the processor module revision 1:

- The processor module revision 1 (R017x) requires a new BootFW / CPUFW from V3.6.x and higher.
- It cannot be downgraded and used with lower FW versions than V3.6.0.
- The processor module revision $1(R 017 x)$ provides the same features as the processor module (R007x) existing today and is fully compatible.
- An existing application using a processor module (R007x) built with

Automation Builder < 2.6 can run on a processor module revision 1 (R017x) but the application must be upgraded to at least $A B 2.6 .0$ or higher.

What must be done using a new processor module revision 1 (R017x)?

- On a new application?
- Just use the processor module revision 1 (R017x)
- Use the latest Automation Builder Software from 2.6.0 or higher.
- On an existing application using an Automation Builder software version smaller than 2.6.0?
- To use a processor module revision 1 in an existing application (e.g., replacement of the processor module), the application must be upgraded to at least AB 2.6.0 or higher.
- If several processor module (revision 1 and revision 0 ) are used within the same project, all the processor modules used in the same application must be upgraded to the FW Version V3.6.x and higher.

### 5.2.1.1.2 Onboard I/Os in processor module PM50x2

## Functionality

The AC500-eCo V3 processor modules PM50x2 have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

With the processor modules revision 1 (rubric R017x), the fast output channels provides up to 4 PTO pulse/direction with up to 200 kHz (rubric R007x, only 100 kHz ). The processor modules revision 1 are supported from $A B 2.6 .0$ and the $A B$ software automatically recognizes the used processor module.

## Connections

## General

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

When replacing a processor module, it is recommended to mark each wire connected to the onboard I/O terminal block before disconnecting it. This should make sure that the wires can be reconnected in the same order.

The connection is carried out by using removable 12-pin and 13-pin terminal blocks.

Table 34: Assignment of the terminals for PM5012-T-ETH:

| Terminal | Signal | Description |

## Connection of the digital inputs

The digital inputs can be used as source inputs or as sink inputs.

## - NOTICE!

## Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 39: Connection of the digital inputs to the PM50x2 processor modules

## Connection of the digital transistor outputs (PM50xx-T-xETH only)

Fig. 29: Connection of digital transistor outputs and configurable digital inputs/outputs
C12 used as configurable digital input
C13 used as configurable digital transistor output

## CAUTION!

## Risk of damaging the processor module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for each output.

The configurable digital channels (C12 and C13) used as digital inputs have the same electrical characteristics as standard digital inputs.

The configurable digital channels (C12 and C13) used as digital transistor outputs have the same electrical characteristics as standard digital outputs.

## Connection of the digital relay outputs (PM50xx-R-ETH only)

Fig. 30: Connection of digital relay outputs and configurable digital inputs/outputs
C12 used as configurable digital input
C13 used as configurable digital transistor output

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## CAUTION!

## Risk of damaging the processor module!

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V . All outputs must be fed from the same phase.
- Use an external fuse for each output.

> The configurable digital channels (C12 and C13) used as digital inputs have the same electrical characteristics as standard digital inputs.
> The configurable digital channels (C12 and C13) used as digital transistor outputs have the same electrical characteristics as standard digital outputs.

## I/O configuration

The configuration data of the onboard I/Os is stored in the processor modules PM50x2.
Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

## Parameterization

For information about parameterization, refer to the configuration description for onboard I/Os for processor modules PM50x2.

* "Basic CPU: PM5012-x-ETH" on page 1484

を, "Standard CPU: PM5032-x-ETH, PM5052-x-ETH Pro CPU: PM5072-T-2ETH, PM5082-T-2ETH" on page 1486

## Diagnosis

No diagnosis is generated for the onboard I/O.
There is only an error message if the configuration does not work. A log entry is generated. The Automation Builder already prevents faulty values from being entered in the configuration. If the configuration does not work, there is a system error, if e.g. faulty software or wrong versions are installed.
Otherwise there are error messages from the blocks for the individual functions.

## State LEDs

Table 40: States of the I/Os

| LED | Status | Color | LED $=$ ON | LED = OFF |
| :--- | :--- | :--- | :--- | :--- |
| I | Digital input | yellow | Input is ON | Input is OFF |
| O | Digital transistor output | yellow | Output is ON | Output is OFF |
| NO | Digital relay output | yellow | Relay contact is <br> closed | Relay contact is <br> open |
| C | Digital configurable <br> input/output | yellow | Configured input// <br> output is ON | Configured input/ <br> output is OFF |

## Technical data of the fast counter inputs

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.
The fast counter functionality can be activated within the onboard I/O configuration.
The fast counter can work in pulse/direction mode or A/B track counter mode.
\& Further information about the operating modes of the fast counter
(4) Further information about the configuration of the fast counter

As AC500-eCo V3 PLCs provide the fast counters via their onboard I/Os not only the correct power distribution to the PLC has to be made, but also the correct wiring to the signal wires. How to connect and use fast counters in AC500-eCo V3 PLCs is described in an application example.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.

| Rated current per channel (max.) | 0.5 A at UP 24 V DC (resistance, general use and pilot duty) |
| Rated current per group (max.) | 4 A |
| Rated current (all channels together, max.) | 4 A |
| Max. leakage current with signal 0 | 0.5 mA |
| Demagnetization when inductive loads are switched off | Must be performed externally according to driven load specification |
| Switching Frequencies |  |
| With inductive loads | On request |
| Short-circuit-proof / Overload-proof | No |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Max. cable length *) |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Shielded | 500 m |
|  | Unshielded | 150 m |

*) For PWM and PTO outputs, a shielded cable must be used.

## Technical data of the digital relay outputs

Table 45: PM5012-R-ETH

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 normally-open relay outputs |
| Distribution of the channels into groups | 2 groups for 2 channels |
| Galvanic isolation | Yes, per group |
| Connection of the channels NO 0 to NO 1 | Terminals 8 to 9 |
| Connection of the channels NO2 to NO3 | Terminals 11 to 12 |
| Reference potential R0.. 1 for the channels NOO to NO1 | Terminal 10 |
| Reference potential R2. 3 for the channels NO2 to NO3 | Terminal 13 |
| Relay output voltage |  |
| Rated value | $\begin{aligned} & 24 \mathrm{~V} \text { DC or } \\ & 100 \mathrm{~V} \mathrm{AC} \mathrm{...} 240 \mathrm{~V} \mathrm{AC} \\ & 50 \mathrm{~Hz} / 60 \mathrm{~Hz} \end{aligned}$ |
| Range | $5 \mathrm{~V} \text { DC ... } 30 \mathrm{~V} \text { DC }$ <br> or $5 \mathrm{~V} \text { AC ... } 250 \mathrm{~V} \text { AC }$ |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) |
| Way of operation | Non-latching type |
| Output delay |  |
| 0 to 1 | Typ. 10 ms |
| 1 to 0 | Typ. 10 ms |
| Output current |  |
| Rated current per channel (max.) | 2.0 A (24 V DC resistance and general use, 100 V AC ... 240 V AC, resistance, general use and pilot duty) |
| Rated current per group (max.) | 6 A |
| Rated current (all channels together, max.) | 12 A |
| Demagnetization when inductive loads are switched off | External demagnetization measures must be implemented when switching inductive loads. |
| Spark suppression with inductive AC loads | Must be performed externally according to driven load specification |
| Switching frequencies |  |
| With resistive loads | Max. 1 Hz |
| With inductive loads | On request |

| Parameter |  |
| :--- | :--- |
| With lamp loads | On request |
| Short-circuit-proof / Overload-proof | No, should be provided by an external fuse <br> or circuit breaker |
| Rated protection fuse (for each channel) | 5 A fast |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Lifetime of relay contacts (cycles) | 100,000 at rated load |
| Max. cable length *) |  |
| Shielded | 500 m |
| Unshielded | 150 m |

*) For PWM and PTO outputs, a shielded cable must be used.

Table 46: PM5032-R-ETH and PM5052-R-ETH

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 6 normally-open relay outputs |
| Distribution of the channels into groups | 2 groups for 3 channels |
| Galvanic isolation | Yes, per group |
| Connection of the channels NO 0 to NO 2 | Terminals 14 to 16 |
| Connection of the channels NO3 to NO5 | Terminals 18 to 20 |
| Reference potential R0.. 2 for the channels NOO to NO2 | Terminal 17 |
| Reference potential R3.. 5 for the channels NO3 to NO5 | Terminal 21 |
| Relay output voltage |  |
| Rated value | $\begin{aligned} & 24 \mathrm{~V} \text { DC or } \\ & 100 \mathrm{~V} \mathrm{AC} \mathrm{...} 240 \mathrm{~V} \mathrm{AC} \\ & 50 \mathrm{~Hz} / 60 \mathrm{~Hz} \end{aligned}$ |
| Range | $\begin{aligned} & 5 \mathrm{~V} \text { DC ... } 30 \vee \mathrm{DC} \\ & \text { or } \\ & 5 \mathrm{~V} \mathrm{AC} \ldots 250 \vee \mathrm{AC} \end{aligned}$ |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered through the I/O bus |
| Way of operation | Non-latching type |
| Output delay |  |
| 0 to 1 | Typ. 10 ms |
| 1 to 0 | Typ. 10 ms |
| Output current |  |
| Rated current per channel (max.) | 2.0 A (24 V DC resistance and general use, 100 V AC ... 240 V AC, resistance, general use and pilot duty) |
| Rated current per group (max.) | 6 A |

| Parameter |  |
| :--- | :--- |
| Rated current (all channels together, max.) | 12 A |
| Demagnetization when inductive loads are <br> switched off | External demagnetization measures must be <br> implemented when switching inductive loads. |
| Spark suppression with inductive AC loads | Must be performed externally according to <br> driven load specification |
| Switching frequencies | Max. 1 Hz |
|  | With resistive loads |
| With inductive loads | On request |
| With lamp loads | On request |
| Short-circuit-proof / Overload-proof | No, should be provided by an external fuse <br> or circuit breaker |
| Rated protection fuse (for each channel) | 5 A fast |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Lifetime of relay contacts (cycles) | 100,000 at rated load |
| Max. cable length *) | 500 m |
| Shielded | 150 m |
| Unshielded |  |

${ }^{*}$ ) For PWM and PTO outputs, a shielded cable must be used.

## Technical data of the limit switch outputs

| Parameter | PM5012-T-ETH | PM5012-R-ETH | $\begin{aligned} & \text { PM5032-T-ETH } \\ & \text { PM5052-T-ETH } \\ & \text { PM5072- } \\ & \text { T-2ETH(W) } \\ & \text { PM5082- } \\ & \text { T-2ETH } \end{aligned}$ | PM5032-R- <br> ETH <br> PM5052-R- <br> ETH |
| :---: | :---: | :---: | :---: | :---: |
| Limit switch |  |  |  |  |
| Useable outputs | 4 | - | 8 | 2 |
| Fast output max. 5 kHz | O0 ... O3 | - | O0 ... O3 | - |
| Fast output, max. 100 kHz | - | - | O4 ... O7 | C12 ... C13 |

Technical data of the PTO outputs

| Parameter | PM5012-T-ETH | PM5012-R-ETH | $\begin{aligned} & \text { PM5032-T-ETH } \\ & \text { PM5052-T-ETH } \\ & \text { PM5072- } \\ & \text { T-2ETH(W) } \\ & \text { PM5082- } \\ & \text { T-2ETH } \end{aligned}$ | PM5032-R- <br> ETH <br> PM5052-R- <br> ETH |
| :---: | :---: | :---: | :---: | :---: |
| PTO |  |  |  |  |
| Useable outputs | - | - | 4 | $1$ pair of output |
| Fast output, max. up to 200 kHz ${ }^{2}$ ) | - | - | O4 ... O7 <br> For 2 PTO 200 kHz ${ }^{1}$ ) Pulse/ Direction or CC/Ccw modes as pair of outputs | C12 ... C13 |
|  |  |  | O4 ... 07 <br> as 4 PTO up to 200 kHz Pulse outputs / Direction using fast output 5 kHz O0...O3 ${ }^{2}$ ) |  |

${ }^{1}$ ) If the load is less than 100 mA it is strongly recommended to connect an additional load resistor ( $240 \Omega / 5 \mathrm{~W}$ or $270 \Omega / 5 \mathrm{~W}$ ) to the output to improve the pulse signal.
${ }^{2}$ ) With the processor modules revision 1 (rubric R017x), the fast output provides then 200 kHz PTO Pulse output instead of 100 kHz . The processor modules revision 1 needs at least AB 2.6.0 and higher.

## Technical data of the PWM outputs

| Parameter | PM5012-T-ETH | PM5012-R-ETH | $\begin{aligned} & \text { PM5032-T-ETH } \\ & \text { PM5052-T-ETH } \\ & \text { PM5072- } \\ & \text { T-2ETH(W) } \\ & \text { PM5082- } \\ & \text { T-2ETH } \end{aligned}$ | PM5032-R- <br> ETH <br> PM5052-R- <br> ETH |
| :---: | :---: | :---: | :---: | :---: |
| PWM |  |  |  |  |
| Useable outputs | 4 | - | 8 | 2 |
| Fast output max. 5 kHz | O0 ... O3 | - | O0 ... O3 | - |
| Fast output, max. 100 kHz | - | - | O4... O7 | C12 ... C13 |

### 5.2.1.1.3 Option boards

## TA5101-4DI - Digital input option board

## Features

- 4 digital inputs 24 V DC (IO to I 3 ) in 1 group
- Module-wise galvanically isolated
- W variant available for use in extended (wide) temperature range

14 yellow LEDs to display the signal states at the digital inputs IO to I3
2 Allocation of signal name
3 5-pin terminal block for input signals

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).
The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via internal CPU connection |
| External power supply | Not necessary |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 5-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

Fig. 31: Internal construction of the digital inputs
Table 47: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | COM 0..3 | Input common for signals IO to I3 |
| 2 | I0 | Input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | I2 | Input signal I2 |
| 5 | I3 | Input signal I3 |

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by 10 mA per TA5101-4DI.

An external power supply connection is not needed.

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The digital inputs can be used as source inputs or as sink inputs.

## NOTICE!

## Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 48: Connection of the option board for digital I/O extension TA5101-4DI

The module provides several diagnosis functions $\Leftrightarrow$ "Diagnosis" on page 221.
The meaning of the LEDs is described in the section 'State LEDs' «"State LEDs" on page 221.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA51xx Parameters" tab to edit the parameterization of the desired option board.

| 日月 TA5101＿4DI $\times$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Spare parts <br> 1SAP 187 400 R0012 <br> * <br> TA5220-SPF5: spring terminal block, <br> removable, 5-pin, spring front, cable <br> front, 6 pieces per packing unit Active |  |  |

## *) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

$\left.{ }^{* *}\right)$ The needed spring terminal block is always delivered with the option board.
The terminal block listed in the table is for spare part only if needed.

## TA5105-4DOT - Digital output option board

## Features

- 4 digital outputs 24 V DC ( O 0 to O 3 ) in 1 group
- Module-wise galvanically isolated
- W variant available for use in extended (wide) temperature range

14 yellow LEDs to display the signal states at the digital outputs $\mathrm{O} 0 \ldots \mathrm{O} 3$
2 Allocation of signal name
3 7-pin terminal block for output signals

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).
The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via internal CPU connection |
| External power supply | Via the terminals ZP and UP (process supply <br> voltage 24 V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

Fig. 32: Internal construction of the digital outputs
Table 51: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | NC | Not connected |
| 2 | O0 | Output signal O0 |
| 3 | O1 | Output signal O1 |
| 4 | O2 | Output signal O2 |
| 5 | O3 | Output signal O3 |
| 6 | UP | Process supply voltage UP +24 V DC |
| 7 | ZP | Process supply voltage ZP 0 V DC |

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by 10 mA per TA5105-4DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP ( 0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

Fig. 33: Connection of the option board for digital I/O extension TA5105-4DOT

## - NOTICE!

- Risk of malfunctions in the plant!

Only if $L+/ M$ of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.

This must be considered in the application planning.

## NOTICE! <br> Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

The module provides several diagnosis functions $\stackrel{y}{ } \stackrel{y}{c}$ Further information on page 227.
The meaning of the LEDs is described in the section State LEDs "State LEDs" on page 228.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA51xx Parameters" tab to edit the parameterization of the desired option board.

## Diagnosis

1. In the device tree, double-click the desired option board.
2. Select the "Diagnosis" tab to view the diagnosis messages of the desired option board.

Table 52: Diagnosis messages

| Device | Severity | Error <br> code | Description |  |

| 1SAP 187 400 R0014 <br> *) | TA5220-SPF7: spring terminal block, <br> removable, 7-pin, spring front, cable <br> front, 6 pieces per packing unit | Active |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
${ }^{* *}$ ) The needed spring terminal block is always delivered with the option board.
The terminal block listed in the table is for spare part only if needed.

## TA5110-2DI2DOT - Digital I/O option board

## Features

- 2 digital inputs 24 V DC ( I 0 to I 1 ) in 1 group
- 2 digital transistor outputs 24 V DC ( O 0 to O 1 ) in 1 group
- Group-wise galvanically isolated
- W variant available for use in extended (wide) temperature range

12 yellow LEDs to display the signal states at the digital outputs O 0 to O 1
22 yellow LEDs to display the signal states at the digital inputs IO to I1
3 Allocation of signal name
4 7-pin terminal block for input/output signals

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).
The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via internal CPU connection |
| External power supply | Via the terminals ZP and UP (process supply <br> voltage 24 V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

Fig. 34: Internal construction of the digital inputs and outputs
Table 54: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | COM 0 $\ldots 1$ | Input common for signals IO to I1 |
| 2 | IO | Input signal I0 |
| 3 | I1 | Input signal I1 |
| 4 | O0 | Output signal O0 |
| 5 | O1 | Output signal O1 |
| 6 | UP | Process supply voltage UP +24 V DC |
| 7 | ZP | Process supply voltage ZP 0 V DC |

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by 10 mA per TA5110-2DI2DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 55: Connection for inputs of the option board for digital I/O extension TA5110-2DI2DOT

Fig. 35: Connection for outputs of the option board for digital I/O extension TA5110-2DI2DOT

## - NOTICE! <br> Risk of malfunctions in the plant!

Only if $L+/ M$ of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.
This must be considered in the application planning.

## NOTICE! <br> Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

The module provides several diagnosis functions $\stackrel{y}{ } \stackrel{y}{c}$ Further information on page 236.
The meaning of the LEDs is described in the section State LEDs "State LEDs" on page 236.

## I/O configurations

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA51xx Parameters" tab to edit the parameterization of the desired option board.

${ }^{* *}$ ) The needed spring terminal block is always delivered with the option board.
The terminal block listed in the table is for spare part only if needed.

## TA5120-2AI-UI - Analog input option board

## Features

- 2 configurable analog inputs ( I 0 and I 1 ) in 1 group

Resolution 12 bits including sign

- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range

1 Allocation of terminal and signal name
22 yellow LEDs to display the signal states at the analog inputs IO and I1
3 6-pin terminal block for analog input signals and power supply (UP, ZP)
4 Input connection diagram for $U$ and $I$

## Intended purpose

The option board is used as analog input extension module for AC500-eCo V3 CPUs (PM50xx).

The analog option boards TA5120-2AI-UI and TA5126-2AO-UI can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher.
Using the option boards with lower versions will create a configuration error and the CPU will not start.

## Functionality

2 analog inputs, individually configurable for

- Unused (default setting)
- 0 V ... 10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

| Parameter |  |
| :--- | :--- |
| Resolution of the analog channels |  |
|  | Value |
|  | Voltage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ |
|  | Current $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, |
| Current $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 12 bits |
| LED displays | 12 bits |
| Internal power supply | 12 bits |
| External power supply | 2 LEDs for signals I0 and I1 |
| Required CPU | Via the CPU PM50xx the terminals UP and ZP (process <br> voltage 24 V DC) |

## Connection

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5120-2AI-UI for analog input extension is plugged into an AC500-eCo V3 processor module PM50xx.
Chapter 4.3.11.1 "Mounting and demounting the option boards" on page 127
The electrical connection is made via a removable 6-pin terminal block.
he terminal block is included in the scope of delivery of the option board. Further terminal blocks can be ordered separately as spare parts.
ⓨ Chapter 5.2.8.1.2 "TA52xx (-x) - Terminal block sets" on page 1292

Table 59: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | I0+ | Positive analog input IO |
| 2 | I0- | Negative analog input IO |
| 3 | I1+ | Positive analog input I1 |
| 4 | I1- | Negative analog input I1 |
| 5 | UP | Process voltage UP = +24 V DC |
| 6 | ZP | Process voltage ZP = 0 V DC |

## CAUTION!

The negative terminal of the analog inputs (voltage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ ) are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP. Hence, analog inputs can not be connected in series.

The internal power supply of the circuits of the module takes place via the connection to the CPU. Thus, the current consumption from 24 V DC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by $\ll 1 \mathrm{~mA}$ per TA5120-2AI-UI.
The external power supply is connected via the terminals UP (+24 V DC) and ZP ( $0 \vee \mathrm{DC}$ ).

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:

Fig. 36: Internal construction of the analog inputs

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The option board provides several diagnosis functions.

* Chapter 5.2.1.1.3.4.8 "Diagnosis" on page 248

Connection of active-type analog sensors (Voltage) with galvanically iso- $U_{I N}$ lated power supply

By connecting the sensor's negative terminal of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to $Z P$.

Table 60: Configurable measuring ranges for TA5120-2AI-UI

| Parameter | Value |
| :--- | :--- |
| Channel configuration | 0 V...+10 V |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

| Parameter | Value |
| :--- | :--- |
| Channel configuration | $0 \mathrm{~mA} \ldots+20 \mathrm{~mA}$ |
|  | or |
|  | $+4 \mathrm{~mA} \ldots+20 \mathrm{~mA}$ |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

## CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1 V , not even in case of long lines.

If AGND does not get connected to ZP, the sensor supply current flows to ZP via the AGND line. This current will distort the measuring signal, as a very small current flows through the AGND line. ZP connection should be close to the sensor. The total current through the PTC should not exceed 50 mA . This measuring method is therefore only suitable for short lines and small compensation currents via the AGND line.

| Parameter | Value |
| :--- | :--- |
| Channel configuration | 0 V...+10 V |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

Connection of passive-type analog sensors (current)

| Parameter | Value |
| :--- | :--- |
| Channel configuration | $0 \mathrm{~mA} \ldots+20 \mathrm{~mA}$ |
|  | or <br>  <br>  $4 \mathrm{~mA} ..+20 \mathrm{~mA}$ |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a $10-$ Volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

## I/O configuration

The option board itself does not store configuration data. It receives its parameterization from the CPU module during power-up of the system.

Hence, replacing option boards is possible without any re-parameterization via software.

| Parameter | Value |
| :--- | :--- |
| Configurability | $0 \mathrm{~V} . .10 \mathrm{~V}$ |
|  | $0 \mathrm{~mA} \ldots . .20 \mathrm{~mA}$ |
|  | $4 \mathrm{~mA} . .20 \mathrm{~mA}$ |
|  | (each input can be configured individu- <br> ally $)$ |
| Unused voltage inputs | Must be configured as "not used" |
| Unused current inputs | Must be configured as "not used" |

## Firmware update via memory card

The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB.
Direct from $A B B$ Software.
Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Firmware $\quad \checkmark$ Precondition: Prepared memory card with boot project and firmware $\Leftrightarrow$ Chapter update 6.3.1.4.5.2.2 "Preparation of memory card" on page 1427.

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
$\Rightarrow$ The alternate flashing of the RUN and the ERR LED indicates the running update process.
At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.
If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.
The text file "SDCARD.RDY" includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
$\Rightarrow$ The system starts with the new firmware.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA5120-2AI-UI Parameters" tab to edit the parameterization of the desired option board.

| TA5120-2AI-UI Parameters | Parameter <br> - Run on config fault | Type | Value | Default Value | Unit | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Technical data

The system data of AC500-eCo V3 apply ${ }^{\text {² }}$ Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminal 5 for +24 V (UP) as well as terminal 6 for 0 V (ZP) |
| Rated value | 24 V DC |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 1 A slow |
| Galvanic isolation | Yes, per module (no isolation between channels) |
| Current consumption |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | From 24 V DC power supply at the termi- <br> nals UP/L+ and ZP/M of the CPU PM50xx | $<1 \mathrm{~mA}$ |
|  | From UP at normal operation | max. 20 mA |
| Inrush current from UP (at power up) | $0.005 \mathrm{~A}^{2} \mathrm{~s}$ |  |
| Max. length of analog cables, conductor cross sec- <br> tion > 0.2 $\mathrm{mm}^{2}$ | On request |  |
| Weight | 20 g |  |
| Mounting position | Horizontal or vertical with derating |  |
| Cooling | The natural convection cooling must not <br> be hindered by cable ducts or other parts <br> in the control cabinet. |  |

## Technical data of the analog inputs

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 2 |
| Distribution of channels into groups | 1 group of 2 channels |
| Connections of the channel 0 |  |
| Voltage mode |  |
| Terminal 10+ and IO- | Terminals 1 and 2 |
| Current mode |  |
| Terminal IO+ and ZP | Termnal 1 and 6 |
| Connections of the channel 1 |  |
| Voltage mode |  |
| Terminal I1+ and I1- | Terminals 3 and 4 |
| Current mode |  |
| Terminal I1+ and ZP | Terminals 3 and 6 |
| Input type | Unipolar |
| Galvanic isolation | Yes, per option board (no isolation between channels) |
| Configurability | ```0 V... }10\mathrm{ V 0 mA... }20\textrm{mA 4 mA... }20\textrm{mA (each input can be configured individu- ally)``` |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ <br> Not used: > 100 k $\Omega$ |

| Parameter | Value |  |
| :---: | :---: | :---: |
| Time constant of the input filter | Voltage: $10 \mu \mathrm{~s}$ Current: $10 \mu \mathrm{~s}$ |  |
| Indication of the input signals | 1 LED per channel |  |
| Conversion cycle *) |  |  |
| 1 activated channel | 1 ms |  |
| 2 activated channel | 2 ms |  |
| Resolution for all configurations | 12 bits |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Max. | $\pm 0.3 \%$ at $+25^{\circ} \mathrm{C}$ |
|  | Max. | $\pm 0.5 \%$ over full temperature range |
| Temperature coefficient <br> (is related to the max error at $+25^{\circ} \mathrm{C}$ and max error in the full range) | $\pm 0.005$ \%/K |  |
| Temporary deviation during EMC disturbance | Max. | $\pm 1$ \% |
| Mapping between input signal and digital value | Input ranges of voltage and current |  |
| Unused voltage inputs | Must be configured as "not used" |  |
| Unused current inputs | Must be configured as "not used" |  |
| Overvoltage protection | Yes |  |

${ }^{*}$ ) The value is the sampling time on the option board. The complete conversion cycle time is also related to the CPU cycle time.

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1SAP 187 100 R0001 | TA5120-2AI-UI: AC500-eCo V3, <br> analog input option board, 2AI U/I, 12 <br> bits, spring/cable front terminal 3.50 <br> mm pitch | Active |

#### Abstract

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

$\left.{ }^{* *}\right)$ The needed spring terminal block is always delivered with the option board.
The terminal block listed in the table is for spare part only if needed.

## TA5123-2AI-RTD - Analog input option board

## Features

- 2 configurable analog inputs ( 10 and I1) in 1 group

Resolution 16 bits including sign

- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range

1 Allocation of signal name
22 yellow LEDs to display the signal states at the analog inputs 10 and I1
3 8-pin terminal block for analog input signals and power supply (UP, ZP)

## Intended purpose

The option board is used as analog input extension module for AC500-eCo V3 CPUs (PM50xx).

The analog option board TA5123-2AI-RTD can only be used from AB 2.6.0, SystemFW 3.6.0, BootFW 3.6 and higher.
Using the option board with lower versions will create a configuration error and the CPU will not start.

## Functionality

2 analog inputs, individually configurable for

- Unused (default setting)
- Pt100, $-50^{\circ} \mathrm{C} . . .+400^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+130^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+130^{\circ} \mathrm{C}$ (3-wire)
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt1000, $-50^{\circ} \mathrm{C} . . .+400^{\circ} \mathrm{C}$ (3-wire)
- Ni1000, $-50^{\circ} \mathrm{C} . . .+150^{\circ} \mathrm{C}$ (2-wire)
- Ni1000, $-50^{\circ} \mathrm{C} . . .+150^{\circ} \mathrm{C}$ (3-wire)
- NTC (2-wire)

| Parameter | Value |
| :--- | :--- |
| Resolution of the analog channels |  |
|  | Temperature |
| LED displays | $0.1^{\circ} \mathrm{C}$ |
| Internal power supply | 2 LEDs for signals I0 and I1 |
| External power supply | Via the CPU PM50xx <br> voltage terminals UP and ZP (process <br> Required CPU |

## Connections

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5123-2AI-RTD for analog input extension is plugged into an AC500-eCo V3 CPU PM50x2.

Insert the module and press it until it locks into place.

## A detailed description of the assembly and disassembly of the module can be found in the chapter Mounting and demounting option boards.

② Chapter 4.3.11.1 "Mounting and demounting the option boards" on page 127

The electrical connection is made via a removable 8-pin terminal block. For more information, please refer to the chapter TA52xx(-x) - Terminal block sets.

The terminal block is included in the scope of delivery of the option board.
Further terminal blocks can be ordered separately as spare parts.

Table 64: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | IOA | Connection for 3-wire measurement of the analog input <br> IO |
| 2 | IO+ | Positive analog input IO |
| 3 | I0- | Negative analog input I0 |
| 4 | I1A | Connection for 3-wire measurement of the analog input <br> I1 |
| 5 | I1+ | Positive analog input I1 |
| 6 | I1- | Negative analog input I1 |
| 7 | UP | Process voltage UP $=+24 \mathrm{VDC}$ |
| 8 | ZP | Process voltage ZP $=0 \mathrm{~V}$ |

## CAUTION!

The negative terminal of the analog inputs are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP. Hence, analog inputs can not be connected in series.

The internal power supply of the circuits of the module takes place via the connection to the CPU. Thus, the current consumption from 24 VDC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by << 1 mA per TA5123-2AI-RTD.
The external power supply is connected via the UP (+24 VDC) and the ZP ( 0 VDC ) terminals.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following block diagram shows the internal construction of the analog inputs:

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The module provides several diagnosis functions, see section Diagnosis.
The meaning of the LEDs is described in the section State LEDs.

## Connection of resistance thermometers in 2wire configuration

Fig. 37: Connection example
The following measuring ranges can be configured $\Longleftrightarrow$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Parameter | Resistance thermometers | Value |
| :--- | :--- | :--- |
| Channel configuration | Pt100 | $-50{ }^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ |
|  |  | $-50^{\circ} \mathrm{C} \ldots+130{ }^{\circ} \mathrm{C}$ |
|  | Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ |
|  | Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ |
|  | NTC | $803 \Omega \ldots 100 \mathrm{k} \Omega$ |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

## Connection of resistance thermometers in 3wire configuration

Fig. 38: Connection example

| Parameter | Resistance thermometers | Value |
| :--- | :--- | :--- |
| Channel configuration | Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ |
|  |  | $-50^{\circ} \mathrm{C} \ldots+130^{\circ} \mathrm{C}$ |
|  | Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ |
|  | Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ |

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means to have all the involved conductors in the same cable. All the conductors must have the same cross section.
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "not used".

## I/O configuration

The option board itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing option boards is possible without any re-parameterization via software.
ⓨ Further information to the option board.

## Firmware update via memory card

The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB.

Direct from ABB Software.
Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

| Firmware |  |
| :--- | :--- |
| update | $\checkmark$ Precondition: Prepared memory card with boot project and firmware ${ }^{4} \Rightarrow$ Chapter |
| 6.3.1.4.5.2.2 "Preparation of memory card" on page 1427. |  |

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
$\Rightarrow$ The alternate flashing of the RUN and the ERR LED indicates the running update process.
At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.

If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.

If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.
The text file "SDCARD.RDY" includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
$\Rightarrow$ The system starts with the new firmware.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA5123-2AI-RTD Parameters" tab to edit the parameterization of the desired option board.

3. The two inputs are set to "Not used" by default.

Select your 2 individually configurable analog inputs.
2. If you select Pt100 (2-wire), PT100 (3-wire), Pt100 (2-wire), PT100 (3-wire), NI1000 (2wire) or NI1000 (3-wire) by double-clicking, parameterization is completed.
If you select NTC (2-wire) by double-clicking, you still have to make further entries.
3. The following steps are only required for the NTC (2-wire) selection.

If you have selected NTC (2-wire) on input 0 (1) , a folder Input 0 (1) - R, T, B configuration appears.

## Data sheet of used NTC

Take the following values from the data sheet of the NTC used.

- Resistance at temperature $T[\Omega]$
- Temperature at resistance $R\left[{ }^{\circ} \mathrm{C}\right.$ ] (the reference temperature is usually $25^{\circ} \mathrm{C}$ )
- B [K] - The shape of the curve, represents the relationship between the resistance and the temperature of a particular thermistor.

4. Enter these values in the column "Value" in the respective cells R, T and B. Observe the correct units in the note.
When you have entered the 3 values with double-click, the parameterization is completed.
② Table 68 "Measuring range: NTC" on page 265

## Diagnosis

| TA5123-2AI-RTD Parameters | Start refresh Stop refresh Acknowledge Selected Alarms |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TA5123-2AI-RTD I/O Mapping | Type | Device | Timestamp | Severity | Error Code | Description | Additional Data |

| TA5123-2AI-RTD IEC Objects |  |  |  |  |  |  |  |
| Diagnosis |  |  |  |  |  |  |  |
| Information |  |  |  |  |  |  |  |

1. In the device tree, double-click the desired option board.
2. Select the "Diagnosis" tab to view the diagnosis messages of the desired option board.

The following table shows the diagnosis messages.

| Severity | Error | Description | Remedy |
| :---: | :---: | :---: | :---: |
| Option board error (Channel 255) |  |  |  |
| 3 | 3 | Timeout <br> Communication timeout to CPU | If the process voltage is connected properly, replace the option board. |
| 3 | 51 | Invalid slot <br> Wrong or missing option board in the appropriate slot | Check the configuration and the hardware setup. |
| 4 | 11 | Process voltage is too low | Check the process voltage. |
| 4 | 34 | Data not ready <br> Data synchronization warning | Check PLC program and synchronize. ${ }^{1}$ ) |
| 3 | 40 | SW-mismatch <br> Hardware does not match the firmware version | Replace the option board. |
| 3 | 53 | Download failed <br> Power loss during firmware update | Replace the option board. ${ }^{2}$ ) |
| 3 | 9 | DIAG_BUF_OVERFLOW Overflow in Diagnosis buffer | Diagnosis overflow usually means too many repeated warnings or errors. Please check all diagnosis in detail and take the appropriate action. A restart will clear the diagnosis. |
| 3 | 43 | DIAG_INTERNAL_ERR <br> Internal error in the option board | Replace the option board. |
| 3 | 26 | DIAG_CFG_PRM_ERR <br> Parameterization error | Check the CPU parameterization. |
| 3 | 19 | DIAG_CRC_ERR <br> Checksum error in option board | Replace the option board. |
| Channel warning |  |  |  |
| 4 | 5 | DIAG_HIGH_LEVEL NTC value too high | Check the NTC input and configuration. |
| 4 | 6 | DIAG_LOW_LEVEL NTC value too low | Check the input value and the wiring. |
| 4 | 7 | Lowest Level <br> Measurement underflow | Check the input value. |
| 4 | 47 | DIAG_WIRE_SHORTCUT <br> Short circuit at analog input | Check the wiring. |
| 4 | 48 | Overload Cut Wire Overflow or broken wire | Check the NTC input and configuration. |

Remarks:

| $\left.{ }^{1}\right)$ | If no other error occurs, the programs are not identical and the param- <br> eter is set to report an error in this case. |
| :--- | :--- |
| $\left.{ }^{2}\right)$ | Do not remove the power supply from the option board during the firm- <br> ware update. |

State LEDs

|  | LED | State | Color | LED = OFF | LED = ON | LED flashes |

## Variable measuring range

With the NTC, a resistance is measured. Depending on the values $R, T$ and $B$ a temperature value can be calculated, from which the digital values (dec. and hex.) are derived.
The following table shows an example with the default value:

- $\quad R=10000 \Omega$
- $\quad T=25^{\circ} \mathrm{C}$
- $\quad B=3435 K$

Table 68: Measuring range: NTC
$\begin{array}{|l|c|c|c|c|}\hline \text { Range/ } \\ \text { LED behavior }\end{array}$ Calculated value $\left.\begin{array}{c}\text { Measured value } \\ {[\Omega]}\end{array}\right)$

## Values written in italics

Values written in italics are variable and depend on the parameters $R, T$ and $B$.
Here, the default values are used (R: $10000 \Omega, \mathrm{~T}: 25^{\circ} \mathrm{C}, \mathrm{B}: 3435 \mathrm{~K}$ )

## Technical data

The system data of AC500-eCo V3 apply ${ }^{4}$ ) Chapter 5.1.1 "System data AC500-eCo" on page 159

Only additional details are therefore documented below.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals 7 for +24 V (UP) and 8 for 0 V (ZP) |
| Rated value | 24 V DC |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 1 A slow |
| Galvanic isolation | Yes, per module (no isolation between channels) |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU PM50x2 | < 1 mA |
| From UP at normal operation | max. 20 mA |
| Inrush current from UP (at power up) | $0.005 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section $\geq 0.2 \mathrm{~mm}^{2}$ | On request |
| Weight | 20 g |
| Mounting position | Horizontal or vertical |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

Technical data of the analog inputs

$\left.{ }^{* *}\right)$ The needed spring terminal block is always delivered with the option board.
The terminal block listed in the table is for spare part only if needed.

## TA5126-2AO-UI - Analog output option board

## Features

- 2 configurable analog outputs ( O 0 and O 1 ) in 1 group

Resolution 12 bits

- Option board is galvanically isolated
- W variant available for use in extended (wide) temperature range

1 Allocation of signal name
22 yellow LEDs to display the signal states at the analog outputs O0 and O1
3 -pin terminal block for analog output signals and power supply (UP, ZP)
4 Output connection diagram for U and I

## Intended purpose

The option board is used as analog output extension module for AC500-eCo V3 CPUs (PM50xx).

The analog option boards TA5120-2AI-UI and TA5126-2AO-UI can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher.
Using the option boards with lower versions will create a configuration error and the CPU will not start.

## Functionality

2 analog outputs, individually configurable for

- Not used (default setting)
- 0 V... 10 V
- $0 \mathrm{~mA} . .20 \mathrm{~mA}$
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage 0 V... 10 V | 12 bits |
| Current 0 mA ... 20 mA , | 12 bits |
| Current 4 mA ... 20 mA | 12 bits |
| LED displays | 2 LEDs for signals O0 and O1 |
| Internal power supply | Via the CPU PM50xx |
| External power supply | Via the terminals UP and ZP (process voltage 24 V DC) |
| Required CPU | PM50xx |

## Connections

## WARNING!

## Removal/Insertion under power

The option boards are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug option boards with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace an option board.

Disconnecting any powered option board while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The option board TA5126-2AO-UI for analog output extension is plugged into an AC500-eCo V3 CPU PM50xx.
$\Longleftrightarrow$ Chapter 4.3.11.1 "Mounting and demounting the option boards" on page 127
The electrical connection is made via a removable 6-pin terminal block.
The terminal block is included in the scope of delivery of the option board. Further terminal blocks can be ordered separately as spare parts
Chapter 5.2.8.1.2 "TA52xx(-x) - Terminal block sets" on page 1292

Table 69: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | O0+ | Positive analog output O0 |
| 2 | O0- | Negative analog output O0 |
| 3 | O1+ | Positive analog output O1 |
| 4 | O1- | Negative analog output O1 |
| 5 | UP | Process voltage UP $=+24$ V DC |
| 6 | ZP | Process voltage ZP = 0 V DC |

## CAUTION!

The negative terminal of the analog outputs (voltage $0 \mathrm{~V} . .10 \mathrm{~V}$ ) are connected internally and form an internal analog ground (AGND). This analog ground is connected to ZP via a PTC resistor. There is no galvanic isolation between the analog circuitry and ZP/UP.

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals $\mathrm{L}+$ and M of the CPU module increases by $\ll 1 \mathrm{~mA}$ per TA5126-2AO-UI.
The external power supply connection is carried out via the terminals UP (+24 V DC) and ZP (0 V DC).

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:

Fig. 39: Internal construction of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Configurability | $0 \mathrm{~V} . .10 \mathrm{~V}$ |
|  | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |
|  | $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ |
|  | (each input can be configured individu- |
| ally $)$ |  |
| Unused voltage outputs | Must be configured as "not used" |
| Unused current outputs | Must be configured as "not used" |

## Firmware update via memory card

The following steps describe the procedure for updating the firmware for the analog option boards using a memory card. Prerequisite is the previous download of the current firmware to the memory card either from the Automation Builder or as online download from ABB.
Direct from $A B B$ Software.
Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Firmware $\checkmark$ Precondition: Prepared memory card with boot project and firmware $\Rightarrow$ Chapter update 6.3.1.4.5.2.2 "Preparation of memory card" on page 1427.

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
$\Rightarrow$ The alternate flashing of the RUN and the ERR LED indicates the running update process.

At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.
If RUN LED blinks (ERR LED is off), the update was successful and the display shows done.
If ERR LED blinks (RUN LED is off), the update failed and the display shows FAIL.
The text file "SDCARD.RDY" includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
$\Rightarrow$ The system starts with the new firmware.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA5126-2AO-UI Parameters" tab to edit the parameterization of the desired option board.

| H0 TA5126_2AO_UI $\times$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TA5126-2AO-UI Parameters | Parameter <br> - Run on config fault | Type <br> Enumeration of BYTE | Value No | Default Value <br> No | Unit | Description |
| TA5126-2AO-UI I/O Mapping |  |  |  |  |  |  |
|  | - Check supply | Enumeration of BYTE | On | On |  | Check supply |
| I/0 mapping list | - Behaviour outputs at comm. error | Enumeration of BYTE | off | Off |  | Output value by communication error |
|  | - Output 0 , channel configuration | Enumeration of BYTE | Not used | Not used |  | Analog output 0-Configuration of analog output channel |

TA5130-KNXPB - Option board KNX address push button

## Features

- W variant available for use in extended (wide) temperature range

1 State LED
2 Allocation of signal name
3 Connector

## Intended purpose

This option board is only intended to be used with PM5072-T-2ETH(W) and PM5082-T-2ETH.

This option board can only be used once on one slot at a time!
The option board is not supported by other AC500-eCo V3 PLCs.
ⓨ Information about the interface to KNX

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA51xx Parameters" tab to edit the parameterization of the desired option board.

## State LEDs

## TA5141-RS232I - Option board for COMx serial communication

## Features

- W variant available for use in extended (wide) temperature range

12 LEDs for communication state display (TxD and RxD)
2 Allocation of signal name
3 5-pin terminal block for communication interface

Option board for COMx serial communication TA5141-RS232I(W) is equipped with 1 RS-232 serial interface with handshake.

The serial interface option boards TA5141-RS232I(W), TA5142-RS485I(W) and TA5142-RS485(W) produced from 2023 can only be used from AB 2.5.2, SystemFW 3.5.0_HF-7, BootFW 3.5.1 and higher. These new produced option boards can be recognized with the Date/Code printed on the sticker or also on the product packaging, the date code looks like $2 x x 3$, where 2 and 3 are for the year and the xx for the production week.
Using the option boards with lower versions will create a configuration error and the CPU will not start.
These new produced option boards cannot be used with lower Automation Builder Version and the CPU BootFW/FW and the application must be upgraded to $A B$ 2.5.2 HF8 or higher.
Application note AC500-eCo V3 - FAQ

## Connections

## Serial interfaces

## NOTICE! <br> Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V .

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142RS485I or TA5142-RS485.

Table 73: TA5141-RS232I

| Serial interface | Pin | Signal | Description |
| :--- | :--- | :--- | :--- |
|  | 1 | RTS | Request To Send <br> DCE is ready to accept data from the DTE |
|  | 2 | TxD | Transmit data (output) |
| 2 | 3 | GND | Common Ground |
|  | 4 | RxD | Receive data (input) |

Cable length The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

RS-232 for point-to-point connection:

| Parameter | Value |
| :--- | :--- |
| Transmission rate | $9.6 \mathrm{kBit} / \mathrm{s}$ to $115.2 \mathrm{kBit} / \mathrm{s}$ |
| Maximum cable length | On request |

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the "TA51xx Parameters" tab to edit the parameterization of the desired option board.

| TA5141-RS232I Parameters | Parameter <br> - Run on config fault | Type | Value | Default Value | Unit | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Information |  | Enumeration of BYTE | No | No |  | Start PLC program even on configuration fault |
|  | - Baudrate | Enumeration of DWORD | 19200 | 19200 | Bits/s | Set the baudrate in Bits per seconds |
|  | - Parity | Enumeration of BYTE | None | None |  | Set the parity Bit type |
|  | - Data Bits | Enumeration of BYTE | 8 | 8 | Bits/character | Set the character size |
|  | - Stop Bits | Enumeration of BYTE | 1 | 1 |  | Set the number of stop Bits per character 2 means 1,5 when character size is 5 Bits |
|  | - Flow control | Enumeration of BYTE | No flow control | No flow control |  | Flow control |

## State LEDs

| Signal | Color | State | Description |
| :--- | :--- | :--- | :--- |
| TxD | Yellow | ON (blinking) | Transmitting |
| RxD | Yellow | ON (blinking) | Receiving |

## Technical data

## Connections

## Serial interfaces

## NOTICE!

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!
If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V .

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142RS485I or TA5142-RS485.

Table 74: TA5142-RS485(I)

| Serial interface | Pin | Signal |
| :--- | :--- | :--- |
|  | 1 | A1 <br> internally connected to A2 |
|  | 2 | B1 <br> internally connected to B2 |
|  | 3 | GND |

Protocols

| No. | Protocol | Description |
| :--- | :--- | :--- |
| 1 | Modbus | Modbus RTU, master or slave |
| 2 | CAA SerialCom | Support for blocks contained in the CAA_SerialCom.lib library |

Bus cable

| Bus line |  |
| :--- | :--- |
| Construction | 2 cores, twisted, with common shield |
| Conductor cross section | $>0.22 \mathrm{~mm}^{2}(24$ AWG) |
| Twisting rate | $>10$ per meter (symmetrically twisted) |
| Core insulation | Polyethylene (PE) |
| Resistance per core | $<100 \Omega / \mathrm{km}$ |
| Characteristic impedance | ca. $120 \Omega(100 \Omega \ldots 150 \Omega)$ |
| Capacitance between the cores | $<55 \mathrm{nF} / \mathrm{km}$ (if higher, the max. bus length must be reduced) |
| Terminating resistors | $120 \Omega 1 / 4 \mathrm{~W}$ at both line ends |
| Remarks | Commonly used telephone cables with PE insulation and a <br> core diameter of $>0.8$ mm are usually sufficient. |
|  | Cables with PVC core insulation and core diameter of <br> $0.8 ~ m m ~ c a n ~ b e ~ u s e d ~ u p ~ t o ~ a ~ l e n g t h ~ o f ~ a p p r o x . ~$ 50 m. In |
| this case, the bus terminating resistor is approx. $100 \Omega$. |  |

Cable length The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

RS-485 for point-to-point or bus connection:

| Parameter | Value |
| :--- | :--- |
| Transmission rate | $9.6 \mathrm{kbit} / \mathrm{s}$ to $115.2 \mathrm{kbit} / \mathrm{s}$ |
| Maximum cable length | On request |

Bus termination The line ends of the bus segment must be equipped with bus terminating resistors. These resistors are integrated in the module TA5142-RS485I. The pull-up and pull-down settings must also be made on the circuit board of the module.

1 Termination resistance settings
2 Pull-up and pull-down settings

Table 75: Configuration

| Settings on the module | State of LEDs | Internal wiring diagram | Description |
| :---: | :---: | :---: | :---: |
|  | TXD $\square$ <br> RXD $\square$ <br> 120R $\square$ <br> PUD $\square$ |  | Master at the bus line end, pull-up and pull-down activated, bus termination $120 \Omega$ |
|  | TXD $\square$ <br> RXD $\square$ <br> 120R $\square$ <br> PUD $\square$ |  | Master within the bus line, pull-up and pull-down activated |

| Settings on the module | State of LEDs | Internal wiring diagram | Description |
| :---: | :---: | :---: | :---: |

## FAQs

Frequently asked and important questions about the AC500-eCo V3 serial communication option boards from 2023 are collected and answered in the application note. AC500 V3-eCo FAQ - TA514X-RSXXX Serial Option Boards.

### 5.2.1.2 AC500 and AC500-XC

### 5.2.1.2.1 Product overview and comparison

## Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:

Terminal base compatibility

The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.
Table 80: Combination of TB56xx-2ETH(-XC) and PM56xx (-XC)

| Processor module | PM5630 | PM5650 | PM5670 | PM5675 |
| :--- | :--- | :--- | :--- | :--- |
| TB5600-2ETH | 0 slot | 0 slot | 0 slot | 0 slot |
| TB5610-2ETH | 1 slot | 1 slot | 1 slot | 1 slot |
| TB5620-2ETH | 2 slots | 2 slots | 2 slots | 2 slots |
| TB5640-2ETH | - | 4 slots | 4 slots | 4 slots |
| TB5660-2ETH | - | - | 6 slots $\left.{ }^{1}\right)$ | 6 slots $\left.{ }^{1}\right)$ |

## Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.
${ }^{1}$ ) PM567x must have an index $\geq \mathrm{C} 0$.

Supported devices

The AC500 V3 terminal bases can be equipped with the following supported devices:
Table 81: Comparison: TB56xx

| Processor module | PM5630 | PM5650 | PM5670 | PM5675 |

|  | Sub-station (number of connections) | 5 | 10 | 20 |

## Ethernet protocols and ports for AC500 V3 products

## General

The communication module CM5640-2ETH acts as a port extender of the used AC500 V3 CPU. It is not offloading the CPU for the protocols.

- the stacks are still executed in CPU.
- the performance is slightly lower or the load is slightly higher than directly from the main CPU, because each communication module and the communication module bus must also be handled.
Each CM5640-2ETH provides:
- 2 additional independent onboard Ethernet interfaces controlled by the CPU and not switched.
- all Ethernet ports, wherever located - on the communication module or on the CPU - must be in different subnets.
Addressing is not done via slot numbers but via IP addresses.

The Ethernet limitations of the CPU used together with CM5640-2ETH apply to all onboard and additional interfaces.

All interfaces of the onboard and CM5640-2ETH modules need to be in different subnets. Overlapping of subnets must be avoided. The selection of the used interface (ETH port) is done automatically according the match of the IP-address of the server and the subnet of the interfaces.

## Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

| Protocol | Port |
| :--- | :--- |
| ABB NetConfig ${ }^{1}$ ) | UDP 24576 |
| Online access with driver 3S Tcp/lp BlkDrvTcp (no scan) | TCP 11740 |

| Protocol | Port |
| :--- | :--- |
| OPC UA server ${ }^{2}$ ) | TCP 4840 |
| Remarks: |  |
| 1): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by <br> deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2. <br> ${ }^{2}$ ): The port 4840 for OPC UA server is closed by default as of SystemFW V3.6.0. |  |

All other ports are closed by default.

## Overview of protocols, sockets and ports

| Protocol | Port | Sockets |
| :---: | :---: | :---: |
| ABB netConfig | 24576 | 1 permanent socket per interface |
| 3 gateway client (e.g. CODESYS) to gateway server | 1217 | 1 permanent socket |
| Online access with driver 3S block driver TCP/IP (no scan) | 11740 | 1 socket per connection + 1 listen |
| Modbus TCP server | 502 or configurable | 1 socket listen +1 socket per server connection, number of server connections is configurable in AB |
| Modbus TCP client with POU ModTcpMast | Random | 1 socket per connection with POU ModTcpMast |
| UDP out of user program with library SysLibSockets.lib | 1 ... 65535 | 1 socket per connection |
| TCP/IP out of user program with library SysLibSockets.lib | 1... 65535 | 1 socket per connection |
| Web server on PLC with web visualization | 80 | 1 listen and 1 per connection |
| NTP/SNTP client | 123 | 1 permanent socket |
| IEC60870-5-104 control station | Random | 1 per connection |
| IEC60870-5-104 substation | 2404 | 1 per connection |
| FTP server | Command port = 21 <br> Data active mode $=20$ <br> Data passive mode = random | 1 per session, max. 4 allowed |
| CODESYS network variables | 1202 | (UDP broadcast) |
| OPC DA server (default 3S block driver) | $\begin{aligned} & \begin{array}{l} \text { UDP }=1740 \\ \text { or } \\ \text { TCP/IP } \\ =11740 \end{array} \end{aligned}$ | 1 socket per connection |
| OPC UA server | 4840 | 1 permanent socket |
| ICMP - ping out of user project with POU ETHx_ICMP_PING DHCP | none | No socket |
| DHCP | 67 | 1 socket during startup |

* Changing the IP addresses using the Automation Builder
* Changing the IP addresses using the CFG key

## Online access

3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver "BIkDrvTcp" on port 11740
- $1 x$ listen on port 11740 if PLC has established online connection

Online access can be established from:

- Automation Builder command 'Login' $\Leftrightarrow$ Chapter 6.4.1.21.3.7.2 "Command 'Login'" on page 2624
- CODESYS OPC DA server
- Panel CP600 series

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
$\Rightarrow$ One socket on port 11740 (listen).
2. Login from Automation Builder via driver "BIKDrvTcp".
$\Rightarrow 2$ sockets on port 11740 ( 1 x online, 1 x listen)
3. Additional login out of OPC server with the same driver.
$\Rightarrow 3$ sockets on port 11740 ( $2 x$ online, $1 x$ listen)
4. Additional connect CP600 via driver "BlkDrvTcp".
$\Rightarrow 4$ sockets on port 11740 ( $3 x$ online, $1 x$ listen)

### 5.2.1.2.2 PM56xx-2ETH for AC500 V3 products

Features
Processor modules with onboard interfaces:

- PM5630-2ETH: processor module, memory 8 MB, with Ethernet support (onboard Ethernet) - 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5650-2ETH: processor module, memory 80 MB , with Ethernet support (onboard Ethernet) - 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5670-2ETH: processor module, memory 160 MB, with Ethernet support (onboard Ethernet) - 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5675-2ETH: processor module, $160 \mathrm{MB}, 8$ GB flash disk, with Ethernet support (onboard Ethernet) - 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- XC version for use in extreme ambient conditions available

16 7-segment state displays with backlight
2 "Triangle" displays for "item"
3 "Square" displays for "state"
3 state LEDs
8 function keys
Slot for memory card
Label
8 Compartment for lithium battery TA521
9 Lithium battery TA521
10 Memory card
11 I/O bus for connection of I/O modules
12 Slot for processor module (processor module mounted on terminal base)

13 Slots for communication modules (multiple, depending on terminal base; unused slots must be covered with TA524)
14 Interface for CAN (5-pin terminal block, removable)
15 Power supply (5-pin terminal block, removable)
16 Serial interface COM1 (9-pin terminal block, removable)
17 RJ45 female connector for ETHERNET1 connection
18 RJ45 female connector for ETHERNET2 connection
19 DIN rail
${ }_{*}^{*_{*} \psi_{k}}$ Sign for XC version

## Short description

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.

Table 85: Comparison: TB56xx

| Processor module | PM5630 | PM5650 | PM5670 | PM5675 |
| :---: | :---: | :---: | :---: | :---: |
| Max. number of variables allowed for each communication module supported |  |  |  |  |
| Input variables | 4 kB | 4 kB | 5 kB | 5 kB |
| Output variables | 4 kB | 4 kB | 5 kB | 5 kB |
| Type of communication module supported |  |  |  |  |
| CM574-RS/RCOM - serial interface | No | No | No | No |
| CM5610-2RS - 2 serial interfaces | X | X | X | X |
| CM582-DP - PROFIBUS DP V0/V1 slave | X | X | X | X |
| CM592-DP - PROFIBUS DP V0/V1 master | X | X | X | X |
| CM579-ETHCAT - EtherCAT master | X | x | X | X |
| CM579-PNIO - PROFINET IO RT controller | X | X | X | X |
| CM589-PNIO - PROFINET IO RT device | X | X | X | X |
| CM589-PNIO-4 - PROFINET IO RT with 4 devices | X | X | X | X |
| CM597-ETH - Ethernet interface | No | No | No | No |
| CM5640-2ETH - 2 Ethernet interfaces | X | X | X | X |
| CM588-CN - CAN, CANopen slave | No | No | No | No |
| CM598-CN - CAN, CANopen master | $\begin{aligned} & \text { only CAN } \\ & \text { 2A/2B } \end{aligned}$ | $\begin{aligned} & \text { only CAN } \\ & \text { 2A/2B } \end{aligned}$ | $\begin{array}{\|l} \text { only CAN } \\ \text { 2A/2B } \end{array}$ | $\begin{aligned} & \text { only CAN } \\ & \text { 2A/2B } \end{aligned}$ |
| Type of AC500-S module supported |  |  |  |  |
| SM560-S - safety module | X | X | X | x |
| SM560-S-FD-1 - safety module with F-Device functionality for 1 PROFIsafe network | X | X | X | X |
| SM560-S -FD-4 - safety module with F-Device functionality for 1 PROFIsafe network | X | X | X | X |

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1) $\Rightarrow$ Chapter 5.2.3.1.4 "Technical data" on page 383.
All other V3 processor modules can operate multiple communication modules via their communication module interface.
The communication modules are mounted on the left side of the processor module on the same terminal base.

On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.

Each processor module can be used as:

- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 V DC.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## Connections

All terminals for connection are available on the terminal base. For information on connection and available interfaces see the descriptions for

- 帠 Chapter 5.2.3.1 "TB56xx for AC500 V3 products" on page 377.

Table 86: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

| Processor module | PM5630 | PM5650 | PM5670 | PM5675 |
| :--- | :--- | :--- | :--- | :--- |
| TB5600-2ETH | 0 slot | 0 slot | 0 slot | 0 slot |
| TB5610-2ETH | 1 slot | 1 slot | 1 slot | 1 slot |
| TB5620-2ETH | 2 slots | 2 slots | 2 slots | 2 slots |
| TB5640-2ETH | - | 4 slots | 4 slots | 4 slots |
| TB5660-2ETH | - | - | 6 slots $\left.{ }^{1}\right)$ | 6 slots $\left.{ }^{1}\right)$ |

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.
${ }^{1}$ ) PM567x must have an index $\geq$ C0.

## Storage elements

## Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.
${ }^{\text {r }}$ Chapter 6.8.2.3.2 "AC500 battery" on page 4445

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery ${ }^{\star}$ Chapter 5.2.8.2.3 "TA521-Battery" on page 1319.

Memory card AC500 processor modules are supplied without memory card. It must be ordered separately. The memory card can be used

- to read and write user files,
- to download a user program,
- for firmware updates,
- for program source code storage.

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards.
$\Leftrightarrow$ Further information

LEDs, display and function keys on the front panel

\& Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding

## Technical data

The system data of AC500 and S500 are applicable to the standard version. ${ }^{\mu}$ Chapter 5.1.2 "System data AC500" on page 166

The system data of AC500-XC are applicable to the XC version. \& Chapter 5.1.3 "System data AC500-XC" on page 169
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

The dimensions are in mm and in brackets in inch.

## Ordering data

Processor modules for AC500
(Standard) V3 products

To enable better product availability into the production and to provide some new features, a revision 3 of the existing AC500 V3 processor module was necessary. The existing AC500 V3 processor module revision 2 with rubric R0278 will move to classic and will be replaced by compatible new AC500 V3 processor module revision 3 with rubric R0378.

For example: The processor module revision 3 PM5630-2ETH (1SAP131 000 R0378) replaces the existing processor module revision 2 PM5630-2ETH (1SAP 131000 R0278) and provides the same features or functionality of the previous ones.

Following points must be considered with the processor module revision 3:

- The processor module revision 3 (R037x) requires a new BootFW / CPUFW from V3.6.x and higher.
- It cannot be downgraded and used with lower FW versions than V3.6.0.
- The processor module revision $3(R 037 x)$ provides the same features as the processor module revision 2 (R027x) existing today and is fully compatible.
- An existing application using a processor module revision 2 (R027x) built with Automation Builder < 2.6 can run on a processor module revision 3 (R037x) but the application must be upgraded to at least $A B 2.6 .0$ or higher.

What must be done using a new processor module revision 3 (R037x)?

- On a new application?
- Just use the new processor module revision 3 (R037x)
- Use the latest Automation Builder software from 2.6.0 or higher.
- On an existing application using an Automation Builder software version smaller than 2.6.0?
- To use a new processor module revision 3 in an existing application (e.g., replacement of the processor module revision 2), the application must be upgraded to at least $A B$ 2.6.0 or higher.
- If several processor module (revision 3 and revision 2) are used within the same project, all the processor modules used in the same application must be upgraded to the FW Version V3.6.x and higher.

[^7]
### 5.2.2 Communication modules for AC500(-XC) processor modules

### 5.2.2. Features

AC500 communication modules are required for

- a connection to standard fieldbus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different fieldbuses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- Hy Chapter 5.2.3.1 "TB56xx for AC500 V3 products" on page 377

There are no restrictions concerning which communication modules can be arranged for a processor module.
Within the AC500 control system, the communication modules can be used as

- bus master or
- slave.

It depends on the

- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:

- CM5640-2ETH: Ethernet
- CM5x2-DP: PROFIBUS
- CM5x9-PNIO: PROFINET
- CM579-ETHCAT: EtherCAT
- CM598-CN: CANopen
- CM5610-2RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.

### 5.2.2.2 Compatibility of communication modules and communication interface modules

### 5.2.2.4 Serial

### 5.2.2.4.1 CM5610-2RS with 2 serial interfaces

## Features

[^8]

Only use terminal blocks approved by ABB to avoid injury and damage to the module.

The communication modules with 2 serial interfaces are delivered with two 9-pin terminal blocks TA532 (1SAP 182000 R0001).

The terminal block listed in the ordering data is for spare part only if needed.

## Purpose

Communication module CM5610-2RS is equipped with 2 serial interfaces (COM1 and COM2) which can be used as serial interface extension of the proocessor module or for communication e.g. for communication via Modbus or ASCII.

Depending on the connection, the physical interface of COM1 and COM2 is either RS-232 or RS-485.

## Connections

## Serial interfaces

Pin assignment

## Bus cable for RS-485

Bus cable

| Bus line | 2 cores, twisted, with common shield |
| :--- | :--- |
| Construction | $>0.22 \mathrm{~mm}^{2}(24 \mathrm{AWG})$ |
| Conductor cross section | $>10$ per meter (symmetrically twisted) |
| Twisting rate | Polyethylene (PE) |
| Core insulation | $<100 \Omega / \mathrm{km}$ |
| Resistance per core | ca. $120 \Omega(100 \Omega \ldots 150 \Omega)$ |
| Characteristic impedance | $<55 \mathrm{nF} / \mathrm{km}$ (if higher, the max. bus length must be reduced) |
| Capacitance between the cores | $<120 \Omega 1 / 4 \mathrm{~W}$ at both line ends |
| Terminating resistors | Commonly used telephone cables with PE insulation and a <br> core diameter of $>0.8$ mm are usually sufficient. |
| Remarks | Cables with PVC core insulation and core diameter of <br> 0.8 mm can be used up to a length of approx. $250 \mathrm{~m} . \mathrm{In}$ <br> this case, the bus terminating resistor is approx. $100 \Omega$. |

## Cable lengths

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

RS-232 (for point-to-point connection):

| Parameter | Value |
| :--- | :--- |
| Transmission rate | $9.6 \mathrm{kbit} / \mathrm{s}$ to $115.2 \mathrm{kbit} / \mathrm{s}$ |
| Maximum cable length | On request |

RS-485 (for point-to-point or bus connection):

| Parameter | Value |
| :--- | :--- |
| Transmission rate | $9.6 \mathrm{kbit} / \mathrm{s}$ to $115.2 \mathrm{kbit} / \mathrm{s}$ |
| Maximum cable length | On request |

## Bus termination (RS-485 only)

The line ends of the bus segment must be equipped with bus terminating resistors. Normally, these resistors are integrated in the interface connectors.

1 Term. P
2 RxD/TxD-P
3 RxD/TxD-N
4 Term. N
A Master at the bus line end, pull-up resistor and pull-down resistor activated, bus terminating resistor $120 \Omega$
B Slave within the bus line
C Slave at the bus line end, bus terminating resistor $120 \Omega$

## State LEDs

| LED |  | Color | State | Description |
| :---: | :---: | :---: | :---: | :---: |
| AHB CM5610 | PWR | Green | ON (light) | Voltage is present |
| $\square$ Pwr $\square$ RDY $\square$ Run $\square$ STA - ERR |  |  | OFF (dark) | Voltage is missing |
|  | RDY | Yellow | Programmable | Depends on user program |
|  | RUN | Green | Programmable | Depends on user program |
|  | STA | Yellow | Programmable | Depends on user program |
|  | ERR | Red | Programmable | Depends on user program |

## Technical data

The system data of AC500 and S500 are applicable to the standard version ${ }^{\xi}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

| Parameter |  | Value |

The terminal block listed in the ordering data is for spare part only if needed.

### 5.2.2.5 CANopen

### 5.2.2.5.1 CM598-CN - CANopen master

## Features

- CANopen master 1 Mbit/s
- XC version for use in extreme ambient conditions available

15 LEDs for state display
2 Label
3 Communication interface, 5-pin, Combicon, male, removable plug with spring terminals
${ }_{*}^{*}+{ }_{*}^{*}$ Sign for XC version

## Purpose

Communication module CM598-CN enables communication over the CANopen field bus.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN $\Leftrightarrow$ Chapter 6.3.2.11.1.1.5 "Configuration of the protocols CAN 2.0 A / CAN 2.0 B" on page 1533.
Support of CANopen protocol is in preparation.

## Connections

Field bus interface

| Interface socket | 5-pin COMBICON |
| :--- | :--- |
| Transmission standard | ISO 11898, potential-free |
| Transmission protocol | CANopen (CAN), 1 Mbaud max. |
| Transfer rate (transmis- <br> sion rate) | $10 \mathrm{kbit} / \mathrm{s}, 20 \mathrm{kbit} / \mathrm{s}, 50 \mathrm{kbit} / \mathrm{s}, 100 \mathrm{kbit} / \mathrm{s}, 125 \mathrm{kbit} / \mathrm{s}, 250 \mathrm{kbit} / \mathrm{s}, 500$ <br> $\mathrm{kbit} / \mathrm{s}, 800 \mathrm{kbit} / \mathrm{s}$ and $1 \mathrm{Mbit} / \mathrm{s}$, |

Pin assignment Table 99: Pin assignment of the CANopen connector

| Interface |  | PIN | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | ®我 | 1 | CAN_GND | CAN reference potential |
|  |  | 2 | CAN_L | Bus line, receive/transmit line, LOW |
|  | (1) 3 - (1) D | 3 | CAN_SHLD | Shield of the bus line |
|  |  | 4 | CAN_H | Bus line, receive/transmit line, HIGH |
|  | $\boxed{\square}$ | 5 | NC | Not connected |
| Terminal block removed | Terminal block inserted |  |  |  |

## NOTICE

U Unused connector!
Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

| Bit Rate (speed) | Bus Length |
| :--- | :--- |
| $1 \mathrm{Mbit} / \mathrm{s}$ | 40 m |
| $800 \mathrm{kbit} / \mathrm{s}$ | 50 m |
| $500 \mathrm{kbit} / \mathrm{s}$ | 100 m |
| $250 \mathrm{kbit} / \mathrm{s}$ | 250 m |
| $125 \mathrm{kbit} / \mathrm{s}$ | 500 m |
| $50 \mathrm{kbit} / \mathrm{s}$ | 1000 m |

Types of bus For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be cables used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

| Length of seg- <br> ment $[\mathrm{m}]$ | Bus cable (shielded, twisted pair) |  |  | Max. transmis- <br> sion rate $[\mathrm{kbit} / \mathrm{s}]$ |
| :--- | :--- | :--- | :--- | :--- |
|  | Conductor <br> cross section <br> $\left[\mathrm{mm}^{2}\right]$ | Line resistance <br> $[\Omega / \mathrm{km}]$ | Wave impe- <br> dance $[\Omega]$ |  |
| $0 \ldots . .40$ | $0.25 \ldots 0.34 /$ <br> AWG23, AWG22 | 70 | 120 | 1000 at 40 m |
| $40 \ldots 300$ | $0.34 \ldots 0.60 /$ <br> AWG22, AWG20 | $<60$ | 120 | $<500$ at 100 m |
| $300 \ldots 600$ | $0.50 \ldots 0.60 /$ <br> AWG20 | $<40$ | 120 | $<100$ at 500 m |
| $600 \ldots 1000$ | $0.75 \ldots . .0 .80 /$ <br> AWG18 | $<26$ | 120 | $<50$ at 1000 m |

Bus terminating The ends of the data lines have to be terminated with a $120 \Omega$ bus terminating resistor. The bus resistors terminating resistor is usually installed directly at the bus connector.

Fig. 40: CANopen interface, bus terminating resistors connected to the line ends

### 5.2.2.6.1 CM579-ETHCAT - EtherCAT master

Features

15 LEDs for state display
22 rotary switches for address setting (not used)
3 Label
42 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

## Intended purpose

Communication module CM579-ETHCAT is for EtherCAT communication.
The comunication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.
② Chapter 6.9.3.6.2 "CM579-ETHCAT" on page 4665

## Connections

Field bus interfaces

The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.

| Pin assignment | Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | TxD+ | Transmit data + |

Not supplied with this device.
(3) Further information about wiring and cable types

The EtherCAT network differentiates between input-connectors (IN) and outputconnectors (OUT):
At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.
At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

## State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

Table 101: Meaning of the diagnosis LEDs

| LED |  | Color | State | Description |
| :---: | :---: | :---: | :---: | :---: |
| ATH CM579 | PWR | Green | On | Power supply available |
|  |  |  | Blinking | --- |
|  |  |  | Off | Power supply not available or defective hardware |
|  | RDY | Yellow | On | Boot procedure |
|  |  |  | Blinking | Boot failure |
|  |  |  | Off | --- |
|  | RUN | Green | On | Communication module is operational |
|  |  |  | Blinking | --- |
|  |  |  | Off | Communication module is not operational |
|  | STA1 | Green | On | No bus error, communication running |
|  |  |  | Blinking | Establishing communication |
|  |  |  | Off | System error |
|  | STA2 | Red | On | Configuration error |
|  |  |  | Blinking | --- |
|  |  |  | Off | No error |
|  | STA1 | Yellow | Blinking | No production data available, |
|  | STA2 | Yellow | (synchronously) | no bus communication possible. |
| LED state during firmware update | STA1 | Green | Blinking (synchronously) | Firmware file transfers during communication module firmware update. |
|  | STA2 | Red |  |  |
|  | STA1 | Green | Blinking (alternately) | Communication module writes the firmware file to the internal flash. <br> Do not power off the PLC! |
|  | STA2 | Red |  |  |

The RJ45 Ethernet connector contains two LEDs showing the current Ethernet port connection state.

Table 102: Meaning of the diagnosis LEDs

| LED |  | Color | State | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | ETHCAT1 LED "Link" | Green | On | Ethernet connection established |
|  |  |  | Off | No Ethernet connection |
|  | ETHCAT1 LED "RX/TX" | Yellow | On | Device sends/receives frames |
|  |  |  | Off | No Ethernet connection |
|  | ETHCAT2 LED "Link" | Green |  | Connector ETHCAT2 is not used |
|  | ETHCAT2 LED "RX/TX" | Yellow |  |  |

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{\aleph}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Internal Supply | Via the communication module interface of the terminal base |
| Protocol | EtherCAT |
| Field bus connector | $2 \times \mathrm{RJ45}$ (ETHCAT1 and ETHCAT2) |
| Technology | Hilscher NETX 100 |
| Transfer rate | 10/100 Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, 2x RJ45 socket |
| Bus length (segment length max.) | 100 m at $100 \mathrm{Mbit} / \mathrm{s}$ |
| Indicators | 5 LEDs |
| Usable CPUs | PM56xx 出 Chapter 5.2.1.2.2 "PM56xx-2ETH for AC500 V3 products" on page 313 |

### 5.2.2.7 Ethernet

### 5.2.2.7.1 CM5640-2ETH - Communication module Ethernet

## Features

- TCP/IP with 2 independent channels
- XC version for use in extreme ambient conditions available

15 LEDs for state display
22 rotary switches for station identification
3 Label
42 communication interfaces Ethernet RJ45
${ }_{x}^{*}+\ldots$ Sign for XC version

## Purpose

The communication module provides additional communication ports for the CPU. The Ethernet communication module is a port extender that provides two additional, separate, non-programmable Ethernet interfaces for the CPU processor module used.
Each communication module and port used results in a slightly higher CPU load on the CPU compared to using the same protocol via the onboard port, since the communication module and the transmission of the communication packets must be additionally processed by the CPU. The complete TCP/IP protocol and the application layers are supported.

- Each communication module port must be addressed via its IP address (not slot no.) and must be in a different subnet than the port(s) of the CPU.
- Each used communication module and port causes a slightly higher CPU load compared to using the same protocol onboard.

It is not possible to close a RSTP ring by using the two ports of the communication module.

Applications:

- TCP/IP for PC/Automation Builder (programming)
- UDP functions using SysSocket or NetBaseServices libraries
- Modbus on TCP/IP (Modbus on TCP/IP, client and server and all standard protocols from the PLC)

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Connections

Field bus inter- The Ethernet communication module has 2 RJ45 interfaces: faces

Pin assignment

| Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | TxD+ | Transmit data + |
|  | 2 | TxD- | Transmit data - |

### 5.2.2.8 PROFIBUS

### 5.2.2.8.1 CM582-DP - PROFIBUS DP slave

## Features

- PROFIBUS DP slave $12 \mathrm{Mbit} / \mathrm{s}$
- Compatible with Automation Builder version starting from V2.0.2, and with CPU firmware version starting from V2.6
- XC version for use in extreme ambient conditions available

15 LEDs for state display
2 Label
3 Communication interface PROFIBUS DP D-sub, 9-pin, female
${ }_{x}^{*}+{ }_{*}^{*}$ Sign for XC version

## Purpose

Communication module CM582-DP enables communication over the PROFIBUS DP field bus.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Connections

Field bus inter- The PROFIBUS DP connector (9-pin, female) has the following pin assignment: face

| Pin |  | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | NC | Not connected |
|  | 2 | NC | Not connected |
|  | 3 | RxD/TxD-P | Receive/Transmit positive |
|  | 4 | CNTR-P | Control signal for repeater, positive |
|  | 5 | DGND | Reference potential for data exchange and +5 VI |
|  | 6 | VP | +5 V (power supply for the bus terminating resistors) |
|  | 7 | NC | Not connected |
|  | 8 | RxD/TxD-N | Receive/Transmit negative |
|  | 9 | NC | Not connected |

Table 105: Correlation of transmission rate, bit time and cable length:

| Tranmission rate in [kbit/s] | Bit time [tBit] | Max. cable length in [m] |

Bus cable

| Parameter | Value |
| :--- | :--- |
| Type | Twisted pair (shielded) |
| Characteristic impedance | $135 \Omega \ldots 165 \Omega$ |
| Cable capacitance | $<30 \mathrm{pF} / \mathrm{m}$ |
| Conductor diameter of the cores | $\geq 0.64 \mathrm{~mm}$ |
| Conductor cross section of the cores | $\geq 0.34 \mathrm{~mm}^{2}$ |
| Cable resistance per core | $\leq 55 \Omega / \mathrm{km}$ |
| Loop resistance (resistance of two cores) | $\leq 110 \Omega / \mathrm{km}$ |

Cable lengths The maximum possible cable length of a PROFIBUS subnet within a segment depends on the tranmission rate (baud rate).

| Transmission Rate | Maximum Cable Length |
| :--- | :--- |
| $9.6 / 19.2 / 93.75$ kBaud | 1200 m |
| 187.5 kBaud | 1000 m |
| 500 kBaud | 400 m |
| 1.5 MBaud | 200 m |
| 3 MBaud to 12 MBaud | 100 m |

Branch lines are generally permissible for transmission rates of up to $1500 \mathrm{kbit} / \mathrm{s}$. But in fact they should be avoided for transmission rates higher than $500 \mathrm{kbit} / \mathrm{s}$.

Bus terminating The line ends (of the bus segments) have to be terminated using bus terminating resistors resistors according to the drawing below. The bus terminating resistors are usually placed inside the bus connector.

Repeaters One bus segment can have up to 32 subscribers. Using repeaters a system can be expanded to up to 126 subscribers. Repeaters are also required for longer transfer lines. Please note that a repeater's load to the bus segment is the same as the load of a normal bus subscriber. The sum of normal bus subscribers and repeaters in one bus segment must not exceed 32 .

Fig. 42: Principle example for a PROFIBUS-DP system with repeaters (1500 kbit/s baud rate)

### 5.2.2.9 PROFINET

### 5.2.2.9.1 CM579-PNIO - PROFINET IO RT controller

## Features

- PROFINET IO controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available

15 LEDs for state display
22 rotary switches for address setting (not used)
3 Label
42 communication interfaces RJ45 (PNIO1 and PNIO2)
${ }_{x}^{*}+{ }_{*}^{*}$ Sign for XC version

Intended purpose
The communication module is for PROFINET RT communication.
The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

| Parameter | Value |
| :--- | :--- |
| Protocol | PROFINET IO RT |
| Usable CPUs | PM57x, PM58x, PM59x <br> そ Chapter 5.2.1.2.2 "PM56xx-2ETH for <br> AC500 V3 products" on page 313 |
| Usable terminal bases | All TB56xx (not TB5600) 乡 Chapter 5.2.3.1 <br> "TB56xx for AC500 V3 products" on page 377 |
| Field bus connector | 2 RJ45 (PNIO1 and PNIO2), with integrated <br> 2-port switch |
| Internal supply | Via the communication module interface of the <br> terminal base |

## Connections

### 5.2.2.9.2 CM589-PNIO(-4) - PROFINET IO RT with 4 devices

Features

- PROFINET IO device
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available

15 LEDs for state display
22 rotary switches for setting the IO device identifier
3 Label
42 communication interfaces RJ45 (PNIO1 and PNIO2)
䊀 Sign for XC version

The communication module is for PROFINET RT communication.
The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.
The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## CM589-PNIO(-4)

CM589-PNIO supports one application relation to communicate to one single PROFINET IO controller.

CM589-PNIO-4 supports 4 application relations to communicate to up to 4 PROFINET IO controllers in parallel using PROFINET Shared Device technology.

Functionality

| Parameter | Value |
| :--- | :--- |

## Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.
${ }^{1}$ ) PM567x must have an index $\geq$ C0.
The following figure shows the TB5620-2ETH as example.

I/O bus (10-pin, female) to connect the I/O terminal units
One available slot for the processor module
Slots for communication modules
Interface for CAN (5-pin terminal block, removable)
Power supply ( 5 -pin terminal block, removable)
Serial interface COM1 (9-pin terminal block, removable)
RJ45 female connector for Ethernet connection
Holes for screw mounting

XC version
$\mathbf{X C}=\mathrm{e}$ Xtreme Conditions

## Extreme conditions

Terminal bases for use in extreme ambient conditions have no ${ }_{*_{+}^{*}}^{{ }^{*}}$ sign for XC version.

The figure 3 in the Part no. 1SAP3... (label) identifies the XC version.

### 5.2.3.1.2 Short description

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.
Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.
The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

Table 114: Combination of TB56xx-2ETH $(-X C)$ and PM56xx $(-X C)$

| Processor module | PM5630 | PM5650 | PM5670 | PM5675 |
| :--- | :--- | :--- | :--- | :--- |
| TB5600-2ETH | 0 slot | 0 slot | 0 slot | 0 slot |
| TB5610-2ETH | 1 slot | 1 slot | 1 slot | 1 slot |
| TB5620-2ETH | 2 slots | 2 slots | 2 slots | 2 slots |
| TB5640-2ETH | - | 4 slots | 4 slots | 4 slots |
| TB5660-2ETH | - | - | 6 slots $\left.{ }^{1}\right)$ | 6 slots $\left.{ }^{1}\right)$ |

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.
${ }^{1}$ ) PM567x must have an index $\geq \mathrm{C} 0$.

## NOTICE!

## Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ${ }^{\star} \Rightarrow$ Chapter 5.2.8.2.4 "TA524 - Dummy communication module" on page 1323.
- I/O bus connectors must not be touched during operation.

### 5.2.3.1.3 Connections

I/O bus
The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added.
② Chapter 4.2.3 "I/O bus - Communication within the PLC" on page 97
« $\leadsto$ Chapter 5.2.4.2 "I/O bus - Data transfer" on page 387

## Power supply

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with $1.5 \mathrm{~mm}^{2}$ conductor) via these terminals, when the ambient temperature never exceeds $+60^{\circ} \mathrm{C}$.

Pin assignment

| Pin Assignment |  | Label | Function | Description |
| :---: | :---: | :---: | :---: | :---: |
| Terminal block removed | Terminal block inserted | L+ | +24 V DC | Positive pin of the power supply voltage |
|  |  | L+ | +24 V DC | Positive pin of the power supply voltage |
|  |  | M | 0 V | Negative pin of the power supply voltage |
|  |  | M | 0 V | Negative pin of the power supply voltage |
|  |  | $\stackrel{1}{=}$ | FE | Functional earth |

## NOTICE!

## Risk of damaging the PLC due to improper voltage levels!

- Never exceed the maximum tolerance values for process and supply voltages.
- Never fall below the minimum tolerance values for process and supply voltages.
Observe the system data ${ }^{\circledR}$ Chapter 5.1.2 "System data AC500" on page 166 and the technical data of the module used.

## NOTICE!

## Risk of malfunction!

To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s .

## NOTICE!

Risk of damaging the terminal base and power supply!
Short circuits might damage the terminal base and power supply.
Make sure that the four clamps $L+$ and $M$ (two of each) are not wrongly connected (e. g. +/- of power supply is connected to both L+/L+ or both M/M).

## NOTICE!

Risk of damaging the terminal base!
Terminal base can be damaged by connecting the power supply terminal block (L+/M) to COM1.

Make sure that the COM1 terminal block is always connected to the terminal base even if you do not use COM1 to prevent this.

## NOTICE!

Risk of damaging the terminal base!
Excessive current might damage the clamp and terminal base.
Make sure that the current flowing through the removable clamps never exceeds 8 A (with $1.5 \mathrm{~mm}^{2}$ conductor).

## Serial interface COM1

The serial interface COM1 is connected to a removable 9-pin terminal block.
From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).

Pin assignment (RS-485 I RS-232)

|  |  | Pin | Signal | Interface | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | Terminator P | RS-485 | Terminator P |
|  |  | 2 | RxD/TxD-P | RS-485 | Receive/Transmit, positive |
|  |  | 3 | RxD/TxD-N | RS-485 | Receive/Transmit, negative |
|  |  | 4 | Terminator N | RS-485 | Terminator N |
|  |  | 5 | RTS | RS-232 | Request to send (output) |
| Terminal block removed | Terminal block inserted | 6 | TxD | RS-232 | Transmit data (output) |
|  |  | 7 | SGND | Signal Ground | Signal Ground |
|  |  | 8 | RxD | RS-232 | Receive data (input) |
|  |  | 9 | CTS | RS-232 | Clear to send (input) |

## - NOTICE! <br> Unused connector! <br> Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

## Ethernet interface

This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.

TB56xx-2ETH for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces.

The two Ethernet interfaces can be configured as independent interfaces or with switch functionality.

In case of two independent interfaces they must be configured to different subnets.

For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.

Pin assignment

| Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | TxD+ | Transmit data + |
|  | 2 | TxD- | Transmit data - |
|  | 3 | RxD+ | Receive data + |
|  | 4 | NU | Not used |
|  | 5 | NU | Not used |

| Interface | Pin | Signal | Description |
| :--- | :--- | :--- | :--- |
|  | 6 | RxD- | Receive data - |
|  | 7 | NU | Not used |
|  | 8 | NU | Not used |
|  | Shield | Cable shield | Functional earth |

## 0 <br> NOTICE! <br> Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices Chapter 5.2.8.3.6 "TA535-Protective caps for XC devices" on page 1332.
« Supported protocols and used Ethernet ports
${ }^{4}$ Communication via Modbus TCP/IP
${ }^{\star}$ Supported protocols and used Ethernet ports

## CAN interface

This interface is the connection to a processor module with onboard CAN e.g. PM56xx-2ETH.

| Interface socket | COMBICON, 5-pin, female, removable plug with spring terminals |
| :--- | :--- |
| Transmission standard | ISO 11898, potential-free |
| Transmission protocol | CANopen (CAN), 1 Mbaud max. |
| Transfer rate (transmis- <br> sion rate) | $50 \mathrm{kbit} / \mathrm{s}, 100 \mathrm{kbit} / \mathrm{s}, 125 \mathrm{kbit} / \mathrm{s}, 250 \mathrm{kbit} / \mathrm{s}, 500 \mathrm{kbit} / \mathrm{s}, 800 \mathrm{kbit} / \mathrm{s}$ <br> and $1 \mathrm{Mbit} / \mathrm{s}$, |

Pin assignment Table 115: Pin assignment of the CANopen connector

| Interface |  | PIN | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\xrightarrow[3]{2}$ <br> Terminal block removed | QR | 1 | CAN_GND | CAN reference potential |
|  |  | 2 | CAN_L | Bus line, receive/transmit line, LOW |
|  | (1) 3 - (1) $D$ | 3 | CAN_SHLD | Shield of the bus line |
|  |  | 4 | CAN_H | Bus line, receive/transmit line, HIGH |
|  | $\otimes$ | 5 | NC | Not connected |
|  | Terminal block inserted |  |  |  |

NOTICE!
Unused connector!
Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

| Bit Rate (speed) | Bus Length |
| :--- | :--- |
| $1 \mathrm{Mbit} / \mathrm{s}$ | 40 m |
| $800 \mathrm{kbit} / \mathrm{s}$ | 50 m |
| $500 \mathrm{kbit} / \mathrm{s}$ | 100 m |
| $250 \mathrm{kbit} / \mathrm{s}$ | 250 m |
| $125 \mathrm{kbit} / \mathrm{s}$ | 500 m |
| $50 \mathrm{kbit} / \mathrm{s}$ | 1000 m |

Types of bus Only bus cables with characteristics as recommended in ISO 11898 are to be used. The cables requirements for the bus cables depend on the length of the bus segment.

Bus terminating Both ends of the CAN bus have to be terminated with a $120 \Omega(\geq 1 / 4 \mathrm{~W}, \leq 5 \%)$ bus terminating resistors resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L).

### 5.2.3.1.4 Technical data

The system data of AC500 and S500 are applicable to the standard version. $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166

The system data of AC500-XC are applicable to the XC version. $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Connection of the supply voltage 24 V <br> DC at the terminal base of the processor <br> module | Removable 5-pin terminal block spring type |
| Max. current consumption from 24 V DC | TB5600: $0.25 \mathrm{~A}^{1}$ ) |
|  | TB5610: $0.35 \mathrm{~A}^{1}$ ) |
|  | TB5620: $0.4 \mathrm{~A}^{1}$ ) |
|  | TB5640: $0.6 \mathrm{~A}^{1}$ ) |
|  | TB5660: $0.8 \mathrm{~A}^{1}$ ) |
| Melting integral of a fuse at 24 V DC | Min. $1 \mathrm{~A}^{2} \mathrm{~s}^{2}$ ) |

### 5.2.4 I/O modules

### 5.2.4.1 Safety instructions

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index FO.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

## NOTICE!

## Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

## Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.
$\star$ Further information about hot swap.

### 5.2.4.2 I/O bus - Data transfer

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to $10 \mathrm{I} / \mathrm{O}$ modules can be added.
Chapter 4.2.3 "//O bus - Communication within the PLC" on page 97

* Chapter 5.2.4.2 "//O bus - Data transfer" on page 387

The synchronized I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.
With its fast data transmission, the I/O bus obtains very low reaction times.
Up to $10 \mathrm{I} / \mathrm{O}$ terminal units (for one I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules $乡 3$ Table 119 "Maximum number of I/O devices which can be connected to the I/O bus" on page 389.

1 I/O bus connection
The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals

## NOTICE!

Except when using hot swap terminal units, the I/O bus is not designed for pulling and plugging modules during operation. If a module is pulled or plugged on a terminal unit that is not hot swap capable while the bus is running, the following consequences are possible

- reset of the station or of the processor module
- system lockup
- damage of the module

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
(4) Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

Profibus (master and slave) and CM589-PNIO are available since version 2.5.0 of the Automation Builder.

Table 119: Maximum number of I/O devices which can be connected to the I/O bus

| Device | Version Automation <br> Builder | Version firmware | Max. number of I/O <br> devices |
| :--- | :--- | :--- | :--- |
| CANopen bus <br> modules CI581-CN <br> and CI582-CN | As of V2.1.0 | All | 0 |
| PROFINET bus <br> modules CI501-PNIO <br> and CI502-PNIO | As of V2.1.0 | all | 10 |

| Modbus communica- <br> tion interface module <br> CI521 and CI522 | Independent from <br> Automation Builder <br> version | all | 10 |

Profibus (master and slave) and CM589-PNIO are available since version 2.5.0 of the Automation Builder.

Table 120: General data of the I/O bus

| Parameter | Value |
| :--- | :--- |
| Supply voltage, signal level | $3.3 \mathrm{~V} \mathrm{DC} \pm 10 \%$ |
| Max. supply current | On request |
| Type of the data interface | Synchronized serial data exchange |

| Parameter | Value |
| :--- | :--- |
| Bus data transmission speed | $1.8 \mathrm{Mb} / \mathrm{s}$ |
| Minimum bus cycle time | $500 ~ \mu \mathrm{~s}$ <br> This value is valid for all module combinations <br> (from 1 to $10 \mathrm{I} / \mathrm{O}$ modules) |
| Galvanic isolation | I/O bus is galvanic connected to CPU and <br> communication interface logic ciruits. Galvanic <br> isolation of I/O bus is I/O module specific. See <br> each module specification for details. |
| Protection against electrostatic discharge <br> (ESD) | TB5xx, TB56xx: with protection diodes, <br> no ESD discharge allowed on the port. |

Table 121: Wiring (bus connection)

| Parameter | Value |
| :--- | :--- |
| Bus connection | Left-side and right-side connection from <br> module to module via a 10-pole HE plug (male <br> at the left side, female at the right side) |
| Mechanical connection | Established by the terminal units |
| Max. bus length | 1 m |

### 5.2.4.3 Digital I/O modules

### 5.2.4.3.1 S500-eCo

## DC562 - Digital input/output module

## Features

- 16 configurable digital inputs/outputs in 1 group, 24 V DC
- Module-wise galvanically isolated

1 I/O bus
216 yellow LEDs to display the states of the inputs/outputs C0 ... C15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input and output signals (9-pin)
6 Terminal block for input and output signals (11-pin)
72 holes for wall-mounting with screws
DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals ZP and UP (process voltage 24 V <br> DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 43: Internal construction of the digital inputs and outputs

Table 122: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | --- | Reserved |
| 2 | C0 | Input/output signal C0 |
| 3 | C1 | Input/output signal C1 |
| 4 | C2 | Input/output signal C2 |
| 5 | C3 | Input/output signal C3 |
| 6 | C4 | Input/output signal C4 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 7 | C5 | Input/output signal C5 |
| 8 | C6 | Input/output signal C6 |
| 9 | C7 | Input/output signal C7 |
| 10 | --- | Reserved |
| 11 | C8 | Input/output signal C8 |
| 12 | C9 | Input/output signal C9 |
| 13 | C10 | Input/output signal C10 |
| 14 | C11 | Input/output signal C11 |
| 15 | C12 | Input/output signal C12 |
| 16 | C13 | Input/output signal C13 |
| 17 | C14 | Input/output signal C14 |
| 18 | C15 | Input/output signal C15 |
| 19 | UP | Process voltage UP +24 V DC |
| 20 | ZP | Process voltage ZP 0 V DC |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP ( 0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

Fig. 44: Connection of the digital input/output module DC562
In this connection example, the inputs/outputs $\mathrm{C} 0 \ldots \mathrm{C} 7$ are connected as inputs and the inputs/ outputs C8 ... C15 are connected as outputs.

The module provides several diagnosis functions $\Leftrightarrow$ Chapter 5.2.4.3.1.1.7 "Diagnosis" on page 397.
The meaning of the LEDs is described in the section State LEDs ${ }^{\mu} \Rightarrow$ Chapter 5.2.4.3.1.1.8 "State LEDs" on page 397.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
$\qquad$
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS SIot <br> Index |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Module ID | Internal | $6155^{1}$ ) | WORD | 6155 <br> $0 x 180 B$ | 0 | 65535 | $x x 01$ |
| Ignore <br> module | No <br> Yes | 0 | BYTE | No <br> $(0 x 00)$ |  |  |  |
| Parameter <br> length 2) | Internal | 1 - CPU | BYTE | 0 | 0 | 255 | $\left.x x 02^{3}\right)$ |

${ }^{1}$ ) with CS31 and addresses less than 70, the value is increased by 1
${ }^{2}$ ) the module has no additional user-configurable parameters
${ }^{3}$ ) Value is hexadecimal: HighByte is slot (xx: $0 \ldots 7$ ), LowByte is index (1 ... n) GSD file:

| Ext_User_Prm_Data_Len $=$ | $0 \times 06$ |
| :--- | :--- |
| Ext_User_Prm_Data_Const $(0)=$ | $0 \times 18,0 \times 0 \mathrm{C}, 0 \times 00,0 \times 02,0 \times 00,0 \times 00 ;$ |

Diagnosis

| E1 ... E4 | d1 | d2 | d3 | d4 | Identifier $000 \text {... } 063$ | $\|$AC500- <br> Display | <- Display in |

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: $14=1 / O$ bus, $11=$ COM1 (e.g. CS31-Bus), $12=$ COM2. <br> The PNIO diagnosis block does not contain this identifier. |
| :---: | :---: |
| $\left.{ }^{2}\right)$ | With "Device" the following allocation applies: <br> 31 = Module itself, $1 . . .10=$ expansion module $1 \ldots$.. 10, ADR = hardware address (e. g. of the DC551-CS31) |
| ${ }^{3}$ ) | With "Module" the following allocation applies depending on the master: <br> Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10 <br> Channel error: I/O bus or PNIO = module type ( 4 = DC); COM1/COM2: 1 ... 10 = expansion 1 ... 10 |
| ${ }^{4}$ ) | In case of module errors, with channel "31 = Module itself" is output. |

## State LEDs

| LED |  | State | Color | LED = OFF | LED = ON |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Inputs/outputs C0 ... C15 | Digital input or digital output | Yellow | Input/output is OFF | Input/output is ON <br> (the LEDs are only operating if the module's circuitry is supplied via the I/O bus) |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
*y Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |  |
| :--- | :--- | :--- |
| Process voltage UP |  |  |
|  | Connections | Terminal 19 for UP (+24 V DC) and terminal 20 <br> for ZP (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption via UP terminal | $90 \mathrm{~mA}+0.5 \mathrm{~A}$ per output (max.) |
|  | Max. ripple | $5 \%$ |
|  | Inrush current | Protection against reversed voltage |
| Current consumption from 24 V DC power <br> supply at the L+/UP and M/ZP terminals of <br> the CPU/communication interface module | Yes |  |
| Galvanic isolation | Yes, between the input/output group and the <br> rest of the module |  |
|  | Isolated groups | 1 group for 16 channels |
| Surge voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 4.8 W |  |
| Input data length | 2 bytes |  |
| Output data length | 2 bytes |  |
| Weight | Ca. 125 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |  |

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 configurable inputs (24 V DC) |
| Distribution of the channels into groups | $1(16$ channels per group) |
| Connections of the channels C0 to C15 | Terminals 1 to 16 |
| Reference potential for the channels C0 to <br> C15 | Terminal 20 (negative pole of the process <br> voltage, name ZP) |
| Indication of the input signals | 1 yellow LED per channel; the LED is ON <br> when the input signal is high (signal 1). The <br> module is powered through the I/O bus. |

| Parameter | Value |
| :---: | :---: |
| Input type according to EN 61131-2 | Type 1 sink |
| Input signal range | +24 V DC |
| Signal 0 | -3 V ... +5V |
| Undefined signal | +5 V ... +15 V |
| Signal 1 | +15 V ... +30 V |
| Ripple with signal 0 | -3 V ... +5V |
| Ripple with signal 1 | +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5V | Typ. 1 mA |
| Input voltage +15 V | $>2.5 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. permissible leakage current (at 2-wire proximity switches) | 1 mA |
| Input delay (0->1 or 1->0) | Typ. 8 ms |
| Max. cable length |  |
| Shielded | 500 m |
| Unshielded | 300 m |

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 configurable transistor outputs |
| Distribution of the channels into groups | 1 (16 channels per group) |
| Connections of the channels C0 to C15 | Terminals 1 to 16 |
| Reference potential for the channels C0 to <br> C15 | Terminal 20 (negative pole of the process <br> voltage, signal name ZP) |
| Common power supply voltage | Terminal 19 (positive pole of the process <br> voltage, signal name UP) |
| Indication of the input signals | 1 yellow LED per channel; the LED is ON when <br> the input signal is high (signal 1). The module <br> is powered through the I/O bus. |
| Way of operation | Non-latching type |
| Output voltage at signal 1 | UP -0.3 V at max. current |
| Output delay (max. at rated load) | 0 50 $\mu \mathrm{s}$ |
|  | 0 to 1 |
| 1 to 0 | $200 \mu \mathrm{~s}$ |
| Output current | 0.5 A at UP 24 V DC |
|  | Rated current per channel (max.) |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Lamp load (max.) | 5 W |
|  | Max. leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Output type | Non-protected |  |
| Protection type | External fuse on each channel |  |
| Rated protection fuse (for each channel) | 3 A fast |  |
| Demagnetization when inductive loads are <br> switched off | Must be performed externally according to <br> driven load specification |  |
| Switching frequency |  |  |
|  | With inductive loads | Max. 0.5 Hz |
|  | With lamp loads | Max. 11 Hz at max. 5 W |
| Short-circuit-proof / Overload-proof | No |  |
|  | Overload message | No |
|  | Output current limitation | No |
|  | Resistance to feedback against 24 V DC <br> signals | Yes |
| Connection of 2 outputs in parallel | Not possible |  |
| Max. cable length |  |  |
|  | Shielded | 500 m |
|  | Unshielded | 150 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DI561-Digital input module

## Features

- 8 digital inputs 24 V DC / 24 V AC (IO ... 17) in 1 group
- Module-wise galvanically isolated

1 I/O bus
28 yellow LEDs to display the signal states of the inputs 10 to 17
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
62 holes for wall-mounting with screws
7 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Not necessary |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 45: Internal construction of the digital inputs

Table 123: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | $\mathrm{CO} \ldots 7$ | Input common for signals IO to <br> I7 |
| 2 | IO | Input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | I2 | Input signal I2 |
| 5 | I3 | Input signal I3 |
| 6 | I4 | Input signal I4 |
| 7 | I5 | Input signal I5 |
| 8 | I6 | Input signal I6 |
| 9 | I7 | Input signal I7 |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from $24 \vee$ DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI561.
An external power supply connection is not needed.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

## NOTICE!

## Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 124: Connection of the digital input module DI561

The module provides several diagnosis functions $\stackrel{\wedge}{ }{ }^{\circ}$ Chapter 5.2.4.3.1.2.7 "Diagnosis" on page 406.
The meaning of the LEDs is described in the section State LEDs ${ }^{\mu}$ Chapter 5.2.4.3.1.2.8 "State LEDs" on page 407.

## I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS SIot <br> Index |

## DI562 - Digital input module

## Features

- 16 digital inputs 24 V DC / 24 V AC (IO ... I15) in 2 groups
- Group-wise galvanically isolated

1 I/O bus
216 yellow LEDs to display the signal states of the inputs I0 ... I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
72 holes for wall-mounting with screws
DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Not necessary |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 46: Internal construction of the digital inputs

Table 125: Assignments of the terminal

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | CO $\ldots$ C7 | Input common for signals I0 to I7 |
| 2 | IO | Input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | I2 | Input signal I2 |
| 5 | I3 | Input signal I3 |
| 6 | I4 | Input signal I4 |
| 7 | I5 | Input signal I5 |
| 8 | I6 | Input signal I6 |
| 9 | I8 C15 | Input signal I7 |
| 10 | I9 | Input common for signals I8 ... I15 |
| 11 | I11 | Input signal I8 |
| 12 | I12 | Input signal I9 |
| 13 | I13 | Input signal I10 |
| 14 | I14 | Input signal I11 |
| 15 | I15 | Input signal I12 |
| 16 | --- | Input signal I13 |
| 17 | --- | Input signal I14 |
| 18 | In | Input signal I15 |
| 19 | 20 | Reserved |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI562.
An external power supply connection is not needed.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions $\Rightarrow$ Chapter 5.2.4.3.1.3.7 "Diagnosis" on page 415.
The digital inputs can be used as source inputs or as sink inputs.

## NOTICE!

## Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Table 126: Connection of the digital input module DI562

The meaning of the LEDs is described in section State LEDs ${ }^{\wedge}>$ Chapter 5.2.4.3.1.3.8 "State LEDs" on page 415.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

for planning and commissioning of new installations.

## DI571-Digital input module

## Features

- 8 digital inputs $100 \ldots 240 \mathrm{~V}$ AC (I0 ... 17 ) in 8 groups
- Module-wise galvanically isolated

I/O bus
28 yellow LEDs to display the signal states of the inputs IO ... I7
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
72 holes for wall-mounting with screws
DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Not necessary |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9 -pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 47: Internal construction of the digital inputs

Table 127: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | IO | Input signal IO |
| 2 | N0 | Neutral conductor for the input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | N1 | Neutral conductor for the input signal I1 |
| 5 | I2 | Input signal I2 |
| 6 | N2 | Neutral conductor for the input signal I2 |
| 7 | I3 | Input signal I3 |
| 8 | N3 | Neutral conductor for the input signal I3 |
| 9 | I4 | Reserved |
| 10 | N4 | Input signal I4 |
| 11 | I5 | Neutral conductor for the input signal I4 |
| 12 | N5 | Input signal I5 |
| 13 |  | Neutral conductor for the input signal I5 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 14 | I6 | Input signal I6 |
| 15 | N6 | Neutral conductor for the input signal I6 |
| 16 | I7 | Input signal I7 |
| 17 | N7 | Neutral conductor for the input signal I7 |
| 18 | --- | Reserved |
| 19 | --- | Reserved |
| 20 | --- | Reserved |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI571.

An external power supply connection is not needed.

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 48: Connection of the digital input module DI571

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage $>240 \mathrm{~V}$ is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions $\stackrel{\mu}{ }{ }^{\circ}$ Chapter 5.2.4.3.1.4.8 "Diagnosis" on page 425.
The meaning of the LEDs is described in the section State LEDs * Chapter 5.2.4.3.1.4.9 "State LEDs" on page 425.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 1 |
| Digital outputs (bytes) | 0 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

$$
\begin{aligned}
& \text { If the external power supply voltage via UP/ZP terminals fails, the I/O module } \\
& \text { loses its configuration data. The whole station has to be switched off and on } \\
& \text { again to re-configure the module. }
\end{aligned}
$$

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of the modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS SIot <br> Index |

The system data of AC500-eCo apply.
« Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |
| :--- | :--- |
| Galvanic isolation | Yes, between the input groups and the rest of <br> the module |
| Isolated groups | 2 (8 channels per group) |
| Current consumption from 24 V DC power <br> supply at the L+/UP and M/ZP terminals of the <br> CPU/communication interface module | Ca. 10 mA |
| Max. power dissipation within the module | 6 W |
| Weight | Ca. 222 g |
| Mounting position | Horizontal or vertical |
| Cooling | The natural convection cooling must not be <br> hindered by cable ducts or other parts in the <br> control cabinet. |

## Technical data of the digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 16 AC inputs (100-240 V AC) |
| Distribution of the channels into groups | 2 (8 channels per group) |
| Input voltage range | 0 V AC ... 264 V AC ( 47 Hz ... 63 Hz ) |
| Input current per channel (typically at $+25^{\circ} \mathrm{C}$ ) | $\begin{aligned} & <3 \mathrm{~mA}(\text { at } 40 \mathrm{~V} \mathrm{AC}) \\ & >6 \mathrm{~mA}(\text { at } 164 \mathrm{~V} \mathrm{AC}) \\ & >8 \mathrm{~mA}(\text { at } 240 \mathrm{~V} \mathrm{AC}) \end{aligned}$ |
| Connections of the channels 10..17 | Terminals 1... 8 |
| Connections of the channels 18...I15 | Terminals $10 . .17$ |
| Reference potential for the channels 10...17 | Terminal 9 |
| Reference potential for the channels 18...115 | Terminal 18 |
| Indication of the input signals | 1 yellow LED per channel. The LED is on when the input signal is high (signal 1). |
| Input type according to EN 61131-2 | Type 1 |
| Input signal range |  |
| Signal 0 (max.) | 40 V AC |
| Undefined signal | $40 \mathrm{~V} \mathrm{AC}<\mathrm{U}<79 \mathrm{~V}$ AC |
| Signal 1 (min.) | 79 V AC |
| Input delay |  |
| Signal 0 -> 1 | Typ. 24 ms |
| Signal 1 -> 0 | Typ. 24 ms |

| Parameter | Value |
| :--- | :--- |
| Input data length | 2 bytes |
| Max. permissible leakage current (at 2-wire prox- <br> imity switches) | 1 mA |
| Max. cable length |  |
|  | Shielded |
|  | Unshielded |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

## DO561 - Digital output module

## Features

- 8 digital outputs 24 V DC ( $\mathrm{O} 0 \ldots \mathrm{O}$ ) in 1 group
- Module-wise galvanically isolated

1 I/O bus
28 yellow LEDs to display the signal states of the outputs $\mathrm{O} 0 \ldots \mathrm{O} 7$
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
62 holes for wall-mounting with screws
7 DIN rail

Intended purpose
The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals ZP and UP (process supply voltage <br> $24 \mathrm{~V} \mathrm{DC})$ |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable $9-$ pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 50: Internal construction of the digital outputs

Table 129: Assignment of the terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| 10 | --- | Reserved |
| 11 | O0 | Output signal O0 |
| 12 | O1 | Output signal O1 |
| 13 | O2 | Output signal O2 |
| 14 | O3 | Output signal O3 |
| 15 | O4 | Output signal O4 |

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| 16 | O5 | Output signal O5 |
| 17 | O6 | Output signal O6 |
| 18 | O7 | Output signal O7 |
| 19 | UP | Process supply voltage <br> UP +24 V DC |
| 20 | ZP | Process supply voltage <br> ZP 0 V |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP ( 0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 51: Connection of the digital output module DO561

## NOTICE!

Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to $50 \mu$ s if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

## - NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions ${ }^{\sharp}>$ Chapter 5.2.4.3.1.6.7 "Diagnosis" on page 442.

The meaning of the LEDs is described in the section State LEDs ${ }^{\mu} \Rightarrow$ Chapter 5.2.4.3.1.6.8 "State LEDs" on page 443.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS SIot <br> Index |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
*y Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminal 19 for UP (+24 V DC) and terminal <br> 20 for ZP (0 V DC) |
|  | Rated value | 24 V DC |
|  | Current consumption via UP terminal | $5 \mathrm{~mA}+$ max. 0.5 A per output |
|  | Max. ripple | 5 \% |
|  | Protection against reversed voltage | Rated protection fuse for UP |
| Current consumption from 24 V DC power <br> supply at the L+/UP and M/ZP terminals of the <br> CPU/communication interface module | Recommended; the outputs must be pro- <br> tected by an 3 A fast-acting fuse |  |
| Galvanic isolation | Yes, between the output group and the rest of <br> the module |  |
| Isolated groups | 1 (8 channels per group) |  |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Power dissipation within the module (max.) | 1.6 W |  |
| Weight | Ca. 115 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be <br> hindered by cable ducts or other parts in the <br> control cabinet. |  |

No effects of No effects of multiple overloads on isolated multi-channel modules occur, as every channel is multiple overprotected individually by an external fuse.

## loads

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 transistor outputs (24 V DC, 0.5 A max.) |
| Distribution of the channels into groups | 1 (8 channels per group) |
| Connection of the channels O0 to O7 | Terminals 11 to 18 |
| Common power supply voltage | Terminal 19 (positive pole of the process <br> voltage, signal name UP) |
| Reference potential for the channels O0 to O7 | Terminal 20 (negative pole of the process <br> voltage, signal name ZP) |

| Parameter | Value |
| :---: | :---: |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus |
| Way of operation | Non-latching type |
| Min. output voltage at signal 1 | 20 V DC at max. current consumption |
| Output delay (max. at rated load) |  |
| 0 to 1 | $50 \mu \mathrm{~s}$ |
| 1 to 0 | $200 \mu \mathrm{~s}$ |
| Output data length | 1 byte |
| Output current |  |
| Rated current per channel (max.) | 0.5 A at UP 24 V DC |
| Rated current per group (max.) | 4 A |
| Lamp load (max.) | 5 W |
| Max. leakage current with signal 0 | 0.5 mA |
| Output type | Non-protected |
| Protection type | External fuse on each channel |
| Rated protection fuse (for each channel) | 3 A fast |
| Demagnetization when inductive loads are switched off | Must be performed externally according to driven load specification |
| Switching Frequencies |  |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | Max. 11 Hz at max. 5 W |
| Short-circuit-proof / Overload-proof | No |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Max. cable length |  |
| Shielded | 500 m |
| Unshielded | 150 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## DO562-Digital output module

## Features

- 16 digital outputs $24 \mathrm{~V} \mathrm{DC}(\mathrm{OO} \ldots \mathrm{O} 15)$ in 1 group
- Module-wise galvanically isolated

1 I/O bus
216 yellow LEDs to display the signal states of the outputs O0 ... O15
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals ZP and UP (process supply voltage <br> 24 V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 52: Internal construction of the digital outputs

Table 130: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | --- | Reserved |
| 2 | O0 | Output signal O0 |
| 3 | O1 | Output signal O1 |
| 4 | O2 | Output signal O2 |
| 5 | O3 | Output signal O3 |
| 6 | O4 | Output signal O4 |
| 7 | O5 | Output signal O5 |
| 8 | O6 | Output signal O6 |
| 9 | O7 | Output signal O7 |
| 10 | --- | Reserved |
| 11 | O8 | Output signal O8 |
| 12 | O9 | Output signal O9 |
| 13 | O10 | Output signal O10 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 14 | O11 | Output signal O11 |
| 15 | O12 | Output signal O12 |
| 16 | O13 | Output signal O13 |
| 17 | O14 | Output signal O14 |
| 18 | O15 | Output signal O15 |
| 19 | UP | Process voltage UP (24 V DC) |
| 20 | ZP | Process voltage ZP (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP ( 0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 53: Connection of the digital output module DO562

## NOTICE!

Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to $50 \mu$ s if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

## NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions ${ }^{\mu}$ Chapter 5.2.4.3.1.7.7 "Diagnosis" on page 453.

The meaning of the LEDs is described in the section Status LEDs $\Longleftrightarrow$ Chapter 5.2.4.3.1.7.8
"State LEDs" on page 453.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
*y Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP |  |
| Connections | Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V DC) |
| Rated value | 24 V DC |
| Current consumption via UP terminal | $20 \mathrm{~mA}+\mathrm{max}$. 0.5 A per output |
| Max. ripple | 5 \% |
| Inrush current | $0.000002 \mathrm{~A}^{2} \mathrm{~s}$ |
| Protection against reversed voltage | Yes |
| Rated protection fuse for UP | Recommended; the outputs must be protected by an 3 A fast-acting fuse |
| Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module | Ca. 10 mA |
| Galvanic isolation | Yes, between the output group and the rest of the module |
| Isolated groups | 1 (16 channels per group) |
| Surge-voltage (max.) | 35 V DC for 0.5 s |
| Max. power dissipation within the module | 1.4 W |
| Weight | Ca. 125 g |
| Mounting position | Horizontal or vertical |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

No effects of No effects of multiple overloads on isolated multi-channel modules occur, as every channel is multiple overloads protected individually by an external fuse.

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 transistor outputs (24 V DC, 0.5 A max.) |
| Distribution of the channels into groups | 1 (16 channels per group) |
| Connection of the channels O0 ... O7 | Terminals $1 \ldots 9$ |
| Connection of the channels O8 ... O15 | Terminals $11 \ldots 18$ |
| Common power supply voltage | Terminal 19 (positive pole of the process voltage, <br> signal name UP) |
| Reference potential for the channels O0 ... <br> O15 | Terminal 20 (negative pole of the process <br> voltage, signal name ZP) |

| Parameter | Value |
| :---: | :---: |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1 ) and the module is powered via the I/O bus |
| Way of operation | Non-latching type |
| Min. output voltage at signal 1 | UP -0.3 V at max. current consumption |
| Output delay (max. at rated load) |  |
| 0 to 1 | $50 \mu \mathrm{~s}$ |
| 1 to 0 | $200 \mu \mathrm{~s}$ |
| Output data length | 2 bytes |
| Output current |  |
| Rated current per channel (max.) | 0.5 A at UP 24 V DC |
| Rated current per group (max.) | 8 A |
| Lamp load (max.) | 5 W |
| Max. leakage current with signal 0 | 0.5 mA |
| Output type | Non-protected |
| Protection type | External fuse on each channel |
| Rated protection fuse (for each channel) | 3 A fast |
| Demagnetization when inductive loads are switched off | Must be performed externally according to driven load specification |
| Switching Frequencies |  |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | Max. 11 Hz at max. 5 W |
| Short-circuit-proof / Overload-proof | No |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Max. cable length |  |
| Shielded | 500 m |
| Unshielded | 150 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DO571 - Digital output module

## Features

- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100 V AC ... 240 V AC, 2 A max. (NOO ... NO7) in 2 groups
- Group-wise galvanically isolated
(6)

1 I/O bus
28 yellow LEDs to display the signal states of the outputs 00 ... O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
62 holes for wall-mounting with screws
7 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminal L+ (process voltage 24 V DC). The negative <br> pole is provided by the I/O bus. |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9 -pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 54: Internal construction of the digital outputs

Table 131: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 10 | NO0 | Normally-open contact of the output NO0 |
| 11 | NO1 | Normally-open contact of the output NO1 |
| 12 | NO2 | Normally-open contact of the output NO2 |
| 13 | NO3 | Normally-open contact of the output NO3 |
| 14 | R0..3 | Output common for signals NO0 to NO3 |
| 15 | NO4 | Normally-open contact of the output NO4 |
| 16 | NO6 | Normally-open contact of the output NO5 |
| 17 | NO7 | Normally-open contact of the output NO6 |
| 18 | L4..7 | Normally-open contact of the output NO7 |
| 19 | Output common for signals NO4 to NO7 |  |
| 20 |  | Process voltage L+ +24 V DC |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO571.
The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/ communication interface module and the DO571 must have a common power supply.

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

## WARNING!

## For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages $>24 \mathrm{~V}$ are connected to the relay group.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0 ... R3 and R4 ... R7) does not exceed 8 A.
Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

Connection of the module:

Fig. 55: Connection of 24 V DC actuators

Fig. 56: Connection of 24 V AC or 100 V AC ... 240 V AC actuators

## NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

Fig. 57: Power supply - the negative connection is realized via the I/O bus
CPU or communication interface module
2 I/O bus
3 DO571

The L+ connection of the DO571 and the 24 V supply of the CPU/communication interface module must be connected to the same $24 V$ power supply.

The module provides several diagnosis functions ${ }^{\mu} \Rightarrow$ Chapter 5.2.4.3.1.8.7 "Diagnosis" on page 464.
The meaning of the LEDs is described in the section Status LEDs $\Leftrightarrow$ Chapter 5.2.4.3.1.8.8 "State LEDs" on page 465 .

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

$$
\begin{aligned}
& \text { If the external power supply voltage via UP/ZP terminals fails, the I/O module } \\
& \text { loses its configuration data. The whole station has to be switched off and on } \\
& \text { again to re-configure the module. }
\end{aligned}
$$

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS Slot <br> Index |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## DO572 - Digital output module

## Features

- 8 digital triac outputs ( O 0 ... O ) in 8 groups
- 120/240 V AC
- Module-wise galvanically isolated

1 I/O bus
28 yellow LEDs to display the signal states of the outputs 00 ... 07
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Not necessary |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 58: Internal construction of the digital outputs

Table 132: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | O0 | Output signal O0 |
| 2 | N0 | Neutral conductor for the <br> output signal O0 |
| 3 | O1 | Output signal O1 |
| 4 | N1 | Neutral conductor for the <br> output signal O1 |
| 5 | --- | Reserved |

| 7 | O3 | Neutral conductor for the <br> output signal O2 |
| 8 | N3 | Output signal O3 |
| 9 | --- | Neutral conductor for the <br> output signal O3 |
| 10 | O4 | Reserved |
| 11 |  | Output signal O4 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 12 | N4 | Neutral conductor for the <br> output signal O4 |
| 13 | O5 | Output signal O5 |
| 14 | N5 | Neutral conductor for the <br> output signal O5 |
| 15 | O6 | Reserved |
| 16 | N6 | Output signal O6 |
| 17 | O7 | Neutral conductor for the <br> output signal O6 |
| 18 | N7 | Output signal O7 |
| 19 | --- | Neutral conductor for the <br> output signal O7 |
| 20 | Reserved |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from $24 \vee$ DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO572.

An external power supply connection is not needed.

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 59: Connection of the module

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage $>240 \mathrm{~V}$ is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.2.4.3.1.9.7 "Diagnosis" on page 474.
The meaning of the LEDs is described in the section State LEDs ${ }_{y}{ }^{4}$ Chapter 5.2.4.3.1.9.8 "State LEDs" on page 475.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
\& Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |
| :--- | :--- |
| Galvanic isolation | Yes, between the channels and the rest of the <br> module |
| Isolated groups | 8 (1 channel per group) |
| Current consumption from 24 V DC power <br> supply at the L+/UP and M/ZP terminals of the <br> CPU/communication interface module | Ca. 10 mA |
| Max. power dissipation within the module | On Request |
| Weight | ca. 120 g |
| Mounting position | Horizontal or vertical |
| Cooling | The natural convection cooling must not be <br> hindered by cable ducts or other parts in the <br> control cabinet. |

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 triac outputs |
| Distribution of the channels into groups | 8 groups (1 channel per group) |
| Connection of the channels O0 to O7 | Terminals 1, 3, 5, 7, 10, 12, 14, 16 |
| Reference potential for the channels O0 to O7 | Terminals 2, 4, 6, 8, 11, 13, 15, 17 |
| Output voltage for signal 1 | On Request |
| Max. leakage current with signal 0 | 1.1 mA root mean square at 132 V AC and |
|  | 1.8 mA root mean square at 264 V AC |
| Output voltage |  |
|  | Rated value |

| Parameter | Value |
| :---: | :---: |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus |
| Way of operation | Non-latching type |
| Output delay | On Request |
| Output data length | 1 byte |
| Output current |  |
| Rated current per channel (max.) | 0.3 A |
| Rated current per group (max.) | 0.3 A |
| Surge current (max.) | On request |
| Lamp load (max.) | On request |
| Spark suppression with inductive AC loads | Must be performed externally according to driven load specification |
| Switching Frequencies |  |
| With resistive loads | Max. 10 Hz |
| With inductive loads | Not applicable |
| With lamp loads | Max. 10 Hz |
| Output type | Non-protected |
| Protection type | External fuse on each channel |
| Rated protection fuse | 2 A fast |
| Short-circuit-proof / Overload-proof | No, should be provided by an external fuse or circuit breaker |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 230 V AC | No |
| Connection of 2 outputs in parallel | Not applicable |
| Max. cable length |  |
| Shielded | 500 m |
| Unshielded | 150 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |

> *) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DO573 - Digital output module

## Features

- 16 digital normally open relay outputs 24 V DC or 100 V AC ... 240 V AC (NOO ... NO15) in 2 groups, 2 A max.
- Group-wise galvanically isolated

1 I/O bus
216 yellow LEDs to display the signal states of the outputs $\mathrm{O} 0 \ldots \mathrm{O} 15$
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals L+ (process voltage 24 V DC) and M (0 V <br> DC); the M terminal is connected to the M terminal of the CPU <br> via the I/O bus |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 14 | NO12 | Normally-open contact of the output NO12 |
| 15 | NO13 | Normally-open contact of the output NO13 |
| 16 | NO14 | Normally-open contact of the output NO14 |
| 17 | NO15 | Normally-open contact of the output NO15 |
| 18 | R8 ... 15 | Output common for signals NO8 to NO15 |
| 19 | L+ | Process voltage L+ (24 V DC) |
| 20 | M | Process voltage M (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO573.

The external power supply connection is carried out via the $\mathrm{L}+(+24 \mathrm{~V} \mathrm{DC}$ ) and the $\mathrm{M}(0 \mathrm{~V}$ DC) terminals. The $M$ terminal is electrically interconnected to the M/ZP terminal of the CPU/ communication interface module.

## WARNING!

Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

## WARNING!

For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages $>24 \mathrm{~V}$ are connected to the relay group.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V . All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0.. 7 and R8..15) does not exceed 10 A .

Never connect total currents > 10 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:

Fig. 61: Connection of $24 V D C$ actuators

Fig. 62: Connection of $100-240$ V AC actuators
The module provides several diagnosis functions.
The meaning of the LEDs is described in the section State LEDs $\Leftrightarrow$ Chapter 5.2.4.3.1.9.8 "State LEDs" on page 475.

Fig. 63: Power supply - the negative connection is realized via the I/O bus

The $L+$ connection of the $D 0573$ and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply .

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DX561-Digital input/output module

## Features

- 8 digital inputs 24 V DC ( $10 \ldots \mathrm{I}$ ) in 1 group
- 8 digital transistor outputs 24 V DC ( $\mathrm{O} 0 \ldots \mathrm{O}$ ) in 1 group
- Group-wise galvanically isolated

1 I/O bus
28 yellow LEDs to display the signal states of the inputs 10 ... 17
38 yellow LEDs to display the signal states of the outputs 00 ... O7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
82 holes for wall-mounting with screws
9 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals ZP and UP (process voltage 24 V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 64: Internal construction of the digital inputs and outputs

Table 134: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | CO ... 7 | Input common for signals IO $\ldots$ <br> I7 |
| 2 | IO | Input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | I2 | Input signal I2 |
| 5 | I3 | Input signal I3 |
| 6 | I4 | Input signal I4 |
| 7 | I5 | Input signal I5 |
| 8 | I6 | Input signal I6 |
| 9 | I7 | Input signal I7 |
| 10 | --- | Reserved |
| 11 | O0 | Output signal O0 |
| 12 | O1 | Output signal O1 |
| 13 | O2 | Output signal O2 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 14 | O3 | Output signal O3 |
| 15 | O4 | Output signal O4 |
| 16 | O5 | Output signal O5 |
| 17 | O6 | Output signal O6 |
| 18 | O7 | Output signal O7 |
| 19 | UP | Process voltage UP +24 V DC |
| 20 | ZP | Process voltage ZP 0 V DC |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

## NOTICE!

## Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Fig. 65: Connection of inputs to the digital input/output module - sink inputs

Fig. 66: Connection of inputs to the digital input/output module - source inputs

Fig. 67: Connection of the outputs to the module

## NOTICE!

## Risk of malfunctions in the plant!

The outputs may switch on for a period of 10 to $50 \mu$ s if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

## - NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions ${ }^{\mu}$ Chapter 5.2.4.3.1.11.7 "Diagnosis" on page 498.

The meaning of the LEDs is described in the Displays section ${ }^{\&} \geqslant$ Chapter 5.2.4.3.1.11.8 "State LEDs" on page 499 chapter.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> Value, <br> Type | Default | Min. | Max. | EDS Slot <br> Index |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
\& Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |  |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminal 19 for UP (+24 V DC) and ter- <br> minal 20 for ZP (0 V DC) |
|  | Rated value | 24 V DC |
|  | Current consumption via UP terminal | $5 \mathrm{~mA}+$ max. 0.5 A per output |
|  | Max. ripple | $5 \%$ |
|  | Inrush current | Protection against reversed voltage |
| Rated protection fuse for UP | Yes <br> Recommended; the outputs must be pro- <br> tected by an 3 A fast-acting fuse |  |
| Current consumption from 24 V DC power supply <br> at the L+/UP and M/ZP terminals of the CPU/com- <br> munication interface module | Ca. 10 mA |  |
| Galvanic isolation | Yes, between the input group and the <br> output group and the rest of the module |  |
| Isolated groups | 2 groups (1 group for 8 input channels, 1 <br> group for 8 output channels) |  |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 2.3 W |  |
| Weight | ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not <br> be hindered by cable ducts or other parts <br> in the control cabinet. |  |

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital inputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 8 |  |
| Distribution of the channels into groups | 1 group for 8 channels |  |
| Connections of the channels $10 \ldots 17$ | Terminals $2 \ldots 9$ |  |
| Reference potential for the channels I0 ... 17 | Terminal 1 |  |
| Indication of the input signals | 1 yellow LED per channel; the LED is ON when the input signal is high (signal 1) |  |
| Monitoring point of input indicator | LED is part of the input circuitry |  |
| Input type according to EN 61131-2 | Type 1 source | Type 1 sink |
| Input signal range | -24 V DC | +24 V DC |
| Signal 0 | -5V ... +3 V | -3V ... +5V |
| Undefined signal | -15V ... + 5 V | +5V ... +15 V |
| Signal 1 | -30 V ... -15V | +15V ... +30 V |
| Ripple with signal 0 | -5 V ... +3 V | -3 V ... +5 V |
| Ripple with signal 1 | -30 V ... -15 V | +15 V ... +30 V |
| Input current per channel |  |  |
| Input voltage +24 V | Typ. 5 mA |  |
| Input voltage +5 V | Typ. 1 mA |  |
| Input voltage +15 V | $>2.5 \mathrm{~mA}$ |  |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |  |
| Max. permissible leakage current (at 2-wire proximity switches) | 1 mA |  |
| Input delay (0->1 or 1->0) | Typ. 8 ms |  |
| Input data length | 1 byte |  |
| Max. cable length |  |  |
| Shielded | 500 m |  |
| Unshielded | 300 m |  |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 transistor outputs (24 V DC, 0.5 A max.) |
| Distribution of the channels into groups | 1 group of 8 channels |
| Connection of the channels $\mathrm{O} 0 \ldots \mathrm{O} 7$ | Terminals $11 \ldots 18$ |
| Reference potential for the channels $\mathrm{O} 0 \ldots \mathrm{O} 7$ | Terminal 20 (negative pole of the process <br> voltage, name ZP) |
| Common power supply voltage | Terminal 19 (positive pole of the process <br> voltage, name UP) |
| Indication of the output signals | 1 yellow LED per channel; the LED is on <br> when the output signal is high (signal 1) <br> and the module is powered via the I/O bus |
| Monitoring point of output indicator | Controlled together with transistor |

| Parameter | Value |
| :---: | :---: |
| Way of operation | Non-latching type |
| Max. output voltage at signal 1 | 20 V DC at max. current consumption |
| Output delay |  |
| 0 to 1 | $50 \mu \mathrm{~s}$ |
| 1 to 0 | $200 \mu \mathrm{~s}$ |
| Output data length | 1 byte |
| Output current |  |
| Rated current per channel (max.) | 0.5 A at UP 24 V DC |
| Rated current per group (max.) | 4 A |
| Rated current (all channels together, max.) | 4 A |
| Lamp load (max.) | 5 W |
| Max. leakage current with signal 0 | 0.5 mA |
| Output type | Non-protected |
| Protection type | External fuse on each channel |
| Rated protection fuse (for each channel) | 3 A fast |
| Demagnetization when inductive loads are switched off | Must be performed externally according to driven load specification |
| Switching Frequencies |  |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | Max. 11 Hz at max. 5 W |
| Short-circuit-proof / Overload-proof | No |
| Overload message | No |
| Output current limitation | No |
| Resistance to feedback against 24 V DC | No |
| Connection of 2 outputs in parallel | Not possible |
| Max. cable length |  |
| Shielded | 500 m |
| Unshielded | 150 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## DX571-Digital input/output module

## Features

- 8 digital inputs 24 V DC / 24 V AC (IO ... I7) in 1 group
- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100 V AC ... 240 V AC, 2 A max. (NO0 ... NO7) in 2 groups
- Group-wise galvanically isolated

1 I/O bus
28 yellow LEDs to display the signal states of the inputs IO ... I7
38 yellow LEDs to display the signal states of the outputs NO0 ... NO7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)

# 7 Terminal block for output signals (11-pin) <br> 82 holes for wall-mounting with screws <br> 9 DIN rail 

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminal L+ (process voltage 24 V DC). The negative <br> pole is provided by the I/O bus. |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 68: Internal construction of the digital inputs and outputs

Table 135: Assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | CO ... 7 | Input common for signals IO ... <br> I7 |
| 2 | IO | Input signal IO |
| 3 | I1 | Input signal I1 |
| 4 | I2 | Input signal I2 |
| 5 | I3 | Input signal I3 |
| 6 | I4 | Input signal I4 |
| 7 | I5 | Input signal I5 |
| 8 | I6 | Input signal I6 |
| 9 | I7 | Input signal I7 |
| 10 | NOO | Normally-open contact of the <br> output 0 |
| 11 | NO1 | Normally-open contact of the <br> output 1 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 12 | NO2 | Normally-open contact of the <br> output 2 |
| 13 | NO3 | Normally-open contact of the <br> output 3 |
| 14 | R0 ... 3 | Output common for signals <br> O0 ... O3 |
| 15 | NO4 | Normally-open contact of the <br> output 4 |
| 16 | NO5 | Normally-open contact of the <br> output 5 |
| 17 | NO7 | Normally-open contact of the <br> output 6 |
| 18 | R4 ... 7 | Normally-open contact of the <br> output 7 |
| 19 | L+ | Output common for signals <br> O4 $\ldots$. O7 |
| 20 | Process voltage +24 V DC |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DX571.
The external power supply connection is carried out via the $L+(+24 \mathrm{~V} C)$ terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/ communication interface module and the DX571 must have a common power supply.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0 ... 3 and R4 ... 7) does not exceed 8 A.

Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The module provides several diagnosis functions (see Diagnosis $\Leftrightarrow$ Chapter 5.2.4.3.1.12.7 "Diagnosis" on page 511).
The digital inputs can be used as source inputs or as sink inputs.

## NOTICE!

Risk of malfunctions in the plant!
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

Fig. 69: Connection of inputs to the digital input/output module DX571-sink inputs

Fig. 70: Connection of inputs to the digital input/output module DX571-source inputs The following figures show the connection of the outputs to the module:

Fig. 71: Connection of 24 V DC actuators

Fig. 72: Connection of 24 V AC or 100 ... 240 V AC actuators

The L+ connection of the DX571 and the 24 V supply of the CPU/communication interface module must be connected to the same $24 V$ power supply.

Fig. 73: Power supply - the minus connection is realized via the I/O bus
1 CPU or communication interface module
2 I/O bus
3 DX571

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

## WARNING!

## For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages $>24 \mathrm{~V}$ are connected to the relay group.

NOTICE!

## Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section $\leadsto$ Chapter 5.2.4.3.1.12.8 "State LEDs" on page 512.

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

| $\left.{ }^{1}\right)$ | In AC500 the following interface identifier applies: <br> $14=$ I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. <br> The PNIO diagnosis block does not contain this identifier. |
| :--- | :--- |
| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> $31=$ Module itself, <br> $1 \ldots 10=$ decentralized communication interface module $1 \ldots 10$, <br> ADR = hardware address (e. g. of the DC551-CS31) |
| $\left.3^{3}\right)$ | With "Module" the following allocation applies depending on the master: <br> Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: $1 \ldots 10=$ expan- <br> sion 1 $\ldots 10$ <br> Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: $1 \ldots 10=$ <br> expansion 1 ... 10 |
| $\left.{ }^{4}\right)$ | In case of module errors, with channel "31 = module itself" is output. |

## State LEDs

| LED |  | State | Color | LED = OFF | LED = ON |
| :---: | :---: | :---: | :---: | :---: | :---: |
| AT13 DX571 | Inputs $10 . . .17$ | Digital input | Yellow | Input is OFF | Input is ON |
|  | $\begin{aligned} & \text { Outputs } \\ & \text { NO0 ... NO7 } \end{aligned}$ | Digital output | Yellow | Output is OFF | Output is ON |

In the undefined signal range, the state LED for the inputs can be ON although the input state detected by the module is OFF.

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
\& Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage L+ |  |  |
|  | Connections | Terminal 20 for L+ (+24 V DC). The neg- <br> ative pole is provided by the I/O bus. |
|  | Rated value | 24 V DC |
|  | Current consumption via L+ | 50 mA |
|  | Inrush current (at power-up) | $0.0035 \mathrm{~A}^{2} \mathrm{~s}$ |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
| Rated protection fuse for L+ | Recommended; the outputs must be pro- <br> tected by a 3 A fast-acting fuse |  |
| Current consumption from 24 V DC power supply at <br> the L+/UP and M/ZP terminals of the CPU/commu- <br> nication interface module | Ca. 5 mA |  |
| Galvanic isolation | Yes, between the input group and the <br> output group and the rest of the module |  |
| Isolated groups | 3 groups (1 group for 8 input channels, 2 <br> groups for 8 output channels) |  |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 2.3 W |  |
| Weight | Ca. 150 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not <br> be hindered by cable ducts or other parts <br> in the control cabinet. |  |

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital inputs

| Parameter | Value |  |  |
| :---: | :---: | :---: | :---: |
| Number of channels per module | 8 |  |  |
| Distribution of the channels into groups | 1 group for 8 channels |  |  |
| Connections of the channels 10 ... I7 | Terminals $2 \ldots 9$ |  |  |
| Reference potential for the channels IO ... I7 | Terminal 1 |  |  |
| Indication of the input signals | 1 yellow LED per channel; the LED is ON when the input signal is high (signal 1) |  |  |
| Monitoring point of input indicator | LED is part of the input circuitry |  |  |
| Input type according to EN 61131-2 | Type 1 source | Type 1 sink | Type 1 AC ${ }^{1}$ ) |

| Input voltage 5 V | Typ. 1 mA |  | Typ. 1 mA r.m.s. |
| Input voltage 14 V |  |  | Typ. 2.7 mA r.m.s. |

| Parameter | Value |  |
| :---: | :---: | :---: |
| Input voltage 15 V | > 2.5 mA |  |
| Input voltage 27 V |  | Typ. 5.5 mA r.m.s. |
| Input voltage 30 V | $<8 \mathrm{~mA}$ |  |
| Max. permissible leakage current (at 2-wire proximity switches) | 1 mA | Typ. 1 mA r.m.s. |
| Input delay (0->1 or 1->0) | Typ. 8 ms |  |
| Input data length | 1 byte |  |
| Max. cable length |  |  |
| Shielded | 500 m |  |
| Unshielded | 300 m |  |

${ }^{1}$ ) When inputs are used with 24 VAC , external surge limiting filters are required.

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 normally-open relay outputs |
| Distribution of the channels into groups | 2 (4 channels per group) |
| Connection of the channels $\mathrm{O} 0 \ldots \mathrm{O} 3$ | Terminals $10 \ldots 13$ |
| Connection of the channels $\mathrm{O} 4 \ldots \mathrm{O} 7$ | Terminals $15 . . .18$ |
| Reference potential for the channels O0 ... O3 | Terminal 14 (signal name R0 ... 3) |
| Reference potential for the channels O4 ... O7 | Terminal 19 (signal name R4 ... 7) |
| Relay coil power supply | Terminal 20 (positive pole of the process supply voltage, signal name $L+$ ). The negative pole is provided by the I/O bus. |
| Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered through the I/O bus |
| Monitoring point of output indicator | Controlled together with relay |
| Way of operation | Non-latching type |
| Relay output voltage |  |
| Rated value | 24 V DC / 24 V AC or 120/240 V AC |
| Output delay |  |
| Switching 0 to 1 (max.) | Typ. 10 ms |
| Switching 1 to 0 (max.) | Typ. 10 ms |
| Output data length | 1 byte |
| Output current |  |
| Rated current per channel (max.) | 2.0 A ( 24 V DC / 24 V AC / 48 V AC / $120 \mathrm{~V} \mathrm{AC} \mathrm{/}$ 240 V AC , only resistive loads) <br> 2.0 A (24 V AC / 48 V AC / 120 V AC , only pilot duty) <br> 1.5 A (240 V AC, only pilot duty) |
| Rated current per group (max.) | 8 A |

| Parameter | Value |
| :--- | :--- |
| Lamp load (max.) | $200 \mathrm{~W}(230 \mathrm{~V} \mathrm{AC}), 30 \mathrm{~W}$ (24 V DC) |
| Spark suppression with inductive AC <br> loads | Must be performed externally according to driven <br> load specification |
| Switching Frequencies |  |
| With resistive loads | Max. 1 Hz |
| With inductive loads | On Request |
| With lamp loads | Max. 1 Hz |
| Output type | Non-protected |
| Protection type | External fuse ${ }^{1}$ ) |
| Rated protection fuse | 5 A fast |
| Short-circuit-proof / Overload-proof | No, should be provided by an external fuse or circuit <br> breaker |
|  | Overload message |
|  | No |
| Connection of 2 outputs in parallel | Not possible |
| Lifetime of relay contacts (cycles) | 100.000 at rated load |
| Max. cable length |  |
|  | Shielded |
|  | Unshielded |

[^12]
## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### 5.2.4.3.2 S500 and S500-XC

DC522 - Digital input/output module

## Features

- 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 V DC / 0.5 A
416 yellow LEDs to display the signal states at the digital inputs/outputs (C0
51 green LED to display the state of the process supply voltage UP
64 red LEDs to display errors
7 Label

```
8 Terminal unit
9 DIN rail
```

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 2 sensor supply voltages 24 V DC, 0.5 A , with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 V DC (C0 ... C15) in 1 group (2.0 ... 2.7 and 4.0 ... 4.7), each of which can be used
- as an input,
- as a transistor output with short-circuit and overload protection, 0.5 A rated current or
- as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.
All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Fast counter | Integrated, many configurable operating <br> modes (only with AC500) |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage <br> $24 \mathrm{~V} \mathrm{DC)}$ |
| Required terminal unit | TU515 or TU516 \& Chapter 5.2.5.2 "TU515, <br> TU516, TU541 and TU542 for I/O modules" <br> on page 938 |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |

The device is plugged on a terminal unit ${ }^{\star}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\star} \Rightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

## Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals $1.9 \ldots$ 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC

1 I/O bus
2 4.0 ... 4.7: Connected with UP (switch) -> Input; Connected with ZP (load) -> Output
3 Control cabinet earth
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.3$ | +24 V | $4 \times$ sensor power supply sources (loadable with 0.5 <br> A in total) |
| $1.4 \ldots 1.7$ | 0 V | 0 V (reference potential) |
| $2.0 \ldots 2.7$ | $\mathrm{C} 0 \ldots \mathrm{C} 7$ | 8 digital inputs/outputs |
| $3.0 \ldots 3.3$ | +24 V | $4 \times$ x sensor power supply sources (loadable with 0.5 <br> A in total) |
| $3.4 \ldots 3.7$ | 0 V | 0 V (reference potential) |
| $4.0 \ldots 4.7$ | $\mathrm{C} 8 \ldots \mathrm{C} 15$ | 8 digital inputs/outputs |

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
(4) Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DC522.
Connect a $470 \Omega / 1 \mathrm{~W}$ resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions.

## Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital inputs (bytes) | 2 | 4 |
| Digital outputs (bytes) | 2 | 4 |
| Counter input data (words) | 0 | 4 |
| Counter output data (words) | 0 | 8 |

## I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version $>\mathrm{V} 2.0 .0$ | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

|  | ${ }^{2}$ ) All of the LEDs CH-ERR1 to CH-ERR4 light up together |  |  |  |  |  |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\sharp}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\stackrel{y}{ }{ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation / with outputs | 0.15 A + max. 0.5 A per output |
| Inrush current from UP (at power up) | $0.005 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. power dissipation within the module | 6 W (outputs unloaded) |

| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40{ }^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## 0 <br> NOTICE! <br> All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group of 16 channels |
| If the channels are used as inputs |  |
|  | Channels C0 ... C7 |
|  | Channels C8 ... C15 |
| If the channels are used as outputs | Terminals $4.0 \ldots 4.7$ |
|  | Channels C0 ... C7 |
|  | Channels C8 ... C15 |
| Indication of the input/output signals | Terminals $2.0 \ldots 2.7$ |
| Monitoring point of input/output indicator | Terminals $4.0 \ldots 4.7$ |
| Galvanic isolation | 1 yellow LED per channel, the LED is ON <br> when the input/output signal is high (signal 1) |

## Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 16 digital inputs |
| Reference potential for all inputs | Terminals $1.9,2.9,3.9$ and 4.9 (negative pole <br> of the process supply voltage, signal name <br> ZP) |
| Galvanic isolation | From the rest of the module |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON <br> when the input signal is high (signal 1) |
| Monitoring point of input/output indicator | LED is part of the input circuitry |
| Input type acc. to EN $61131-2$ | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 8 ms, configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
| Undefined signal | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ *) |
|  | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Sipple with signal 0 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 1 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ *) |
| Input current per channel | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Typ. 5 mA |
| Input voltage +15 V | $>1 \mathrm{~mA}$ |
| Input voltage +30 V | $>5 \mathrm{~mA}$ |
| Max. cable length | $<8 \mathrm{~mA}$ |
|  |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V . Consequently, the input voltage must range $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and $-6 \mathrm{~V} \ldots+30 \mathrm{~V}$ when UPx $=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | Max. 16 transistor outputs |
| Reference potential for all outputs | Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs: terminals $1.8,2.8,3.8$ and 4.8 (positive pole of the process supply voltage, signal name UP) |
| Output voltage for signal 1 | UP (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value, per channel | 500 mA at $\mathrm{UP}=24 \mathrm{~V}$ |
| Maximum value (all channels together) | 8 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Rated protection fuse on UP | 10 A fast |
| Demagnetization when inductive loads are switched off | With varistors integrated in the module (see figure below) |
| Switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | Max. 11 Hz with max. 5 W |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DC523 - Digital input/output module

## Features

- 24 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 V DC / 0.5 A
424 yellow LEDs to display the signal states at the digital inputs/outputs (C0 ... C23)
51 green LED to display the status of the process supply voltage UP
64 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 1 sensor supply voltage 24 V DC, 0.5 A , with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 V DC (C0 ... C23) in 1 group (2.0 ... 2.7, 3.0 ... 3.7 and $4.0 \ldots 4.7$ ), of which each can be used
- as an input,
- as a transistor output with short circuit and overload protection, 0.5 A rated current or
- as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Fast counter | Integrated, many configurable operating <br> modes (only with AC500) |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage <br> 24 V DC) |
| Required terminal unit | TU515 or TU516 « Chapter 5.2.5.2 "TU515, <br> TU516, TU541 and TU542 for I/O modules" <br> on page 938 |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

The device is plugged on a terminal unit ${ }^{\wedge}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\mu}$, Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

## Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals $1.8 \ldots 4.8$ : process voltage UP $=+24 \mathrm{~V}$ DC

Terminals $1.9 \ldots 4.9$ : process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC

1 I/O bus
2 4.0 ... 4.7: Connected with UP (switch) -> Input;
Connected with ZP (load) -> Output
3 Control cabinet earth
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.3$ | +24 V | $4 \times$ sensor power supply sources (loadable <br> with 0.5 A in total) |
| $1.4 \ldots 1.7$ | 0 V | 0 V (reference potential) |
| $2.0 \ldots 2.7$ | $\mathrm{C} 0 \ldots \mathrm{C} 7$ | 8 digital inputs/outputs |
| $3.0 \ldots 3.7$ | $\mathrm{C} 8 \ldots \mathrm{C} 15$ | 8 digital inputs/outputs |
| $4.0 \ldots 4.7$ | $\mathrm{C} 16 \ldots \mathrm{C} 23$ | 8 digital inputs/outputs |

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC523.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

## NOTICE!

## Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DC523.
Connect a $470 \Omega / 1 \mathrm{~W}$ resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions.

Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital inputs (bytes) | 3 | 5 |
| Digital outputs (bytes) | 3 | 5 |
| Counter input data (words) | 0 | 4 |
| Counter output data (words) | 0 | 8 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## DC532 - Digital input/output module

## Features

- 16 digital inputs 24 V DC, 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
316 yellow LEDs to display the signal states at the digital inputs (IO
416 yellow LEDs to display the signal states at the digital inputs/outputs (C16 ... C31)
51 green LED to display the state of the process supply voltage UP
64 red LEDs to display errors
7 Label
8 Terminal unit
DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input / output unit.

- 16 digital inputs 24 V DC in 2 groups (1.0 ... 1.7 and 2.0 ... 2.7)
- 16 digital configurable inputs/outputs 24 V DC (C16 ... C31) in 1 group ( $3.0 \ldots 3.7$ and 4.0 ... 4.7), of which each can be used
- as an input,
- as a transistor output with short circuit and overload protection, 0.5 A rated current or
- as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Digital inputs | $16(24 \mathrm{~V} \mathrm{DC})$ |
| Digital inputs/outputs | $16(24 \mathrm{~V} \mathrm{DC})$ |
| Fast counter | Integrated, many configurable operating <br> modes (only with AC500) |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage <br> $24 ~ V ~ D C) ~$ |
| Required terminal unit | TU515 or TU516 © Chapter 5.2.5.2 "TU515, <br> TU516, TU541 and TU542 for I/O modules" <br> on page 938 |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |

The device is plugged on a terminal unit ${ }^{\star}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\circledR} \Rightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

## Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:
Terminals $1.8 \ldots 4.8$ : process voltage UP $=+24 \mathrm{~V}$ DC
Terminals 1.9 ... 4.9: process voltage ZP $=0 \mathrm{~V}$ DC

1 I/O bus
2 4.0 ... 4.7: Connected with UP (switch) -> Input; Connected with ZP (load) -> Output
3 Control cabinet earth
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | IO $\ldots$ I7 | 8 digital inputs |
| $2.0 \ldots 2.7$ | I8 .. I15 | 8 digital inputs |
| $3.0 \ldots 3.7$ | $\mathrm{C} 16 \ldots \mathrm{C} 23$ | 8 digital inputs/outputs |
| $4.0 \ldots 4.7$ | $\mathrm{C} 24 \ldots \mathrm{C} 31$ | 8 digital inputs/outputs |

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC532.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
(4) Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions.

## Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital inputs (bytes) | 4 | 6 |
| Digital outputs (bytes) | 2 | 4 |
| Counter input data (words) | 0 | 4 |
| Counter output data (words) | 0 | 8 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.
Module: Module slot address: $\mathrm{Y}=1$... 10

## State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{4}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP |  |
| Connections | Terminals $1.8,2.8,3.8$ and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation / with outputs | 0.15 A + max. 0.5 A per output |
| Inrush current from UP (at power up) | $0.007 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. power dissipation within the module | 6 W (outputs unloaded) |
| Weight (without terminal unit) | ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## - NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 |
| Distribution of the channels into groups | 1 group of 16 channels |
| Terminals of the channels I0 ... I7 | $1.0 \ldots 1.7$ |
| Terminals of the channels I8 ... I15 | $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9,2.8,3.8$ and 4.9 (negative pole of <br> the process supply voltage, signal name ZP) |
| Galvanic isolation | From the rest of the module (I/O bus) |

| Parameter | Value |
| :--- | :--- |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1) |
| Monitoring point of input indicator | LED is part of the input circuitry |
| Input type acc. to EN 61131-2 | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 8 ms, configurable from 0.1 to 32 ms |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
| Undefined signal | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ <br> Signal 1 |
| Ripple with signal 0 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 1 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Input current per channel | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Typ. 5 mA |
|  | Input voltage +15 V |
| Input voltage +30 V | $>1 \mathrm{~mA}$ |
| Max. cable length | $>5 \mathrm{~mA}$ |
|  | Shielded |
| Unshielded | $<8 \mathrm{~mA}$ |

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group of 16 channels |
| If the channels are used as inputs |  |
|  | Channels I16 ... I23 |
|  | Channels I24 ... I31 |
| If the channels are used as outputs | Terminals $4.0 \ldots 4.7$ |
|  | Channels Q16 ... Q23 |
|  | Channels Q24 ... Q31 |
| Indication of the input/output signals | Terminals $3.0 \ldots 3.7$ |
| Monitoring point of input/output indicator | Terminals 4.0 ... 4.7 <br> the input/output signal is high (signal 1) |
| Galvanic isolation | LED is part of the input circuitry |

Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 16 digital inputs |
| Reference potential for all inputs | Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of <br> the process supply voltage, signal name ZP) |
| Input current, per channel | See 'Technical Data of the Digital Inputs' <br> ¿ Chapter 5.2.4.3.2.3.9.2 "Technical data of <br> the digital inputs" on page 548 |
| Input type acc. to EN 61131-2 | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 8 ms, configurable from 0.1 to 32 ms |
| Input signal voltage | 24 V DC |
| Signal 0 | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ *) |
| undefined signal | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ *) |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Max. cable length | 1000 m |
|  | Shielded |
| Unshielded | 600 m |

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V . Consequently, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \mathrm{~V} . .+30 \mathrm{~V}$ when UPx $=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 16 transistor outputs |
| Reference potential for all outputs | Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole <br> of the process supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 <br> (positive pole of the process supply voltage, <br> signal name UP) |
| Output voltage for signal 1 | UP (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 5 |
|  | Rated value, per channel |
| Maximum value (all channels together) | 8 A |
| Leakage current with signal 0 | $<0.5$ mA |
| Rated protection fuse on UP | 10 A fast |
| Demagnetization when inductive loads are <br> switched off | With varistors integrated in the module (see <br> figure below) |
| Switching frequency |  |
|  | With resistive load |

| Parameter |  | Value |
| :--- | :--- | :--- |
| With inductive loads | Max. 0.5 Hz |  |
|  | With lamp loads | Max. 11 Hz with max. 5 W |
| Short-circuit-proof / overload-proof | Yes |  |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |  |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |  |
| Resistance to feedback against 24 V signals | Yes |  |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 76: Digital input/output (circuit diagram)
1 UPx (+ 24 V )
2 Digital input/output
3 ZPx (0 V)
4 For demagnization when inductive loads are switched off

## Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- FBP interface module
- CS31 bus module
- CANopen communication interface module

| Parameter | Value |
| :--- | :--- |
| Used inputs | $\mathrm{C} 24 / \mathrm{C} 25$ |
| Used outputs | C 26 |
| Counting frequency | Max. 50 kHz |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## DI524 - Digital input module

## Features

- 32 digital inputs 24 V DC in 4 groups (1.0 ... 1.7, 2.0 ... 2.7, 3.0 ... 3.7 and $4.0 \ldots 4.7$ )
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
332 yellow LEDs to display the signal states at the digital inputs (IO ... I31)
41 green LED to display the state of the process supply voltage UP
54 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.
All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Fast counter | Integrated, many configurable operating modes (only <br> with AC500) |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Via the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage <br> 24 V DC) |
| Required terminal units | TU515 or TU516 \% Chapter 5.2.5.2 "TU515, TU516, <br> TU541 and TU542 for I/O modules" on page 938 |
| Effect of incorrect input terminal con- <br> nection | Wrong or no signal detected, no damage up to 35 V |

The device is plugged on a terminal unit ${ }^{\star} \Rightarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\text {}} \gg$ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324.

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals $1.9 \ldots 4.9$ process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC

Table 136: Assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | $\mathrm{I} 0 \ldots \mathrm{I} 7$ | 8 digital inputs |
| $2.0 \ldots 2.7$ | $\mathrm{I} 8 \ldots \mathrm{I} 15$ | 8 digital inputs |
| $3.0 \ldots 3.7$ | $\mathrm{I} 16 \ldots \mathrm{I} 23$ | 8 digital inputs |
| $4.0 \ldots 4.7$ | $\mathrm{I} 24 \ldots \mathrm{I} 31$ | 8 digital inputs |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

1 I/O bus
2 Control cabinet earth

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The module provides several diagnosis functions.

State LEDs
During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\mu}$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse for UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/ communication interface module | ca. 2 mA |
| From UP at normal operation | 0.15 A |
| Inrush current from UP (at power up) | $0.008 \mathrm{~A}^{2} \mathrm{~s}$ |
| Weight (without terminal unit) | ca. 105 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 32 |
| Distribution of the channels into groups | 1 group of 32 channels |
| Terminals of the channels 10 ... 17 | 1.0 ... 1.7 |
| Terminals of the channels 18... 115 | 2.0 ... 2.7 |
| Terminals of the channels I16 ... 123 | 3.0 ... 3.7 |
| Terminals of the channels I24 ... I31 | 4.0 ... 4.7 |
| Reference potential for all inputs | Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP) |
| Galvanic isolation | From the rest of the module (I/O bus) |
| Indication of the input signals | One yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Monitoring point of input indicator | LED is part of the input circuitry |
| Input type acc. to EN 61131-2 | Type 1 |
| Input delay (0-> 1 or 1 -> 0 ) | Typ. 8 ms , configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| Signal 0 | -3 V ... +5V |
| Undefined signal | > +5V ... < +15 V |
| Signal 1 | +15 V ... +30 V |
| Ripple with signal 0 | Within -3V ... +5V |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | $>1 \mathrm{~mA}$ |
| Input voltage +15 V | $>5 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

## Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- FBP interface module
- CS31 bus module
- CANopen communication interface module

| Parameter | Value |
| :--- | :--- |
| Used inputs | $\mathrm{I} 24 / \mathrm{I} 25$ |
| Used outputs | None |
| Counting frequency | Max. 50 kHz |

(3) Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## Ordering data

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## DO524 - Digital output module

## Features

- 32 digital outputs 24 V DC / 0.5 A in 4 groups ( 1.0 ... 4.7) with short circuit and overload protection
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
332 yellow LEDs to display the signal states at the digital outputs (O0 ... O31)
41 green LED to display the state of the process supply voltage UP
54 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels.

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Via the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage <br> $24 ~ V ~ D C) ~$ |
| Required terminal unit | TU515 or TU516 \& Chapter 5.2.5.2 "TU515, TU516, <br> TU541 and TU542 for I/O modules" on page 938 |

The device is plugged on a terminal unit ${ }^{\star}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 . Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\star} \Rightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:
Terminals $1.8 \ldots 4.8$ : process voltage UP $=+24 \mathrm{~V}$ DC
Terminals $1.9 \ldots 4.9$ : process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | $\mathrm{O} 0 \ldots \mathrm{O} 7$ | 8 digital outputs |
| $2.0 \ldots 2.7$ | $\mathrm{O} 8 \ldots \mathrm{O} 15$ | 8 digital outputs |
| $3.0 \ldots 3.7$ | $\mathrm{O} 16 \ldots \mathrm{O} 23$ | 8 digital outputs |
| $4.0 \ldots 4.7$ | $\mathrm{O} 24 \ldots \mathrm{O} 31$ | 8 digital outputs |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO524.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 77: Internal construction of the digital outputs
The module provides several diagnosis functions.

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 4 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |

Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.
Potential separation between the channel groups.

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states, errors and supply voltages |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals ZP, ZP3, ZP4, UP, UP3 and UP4 <br> (process voltage 24 V DC) |
| Required terminal unit | TU542 « Chapter 5.2.5.2 "TU515, TU516, TU541 <br> and TU542 for I/O modules" on page 938 |

The output module is plugged on the terminal unit TU542. Properly position the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\mu}$ ² Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals $1.8 \ldots 2.8$ and $1.9 \ldots 2.9$ are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

| Terminals 1.8 ... 2.8: | Process voltage UP $=+24 \mathrm{~V}$ DC |
| :--- | :--- |
| Terminals 1.9 ... 2.9: | Process voltage ZP $=0 \mathrm{~V}$ |
| Terminal 3.8: | Process voltage UP3 $=+24 \mathrm{~V}$ DC |
| Terminal 3.9: | Process voltage ZP3 $=0 \mathrm{~V}$ |
| Terminal 4.8: | Process voltage UP4 $=+24 \mathrm{~V}$ DC |
| Terminal 4.9: | Process voltage ZP4 $=0 \mathrm{~V}$ |

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $3.0,3.1,3.4,3.5$ | O0 ... O3 | 4 digital outputs |
| $4.0,4.1,4.4,4.5$ | $\mathrm{O} 4 \ldots \mathrm{O} 7$ | 4 digital outputs |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO526.
The external power supply connection is carried out via the UP, UP3, UP4 (+24 V DC) and the ZP, ZP3, ZP4 (0 V DC) terminals.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

| :--- | :--- |
| Digital outputs (bytes) | 1 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions $\geq$ 1.2.3.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: $\mathrm{Y}=1$... 7

| Name | Value | Internal value | Internal value, type | Default | Min. | Max. | Max. |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\leftrightarrows}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP, UP3 and UP4 |  |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) as well as 1.9 and $2.90 \mathrm{~V}(\mathrm{ZP})$ <br> Terminals 3.8 for +24 V (UP3) as well as 3.9 for 0 V (ZP3) <br> Terminals 4.8 for +24 V (UP4) as well as 4.9 for 0 V (ZP4) |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP, UP3 and UP4 | 10 A fast (for each process supply voltage) |
| Galvanic isolation | Yes, per module and per output channel groups |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation / with outputs | Ca. $20 \mathrm{~mA}+1.5 \mathrm{~mA}$ per output |
| From UP3 or UP4 at normal operation / with outputs | Ca. 0.01 A + max. 2 A per output |
| Inrush current from UP (at power up) | $0.015 \mathrm{~A}^{2} \mathrm{~s}$ |

| Parameter |  |
| :--- | :--- |
| Inrush current from UP3 or UP4 (at <br> power up) | $0.005 \mathrm{~A}^{2}$ s (without output load) |
| Max. power dissipation within the module | 6 W |
| Weight (without terminal unit) | Ca. 135 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to <br> $50 \%$ at $+40{ }^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |

No effects of multiple overloads

## NOTICE!

## Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply and continuous overvoltage up to 30 V DC.

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 outputs (with transistors, non-latching type) |
| Distribution of the channels into groups | 2 groups of 4 channels |
| Connection of the channels |  |
| O0 ... O 3 | Terminals 3.0, 3.1, 3.4, 3.5 |
| O4 ... 07 | Terminals 4.0, 4.1, 4.4, 4.5 |
| Indication of the output signals | 1 yellow LED per channel, the LED is ON if the output signal is high (signal 1) |
| Power supply voltage for the module | Terminals 1.8 and 2.8 (positive pole of the process supply voltage, signal name UP) |
| Reference potential for module power supply | Terminals 1.9 and 2.9 (negative pole of the process supply voltage, signal name ZP) |
| Power supply voltage for the outputs O 0 to O3 | Terminal 3.8 (positive pole of the process supply voltage, signal name UP3) |
| Reference potential for the outputs O 0 to O 3 | Terminal 3.9 (negative pole of the process supply voltage, signal name ZP3) |
| Power supply voltage for the outputs O 4 to 07 | Terminal 4.8 (positive pole of the process supply voltage, signal name UP4) |
| Reference potential for the outputs O 4 to O 7 | Terminal 4.9 (negative pole of the process supply voltage, signal name ZP4) |
| Output voltage for signal 1 | UP (-0.4 V) |
| Output delay ( $0->1$ or 1->0) | On request |
| Output current |  |
| Rated value, per channel | 2 A at UP3 or UP4 $=24 \mathrm{~V}$ |

| Parameter |  | Value |
| :--- | :--- | :--- |
| Maximum value (channels O0 ... O3) | 8 A |  |
|  | Maximum value (channels O4 ... O7) | 8 A |
| Leakage current with signal 0 | $<0.1 \mathrm{~mA}$ |  |
| Rated protection fuse on UP | 10 A fast |  |
| Demagnetization when inductive loads are <br> switched off | With clamp diode in output high side driver |  |
| Switching frequency |  |  |
|  | With resistive load | On request |
|  | With inductive loads | Max. 2 Hz |
| With lamp loads |  | No (should be done externally) |
| Short-circuit proof / overload proof | No |  |
| Overload message | No (should be done externally) |  |
| Output current limitation | Yes to UP3 or UP4. No to outputs in same <br> group. |  |
| Resistance to feedback against 24 V signals |  |  |
| Max. cable length | 1000 m |  |
|  | Shielded | 600 m |
|  | Unshielded |  |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## DX522 - Digital input/output module

## Features

- 8 digital inputs 24 V DC, module-wise galvanically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states at the digital inputs ( 10 ... 17)
48 yellow LEDs to display the signal states at the digital relay outputs (R0 ... R7)
1 green LED to display the state of the process supply voltage UP
2 red LEDs to display errors
Label
Terminal unit
DIN rail
Sign for XC version

Intended purpose
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 8 digital inputs 24 V DC in 1 group (1.0...1.7)
- 8 digital relay outputs with one change-over contact each (R0...R7). All output channels are galvanically isolated from each other.
- Fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.
All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Fast counter | Integrated, many configurable operating modes (only with <br> AC500) |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process supply voltage <br> $24 \mathrm{~V} \mathrm{DC)}$ |
| Required terminal units | TU531 or TU532 \& Chapter 5.2.5.3 "TU531 and TU532 for <br> I/O modules" on page 945 |

The device is plugged on a terminal unit $\Rightarrow$ Chapter 5.2.5.3 "TU531 and TU532 for I/O modules" on page 945 . Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\text {² }}$, Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324.

## Connections

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 ... 4.8: process supply voltage UP $=+24 \mathrm{~V}$ DC
- Terminals $1.9 \ldots 4.9$ : process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC

Table 137: Assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | IO $\ldots$ I7 | Input signals of the 8 digital <br> inputs |
| $1.8 \ldots 4.8$ | UP | Process supply voltage +24 V <br> DC |
| $1.9 \ldots 4.9$ | RO | Reference potential for the 8 <br> digital inputs and the process <br> supply voltage |
| 2.0 | NO 0 | Common contact of the first <br> relay output |
| 3.0 | NC 0 | Normally-open contact of the <br> first relay output |
| 4.0 | NO 1 | Normally-closed contact of the <br> first relay output |
| 2.1 | NC 1 | Common contact of the <br> second relay output |
| 3.1 | : | Normally-open contact of the <br> second relay output |
| 4.1 | R7 | Normally-closed contact of the <br> second relay output |
| $:$ | NO 7 | NC 7 |
| 2.7 | Common contact of the eighth <br> relay output |  |
| 3.7 | Normally-open contact of the <br> eighth relay output |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

② Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions.

Fig. 79: Connection of the digital input/output module DX522
I/O bus
2 Control cabinet earth

## NOTICE!

- If the relay outputs have to switch inductive DC loads, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive AC loads, spark suppressors are required.

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

## NOTICE!

## Risk of damaging the PLC module!

The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single-phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 8 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 120/230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

## NOTICE!

## Risk of damaging the PLC module!

There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or modulewise.

## Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital inputs (bytes) | 1 | 3 |
| Digital outputs (bytes) | 1 | 3 |
| Counter input data (words) | 0 | 4 |
| Counter output data (words) | 0 | 8 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminals $1.8,2.8,3.8$ and 4.8 for +24 V (UP) <br> as well as $1.9,2.9,3.9$ and 4.9 for 0 V (ZP) |
|  | Rated value | 24 V DC |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP | 10 A fast |
|  | Galvanic isolation | Yes, per module |
| Current consumption | From 24 V DC power supply at the <br> terminals UP/L+ and ZP/M of the CPU/ <br> communication interface module | ca. 2 mA |
|  | From UP at normal operation / with out- <br> puts | $0.05 \mathrm{~A}+$ output loads |
|  | Inrush current from UP (at power up) | 0.010 A² |
| Max. power dissipation within the module | 6 W (outputs OFF) |  |
| Weight (without terminal unit) | ca. 300 g |  |
| Mounting position | Horizontal or vertical with derating (output <br> load reduced to $50 \%$ at $+40{ }^{\circ} \mathrm{C}$ per group) |  |
| Cooling | The natural convection cooling must not be <br> hindered by cable ducts or other parts in the <br> control cabinet. |  |

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels I0 ... I7 | $1.0 \ldots 1.7$ |

## Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- FBP interface module
- CS31 bus module
- CANopen communication interface module

| Parameter | Value |
| :--- | :--- |
| Used inputs | I0 / I1 |
| Used outputs | None |
| Counting frequency | 50 kHz max. |

Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1SAP 245 200 R0001 | DX522, digital input/output module, <br> 8 DI, 24 V DC, 8 DO relays | Active |

*) Modules in lifecycle Classic are available from stock but not recommended
for planning and commissioning of new installations.

## DX531 - Digital input/output module

## Features

- 8 digital inputs $120 / 230$ V AC
- 4 relay outputs with one change-over contacts each
- Module-wise galvanically isolated

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states at the digital inputs (IO ... I7)
44 yellow LEDs to display the signal states at the digital relay outputs (R0 ... R3)
51 green LED to display the state of the process supply voltage UP
62 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
$\stackrel{{ }_{c}^{*}+\underset{k}{*}}{\boldsymbol{c}_{k}}$ Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input / output unit.

- 8 digital inputs $120 / 230 \mathrm{~V}$ AC in 1 group (2.0 ... 2.3 and $3.0 \ldots 3.3$ )
- 4 digital relay outputs with one change-over contact each (R0 ... R3). All output channels are galvanically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process supply voltage <br> 24 V DC) |
| Required terminal units | TU531 or TU532 4. Chapter 5.2.5.3 "TU531 and <br> TU532 for I/O modules" on page 945 |

The device is plugged on a terminal unit ${ }^{\wedge} \triangleq$ Chapter 5.2.5.3 "TU531 and TU532 for I/O modules" on page 945 . Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting ${ }^{\wedge}>$ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324.

## Connections

## WARNING!

## Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals $1.8 \ldots$.. 4.8: process supply voltage UP $=+24 \mathrm{~V}$ DC
- Terminals $1.9 \ldots 4.9$ : process supply voltage $\mathrm{ZP}=0 \mathrm{~V} \mathrm{DC}$

Table 138: Assignment of the other terminals

| Terminals | Signal | Description |
| :---: | :---: | :---: |
| 1.0 ... 1.7 | unused |  |
| 2.0 and 3.0 | 10 and I1 | Input signals for the digital inputs IO and I1 |
| 4.0 | N01 | Neutral conductor for the digital inputs I0 and I1 |
| 2.1 and 3.1 | 12 and I3 | Input signals for the digital inputs I2 and I3 |
| 4.1 | N23 | Neutral conductor for the digital inputs I2 and I3 |
| 2.2 and 3.2 | 14 and 15 | Input signals for the digital inputs 14 and I5 |
| 4.2 | N45 | Neutral conductor for the digital inputs 14 and I5 |
| 2.3 and 3.3 | 16 and 17 | Input signals for the digital inputs I6 and I7 |
| 4.3 | N67 | Neutral conductor for the digital inputs 16 and I7 |
| 2.4 | R0 | Common contact of the first relay output |
| 3.4 and 4.4 | NOO and NCO | NO and NC contacts of the first relay output |
| 2.5 | R1 | Common contact of the second relay output |
| 3.5 and 4.5 | NO1 and NC1 | NO and NC contacts of the second relay output |
| 2.6 | R2 | Common contact of the third relay output |
| 3.6 and 4.6 | NO2 and NC2 | NO and NC contacts of the third relay output |
| 2.7 | R3 | Common contact of the fourth relay output |
| 3.7 and 4.7 | NO3 and NC3 | NO and NC contacts of the fourth relay output |

## Digital inputs

2.316
$3.3 \quad 17$
4.3 N67

Digital outputs

$3.7 \mathrm{NO}_{2-7}^{4.7}$

Fig. 80: Internal construction
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals $L+/ U P$ and M/ZP of the CPU/communication interface module increases by 2 mA per $\mathrm{DX531}$. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 81: Connection of the module
I/O bus
2 Control cabinet earth

## NOTICE!

- If the relay outputs have to switch inductive DC loads, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive AC loads, spark suppressors are required.

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

## NOTICE!

## Risk of damaging the PLC module!

The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 VAC and 3 -phase loads are not allowed.
- The 4 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and $120 / 230 \mathrm{~V}$ AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
- All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 V AC max., not for 400 V AC , not even between two input terminals.
- All neutral conductor connections must be common to the same supply system, since the terminals $4.0 \ldots 4.3$ are interconnected within the module. Otherwise, accidental energization could occur.

## NOTICE!

## Risk of damaging the PLC module!

There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic $\mathrm{gG} / \mathrm{gL}$ ). Depending on the application, fuses can be used for single channels or modulewise.

The module provides several diagnosis functions.

## Internal data exchange

| Digital inputs (bytes) | 1 |
| :--- | :--- |
| Digital outputs (bytes) | 1 |
| Counter input data (words) | 0 |
| Counter output data (words) | 0 |

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: $\mathrm{Y}=1$... 10

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{\aleph}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for <br> +24 V DC (UP) as well as 1.9, 2.9, <br> 3.9 and 4.9 for 0 V DC (ZP) |
|  | Rated value | 24 V DC |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |  |
| Current consumption |  |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | From 24 V DC power supply at the terminals <br> UP/L+ and ZP/M of the CPU/communication inter- <br> face module | ca. 2 mA |
|  | From UP at normal operation / with outputs | $0.15 \mathrm{~A}+$ output loads |
| Inrush current from UP (at power up) | $0.004 \mathrm{~A}^{2} \mathrm{~s}$ |  |
| Max. power dissipation within the module | 6 W (outputs OFF) |  |
| Weight (without terminal unit) | Ca. 300 g |  |
| Mounting position | Horizontal or vertical with derating <br> (output load reduced to $50 \%$ at <br> $+40{ }^{\circ} \mathrm{C}$ per group) |  |
| Cooling | The natural convection cooling <br> must not be hindered by cable <br> ducts or other parts in the control <br> cabinet. |  |

No effects of multiple overloads

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

## Technical data of the digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |

## Fast counter

More information can be found in the Automation Builder chapter, "Fast counters in AC500 devices".
(2) Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

### 5.2.4.4 Analog I/O modules

### 5.2.4.4.1 S500-eCo

## AI561 - Analog input module

## Features

- 4 configurable analog inputs ( $10 \ldots$ I3) in 1 group
- Resolution: 12 bits including sign

1 I/O bus
21 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.
All other circuitry of the module is not galvanically isolated from the inputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

4 analog inputs, individually configurable for

- Not used (default setting)
- $-2.5 \mathrm{~V} . . .+2.5 \mathrm{~V}$
- $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$
- $0 \mathrm{~V} . .+5 \mathrm{~V}$
- $0 \mathrm{~V} \ldots+10 \mathrm{~V}$
- $0 \mathrm{~mA} . .220 \mathrm{~mA}$
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage bipolar (-2.5 V ... +2.5 V ; $-5 \mathrm{~V} \ldots+5$ V) | 12 bits including sign |
| Voltage unipolar ( $0 \mathrm{~V} \ldots 5 \mathrm{~V} ; 0 \mathrm{~V} \ldots 10 \mathrm{~V}$ ) | 12 bits |
| Current (0 mA ... 20 mA ; $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ ) | 12 bits |
| LED displays | 2 LEDs for process voltage and error messages |
| Internal supply | Via I/O bus |
| External supply | Via the terminals L+ (process voltage 24 $V D C)$ and $M(0 \vee D C)$; the $M$ terminal is connected to the M terminal of the CPU via the I/O bus |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

| 17 | --- | Reserved |
| 18 | SG | Shield grounding |
| 19 | L+ | Process voltage L+ (24 V DC) |
| 20 | M | Process voltage M (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per AI561.
The external power supply connection is carried out via the $\mathrm{L}+(+24 \mathrm{~V} \mathrm{DC}$ ) and the M ( 0 V DC) terminals. The $M$ terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

## NOTICE!

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

## NOTICE!

Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ${ }^{*} \Rightarrow$ Chapter 5.2.4.4.1.1.7 "Diagnosis" on page 615 .

The following figure is an example of the internal construction of the analog input AIO. The analog inputs Al1 ... Al3 are designed in the same way.

## CAUTION!

## Risk of damaging the analog input!

The $250 \Omega$ input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA .

Table 139: Example of the connection of analog sensors (voltage) to the input 10 of the analog input module AI561 (Proceed with the inputs I1 ... I3 in the same way)

24 VDC

| Connection of active-type analog sensors <br> (voltage) | Connection of passive-type analog sen- <br> sors (voltage) |
| :--- | :--- |
| $-2.5 \mathrm{~V} \ldots 2.5 \mathrm{~V}$ | $-2.5 \mathrm{~V} \ldots 2.5 \mathrm{~V}$ |
| $-5 \mathrm{~V} \ldots 5 \mathrm{~V}$ | $-5 \mathrm{~V} \ldots 5 \mathrm{~V}$ |
| $0 \mathrm{~V} \ldots 5 \mathrm{~V}$ | $0 \mathrm{~V} \ldots 5 \mathrm{~V}$ |
| $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ |

Table 140: Example of the connection of analog sensors to the Input IO of the analog input module AI561 ( Proceed with the inputs I1 ... I3 in the same way.)

| Connection of active-type analog sensors <br> (voltage) | Connection of passive-type analog sen- <br> sors (voltage) |
| :--- | :--- |
| $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |
| $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |  |

The meaning of the LEDs is described in the Displays section $\Rightarrow$ Chapter 5.2.4.4.1.1.8 "State LEDs" on page 616.

## I/O configuration

The analog input module AI561 does not store configuration data itself.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> Value | Internal <br> value, <br> Type | Default | Min. | Max. | EDS Slot <br> Index |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

The represented resolution corresponds to 12 bits including sign.

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
« Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage L+ |  |  |
|  | Connections | Terminal 19 for L+ (+24 V DC) and terminal 20 <br> for M (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption via L+ terminal | 0.1 A |
|  | Inrush current (at power up) | $0.05 \mathrm{~A}^{2} \mathrm{~s}$ |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Protection fuse for L+ | Recommended |
| Current consumption from 24 V DC power <br> supply at the terminals UP/L+ and ZP/M of the <br> CPU/communication interface module | Ca. 10 mA |  |
| Galvanic isolation | No |  |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 2.7 W |  |
| Weight | Ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be <br> hindered by cable ducts or other parts in the <br> control cabinet. |  |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 4 individually configurable voltage or current <br> inputs |
| Distribution of channels into groups | 1 (4 channels per group) |
| Resolution |  |
| Unipolar | Voltage: $0 \mathrm{~V} \ldots+5 \mathrm{~V} ; 0 \mathrm{~V} \ldots+10 \mathrm{~V}: 12$ bits <br> Current $0 \mathrm{~mA} \ldots 20 \mathrm{~mA} ; 4 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits |
| Bipolar | Voltage $-2.5 \mathrm{~V} \ldots+2.5 \mathrm{~V} ;-5 \mathrm{~V} \ldots+5 \mathrm{~V}: 12$ bits <br> including sign |
| Connection of the signals I0- to I3- | Terminals $3,6,9,12$ |
| Connection of the signals I0+ to I3+ | Terminals $2,5,8,11$ |
| Input type | Differential |
| Galvanic isolation | No galvanic isolation between the inputs and <br> the I/O bus |
| Common mode input range | Signal voltage plus common mode voltage <br> must be within $\pm 12 \mathrm{~V}$ |

| Parameter | Value |
| :---: | :---: |
| Indication of the input signals | No |
| Channel input resistance | Voltage: > $1 \mathrm{M} \Omega$ <br> Current: ca. $250 \Omega$ |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. $\pm 0.5 \%$ of full scale (voltage) <br>  $\pm 0.5 \%$ of full scale (current 0 <br>  $\mathrm{~mA} \ldots 20 \mathrm{~mA}$ ) <br> $\pm 0.7 \%$ of full scale (current 4  <br> $\mathrm{~mA} \ldots 20 \mathrm{~mA}$ )  <br> at $+25^{\circ} \mathrm{C}$  |
|  | Max. $\pm 2 \%$ of full scale (all ranges) <br> at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturb- <br> ance |
| Time constant of the input filter | Voltage: $300 \mu \mathrm{~s}$ <br> Current: $300 \mu \mathrm{~s}$ |
| Relationship between input signal and hex code | Chapter 5.2.4.4.1.1.9 "Measuring ranges" on page 617 |
| Analog to digital conversion time | Typ. $500 \mu$ s per channel |
| Unused inputs | Can be left open and should be configured as "unused" |
| Input data length | 8 bytes |
| Overvoltage protection | Yes, up to 30 V DC only for voltage input |
| Max. cable length (conductor cross section $\left.>0,14 \mathrm{~mm}^{2}\right)$ |  |
| Unshielded wire | 10 m |
| Shielded wire | 100 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## Al562-Analog input module

## Features

- 2 configurable analog resistance temperature detector (RTD) inputs (IO and I1) in 1 group
- Resolution: 16 bits including sign

1 I/O bus
21 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (11-pin)
62 holes for wall-mounting with screws
7 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

## Functionality

2 analog RTD-inputs, individually configurable for

- Not used (default)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$, 2-wire
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$, 3-wire
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$, 2-wire
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$, 3-wire
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$, 2-wire
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$, 3-wire
- Ni100, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$, 2-wire
- Ni100, $-50^{\circ} \mathrm{C} . . .+150{ }^{\circ} \mathrm{C}$, 3-wire
- Analog input resistance $0 \Omega \ldots 150 \Omega$
- Analog input resistance $0 \Omega \ldots 300 \Omega$

| Parameter |  |
| :--- | :--- |
| Resolution of the analog channels |  |
|  | Temperature |
| LED displays | $+0.1^{\circ} \mathrm{C}$ |
| Internal supply | 2 LEDs for process voltage and error messages |
| External supply | Via I/O bus | | Via the terminals UP (process voltage 24 V DC) and |
| :--- |
| ZP (0 V DC) |.

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 83: Internal construction of the analog inputs
The assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 10 | O0+ | Current source of channel 0 |
| 11 | I0+ | Sense input of channel 0 |
| 12 | I0- | Return input of channel 0 |
| 13 | O1+ | Current source of channel 1 |
| 14 | I1+ | Sense input of channel 1 |
| 15 | I1- | Return input of channel 1 |
| 16 | SG | Reserved |
| 17 | SG | Shield grounding |
| 18 | UP | Shield grounding |
| 19 | ZP | Process voltage UP (24 V DC) |
| 20 | Process voltage ZP (0 V DC) |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per AI562.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## NOTICE!

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions $\Rightarrow$ Chapter 5.2.4.4.1.2.7 "Diagnosis" on page 626.

Table 142: Connection of RTDs to the inputs of the analog input module A1562

With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.

The meaning of the LEDs is described in the Displays section ${ }^{*} \Rightarrow$ Chapter 5.2.4.4.1.2.8 "State LEDs" on page 627.

## I/O configuration

The analog input module AI562 does not store configuration data itself.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: $14=\mathrm{I} / \mathrm{O}$ bus, $11=$ COM1 (e.g. CS31 bus), $12=$ COM2. <br> The PNIO diagnosis block does not contain this identifier |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> 31 = module itself, $1 \ldots 10$ = expansion module $1 \ldots 10$, ADR = hardware address (e. g. of the DC551-CS31) |
| ${ }^{3}$ ) | With "Module" the following allocation applies dependent of the master: <br> Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... $10=$ expansion 1... 10 <br> Channel error: I/O bus or PNIO = module type ( 1 = AI); COM1/COM2: 1 ... 10 = expansion 1 ... 10 |
| ${ }^{4}$ ) | In case of module errors, with channel "31 = Module itself" is output. |

State LEDs

| LED |  | State <br> Process voltage 24 V DC via terminal | Color <br> Green | LED = OFF <br> CPU module voltage or external 24 V DC supply voltage is missing | LED = ON <br> 3.3 V system voltage (I/O bus) and external 24 V DC supply voltage are present | LED flashes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PWR |  |  |  |  |  |
|  | ERR | Channel or module error | Red | No error or process voltage is missing | Severe error in the module | Error on 1 or more channels of the module |

## Measuring ranges

## Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

## Resistance temperature detectors

| Range | $\mathrm{Pt100} / \mathrm{Pt1000}$ <br> $-50{ }^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | $\mathrm{Ni} 1000 / \mathrm{Ni100}$ <br> $-50^{\circ} \mathrm{C} \ldots+150$ |  |
| :--- | :--- | :--- | :--- | :--- |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.

* Chapter 5.1.1 "System data AC500-eCo" on page 159

Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminal 19 for UP (+24 V DC) and terminal 20 <br> for ZP (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption | 0.04 A |
|  | Inrush current (at power-up) | $0.05 \mathrm{~A}^{2} \mathrm{~s}$ |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Protection fuse for UP | Recommended |
| Current consumption from 24 V DC power <br> supply at the terminals UP/L+ and ZP/M of <br> the CPU/communication interface module | Ca. 5 mA |  |
| Galvanic isolation | Yes, between the input group and the rest of the <br> module |  |
|  | Isolated groups | 1 (2 channels per group) |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 1.1 W |  |
| Weight | Ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |  |

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 2 configurable RTD (resistance temperature detector) <br> inputs |
| Distribution of channels into groups | 1 (2 channels per group) |
| Resolution |  |
|  | RTD |
| Resistance |  |
| Connection of the signals O0+ and <br> O1+ | Terminals 10 and 13 |
| Connection of the signals I0- and I1- | Terminals 11 and 14 |
| Connection of the signals I0+ and I1+ | Terminals 12 and 15 |
| Input type | Module ground referenced RTD for 2-wire and 3-wire <br> resistance temperature detectors |
| Galvanic isolation | Against internal power supply and other modules |

| Parameter | Value |  |
| :---: | :---: | :---: |
| Input ranges | Pt100, Pt1000, Ni100, Ni1000 |  |
|  | $150 \Omega, 300 \Omega$ |  |
| Indication of the input signals | No |  |
| Module update time | All channels: <1 s |  |
| Channel input resistance | > $100 \mathrm{k} \Omega$ |  |
| Input filter attenuation | -3 dB at 3.6 kHz |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | Depending on RTD max. $\pm 0.6 \%$ of full scale (guaranteed for 3 -wires connection only) $\text { at }+25^{\circ} \mathrm{C}$ |
|  | Max. | $\pm 2 \%$ of full scale (guaranteed for 3-wires connection only) <br> at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbances |
| Measuring range | « Chapter 5.2.4.4.1.2.9 "Measuring ranges" on page 627 |  |
| Analog to digital conversion time | Typ. 140 ms per channel |  |
| Unused inputs | Can be left open and should be configured as "unused" |  |
| Input data length | 4 bytes |  |
| Power dissipation inside the sensor (max.) | 1 mW |  |
| Suppression of interference | On request |  |
| Maximum input voltage | 30 V DC (sense), 5 V DC (source) |  |
| Basic error (resistance) | 0.1 \% of full-scale |  |
| Repeatability | 0.05 \% of full-scale |  |
| Overvoltage protection | Yes, up to 30 V DC |  |
| Wire loop resistance | < $20 \Omega$ |  |
| Max. cable length (conductor cross section > $0.14 \mathrm{~mm}^{2}$ ) |  |  |
| Unshielded wire | 10 m |  |
| Shielded wire | 100 m |  |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1TNE 968 902 R1102 | Al562, analog input module, 2 AI, RTD | Active |
| 1TNE 968 901 R3102 | Terminal block TA563-11, 11 pins, <br> screw front, cable side, 6 pieces per <br> unit | Active |
| 1TNE 968 901 R3104 | Terminal block TA564-11, 11 pins, <br> screw front, cable front, 6 pieces per <br> unit | Active |
| 1TNE 968 901 R3106 | Terminal block TA565-11, 11 pins, <br> spring front, cable front, 6 pieces per <br> unit | Active |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## Al563 - Analog input module

## Features

- 4 configurable thermocouple (TC) / $-80 \mathrm{mV} \ldots+80 \mathrm{mV}$ inputs (I0 ... I3) in 1 group
- Resolution: 16 bits including sign

1 I/O bus
21 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

Intended purpose
The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

4 analog TC inputs, individually configurable for

- Not used (default)
- Voltage $-80 \mathrm{mV} \ldots+80 \mathrm{mV}$
- Thermocouple J-type $-210^{\circ} \mathrm{C} \ldots+1200^{\circ} \mathrm{C}$
- Thermocouple K-type $-270^{\circ} \mathrm{C} \ldots+1372{ }^{\circ} \mathrm{C}$
- Thermocouple R-type $-50^{\circ} \mathrm{C} \ldots+1768^{\circ} \mathrm{C}$
- Thermocouple S-type $-50^{\circ} \mathrm{C} \ldots+1768^{\circ} \mathrm{C}$
- Thermocouple T-type $-270^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$
- Thermocouple E-type $-270^{\circ} \mathrm{C} \ldots+1000^{\circ} \mathrm{C}$
- Thermocouple N-type $-270^{\circ} \mathrm{C} \ldots+1300^{\circ} \mathrm{C}$

| Parameter | Value |
| :--- | :--- |
| Resolution of the analog channels |  |
| Temperature | $+0.1^{\circ} \mathrm{C}$ |
| LED displays | 2 LEDs for process voltage and error mes- <br> sages |
| Internal supply | Via I/O bus |
| External supply | Via the terminals UP (process voltage 24 V <br> DC $)$ and ZP (0 V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

After powering up the system, input channels, which are configured will have undefined values /diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET communication interface module, the firmware version of PROFINET communication interface module must be 1.2 or above.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 84: Internal construction of the analog inputs

Table 144: Assignment of the terminals

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | IO+ | Positive pole of channel 0 |
| 2 | IO- | Negative pole of channel 0 |
| 3 | I1+ | Positive pole of channel 1 |
| 4 | I1- | Negative pole of channel 1 |
| 5 | I2+ | Positive pole of channel 2 |
| 6 | I2- | Negative pole of channel 2 |
| 7 | I3+ | Positive pole of channel 3 |
| 8 | I3- | Negative pole of channel 3 |
| 9 | --- | Reserved |
| 10 | --- | Reserved |
| 11 | --- | Reserved |
| 12 | --- | Reserved |
| 13 | --- | Reserved |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 14 | --- | Reserved |
| 15 | SG | Shield grounding |
| 16 | SG | Shield grounding |
| 17 | SG | Shield grounding |
| 18 | SG | Shield grounding |
| 19 | UP | Process voltage UP (24 V DC) |
| 20 | ZP | Process voltage ZP (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## NOTICE!

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

## NOTICE!

Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ${ }^{\circ} \Rightarrow$ Chapter 5.2.4.4.1.3.7 "Diagnosis" on page 638.
The following figure shows the connection of thermocouples to the inputs of the module:

Fig. 85: Connection of thermocouples to the inputs of the module
The meaning of the LEDs is described in Displays chapter ${ }^{〔}$ Chapter 5.2.4.4.1.3.8 "State LEDs" on page 639.

I/O configuration
The analog input module AI563 does not store configuration data itself.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal <br> value | Internal <br> value, <br> Type | Default | Min. | Max. | EDS Slot <br> Index |

| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> 31 = module itself, $1 \ldots 10=$ expansion module $1 . . .10$, ADR $=$ hardware address (e. g. of the DC551-CS31) |
| ${ }^{3}$ ) | With "Module" the following allocation applies dependent of the master: <br> Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1 ... 10 = expansion 1 ... 10 <br> Channel error: I/O bus or PNIO = module type ( $1=\mathrm{AI}$ ); COM1/ COM2: 1 ... 10 = expansion 1 ... 10 |
| ${ }^{4}$ ) | In case of module errors, with channel "31 = Module itself" is output. |

## State LEDs

| LED |  | State | Color | LED = OFF | LED = ON | LED flashes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PWR | Process voltage 24 V DC via terminal | Green | CPU module voltage or external 24 V DC supply voltage is missing | 3.3 V system voltage (I/O bus) and external 24 V DC supply voltage are present | --- |
|  | ERR | Channel or module error | Red | No error or process voltage is missing | Severe error in the module | Error on 1 or more channels of the module |

## Measuring ranges

Al563 needs typ. 6 to 8 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During this time, the accuracy of the measurement values is not within specification. After that, valid measurement values are provided by the module. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms , a re-initialization is performed by Al563.

## Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

| Range | $\begin{aligned} & \text { Type J } \\ & -210^{\circ} \mathrm{C} \ldots \\ & +1200^{\circ} \mathrm{C} \end{aligned}$ | $\begin{aligned} & \text { Type K } \\ & 270^{\circ} \mathrm{C} \ldots \\ & +1372^{\circ} \mathrm{C} \end{aligned}$ | $\begin{aligned} & \hline \text { Type N } \\ & 270^{\circ} \mathrm{C} \ldots . \\ & +1300^{\circ} \mathrm{C} \end{aligned}$ | $\begin{aligned} & \hline \text { Type } \mathrm{T} \\ & -270^{\circ} \mathrm{C} \ldots \\ & +400^{\circ} \mathrm{C} \end{aligned}$ | Digital value |  |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
年 Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage UP |  |  |
|  | Connections | Terminal 19 for UP (+24 V DC) and terminal 20 <br> for ZP (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption | 0.10 A |
|  | Inrush current (at power-up) | $0.07 \mathrm{~A}^{2} \mathrm{~s}$ |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse for UP | Not necessary |
| Current consumption from 24 V DC power <br> supply at the terminals UP/L+ and ZP/M of <br> the CPU/communication interface module | Ca. 5 mA |  |
| Galvanic isolation | Yes, between the channels and the rest of the <br> module |  |
|  | Isolated groups | 1 (4 channels per group) |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 2.6 W |  |
| Weight | Ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |  |

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 4 configurable thermocouple (TC) inputs |
| Distribution of channels into groups | 1 (4 channels per group) |
| Resolution |  |
|  | Temperature |
| Voltage | $0.1^{\circ} \mathrm{C}$ |
| Connection of the signals I0+ to I3+ | Terminals 1, 3, 5 and 7 |
| Connection of the signals I0- to I3- | Terminals 2, 4, 6 and 8 |
| Input type | Floating thermocouple |
| Galvanic isolation | Against internal power supply and other modules |
| Common mode rejection | $>120$ dB at 120 V AC |
| Indication of the input signals | No |
| Module update time | All channels: < 1.6 s |

| Parameter | Value |  |
| :--- | :--- | :--- |
| Channel input resistance | On request |  |
| Input filter attenuation | -3 dB at 15 kHz |  |
| Cold junction error | $\pm 1.5^{\circ} \mathrm{C}$ |  |
| Conversion error of the analog values <br> caused by non-linearity, adjustment <br> error at factory and resolution within <br> the normal range | Typ. |  |

## Accuracy of thermocouple ranges at $25^{\circ} \mathrm{C}$ (with cold junction compensation)

| Thermocouple Type | Range | Accuracy |
| :--- | :--- | :--- |
| E | $-270^{\circ} \mathrm{C} \ldots-220^{\circ} \mathrm{C}$ | $\pm 2 \%$ |
|  | $-220^{\circ} \mathrm{C} \ldots+1000^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
| J | $-210^{\circ} \mathrm{C} \ldots+1200^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
| K | $-270^{\circ} \mathrm{C} \ldots-220^{\circ} \mathrm{C}$ | $\pm 1.5 \%$ |
|  | $-220^{\circ} \mathrm{C} \ldots+1372{ }^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
| N | $-270^{\circ} \mathrm{C} \ldots-150^{\circ} \mathrm{C}$ | $\pm 2 \%$ |
|  | $-150^{\circ} \mathrm{C} \ldots+1300^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
| R | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | $\pm 1.5 \%$ |
| S | $+150^{\circ} \mathrm{C} \ldots+1768{ }^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
| T | $-50^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ | $\pm 1.5 \%$ |
|  | $+150^{\circ} \mathrm{C} \ldots+1768{ }^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |
|  | $-270^{\circ} \mathrm{C} \ldots-240^{\circ} \mathrm{C}$ | $\pm 3 \%$ |
|  | $-240^{\circ} \mathrm{C} \ldots-0^{\circ} \mathrm{C}$ | $\pm 2 \%$ |
| $0^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | $\pm 0.6 \%$ |  |

These accuracy values are valid only for stable module temperatures.

## Dimensions

The dimensions are in mm and in brackets in inch.

Ordering data

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## AO561-Analog output module

## Features

- 2 configurable analog outputs (O0 ... O1) in 1 group
- Resolution: 12 bits including sign

1 I/O bus
21 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
62 holes for wall-mounting with screws
7 DIN rail

Intended purpose
The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are not galvanically isolated from each other.
The other electronic circuitry of the module is not galvanically isolated from the outputs or from the I/O bus

The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.

## Functionality

2 analog outputs, individually configurable for

- Not used (default setting)
-     - 10 V ... +10 V
- $0 \mathrm{~mA} . .20 \mathrm{~mA}$
- 4 mA ... 20 mA

| Parameter | Value |
| :--- | :--- |
| Resolution of the analog channels |  |
|  | Voltage bipolar $(-10 \mathrm{~V} \ldots+10 \mathrm{~V})$ |
|  | Current $(0 \mathrm{~mA} \ldots 20 \mathrm{~mA} ; 4 \mathrm{~mA} \ldots 20 \mathrm{~mA})$ |
| LED displays | 12 bits including sign |
| Internal supply | 2 LEDs for process voltage and error messages |
| External supply | Via I/O bus |
|  | Via the terminals $\mathrm{L}+$ (process voltage 24 V DC$)$ <br> and $\mathrm{M}(0 \mathrm{~V}$ DC $) ;$ the M terminal is connected to <br> the M terminal of the CPU via the I/O bus |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 86: Internal construction of the analog outputs
The assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 10 | --- | Reserved |
| 11 | --- | Reserved |
| 12 | --- | Reserved |
| 13 | O0U+ | Voltage output of channel 0 |
| 14 | O0I+ | Current output of channel 0 |
| 15 | O1U+ | Voltage output of channel 1 |
| 16 | O1I+ | Current output of channel 1 |
| 17 | O01- | Negative pole of channels O0 and O1 |
| 18 | L+ | Shield grounding |
| 19 | M | Process voltage L+ (24 V DC) |
| 20 | Process voltage M (0 V DC) |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from $24 \vee$ DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AO561.

The external power supply connection is carried out via the $\mathrm{L}+(+24 \mathrm{~V} \mathrm{DC}$ ) and the $\mathrm{M}(0 \mathrm{~V}$ $D C$ ) terminals. The $M$ terminal is electrically interconnected to the $M / Z P$ terminal of the CPU/ communication interface module.

## NOTICE!

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

## NOTICE!

## Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions Chapter 5.2.4.4.1.4.7 "Diagnosis" on page 650.

Table 146: Connection of analog actuators to the analog output module AO561

The output signal is undefined if the supply voltage at the $L+$ terminal is below 10 V . This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

## I/O configuration

The analog output module A0561 does not store configuration data itself.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| Name | Value | Internal value | Internal value, Type | Default | Min. | Max. | EDS Slot Index |

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
*) Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter | Value |  |
| :--- | :--- | :--- |
| Process supply voltage L+ |  |  |
|  | Connections | Terminal 19 for L+ (+24 V DC) and terminal 20 <br> for M (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption | $0.1 \mathrm{~A}+$ output load |
|  | Inrush current (at power-up) | $0.05 \mathrm{~A}^{2} \mathrm{~s}$ |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Protection fuse for L+ | Recommended |
| Current consumption from 24 V DC power <br> supply at the terminals UP/L+ and ZP/M of <br> the CPU/communication interface module | Ca. 5 mA |  |
| Galvanic isolation | No |  |
| Surge-voltage (max.) | $35 \mathrm{~V} \mathrm{DC} \mathrm{for} \mathrm{0.5} \mathrm{~s}$ |  |
| Max. power dissipation within the module | 3.1 W |  |
| Weight | Ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |  |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog outputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 2 configurable voltage or current outputs |  |
| Distribution of channels into groups | 1 (2 channels per group) |  |
| Connection of the signals O0U- and O1U+ | Terminals 13 and 15 |  |
| Connection of the signals $\mathrm{OOI}+$ and $\mathrm{O} 11+$ | Terminals 14 and 16 |  |
| Output type | Bipolar with voltage, unipolar with current |  |
| Resolution | 12 bits including sign |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\pm 0.5 \%$ of full scale at $+25^{\circ} \mathrm{C}$ |
|  | Max. | $\pm 2 \%$ of full scale at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbances |
| Indication of the output signals | No |  |
| Output Resistance (load) as current output | $0 \Omega \ldots 500 \Omega$ |  |
| Output load ability as voltage output | $\pm 2 \mathrm{~mA}$ max. |  |
| Output data length | 4 bytes |  |
| Relationship between output signal and hex code | ® Chapter 5.2.4.4.1.4.9 "Output ranges" on page 651 |  |
| Unused outputs | Must not be connected and must be configured as "unused" |  |
| Overvoltage protection | Yes, up to 30 V DC |  |
| Max. cable length (conductor cross section $>0.14 \mathrm{~mm}^{2}$ ) |  |  |
| Unshielded wire | 10 m |  |
| Shielded wire | 100 m |  |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## AX561 - Analog input/output module

## Features

- 4 configurable analog inputs (IO ... 13 ) in 1 group
- 2 configurable analog outputs ( O 0 and O 1 ) in 1 group
- Resolution: 12 bits including sign

1 I/O bus
21 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for output signals (11-pin)
72 holes for wall-mounting with screws
8 DIN rail

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.
The outputs are not galvanically isolated from each other.
All other circuitry of the module is not galvanically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

## Functionality

4 analog inputs, individually configurable for

- Not used (default)
- $-2.5 \mathrm{~V} . .+2.5 \mathrm{~V}$
- $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$
- $0 \mathrm{~V} \ldots+5 \mathrm{~V}$
- $0 \mathrm{~V} \ldots+10 \mathrm{~V}$
- 0 mA ... 20 mA
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$

2 analog outputs, individually configurable for

- Not used (default)
- -10 V ... +10 V
- 0 mA ... 20 mA
- 4 mA ... 20 mA

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage bipolar (-2.5 V ... +2.5 V; $-5 \vee \ldots+5 \vee)$ | 12 bits including sign |
| Voltage unipolar ( $0 \mathrm{~V} \ldots 5 \mathrm{~V}$; $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ ) | 12 bits |
| Current (0 mA ... 20 mA ; 4 mA ... 20 mA ) | 12 bits |
| LED displays | 2 LEDs for process voltage and error messages |
| Internal supply | Via I/O bus |
| External supply | Via the terminals L+ (process voltage 24 V $D C$ ) and $M(0 \vee D C)$; the $M$ terminal is connected to the M terminal of the CPU via the I/O bus |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

Fig. 87: Internal construction of the analog inputs and outputs

Table 148: Assignment of the terminals

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1 | R0 | Burden resistor for input signal 0 for current sensing |
| 2 | I0+ | Positive pole of input signal 0 |
| 3 | I0- | Negative pole of input signal 0 |
| 4 | R1 | Burden resistor for input signal 1 for current sensing |
| 5 | I1+ | Positive pole of input signal 1 |
| 6 | I1- | Negative pole of input signal 1 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 7 | R2 | Burden resistor for input signal 2 for current sensing |
| 8 | I2+ | Positive pole of input signal 2 |
| 9 | I2- | Negative pole of input signal 2 |
| 10 | R3 | Burden resistor for input signal 3 for current sensing |
| 11 | I3+ | Positive pole of input signal 3 |
| 12 | I3- | Negative pole of input signal 3 |
| 13 | O0I+ | Voltage output of channel 0 |
| 14 | O1U+ | Current output of channel 0 |
| 15 | O1I+ | Voltage output of channel 1 |
| 16 | SG | Current output of channel 1 |
| 17 | L+ | Negative pole of channels O0 and O1 |
| 18 | M | Shield grounding |
| 19 | Process voltage L+ (24 V DC) |  |
| 20 | Process voltage M (0 V DC) |  |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AX561.
The external power supply connection is carried out via the $\mathrm{L}+(+24 \mathrm{~V} D C$ ) and the M ( 0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

## NOTICE!

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.
Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ${ }^{\star}>$ Chapter 5.2.4.4.1.5.7 "Diagnosis" on page 665.

Fig. 88: Example of the internal construction of the analog input AIO (analog inputs Al1 ... Al3 are designed in the same way)

## CAUTION!

## Risk of damaging the analog input!

The $250 \Omega$ input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA .

The following figures are an example of the connection of analog sensors (voltage) to the input IO of the analog input/output module AX561. Proceed with the inputs I1 ... I3 in the same way.

Table 149: Example of the connection of analog sensors (voltage) to the input IO of the analog input/output module AX561 (Proceed with the inputs I1 to I3 in the same way)

| Connection of active-type analog sensors <br> (voltage) | Connection of passive-type analog sen- <br> sors (voltage) |
| :--- | :--- |
| $-2.5 \mathrm{~V} \ldots 2.5 \mathrm{~V}$ | $-2.5 \mathrm{~V} \ldots 2.5 \mathrm{~V}$ |
| $-5 \mathrm{~V} \ldots 5 \mathrm{~V}$ | $-5 \mathrm{~V} \ldots 5 \mathrm{~V}$ |
| $0 \mathrm{~V} \ldots 5 \mathrm{~V}$ | $0 \mathrm{~V} \ldots 5 \mathrm{~V}$ |
| $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ |

Table 150: Example of the connection of analog sensors (current) to the input 10 of the analog input/output module AX561 (Proceed with the inputs I1 ... I3 in the same way)

| Connection of active-type analog sensors <br> (voltage) | Connection of passive-type analog sen- <br> sors (voltage) |
| :--- | :--- |
| $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |
| $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |  |

Table 151: Example of the connection of analog actuators to the analog input/output module AX561

The output signal is undefined if the supply voltage at the $L+$ terminal is below 10 V . This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter ${ }^{\$}$ Chapter 5.2.4.4.1.5.8 "State LEDs" on page 666.

## I/O configuration

The I/O module does not store configuration data itself.

## Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.
$\left.\begin{array}{|l|l|l|l|l|l|l|l|}\hline \text { Name } & \text { Value } & \begin{array}{l}\text { Internal } \\ \text { Value }\end{array} & \begin{array}{l}\text { Internal } \\ \text { value, } \\ \text { Type }\end{array} & \text { Default } & \text { Min. } & \text { Max. } & \begin{array}{l}\text { EDS SIot } \\ \text { Index }\end{array} \\ \hline \text { Module ID } & \text { Internal } & 6520^{1} \text { ) } & \text { WORD } & 0 \times 1978 & 0 & 65535 & \text { xx01 } \\ \hline \begin{array}{l}\text { Ignore } \\ \text { module }\end{array} & \begin{array}{l}\text { No } \\ \text { Yes }\end{array} & 0 & \text { BYTE } \\ 1 & \text { No } \\ 0 x 00\end{array}\right]$

## Technical data

## Technical data of the module

The system data of AC500-eCo apply.
«4 Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage L+ |  |  |
|  | Connections | Terminal 19 for L+ (+24 V DC) and terminal 20 <br> for M (0 V) |
|  | Rated value | 24 V DC |
|  | Current consumption via L+ terminal | $0.14 \mathrm{~A}+$ output load |
|  | Inrush current (at power-up) | 0.05 A |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Protection fuse for L+ | Recommended |
| Current consumption from 24 V DC power <br> supply at the terminals UP/L+ and ZP/M of <br> the CPU/communication interface module | Ca. 5 mA |  |
| Galvanic isolation | No |  |
| Surge-voltage (max.) | 35 V DC for 0.5 s |  |
| Max. power dissipation within the module | 4.9 W |  |
| Weight | Ca. 120 g |  |
| Mounting position | Horizontal or vertical |  |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the control <br> cabinet. |  |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per <br> module | 4 individually configurable voltage or current inputs |
| Distribution of channels into <br> groups | 1 (4 channels per group) |
| Resolution | Unipolar |
| Voltage: $0 \mathrm{~V} \ldots+5 \mathrm{~V} ; 0 \mathrm{~V} \ldots+10 \mathrm{~V}: 12$ bits <br> Current $0 \mathrm{~mA} \ldots 20 \mathrm{~mA} ; 4 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits |  |
| Connection of the signals I0- to <br> I3- | Terminals $3,6,9,12$ |
| Connection of the signals I0+ to <br> I3+ | Terminals $2,5,8,11$ |
| Input type | Differential |
| Galvanic isolation | No galvanic isolation between the inputs and the I/O bus |
| Common mode input range | Signal voltage plus common mode voltage must be within $\pm$ <br> 12 V |
| Indication of the input signals | No |
| Channel input resistance | Voltage: $>12$ bits including sign |
|  | Current: ca. $250 \Omega$ |

| Parameter | Value |  |
| :---: | :---: | :---: |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\begin{aligned} & \pm 0.5 \% \text { of full scale (voltage) } \\ & \pm 0.5 \% \text { of full scale (current } 0 \mathrm{~mA} \ldots 20 \mathrm{~mA} \text { ) } \\ & \pm 0.7 \% \text { of full scale (current } 4 \mathrm{~mA} \ldots 20 \mathrm{~mA} \text { ) } \\ & \text { at }+25^{\circ} \mathrm{C} \end{aligned}$ |
|  | Max. | $\pm 2$ \% of full scale (all ranges) at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbance |
| Time constant of the input filter | Voltage: $300 \mu \mathrm{~s}$ Current: $300 \mu \mathrm{~s}$ |  |
| Relationship between input signal and hex code | $\stackrel{\text { ® Table on page } 667}{ }$ |  |
| Analog to digital conversion time | Typ. $500 \mu$ s per channel |  |
| Unused inputs | Can be left open and should be configured as "unused" |  |
| Input data length | 8 bytes |  |
| Overvoltage protection | Yes, up to 30 V DC only for voltage input |  |
| Max. cable length (conductor cross section > $0.14 \mathrm{~mm}^{2}$ ) |  |  |
| Unshielded wire | 10 m |  |
| Shielded wire | 100 m |  |

## Technical data of the analog outputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 2 configurable voltage or current outputs |  |
| Distribution of channels into groups | 1 (2 channels per group) |  |
| Connection of the signals O0U- and O1U+ | Terminals 13 and 15 |  |
| Connection of the signals $\mathrm{O} 01+$ and O11+ | Terminals 14 and 16 |  |
| Output type | Bipolar with voltage, unipolar with current |  |
| Resolution | 12 bits including sign |  |
| Indication of the output signals | No |  |
| Output resistance (load) as current output | $0 \Omega \ldots 500 \Omega$ |  |
| Output load ability as voltage output | 2 mA max. |  |
| Relationship between input signal and hex code | Table Output Ranges $\stackrel{y}{*}$ Table on page 668 |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | ```\pm0.5 % of full scale (voltage) \pm0.5 % of full scale (current 0mA ... }20\textrm{mA} \pm0.7 % of full scale (current 4 mA ... 20 mA) at +25*}\textrm{C``` |
|  | Max. | $\pm 2 \%$ of full scale (all ranges) at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbance |

| Parameter | Value |
| :--- | :--- |
| Unused outputs | Can be left open and should be configured <br> as "unused" |
| Output data length | 4 bytes |
| Overvoltage protection | Yes, up to 30 V DC |
| Max. cable length (conductor cross section <br> $>0.14 \mathrm{~mm}^{2}$ ) |  |
|  | Unshielded wire |
| Shielded wire | 10 m |

## Dimensions

The dimensions are in mm and in brackets in inch.

## Ordering data

### 5.2.4.4.2 S500 and S500-XC

## AC522 - Analog input/output module

## Features

- 8 channels configurable as analog inputs/outputs in one group (2.0 ... 2.7 and 3.0 ... 3.7)
- Resolution 12 bits including sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states at the analog inputs/outputs (C0 ... C7)
41 green LED to display the state of the process supply voltage UP
51 red LED to display errors
6 Label
7 Terminal unit
8 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process voltage of 24 V DC.

The inputs and outputs are galvanically isolated from all other circuitry of the module.

## Functionality

> If used as inputs, the following signal ranges are individually configurable:

- Unused (default setting)
- 0 V ... 10 V
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$
- $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (2-wire)
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ with differential inputs, requires 2 channels
- Digital signals (digital input)

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage -10 V ... +10 V | 12 bits including sign |
| Voltage 0 V ... 10 V | 12 bits |
| $\begin{aligned} & \text { Current } 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}, \\ & 4 \mathrm{~mA} \ldots 20 \mathrm{~mA} \end{aligned}$ | 12 bits |
| Temperature | $+0.1^{\circ} \mathrm{C}$ |
| LED displays | 10 LEDs for signals and error messages |
| Internal power supply | Via the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage 24 V DC) |
| Required terminal unit | TU515 or TU516 \& Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit $\Leftrightarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\star}$ ch Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8,2.8,3.8$ and 4.8 as well as $1.9,2.9,3.9$ and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | Unused | Unused |
| $2.0 \ldots 2.7$ | C0- ... C7- | Negative poles of the 8 analog <br> inputs/outputs |
| $3.0 \ldots 3.7$ | C0+ .. C7+ | Positive poles of the analog <br> inputs/outputs |
| $4.0 \ldots 4.7$ | Unused | Unused |

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module. The external power supply connection is carried out via the UP (+24 V DC) and the $\mathrm{ZP}(0 \mathrm{~V} \mathrm{DC})$ terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 89: Connection of the I/O module
14 analog I/O channels as inputs for 0 V ... $10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .22 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}, \mathrm{Pt} 100 / \mathrm{Pt} 1000 /$ Ni1000 digital signals as outputs for -10 V ... $+10 \mathrm{~V}, 0 \mathrm{~mA} . . .20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$
24 analog I/O channels as inputs for $0 \mathrm{~V} \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}, \mathrm{Pt} 100 / \mathrm{Pt} 1000 /$ Ni1000 digital signals as outputs for $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$

The process voltage must be included in the grounding concept of the control system (e.g. grounding the negative pole).

By installing equipotential bonding conductors between the different parts of the system, it must be made ensured that the potential difference between ZP and AGND never exeeds 1 V .

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| :--- | :--- | :--- |
| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

1 Return line
2 Twisted pair within the cable

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. C1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| :--- | :--- | :--- |
| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

By connecting to AGND the galvanically isolated voltage source of the sensor is referred to ZP. The following measuring ranges can be configured:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

The following measuring ranges can be configured:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

## CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1 V , not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to $Z P$, the sensor current flows to $Z P$ via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA . This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V} *)$ | 1 channel used |
| $*)$ if the sensor can provide this signal range |  |  |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current)

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

## CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 -volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

The negative pole of the sensor must be grounded next to the sensor.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |
| Effect of incorrect input ter- <br> minal connection |  | Wrong or no signal detected, <br> no damage up to 35 V |

## Connection of analog output loads (Voltage, current)

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load max. $\pm 10 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

Only the channels $0 \ldots 3$ can be configured as current output ( $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ or $4 \mathrm{~mA} . .20 \mathrm{~mA}$ ).

Unused analog outputs can be left open-circuited.

Internal data exchange

| Analog inputs (words) | 8 |
| :--- | :--- |
| Analog outputs (words) | 8 |

## I/O configuration

The module does not store configuration data itself. The 8 configurable analog channels are defined as inputs or outputs by the configuration, i.e. each of the configurable channels can used as input or output (or re-readable output in case of voltage input/output).

When a channel is used as input, the corresponding output must be configured unused.
When a channel is used as output, the corresponding input must be configured unused.

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The System Data of AC500 and S500 « Chapter 5.1.2 "System data AC500" on page 166 are applicable to the standard version.

Only additional details are therefore documented below.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Rated value | 24 VDC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module | Ca. 2 mA |
| From UP at normal operation | 0.10 A + output loads |
| Inrush current from UP (at power up) | $0.040 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section $>0.14 \mathrm{~mm}^{2}$ | 100 m |
| Weight | 300 g |

| Parameter | Value |
| :--- | :--- |
| Mounting position | Horizontal or vertical with derating <br> (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ <br> per group) |
| Cooling | The natural convection cooling must not <br> be hindered by cable ducts or other parts <br> in the control cabinet. |

- NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 8 |  |
| Distribution of channels into groups | 1 group of 8 channels |  |
| Connections of the channels C0- ... C7- | Terminals 2.0 ... 2.7 |  |
| Connections of the channels $\mathrm{C} 0+\ldots \mathrm{C} 7+$ | Terminals 3.0 ... 3.7 |  |
| Input type | Bipolar (not with current or Pt100/Pt1000/Ni1000) |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | $0 \vee \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .20 \mathrm{~mA}$, 4 mA ... 20 mA, Pt100/1000, Ni1000 (each input can be configured individually) |  |
| Channel input resistance | $\begin{aligned} & \text { Voltage: > } 100 \mathrm{k} \Omega \\ & \text { Current: ca. } 330 \Omega \end{aligned}$ |  |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$Current: $100 \mu \mathrm{~s}$ |  |
| Indication of the input signals | One LED per channel |  |
| Conversion cycle | 2 ms (for 8 inputs +8 outputs), with $\mathrm{Pt} / \mathrm{Ni}$... 1 s |  |
| Resolution | Range 0 V ... 10 V : 12 bits <br> Range $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ : 12 bits including sign <br> Range $0 \mathrm{~mA} . .20 \mathrm{~mA}$ : 12 bits <br> Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal | Typ. | $\begin{aligned} & \pm 0.5 \% \text { of full scale } \\ & \text { at }+25^{\circ} \mathrm{C} \end{aligned}$ |
|  | Max. | $\pm 1$ \% of full scale (all ranges) <br> at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbance |
| Relationship between input signal and hex code | See table ${ }^{\mu}$ Chapter 5.2.4.4.2.1.10.1 "Input ranges of voltage, current and digital input" on page 692 |  |
| Unused inputs | Must be configured as "unused". |  |
| Overvoltage protection | Yes |  |

Technical data of the analog inputs, if used as digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 8 |
| Distribution of channels into groups | 1 group of 8 channels |
| Connections of the channels $\mathrm{C} 0+\ldots \mathrm{C} 7+$ | Terminals $3.0 \ldots 3.7$ |
| Reference potential for the inputs | Terminals $1.9 \ldots 4.9(\mathrm{ZP})$ |
| Input signal delay | Typ. 8 ms, configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 VDC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Input current per channel | $+5 \mathrm{~V} \ldots+5 \mathrm{~V} . . .13 \mathrm{~V}$ |
|  | Input voltage +24 V |
|  | Input voltage +5 V |
|  | Input voltage +15 V |
|  | Input voltage +30 V |
| Input resistance | Typ. 7 mA |

## Technical data of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8, all channels for voltage, the first 4 channels <br> also for current |
| Distribution of channels into groups | 1 group of 8 channels |
|  | Channels C0- .. C7- |
| Channels C0+ ... C7+ | Terminals $2.0 \ldots 2.7$ |
| Output type | Terminals $3.0 \ldots 3.7$ |
| Galvanic isolation | Against internal supply and other modules |
| Configurability | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, <br> $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ (each output can be config- <br> ured individually), current outputs only chan- <br> nels $0 \ldots 3$ |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |
| Output loadability, as voltage output | Max. $\pm 10 \mathrm{~mA}$ |
| Indication of the output signals | One LED per channel |
| Resolution | 12 bits including sign |
| Settling time for full range change (resistive <br> load, output signal within specified tolerance) | Typ. 5 ms |
| Conversion error of the analog values caused <br> by non-linearity, adjustment error at factory <br> and resolution within the normal range | Typ. |

| Parameter | Value |
| :--- | :--- |
|  | Max. |
| $\pm 1 \%$ of full scale (all ranges) <br> at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturb- <br> ance |  |
| Relationship between output signal and hex <br> code | See table 'AC522 - Analog input/output <br> module' $\leftrightarrows$ Chapter 5.2.4.4.2.1.10.3 "Output <br> ranges voltage and current" on page 693 |
| Unused outputs | Must be configured as "unused". |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

${ }^{*}$ ) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

Al523 - Analog input module

## Features

- 16 configurable analog inputs (IO ... I15) in 2 groups (1.0 ... 2.7 and $3.0 \ldots 4.7$ )

Resolution 12 bits including sign

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
316 yellow LEDs to display the signal states at the analog inputs (IO ... I15)
41 green LED to display the state of the process supply voltage UP
$5 \quad 2$ red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

## Functionality

16 analog inputs, individually configurable for

- Unused (default setting)
- 0 V ... 10 V
-     - $10 \mathrm{~V} \ldots+10 \mathrm{~V}$
- $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- 4 mA ... 20 mA
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (2-wire)
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ with differential inputs, requires 2 channels
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ with differential inputs, requires 2 channels
- Digital signals (digital input)

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage -10 V ... +10 V | 12 bits including sign |
| Voltage 0 V ... 10 V | 12 bits |
| Current 0 mA ... $20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$ | 12 bits |
| Temperature | $0.1{ }^{\circ} \mathrm{C}$ |
| LED displays | 19 LEDs for signals and error messages |
| Internal power supply | Via the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage 24 V DC) |
| Required terminal unit | TU515 or TU516 ${ }^{\Perp}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 |

## Connections

The modules are plugged on an I/O terminal unit $\triangleq$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\wedge}>$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

Terminals 1.8 ... 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals $1.9 \ldots 4.9$ : process voltage $\mathrm{ZP}=0 \mathrm{~V}$
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | $10-\ldots$ I7- | Negative poles of the first 8 <br> analog inputs |
| $2.0 \ldots 2.7$ | $10+\ldots$ I7+ | Positive poles of the first 8 <br> analog inputs |
| $3.0 \ldots 3.7$ | $18-\ldots$ I15- | Negative poles of the fol- <br> lowing 8 analog inputs |
| $4.0 \ldots 4.7$ | $18+\ldots$ I15+ | Positive poles of the following <br> 8 analog inputs |

## CAUTION!

The negative poles of the analog inputs are galvanically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also galvanically connected to each other to form an "Analog Ground" signal.

## CAUTION!

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

## CAUTION!

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per Al523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

๕ Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

The following figure shows the connection of the module:

Fig. 90: 16 analog inputs in two groups, individually configurable ${ }^{\Perp}$ Chapter 5.2.4.4.2.2.3 "Functionality" on page 699

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The modules provide several diagnosis functions $\left.{ }^{\circ}\right\rangle$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module Al523 provides a constant current source which is multiplexed over the 8 analog channels.

Fig. 91: Connection example
The following measuring ranges can be configured ${ }^{\wedge}$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page 714.

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| :--- | :--- | :--- |
| $\mathrm{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |

The function of the LEDs is described under Displays $\Leftrightarrow$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

The module AI523 performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module Al523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

Fig. 92: Connection example
If several measuring points are adjacent to each other, the return line is necessary only once. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
The following measuring ranges can be configured ${ }^{y}$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page 714

| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| :--- | :--- | :--- |
| $\mathrm{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |

The function of the LEDs is described under Displays ${ }^{*}$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

The module AI523 performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Fig. 93: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page $714 \Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Displays $\Rightarrow$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 94: Connection example
The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page $714 \Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

The function of the LEDs is described under Displays $\Leftrightarrow$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

Unused input channels can be left open-circuited, because they are of low resistance.

Fig. 95: Connection example

## CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1 V , not even in case of long lines ${ }^{\#} \Rightarrow$ Chapter 5.2.4.4.2.2 "Al523 Analog input module" on page 698.

If AGND does not get connected to $Z P$, the sensor current flows to $Z P$ via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 $m A$. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $\left.-10 \mathrm{~V} \ldots+10 \mathrm{~V}{ }^{*}\right)$ | 1 channel used |
| $\left.{ }^{*}\right)$ if the sensor can provide this signal range |  |  |

The function of the LEDs is described under Displays « Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current)

Fig. 96: Connection example
The following measuring ranges can be configured $\Longleftrightarrow$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page $714 \Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under Displays $\Leftrightarrow$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.

## CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 -volt Zener diode (in parallel to I+ and ZP). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA .

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.
The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

The ground potential at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

Fig. 97: Connection example

The negative pole of the sensor must be grounded next to the sensor.

The following measuring ranges can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page $714 \Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

The function of the LEDs is described under Displays $\Leftrightarrow$ Chapter 5.2.4.4.2.2.8 "Diagnosis" on page 717.
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 98: Connection example
The following operating mode can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.2.7 "Parameterization" on page $714 \Leftrightarrow$ Chapter 5.2.4.4.2.2.10 "Measuring ranges" on page 719

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |
| Effect of incorrect input ter- <br> minal connection |  | Wrong or no signal detected, <br> no damage up to 35 V |

The function of the LEDs is described under Displays.

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 0 |
| Counter input data (words) | 16 |
| Counter output data (words) | 0 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\leftrightarrow}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\stackrel{\Perp}{ }{ }^{\Perp}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals $1.8,2.8,3.8$ and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation / with outputs | 0.15 A + output loads |

| Parameter | Value |
| :--- | :--- |
| Inrush current from UP (at power up) | $0.050 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section <br> $>0.14 \mathrm{~mm}^{2}$ | 100 m |
| Weight | 300 g |
| Mounting position | Horizontal or vertical with derating <br> (output load reduced to $50 \%$ at +40 <br> ${ }^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must <br> not be hindered by cable ducts or <br> other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 16 |  |
| Distribution of channels into groups | 2 groups of 8 channels each |  |
| Connections of the channels I0- ... I7Connections of the channels IO+ ... I7+ | Terminals 1.0 ... 1.7 <br> Terminals 2.0 ... 2.7 |  |
| Connections of the channels I8- ... I15- <br> Connections of the channels I8+ ... I15+ | Terminals 3.0 ... 3.7 Terminals 4.0 ... 4.7 |  |
| Input type | Bipolar (not with current or Pt100/ Pt1000/ Ni1000) |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | $0 \vee \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 / 4 \mathrm{~mA} . . .20 \mathrm{~mA}$, Pt100/1000, Ni1000 (each input can be configured individually) |  |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |  |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |  |
| Indication of the input signals | 1 LED per channel |  |
| Conversion cycle | 2 ms (for 16 inputs), with Pt/Ni... 1 s |  |
| Resolution | Range $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ : 12 bits |  |
|  | Range -10 V ... +10 V: 12 bits including sign |  |
|  | Range $0 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits |  |
|  | Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\pm 0.5 \%$ of full scale at $+25^{\circ} \mathrm{C}$ |

| Parameter | Value |
| :--- | :--- |
|  | Max.$\pm 1 \%$ of full scale (all ranges) <br> at $0{ }^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbance |
| Relationship between input signal and hex <br> code | そ Chapter 5.2.4.4.2.2.10.2 "Input ranges <br> resistance temperature detector" on page 720 |
| Unused voltage inputs | Are configured as "unused" |
| Unused current inputs | Have a low resistance, can be left open- <br> circuited |
| Overvoltage protection | Yes |

## Technical data of the analog inputs, if used as digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | Max. 16 |
| Distribution of channels into groups | 2 groups of 8 channels each |
| Connections of the channels 10+ ... 17+ Connections of the channels I8+ ... I15+ | $\begin{aligned} & \text { Terminals } 2.0 \ldots 2.7 \\ & \text { Terminals } 4.0 \ldots 4.7 \end{aligned}$ |
| Reference potential for the inputs | Terminals 1.9, 2.9, 3.9 and 4.9 (ZP) |
| Input signal delay | Typ. 8 ms , configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
| Signal 0 | -30 V ... +5V |
| Undefined signal | +5V ... +13 V |
| Signal 1 | +13V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 7 mA |
| Input voltage +5 V | Typ. 1.4 mA |
| Input voltage +15 V | Typ. 4.3 mA |
| Input voltage +30 V | < 9 mA |
| Input resistance | Ca. $3.5 \mathrm{k} \Omega$ |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1SAP 250 300 R0001 | Al523, analog input module, 16 AI, <br> U/I/Pt100, 12 bits including sign, <br> 2-wires | Active |
| 1SAP 450 300 R0001 | Al523-XC, analog input module, 16 AI, <br> U/I/Pt100, 12 bits including sign, <br> 2-wires, XC version | Active |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## Al531-Analog input module

## Features

- 8 configurable analog inputs ( $10 \ldots 17$ ) in 2 groups ( 1.0 ... 1.7 and $2.0 \ldots 2.7$ as well as 3.0 ... 3.7 and 4.0 ... 4.7)

Resolution 16 bits including sign

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal names
34 yellow LEDs to display the states at the inputs $10 \ldots$ I3
44 yellow LEDs to display the states at the inputs $14 \ldots$... 7
51 green LED to display the process supply voltage UP
62 red LEDs to display errors (CH-ERR2 and CH-ERR4)
7 Label
8 Terminal unit
9 DIN rail
${ }_{*}^{*}+\underset{*}{*}$ Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

## Functionality

8 analog inputs, individually configurable for

- Unused (default setting)
- 0 V ... $5 \mathrm{~V}, 0 \mathrm{~V}$... 10 V
- $-50 \mathrm{mV} \ldots+50 \mathrm{mV},-500 \mathrm{mV}$... +500 mV
- $-1 \mathrm{~V} \ldots+1 \mathrm{~V},-5 \mathrm{~V} \ldots+5 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}$
- $0 \mathrm{~mA} . . .20 \mathrm{~mA}$
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$
- $-20 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ or $+400^{\circ} \mathrm{C}$ (2-, 3- and 4 -wire)
- Pt100, $-200^{\circ} \mathrm{C} \ldots+850^{\circ} \mathrm{C}(2-, 3-$ and 4 -wire $)$
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-, 3- and 4-wire)
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (2-, 3- and 4-wire)
- $\operatorname{Cu50}$ (1.426): $-50^{\circ} \mathrm{C} \ldots+200^{\circ} \mathrm{C}$ (2-, 3- and 4 -wire)
- Cu50 (1.428): $-200^{\circ} \mathrm{C} \ldots+200^{\circ} \mathrm{C}$ (2-, 3- and 4-wire)
- $0 \Omega \ldots 50 \mathrm{k} \Omega$
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

| Parameter |  |
| :--- | :--- |
| Vesolution of the analog channels |  |
|  | Voltage and current |
| Temperature | 16 bits including sign |
| LED displays | $+0.1^{\circ} \mathrm{C}\left(0,01^{\circ} \mathrm{C}\right.$ at $\left.\mathrm{Pt} 100-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}\right)$ |
| Internal power supply | 11 LEDs for signals and error messages |
| External power supply | through the I/O bus interface (I/O bus) |
| Required terminal unit | via terminals (process voltage UP = 24 V DC$)$ |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit $\Leftrightarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\star} \Rightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8,2.8,3.8,4.8,1.9,2.9,3.9$ and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $2.0,2.2,2.4,2.6$ | IO+ .. I3+ | Positive poles of the first 4 <br> analog inputs |
| $1.0,1.2,1.4,1.6$ | IO- ... I3- | Negative poles of the first 4 <br> analog inputs |
| $2.1,2.3,2.5,2.7$ | IOA ... I3A | Connections A (supply) of the <br> first 4 analog inputs |
| $1.1,1.3,1.5,1.7$ | IOB ... I3B | Connections B (analog <br> ground) of the first 4 analog <br> inputs |
| $4.0,4.2,4.4,4.6$ | I4+ .. I7+ | Positive poles of the following <br> 4 analog inputs |
| $3.0,3.2,3.4,3.6$ | I4- I7- $\ldots$ I7A | Negative poles of the fol- <br> lowing 4 analog inputs |
| $4.1,4.3,4.5,4.7$ | Connections A (supply) of the <br> following 4 analog inputs |  |
| $3.1,3.3,3.5,3.7$ | Connections B (analog <br> ground) of the following 4 <br> analog inputs |  |

The " $1 x B$ " clamps ( $x=0 \ldots 7$ ) of the analog inputs are galvanically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix-may accept a potential difference up to $\pm 20$ V DC with regard to the common reference potential IxB (AGND, $Z P$ ). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.

For the open-circuit detection (wire break), each positive analog input channel Ix+ is pulled up to "plus" by a high-resistance resistor and each negative analog input channel Ix- is pulled down to "minus" by a resistor. If wire break occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI531.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
(4) Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 99: 8 analog inputs in two groups, individually configurable ${ }^{\mu}$ Chapter 5.2.4.4.2.3.3 "Functionality" on page 726

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The module provides several diagnosis functions $\#$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753 .

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply Standard ranges

Fig. 100: Connection example
The measuring ranges can be configured ${ }^{\mu}$, Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Voltage | $-50 \mathrm{mV} \ldots+50 \mathrm{mV}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-500 \mathrm{mV} \ldots+500 \mathrm{mV}$ | 1 channel used |
| Voltage | $-1 \mathrm{~V} \ldots+1 \mathrm{~V}$ | 1 channel used |
| Voltage | $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The measuring range can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Voltage | Common mode voltage | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under diagnosis and displays/displays $\Rightarrow$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply
Standard ranges

Fig. 102: Connection example
CAUTION!
If GND is not directly connected to ZP at the sensor, the supply current flows
via the GND line to ZP. Measuring errors can only occur caused by voltage
differences higher than $\pm 20 \mathrm{~V}$ DC between GND and ZP .

The measuring ranges can be configured ${ }^{*}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| Voltage | $-50 \mathrm{mV} \ldots+50 \mathrm{mV}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-500 \mathrm{mV} \ldots+500 \mathrm{mV}$ | 1 channel used |
| Voltage | $-1 \mathrm{~V} \ldots+1 \mathrm{~V}$ | 1 channel used |
| Voltage | $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

Fig. 103: Connection example

## CAUTION!

If GND is not directly connected to ZP at the sensor, the supply current flows via the GND line to ZP . Measuring errors can only occur caused by voltage differences higher than $\pm 20 \mathrm{~V}$ DC between GND and ZP.

The measuring range can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| Voltage | Common mode voltage | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under diagnosis and displays/displays $\Rightarrow$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 104: Connection example
The following measuring ranges can be configured ${ }^{\Leftrightarrow}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Current | $-20 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

The function of the LEDs is described under diagnosis and displays/displays ${ }_{\mu}^{\mu}$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

Unused input channels can be left open, because they are of low resistance.

## Connection of active-type analog sensors (Current) with galvanically isolated power supply and seriesconnection of an additional input

Fig. 105: Connection example
1 Analog input of the second device

If series-connection of an additional input is used, the input resistance of the module (ca. $330 \Omega$ ) must be added to the input resistance of the second device. Make sure that the maximum permitted load resistance of the analog sensor is not exceeded (see the data sheet of the analog sensor).

The input of the module is not related to ZP. If the input of the second device is related to $Z P$, the order of sequence in the series-connection must be observed by all means (from the sensor to the module and then to the input of the second device).

The following measuring ranges can be configured ${ }^{y} y$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Current | $-20 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

For a description of the functions of the LEDs, please refer to diagnosis and displays/displays (y) Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

Unused input channels can be left open, because they are of low resistance.

## Connection of passive-type analog sensors (Current)

Fig. 106: Connection example
The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Current | $-20 \mathrm{~mA} \ldots 20 \mathrm{~mA}{ }^{*}$ ) | 1 channel used |
| :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA} *$ ) | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| ${ }^{*}$ ) This setting is not applicable with passive-type analog sensors (current). |  |  |

The function of the LEDs is described under diagnosis and displays/displays $\Rightarrow$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

Unused input channels can be left open, because they are of low resistance.

Fig. 107: Connection example
1 Analog input of the second device

If series-connection of an additional input is used, the input resistance of the module (ca. $330 \Omega$ ) must be added to the input resistance of the second device. Make sure that the maximum permitted load resistance of the analog sensor is not exceeded (see the data sheet of the analog sensor).

The input of the module is not related to ZP. If the input of the second device is related to $Z P$, the order of sequence in the series-connection must be observed by all means (from the sensor to the module and then to the input of the second device).

The following measuring ranges can be configured $\leadsto$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:

| Current | $-20 \mathrm{~mA} \ldots 20 \mathrm{~mA} *)$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ *) | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| ${ }^{*}$ ) This setting is not applicable with passive-type analog sensors (current). |  |  |

The function of the LEDs is described under diagnosis and displays/displays $\Leftrightarrow$ Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

Unused input channels can be left open, because they are of low resistance.

## Connection of digital signal sources at analog inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 108: Connection example
The following operating mode can be configured ${ }^{\wedge}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |
| Effect of incorrect input ter- <br> minal connection |  | Wrong or no signal detected, <br> no damage up to 35 V |

For a description of the function of the LEDs, please refer to diagnosis and displays/displays « Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 109: Connection example
The following measuring ranges can be configured ${ }^{\Leftrightarrow}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:
$\left.\begin{array}{|l|l|l|}\hline \text { Pt100 } & -50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C} /+400^{\circ} \mathrm{C} ; & 1 \text { channel used } \\ -200^{\circ} \mathrm{C} \ldots+850^{\circ} \mathrm{C}\end{array}\right]$

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.
The module linearizes the resistance thermometer characteristics.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 110: Connection example
The following measuring ranges can be configured ${ }^{\Perp}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70{ }^{\circ} \mathrm{C} /+400^{\circ} \mathrm{C} ;$ | 1 channel used |
| :--- | :--- | :--- |
|  | $-200^{\circ} \mathrm{C} \ldots+850{ }^{\circ} \mathrm{C}$ |  |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 1 channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ | 1 channel used |
| Cu50 | $-50^{\circ} \mathrm{C} \ldots+200^{\circ} \mathrm{C}(1.426) ;$ | 1 channel used |
|  | $-200^{\circ} \mathrm{C} \ldots+200^{\circ} \mathrm{C}(1.428)$ |  |

For a description of the function of the LEDs, please refer to diagnosis and displays/displays «y Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.
The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means to have all the involved conductors in the same cable. All the conductors must have the same cross section.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 4-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 111: Connection example
The following measuring ranges can be configured ${ }^{«}$, Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749:
$\left.\begin{array}{|l|l|l|}\hline \text { Pt100 } & -50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C} /+400^{\circ} \mathrm{C} ; & 1 \text { channel used } \\ -200^{\circ} \mathrm{C} \ldots+850^{\circ} \mathrm{C}\end{array}\right]$

For a description of the function of the LEDs, please refer to diagnosis and displays/displays * Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means, to have all the involved conductors in the same cable.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistors in 2-wire configuration

For evaluating resistors, a constant current must flow through them to build the necessary voltage drop. For this, the module Al531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 112: Connection example
The following measuring ranges can be configured $\#$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| Resistor | $50 \mathrm{k} \Omega$ | 1 channel used |
| :--- | :--- | :--- |

For a description of the function of the LEDs, please refer to diagnosis and displays/displays * Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of a resistance measuring bridge with internal supply

When resistance measuring bridges are connected, the short-circuit-proof voltage output (internal supply) at pin 10 A (or $12 \mathrm{~A}, 14 \mathrm{~A}, 16 \mathrm{~A}$ ) must be used. This supply voltage is activated as soon as "Voltage Measurement" is configured for the relevant channel.

Fig. 113: Connection example
1 Internal supply
All voltage measuring ranges can be configured $\stackrel{y}{ }{ }^{\wedge}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749.

| Voltage | $-50 \mathrm{mV} \ldots+50 \mathrm{mV}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-500 \mathrm{mV} \ldots+500 \mathrm{mV}$ | 1 channel used |
| Voltage | $-1 \mathrm{~V} \ldots+1 \mathrm{~V}$ | 1 channel used |
| Voltage | $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

## Connection of a resistance measuring bridge with external supply

With the connection of a resistance measuring bridge with external supply, the supply voltage is provided separately.

Fig. 114: Connection example
1 Bridge to IxB necessary with galvanically isolated supply
All voltage measuring ranges can be configured $\stackrel{y}{ }$, Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 .

| Voltage | $-50 \mathrm{mV} \ldots+50 \mathrm{mV}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-500 \mathrm{mV} \ldots+500 \mathrm{mV}$ | 1 channel used |
| Voltage | $-1 \mathrm{~V} \ldots+1 \mathrm{~V}$ | 1 channel used |
| Voltage | $-5 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+5 \mathrm{~V}$ | 1 channel used |
| Voltage | $0 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

## Connection of thermocouples

Fig. 115: Connection example
The following measuring ranges can be configured ${ }^{\mu}$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749 :

| J type | $-210^{\circ} \mathrm{C} \ldots+1200^{\circ} \mathrm{C}$ | Fe-CuNi | 1 channel used |
| :--- | :--- | :--- | :--- |
| K type | $-270^{\circ} \mathrm{C} \ldots+1372^{\circ} \mathrm{C}$ | $\mathrm{Ni}-\mathrm{CrNi}$ | 1 channel used |

| S type | $-50^{\circ} \mathrm{C} \ldots+1768^{\circ} \mathrm{C}$ | $\mathrm{Pt} 10 R \mathrm{Rh}-\mathrm{Pt}$ | 1 channel used |
| T type | $-270^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | $\mathrm{Cu}-\mathrm{CuNi}$ | 1 channel used |

For a description of the function of the LEDs, please refer to diagnosis and displays/displays *) Chapter 5.2.4.4.2.3.8 "Diagnosis" on page 753.
The module linearizes the thermocouple characteristics. It supports the following possibilities of temperature compensation and handling with cold junctions:

## Internal compensation

An internal temperature sensor which is located next to the terminal unit is used to detect the temperature of the cold junction. So the compensating cables must be connected directly to the terminal unit, where the cold junction is located.

The setting "Internal compensation (default)" for the parameter "Compensation channel" should be selected.

To get more precise temperature measurements, the use of an external compensation method is recommended.

## External compensation with temperature input

The temperature for the cold junction can be determinated externally.
A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred to the module via the output data word to all required channels. The possible temperature range is $-25^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ and is monitored by the AI531.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

## External compensation with compensation box

A compensation box balances the temperature difference between the cold junction and the reference temperature by generating a bridge voltage. The reference temperature is transferred via the output data word.
The compensation box must fit to the type of thermocouple and is located at the end of the compensating cables, where the cold junction is located. The cabling to the AI531 can be carried out with normal cables. The operating manual of the compensation box also has to be considered.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

## External compensation with flanking channel

A flanking channel of the same input group can be used for compensation, e. g. for channel 3 , the channels 0,1 and 2 can be selected as reference channels. The type of sensor for the reference channel can be selected in the parameters for the flanking channel. For example, a RTD sensor which is located next to the thermocouple terminal can be used as reference point for other channels.
The setting "Channel $x$ " for the parameter "Compensation channel" should be selected. Refer to 'Channel configuration' for possible settings $\Rightarrow$ Chapter 5.2.4.4.2.3.7 "Parameterization" on page 749.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 0 |
| Analog inputs (words) | 8 |
| Analog outputs (words) | 1 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
This means that replacing I/O modules is possible without any re-parameterization via software.

$$
\begin{aligned}
& \text { If the external power supply voltage via UP/ZP terminals fails, the I/O module } \\
& \text { loses its configuration data. The whole station has to be switched off and on } \\
& \text { again to re-configure the module. }
\end{aligned}
$$

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\stackrel{\text { Chapter 5.1.3 "System data }}{ }$ AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals $1.8,2.8,3.8$ and 4.8 for +24 V (UP) as well as $1.9,2.9,3.9$ and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| Current consumption from UP in normal operation | 130 mA |
| Inrush current from UP (at power up) | $0.056 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section $>0.14 \mathrm{~mm}^{2}$ ) | 100 m |
| Weight | 130 g |
| Mounting position | Horizontal or vertical with derating (max. temperature $40^{\circ} \mathrm{C}$ ) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |
| *) Please note that an additional current of approx. $3 \mu \mathrm{~A}$ flows out of the input for the wire break detection. Depending on the internal resistance of the signal source and the wire, this can lead to a higher measured value due to the voltage drop. |  |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of channels into groups | 2 groups of 4 channels each |
| Connections of the channels I0 ... I3 | Terminals 1.0 ... 1.7 and terminals 2.0 ... 2.7 |
| Connections of the channels 14 ... 17 | Terminals 3.0 ... 3.7 and terminals 4.0 ... 4.7 |
| Input type | Bipolar (not with current or Pt100/ Pt1000/ Ni1000/ Cu50/ resistor) |
| Galvanic isolation | Against internal supply and other modules |
| Common mode input range | $\pm 20 \mathrm{~V}$ DC plus signal voltage |
| Configurability | Digital input, $-50 \mathrm{mV} \ldots+50 \mathrm{mV}$, -500 mV ... $+500 \mathrm{mV},-1 \mathrm{~V} \ldots+1 \mathrm{~V}$, $-5 \vee \ldots+5 \vee,-10 \vee \ldots+10 \vee$, $0 \mathrm{~V} . .+5 \mathrm{~V}, 0 \mathrm{~V} \ldots+10 \mathrm{~V}$, -20 mA ... $+20 \mathrm{~mA}, 0 \mathrm{~mA} . .20 \mathrm{~mA}$, 4 mA ... $20 \mathrm{~mA}, \mathrm{Pt} 100$, Pt1000, Ni1000, Cu50, resistor, thermocouple types J, K, $\mathrm{N}, \mathrm{S}, \mathrm{T}$ (each input can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$, current: ca. $330 \Omega$ |
| Time constant of the input filter | Line-frequency suppression $50 \mathrm{~Hz}, 60$ Hz , none |
| Indication of the input signals | 1 yellow LED per channel, the brightness depends on the value of the analog signal |
| Conversion time | 1 ms (none), <br> $100 \mathrm{~ms}(50 \mathrm{~Hz} / 60 \mathrm{~Hz})$ per channel |
| Resolution | 16 bits including sign |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | $\begin{array}{\|l\|l} \hline \text { Typ. } & \pm 0.1 \% \text { (voltage) } \\ & \pm 0.3 \% \text { (current, resistor) } \\ & \text { at } 25^{\circ} \mathrm{C} \\ \hline \end{array}$ |

| 1SAP 450 600 R0001 | AI531-XC, analog input module, 8 AI, <br> U/I/Pt100, TC, 16 bits including sign, <br> 4-wires, XC version | Active |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## AO523-Analog output module

## Features

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
316 yellow LEDs to display the signal states at the analog outputs (O0 ... O15)
41 green LED to display the state of the process supply voltage UP
52 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
${ }_{*}^{*}+{ }_{*}^{*}$ Sign for XC version

Intended purpose
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

- 16 analog outputs in two groups:
- 8 channels configurable for voltage or currrent output (O0...O3 / O8...O11)
- 8 channels for voltage output (O4...O7 / O12...O15)

Resolution 12 bits including sign

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage -10 V ... +10 V | 12 bits including sign |
| Current 0 mA ... $20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$ | 12 bits |
| LED displays | 19 LEDs for signals and error messages |
| Internal power supply | Through the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage 24 V DC) |
| Required terminal unit | TU515 or TU516 $\Leftrightarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit $\&$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\star} \Rightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:
Terminals $1.8 \ldots 4.8$ : process voltage UP $=+24 \mathrm{~V}$ DC
Terminals 1.9 ... 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | $\mathrm{O} 0-\ldots \mathrm{O} 7-$ | Negative poles of the first 8 <br> analog outputs |
| $2.0 \ldots 2.7$ | $\mathrm{O} 0+\ldots \mathrm{O}++$ | Positive poles of the first 8 <br> analog outputs |

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $3.0 \ldots 3.7$ | O8- .. O15- | Negative poles of the fol- <br> lowing 8 analog outputs |
| $4.0 \ldots 4.7$ | $\mathrm{O8}+\ldots \mathrm{O} 15+$ | Positive poles of the following <br> 8 analog outputs |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AO523.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

๕ Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 116: Connection of the module: 16 analog outputs in two groups ${ }^{\wedge}$ Chapter 5.2.4.4.2.4.3 "Functionality" on page 765

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

The modules provide several diagnosis functions ${ }^{\mu}$ Chapter 5.2.4.4.2.4.8 "Diagnosis" on page 774 .

## Connection of analog output loads (Voltage, current)

Fig. 117: Connection example
The following measuring ranges can be configured $\Longleftrightarrow$ Chapter 5.2.4.4.2.4.7 "Parameterization" on page 769:

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load max. $\pm 10 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| Current | $4 \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

Only the channels $0 \ldots 3$ and $8 \ldots 11$ can be configured as current output ( $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ or $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ ).
The function of the LEDs is described under Displays.
Unused analog outputs can be left open-circuited.

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 0 |
| Analog inputs (words) | 0 |
| Analog outputs (words) | 16 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\circledR}$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{\Perp}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals $1.8,2.8,3.8$ and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| Current consumption from UP at normal operation | 0.15 A + output loads |
| Inrush current from UP (at power up) | 0.040 A ${ }^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section $>0.14 \mathrm{~mm}^{2}$ | 100 m |
| Weight | 300 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40{ }^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog outputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 16, of for vo 012 | ich channnels O 0 ... O 3 and $\mathrm{O} 8 \ldots \mathrm{O} 11$ e and current, and channels O 4 ... 7 and only for voltage |
| Distribution of channels into groups | 1 group |  |
| Channels O0- ... O7- <br> Channels O0+ ... O7+ | Terminals 1.0 ... 1.7 <br> Terminals 2.0 ... 2.7 |  |
| Channels O8- ... O15- <br> Channels O8+ ... O15+ | Terminals 3.0 ... 3.7 <br> Terminals 4.0 ... 4.7 |  |
| Output type | Bipolar with voltage, unipolar with current |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .20 \mathrm{~mA}, 4 \mathrm{~mA} . .20 \mathrm{~mA}$ (each output can be configured individually), current outputs only channels $0 . . .3$ and $8 \ldots 11$ |  |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |  |
| Output loadability, as voltage output | Max. $\pm 10 \mathrm{~mA}$ |  |
| Indication of the output signals | One LED per channel |  |
| Resolution | 12 bits including sign |  |
| Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\pm 0.5 \%$ of full scale at $+25^{\circ} \mathrm{C}$ |
|  | Max. | $\pm 1$ \% of full scale (all ranges) at $0^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$ or EMC disturbance |
| Relationship between output signal and hex code | y Chapter 5.2.4.4.2.4.10 "Output ranges" on page 776 |  |
| Unused outputs | Can be left open-circuited |  |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## AX521-Analog input/output module

## Features

- 4 configurable analog inputs (IO ... I3) in 1 group (1.0 ... 2.3)

Resolution 12 bits including sign

- 4 configurable analog outputs ( O 0 ... O 3 ) in 1 group ( 3.0 ... 4.3)

Resolution 12 bits including sign

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
34 yellow LEDs to display the signal states at the analog inputs (IO ... I3)
44 yellow LEDs to display the signal states at the analog outputs ( $\mathrm{O} 0 \ldots \mathrm{O} 3$ )
51 green LED to display the state of the process supply voltage UP
62 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

## Functionality

AX521 4 analog inputs (channel 0... channel 3), individually configurable for

- Unused (default setting)
- 0 V ... 10 V
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$
- 0 mA ... 20 mA
- 4 mA ... 20 mA
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (2-wire)
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- $0 \vee \ldots 10 \mathrm{~V}$ with differential inputs, requires 2 channels
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (channel $0 \ldots$ channel 3 ), individually configurable for

- Unused (default setting)
- -10 V ... +10 V
- $0 \mathrm{~mA} . .20 \mathrm{~mA}$
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$

| Parameter | Value |
| :---: | :---: |
| Resolution of the analog channels |  |
| Voltage -10 V ... +10 V | 12 bits including sign |
| Voltage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 12 bits |
| Current 0 mA ... $20 \mathrm{~mA}, 4 \mathrm{~mA}$... 20 mA | 12 bits |
| Temperature | $+0.1^{\circ} \mathrm{C}$ |
| LED displays | 11 LEDs for signals and error messages |
| Internal power supply | Via the I/O bus interface (I/O bus) |
| External power supply | Via the terminals ZP and UP (process voltage 24 V DC) |
| Required terminal unit | TU515 or TU516 $\stackrel{y y}{*}$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit $\Leftrightarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\text {}} \gg$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8,2.8,3.8$ and 4.8 as well as $1.9,2.9,3.9$ and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC

Table 175: Assignment of the other terminals

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.3$ | $\mathrm{IO} \ldots \mathrm{I} 3-$ | Negative poles of the 4 analog <br> inputs |
| $2.0 \ldots 2.3$ | $\mathrm{IO}+\ldots \mathrm{I} 3+$ | Positive poles of the 4 analog <br> inputs |
| $3.0 \ldots 3.3$ | $\mathrm{O} 0-\ldots \mathrm{O} 3-$ | Negative poles of the 4 analog <br> outputs |
| $4.0 \ldots 4.3$ | $\mathrm{O}+\ldots \mathrm{O} 3+$ | Positive poles of the 4 analog <br> outputs |

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
(7) Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153

The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.
Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 118: Connection of the I/O module: 4 analog inputs and 4 analog outputs, individually configurable ${ }^{\text {® }}$ Chapter 5.2.4.4.2.5.3 "Functionality" on page 781

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

Fig. 119: Connection example

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| :--- | :--- | :--- |
| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

Fig. 120: Connection example

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| :--- | :--- | :--- |
| $\mathrm{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Fig. 121: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 ${ }^{〔}$, Chapter 5.2.4.4.2.5.7 "Parameterization" on page 796 and for AX522 ${ }^{〔}$ Chapter 5.2.4.4.2.6.7 "Parameterization" on page 826:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 122: Connection example

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

Unused input channels can be left open-circuited, because they are of low resistance.

Fig. 123: Connection example

## CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1 V , not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to $Z P$ via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA . This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V} *)$ | 1 channel used |

*) if the sensor can provide this signal range
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current)

Fig. 124: Connection example

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

## CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 -volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

Fig. 125: Connection example

> The negative pole of the sensor must be grounded next to the sensor.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 126: Connection example

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |
| Effect of incorrect input ter- <br> minal connection |  | Wrong or no signal detected, <br> no damage up to 35 V |

Fig. 127: Connection example

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load max. $\pm 10 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

Only the channels $0 \ldots 3$ can be configured as current output ( $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ or $4 \mathrm{~mA} . .20 \mathrm{~mA}$ ).
Unused analog outputs can be left open-circuited.

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 0 |
| Counter input data (words) | 4 |
| Counter output data (words) | 4 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: $\mathrm{Y}=1$... 10

| No. | Name | Value | Internal <br> value | Internal <br> value, <br> type | Default | Min. | Max. | EDS <br> Slot/ <br> Index |

Table 177: Channel configuration ${ }^{2}$ )

| Internal value | Operating modes of the analog inputs, individually configurable |
| :---: | :---: |
| 0 | Unused (default) |
| 1 | Analog input 0 V ... 10 V |
| 2 | Digital input |
| 3 | Analog input 0 mA ... 20 mA |
| 4 | Analog input 4 mA ... 20 mA |
| 5 | Analog input -10 V ... +10 V |
| 8 | Analog input Pt100, $-50{ }^{\circ} \mathrm{C} \ldots+400{ }^{\circ} \mathrm{C}$ (2-wire) |
| 9 | Analog input Pt100, $-50^{\circ} \mathrm{C} \ldots+40{ }^{\circ} \mathrm{C}$ (3-wire), requires 2 channels *) |
| 10 | Analog input $0 \ldots 10 \mathrm{~V}$ via differential inputs, requires 2 channels *) |
| 11 | Analog input $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ via differential inputs, requires 2 channels *) |
| 14 | Analog input Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (2-wire) |
| 15 | Analog input Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (3-wire), requires 2 channels *) |
| 16 | Analog input Pt1000, $-50^{\circ} \mathrm{C} \ldots+400{ }^{\circ} \mathrm{C}$ (2-wire) |
| 17 | Analog input Pt1000, $-50^{\circ} \mathrm{C} \ldots+400{ }^{\circ} \mathrm{C}$ (3-wire), requires 2 channels *) |
| 18 | Analog input Ni1000, $-50^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ (2-wire) |
| 19 | Analog input Ni1000, $-50^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ (3-wire), requires 2 channels *) |
|  | *) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1). |

| 4 | 14 | 1... 10 | 3 | $4 \ldots 7$ | $8 \ldots 15$ | 4 | Analog value overflow at an analog output |  | Check output value |
|  | 11 / 12 | ADR | $1 . .10$ |  |  |  |  |  |  |
| 4 | 14 | 1... 10 | 3 | $4 \ldots 7$ | 8... 15 | 7 | Analog value underflow at an analog output |  | Check output value |
|  | 11 / 12 | ADR | $1 . .10$ |  |  |  |  |  |  |

Remarks:

| ${ }^{1}$ ) | In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), $12=$ COM2. <br> The FBP diagnosis block does not contain this identifier. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> 31 = module itself, $1 \ldots 10=$ expansion module $1 \ldots 10$, ADR = hardware address (e.g. of the DC551) |
| $\left.{ }^{3}\right)$ | With "Module" the following allocation applies depending on the master: <br> Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1 ... $10=$ expansion 1 ... 10 <br> Channel error: I/O bus or FBP = module type ( 1 = AI, 3 = AO); COM1/COM2: <br> 1 ... 10 = expansion $1 . . .10$ |
| $\left.{ }^{4}\right)$ | In case of module errors, with channel "31 = Module itself" is output. |

State LEDs
During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

## Measuring ranges

Input ranges of voltage, current and digital input
The represented resolution corresponds to 16 bits.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process voltage |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP | 10 A fast |
| Galvanic isolation | Yes, per module |
| Current consumption |  |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation | 0.15 A + output loads |
| Inrush current from UP (at power up) | $0.020 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section > $0.14 \mathrm{~mm}^{2}$ | 100 m |
| Weight | 300 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

NOTICE!
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels I0- ... I3- | Terminals $1.0 \ldots 1.3$ |

| Parameter | Value |  |
| :---: | :---: | :---: |
| Connections of the channels 10+ ... 13+ | Terminals 2.0 ... 2.3 |  |
| Input type | Bipolar (not with current or Pt100/Pt1000/Ni1000) |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | $0 \mathrm{~V} \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA},$ <br> $4 \mathrm{~mA} . . .20 \mathrm{~mA}, \mathrm{Pt} 100 / 1000$, Ni1000 (each input can be configured individually) |  |
| Channel input resistance | Voltage: > 100 k $\Omega$ Current: ca. $330 \Omega$ |  |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |  |
| Indication of the input signals | One LED per channel |  |
| Conversion cycle | 2 ms (for 8 inputs +8 outputs), with $\mathrm{Pt} / \mathrm{Ni}$... 1 s |  |
| Resolution | Range 0 V ... 10 V : 12 bits <br> Range -10 V ... +10 V : 12 bits including sign <br> Range $0 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits <br> Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within | Typ. | $\pm 0.5 \%$ of full scale at $25^{\circ} \mathrm{C}$ |
| the normal range | Max. | $\pm 1 \%$ of full scale (all ranges) at $0^{\circ} \mathrm{C} \ldots 60^{\circ} \mathrm{C}$ or EMC disturbance |
| Relationship between input signal and hex code | Chapter 5.2.4.4.2.5.10.2 "Input ranges resistance temperature detector" on page 804 |  |
| Unused voltage inputs | Are configured as "unused" |  |
| Unused current inputs | Have a low resistance, can be left open-circuited |  |
| Overvoltage protection | Yes |  |

## Technical data of the analog inputs, if used as digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels I0+ to I3+ | Terminals 2.0 to 2.3 |
| Reference potential for the inputs | Terminals $1.9,2.9,3.9$ and 4.9 (ZP) |
| Input signal delay | Typ. 8 ms, configurable from 0.1 to 32 ms |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Input current per channel | $+5 \mathrm{~V} \ldots+13 \mathrm{~V} \mathrm{~V}$ |
|  | Input voltage +24 V |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Input voltage +5 V | Typ. 1.4 mA |
|  | Input voltage +15 V | Typ. 4.3 mA |
|  | Input voltage +30 V | $<9 \mathrm{~mA}$ |
| Input resistance | ca. $3.5 \mathrm{k} \Omega$ |  |

## Technical data of the analog outputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 4, all channels for voltage and current |  |
| Distribution of channels into groups | 1 group of 4 channels |  |
| Channels O0- ... O3- | Terminals 3.0 ... 3.3 |  |
| Channels O0+ ... O3+ | Terminals 4.0 ... 4.3 |  |
| Output type | Bipolar with voltage, unipolar with current |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | -10 V ... +10 V, 0 mA ... $20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$ (each output can be configured individually), current outputs only channels $0 \ldots 3$ |  |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |  |
| Output loadability, as voltage output | Max. $\pm 10 \mathrm{~mA}$ |  |
| Indication of the output signals | One LED per channel |  |
| Resolution | 12 bits including sign |  |
| Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\pm 0.5 \%$ of full scale at $25^{\circ} \mathrm{C}$ |
|  | Max. | $\pm 1 \%$ of full scale (all ranges) <br> at $0^{\circ} \mathrm{C} . . .60^{\circ} \mathrm{C}$ or EMC disturbance |
| Relationship between output signal and hex code |  |  |
| Unused outputs | Can be left open-circuited |  |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

Ordering Data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1SAP 250 100 R0001 | AX521, analog input/output module, <br> $4 \mathrm{AI}, 4 \mathrm{AO}, \mathrm{U} / / / \mathrm{Pt} 100$, <br> 12 bits including sign, 2-wires | Active |
| 1SAP 450 100 R0001 | AX521-XC, analog input/output <br> module, 4 AI, 4 AO, U/I/Pt100, <br> 12 bits including sign, 2-wires, <br> XC version | Active |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## AX522 - Analog input/output module

## Features

- 8 configurable analog inputs ( 10 ... 17) in 1 group (1.0 ... 2.7)

Resolution 12 bits including sign

- 8 configurable analog outputs ( $\mathrm{O} 0 \ldots \mathrm{O}$ ) in 1 group ( 3.0 ... 4.7)

Resolution 12 bits including sign

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states at the analog inputs (I0 ... I7)
48 yellow LEDs to display the signal states at the analog outputs ( $\mathrm{O} 0 \ldots \mathrm{O}$ )
51 green LED to display the state of the process supply voltage UP
62 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
Sign for XC version

## Intended purpose

The device can be used as a decentralized I/O extension module for S 500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

## Functionality

8 analog inputs (channel $0 \ldots$ channel 7 ), individually configurable

- Unused (default setting)
- 0 V ... 10 V
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$
- $0 \mathrm{~mA} . .20 \mathrm{~mA}$
- $4 \mathrm{~mA} . .20 \mathrm{~mA}$
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt100, $-50^{\circ} \mathrm{C} . . .+70^{\circ} \mathrm{C}$ (2-wire)
- Pt100, $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (2-wire)
- Pt1000, $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (2-wire)
- Ni1000, $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ (3-wire), requires 2 channels
- 0 V ... 10 V with differential inputs, requires 2 channels
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ with differential inputs, requires 2 channels
- Digital signals (digital input)

| Parameter | Value |
| :--- | :--- |
| Resolution of the analog channels |  |
|  | Voltage $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ |
|  | Voltage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ |
|  | Current $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, <br> $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ |
| Temperature | 12 bits including sign |
| LED displays | 12 bits |
| Internal power supply | $0.1^{\circ} \mathrm{C}$ |
| External power supply | 19 LEDs for signals and error messages |
| Required terminal unit | Via the I/O bus interface (I/O bus) <br> 24 <br> Via V DC) |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The modules are plugged on an I/O terminal unit ${ }^{\wedge}$ h Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting $\stackrel{y y}{c}$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $1.8,2.8,3.8$ and 4.8 as well as $1.9,2.9,3.9$ and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:
Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP $=+24 \mathrm{~V} D$
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage $\mathrm{ZP}=0 \mathrm{~V}$ DC
The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | $10-\ldots \mathrm{I} 7-$ | Negative poles of the 8 analog <br> inputs |
| $2.0 \ldots 2.7$ | $\mathrm{IO+} \ldots \mathrm{I7}+$ | Positive poles of the 8 analog <br> inputs |
| $3.0 \ldots 3.7$ | $\mathrm{O} 0-\ldots \mathrm{O}-$ | Negative poles of the 8 analog <br> outputs |
| $4.0 \ldots 4.7$ | $\mathrm{O} 0+\ldots \mathrm{O}++$ | Positive poles of the 8 analog <br> outputs |

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.

② Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 128: Connection of the I/O module: 8 analog inputs and 8 analog outputs, individually configurable ${ }^{\mu}$ chapter 5.2.4.4.2.6.3 "Functionality" on page 811

## CAUTION!

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V .

## CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative terminal).

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

Fig. 129: Connection example

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| :--- | :--- | :--- |
| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| $\operatorname{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, one <br> channel used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

Fig. 130: Connection example

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| :--- | :--- | :--- |
| $\mathrm{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, two <br> channels used |

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Fig. 131: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 ${ }^{〔}$, Chapter 5.2.4.4.2.5.7 "Parameterization" on page 796 and for AX522 ${ }^{〔}$ Chapter 5.2.4.4.2.6.7 "Parameterization" on page 826:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 132: Connection example

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

Unused input channels can be left open-circuited, because they are of low resistance.

Fig. 133: Connection example

## CAUTION!

The potential difference between AGND and ZP at the module must not be greater than 1 V , not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to $Z P$ via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA . This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V} *)$ | 1 channel used |

*) if the sensor can provide this signal range
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current)

Fig. 134: Connection example

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

## CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 -volt Zener diode (in parallel to I+ and ZP). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

Fig. 135: Connection example

> The negative pole of the sensor must be grounded next to the sensor.

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 136: Connection example

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |
| Effect of incorrect input ter- <br> minal connection |  | Wrong or no signal detected, <br> no damage up to 35 V |

Fig. 137: Connection example

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load max. $\pm 10 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

Only the channels $0 \ldots 3$ can be configured as current output ( $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ or $4 \mathrm{~mA} . .20 \mathrm{~mA}$ ).
Unused analog outputs can be left open-circuited.

## Internal data exchange

| Digital inputs (bytes) | 0 |
| :--- | :--- |
| Digital outputs (bytes) | 0 |
| Counter input data (words) | 8 |
| Counter output data (words) | 8 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1 ... 10

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module slot address: $\mathrm{Y}=1$... 7

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version * Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process voltage |  |  |
|  | Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V <br> (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 <br> V (ZP) |
|  | Rated value | 24 V DC |
|  | Max. ripple | $5 \%$ |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP | 10 A fast |
|  | Galvanic isolation | Yes, per module |
| Current consumption |  |  |

| Parameter | Value |
| :---: | :---: |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | Ca. 2 mA |
| From UP at normal operation | 0.15 A + output loads |
| Inrush current from UP (at power up) | $0.020 \mathrm{~A}^{2} \mathrm{~s}$ |
| Max. length of analog cables, conductor cross section $>0.14 \mathrm{~mm}^{2}$ | 100 m |
| Weight | 300 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## Technical data of the analog inputs

| Parameter | Value |  |
| :---: | :---: | :---: |
| Number of channels per module | 8 |  |
| Distribution of channels into groups | 1 group of 8 channels |  |
| Connections of the channels 10- ...17- | Terminals 1.0 ... 1.7 |  |
| Connections of the channels 10+ ... 17+ | Terminals 2.0 ... 2.3 |  |
| Input type | Bipolar (not with current or Pt100/Pt1000/Ni1000) |  |
| Galvanic isolation | Against internal supply and other modules |  |
| Configurability | $0 \vee \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .22 \mathrm{~mA}$, 4 mA ... 20 mA, Pt100/1000, Ni1000 (each input can be configured individually) |  |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |  |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ current: $100 \mu \mathrm{~s}$ |  |
| Indication of the input signals | One LED per channel |  |
| Conversion cycle | 2 ms (for 8 inputs +8 outputs), with $\mathrm{Pt} / \mathrm{Ni} . . .1 \mathrm{~s}$ |  |
| Resolution | Range 0 V ... 10 V : 12 bits <br> Range -10 V ... +10 V: 12 bits including sign <br> Range $0 \mathrm{~mA} . . .20 \mathrm{~mA}: 12$ bits <br> Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits |  |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. | $\begin{aligned} & \pm 0.5 \% \text { of full scale } \\ & \text { at } 25^{\circ} \mathrm{C} \end{aligned}$ |

| Parameter | Value |  |
| :--- | :--- | :--- |
|  | Max. | $\pm 1 \%$ of full scale (all ranges) <br> at $0^{\circ} \mathrm{C} \ldots 60^{\circ} \mathrm{C}$ or EMC disturbance |
| Unused voltage inputs | Are configured as "unused" |  |
| Unused current inputs | Have a low resistance, can be left open-circuited |  |
| Overvoltage protection | Yes |  |

## Technical data of the analog inputs, if used as digital Inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 8 |
| Distribution of channels into groups | 1 group of 8 channels |
| Connections of the channels I0+ ... I7+ | Terminals $2.0 \ldots 2.7$ |
| Reference potential for the inputs | Terminals $1.9,2.9,3.9$ and $4.9(\mathrm{ZP})$ |
| Input signal delay | Typ. 8 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Input current per channel | $+50 \mathrm{~V} \ldots+5 \mathrm{~V} . .+13 \mathrm{~V}$ |
|  | Input voltage +24 V |
|  | Input voltage +5 V |
|  | Input voltage +15 V |
|  | Input voltage +30 V |
| Input resistance | Typ. 7 mA |

## Technical data of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8, all channels for voltage, the first 4 channels <br> also for current |
| Distribution of channels into groups | 1 group of 8 channels |
|  | Channels O0- .. O7- |
|  | Terminals $3.0 \ldots 3.7$ |
| Output type | Terminals $4.0 \ldots 4.7$ |
| Galvanic isolation | Bipolar with voltage, unipolar with current |
| Configurability | Against internal supply and other modules |
|  | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, <br> $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}($ each output can be config- <br> ured individually), current outputs only chan- <br> nels $0 \ldots 3$ |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |

| Parameter | Value |  |
| :--- | :--- | :---: |
| Output loadability, as voltage output | Max. $\pm 10 \mathrm{~mA}$ |  |
| Indication of the output signals | One LED per channel |  |
| Resolution | 12 bits including sign |  |
| Settling time for full range change (resistive <br> load, output signal within specified tolerance) | Typ. 5 ms |  |
| Conversion error of the analog values caused <br> by non-linearity, adjustment error at factory <br> and resolution within the normal range | Typ. |  |
|  | $\pm 0.5 \%$ of full scale <br> at $25^{\circ} \mathrm{C}$ |  |
|  | Max. |  |
| Relationship between output signal and hex full scale (all ranges) <br> code $0^{\circ} \mathrm{C} \ldots 60^{\circ} \mathrm{C}$ or EMC disturbance |  |  |
| Unused outputs |  |  |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |

### 5.2.4.5 Digital/Analog I/O modules

### 5.2.4.5.1 S500 and S500-XC

DA501 - Digital/Analog input/output module

## Features

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.

Resolution 12 bits including sign

- 2 analog outputs, voltage and current

Resolution 12 bits including sign

- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
316 yellow LEDs to display the signal states of the digital inputs DIO ... DI15
44 yellow LEDs to display the signal states of the analog inputs AIO ... AI3
2 yellow LEDs to display the signal states of the analog outputs AOO ... AO1
68 yellow LEDs to display the signal state of the configurable digital inputs/outputs DC16 ... DC23
71 green LED to display the state of the process supply voltage UP
4 red LEDs to display errors
Label
10 Terminal unit
11 DIN rail

Intended purpose
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

## Functionality

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.

Resolution 12 bits including sign

- 2 analog outputs, voltage and current

Resolution 12 bits including sign

- Fast counter

| Parameter | Value |
| :--- | :--- |
| Fast Counter | Integrated, many configurable operating <br> modes |
| Power supply | From the process supply voltage UP |
| LED displays | For system displays, signal states, errors and <br> power supply |
| Internal supply voltage | Via the I/O bus interface (I/O bus) |
| External supply voltage | Via terminals UP and ZP (process supply <br> voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |
| Required terminal unit | TU515 or TU516 « Chapter 5.2.5.2 "TU515, <br> TU516, TU541 and TU542 for I/O modules" <br> on page 938 |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 « Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938.
The assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | DI0 | Signal of the digital input DI0 |
| 1.1 | DI1 | Signal of the digital input DI1 |
| 1.2 | DI2 | Signal of the digital input DI2 |
| 1.3 | DI3 | Signal of the digital input DI3 |
| 1.4 | DI4 | Signal of the digital input DI4 |
| 1.5 | DI5 | Signal of the digital input DI5 |
| 1.6 | DI6 | Signal of the digital input DI6 |
| 1.7 | DI7 | Signal of the digital input DI7 |
| 1.8 | UP | Process voltage UP (24 V DC) |
| 1.9 | ZP | Process voltage ZP (0 V DC) |
| 2.0 | DI8 | Signal of the digital input DI8 |
| 2.1 | DI9 | Signal of the digital input DI9 |
| 2.2 | DI10 | Signal of the digital input DI10 |

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 2.3 | DI11 | Signal of the digital input DI11 |
| 2.4 | DI12 | Signal of the digital input DI12 |
| 2.5 | DI13 | Signal of the digital input DI13 |
| 2.6 | DI14 | Signal of the digital input DI14 |
| 2.7 | DI15 | Signal of the digital input DI15 |
| 2.8 | UP | Process voltage UP (24V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | Al0+ | Positive pole of analog input signal 0 |
| 3.1 | Al1+ | Positive pole of analog input signal 1 |
| 3.2 | Al2+ | Positive pole of analog input signal 2 |
| 3.3 | Al3+ | Positive pole of analog input signal 3 |
| 3.4 | Al- | Negative pole of analog input signals 0 to 3 |
| 3.5 | AO0+ | Positive pole of analog output signal 0 |
| 3.6 | AO1+ | Positive pole of analog output signal 1 |
| 3.7 | AO- | Negative pole of analog output signals 0 and 1 |
| 3.8 | UP | Process voltage UP (24V DC) |
| 3.9 | ZP | Process voltage ZP (0 V DC) |
| 4.0 | C16 | Signal of the configurable digital input/ output C16 |
| 4.1 | C17 | Signal of the configurable digital input/ output C17 |
| 4.2 | C18 | Signal of the configurable digital input/ output C18 |
| 4.3 | C19 | Signal of the configurable digital input/ output C19 |
| 4.4 | C20 | Signal of the configurable digital input/ output C20 |
| 4.5 | C21 | Signal of the configurable digital input/ output C21 |
| 4.6 | C22 | Signal of the configurable digital input/ output C22 |
| 4.7 | C23 | Signal of the configurable digital input/ output C23 |
| 4.8 | UP | Process voltage UP (24 V DC) |
| 4.9 | ZP | Process voltage ZP (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA501.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

## NOTICE!

Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## CAUTION!

## Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

Fig. 138: Terminal assignment of the module
The module provides several diagnosis functions ${ }^{«}$ Chapter 5.2.4.5.1.1.8 "Diagnosis" on page 861.

## Connection of the digital inputs

The following figure shows the connection of the digital input DIO. Proceed with the digital inputs DI1 ... DI15 in the same way.

Fig. 139: Connection of the module
The meaning of the LEDs is described in the Displays chapter $\Leftrightarrow$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

## Connection of the configurable digital inputs/outputs

Fig. 140: Connection of configurable digital inputs/outputs to the module (DC16 ... DC23) (DC16 as an input, DC17 as an output)

## CAUTION!

## Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DA501.
If the inputs are used as fast counter inputs, connect a $470 \Omega / 1 \mathrm{~W}$ resistor in series to inputs DC16/DC17.

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 141: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AlO to Al3)

The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni 1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

The function of the LEDs is described under Diagnosis and displays / Displays $\Leftrightarrow$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

The module DA501 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 142: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AIO ... Al3)

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| $\operatorname{Pt100}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| $\operatorname{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Ni 1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.4.5.1.1.8 "Diagnosis" on page 861.

0
The module DA501 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 143: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured $\Longleftrightarrow$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856 :

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{\mu}{ }^{\circ}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 144: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured $\Rightarrow$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays $\stackrel{\leftrightarrow}{~}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 145: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AIO ... AI3)

## CAUTION!

Risk of faulty measurements!
The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

The following measuring ranges can be configured $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856 :

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{\wedge}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of passive-type analog sensors (Current) to the analog inputs

Fig. 146: Connection of passive-type analog sensors (current) to the analog inputs (AIO to AI3) The following measuring ranges can be configured ${ }^{\Leftrightarrow}$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{〔}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.

## CAUTION!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10 -volt Zener diode in parallel to I+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AIO and AI1. Proceed with AI2 and AI3 in the same way.

Fig. 147: Connection of active-type analog sensors (voltage) to differential analog inputs (AIO ... Al3)
The following measuring ranges can be configured ${ }^{4}$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{\Leftrightarrow} \Rightarrow$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.
To avoid error messages from unused analog input channels, configure them as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 148: connection of digital sensors to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{\mu}$ Chapter 5 .2.4.5.1.1.9 "State LEDs" on page 863.

## Connection of analog output loads (Voltage)

Fig. 149: Connection of analog output loads (voltage) to the analog outputs (AOO and AO1)

The following measuring ranges can be configured ${ }^{\Perp}$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856 :

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load $\pm 10 \mathrm{~mA}$ max. | 1 channel used |
| :--- | :--- | :--- | :--- |

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{\text {es }}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.
Unused analog outputs can be left open-circuited.

## Connection of analog output loads (Current)

Fig. 150: Connection of analog output loads (current) to the analog outputs (AOO and AO1)
The following measuring ranges can be configured $«$ Chapter 5.2.4.5.1.1.7 "Parameterization" on page 856:
0

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | $\operatorname{Load} 0 \Omega \ldots 50 \Omega$ | 1 channel used |

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ${ }^{4}$ Chapter 5.2.4.5.1.1.9 "State LEDs" on page 863.
Unused analog outputs can be left open-circuited.

## Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital inputs (bytes) | 3 | 5 |
| Digital outputs (bytes) | 1 | 3 |
| Analog inputs (words) | 4 | 4 |

|  | Without the fast counter | With the fast counter (only <br> with AC500) |
| :--- | :--- | :--- |
| Digital outputs (words) | 2 | 2 |
| Counter input data (words) | 0 | 4 |
| Counter output data (words) | 0 | 8 |

## I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version $>\mathrm{V} 2.0 .0$ | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: $\mathrm{Y}=1$... 10

| Name | Value | Internal value | Internal <br> value, type | Default | EDS Slot $/$ <br> Index |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Module ID <br> ${ }^{1}$ ) | Internal | 1810 | WORD | 1810 | $0 x 0$ Y01 |
| Ignore module <br> see table $\left.{ }^{2}\right)$ | Internal | Yes <br> No | BYTE | No | not for FBP |
| Parameter <br> length | Internal | 8 | BYTE | 8 | $0 x$ Y02 |
| Check supply | off | 0 | BYTE | 1 | $0 x Y 03$ |
|  | on | 1 |  |  |  |

$\left.\begin{array}{|l|l|l|l|l|l|}\hline \text { Name } & \text { Value } & \text { Internal value } & \begin{array}{l}\text { Internal } \\ \text { value, type }\end{array} & \text { Default } & \begin{array}{l}\text { EDS Slot / } \\ \text { Index }\end{array} \\ \hline \begin{array}{l}\text { Fast counter } \\ { }^{3} \text { ) }\end{array} & 0 & 0 & \text { BYTE } & 0 & \text { not for FBP } \\ : & 10 \\ 4)\end{array}\right)$

| ${ }^{2}$ ) | Setting | Description |
| :--- | :--- | :--- |
|  | On | Error LED lights up at errors of all error classes, Failsafe <br> mode off |
|  | Off by E4 | Error LED lights up at errors of error classes E1, E2 and E3, <br> Failsafe mode off |
|  | Off by E3 | Error LED lights up at errors of error classes E1 and E2, <br> Failsafe mode off |
|  | Off by E4 + Failsafe | Error LED lights up at errors of error classes E1, E2 and E3, <br> mode on *) <br> Failsafe mode on *) |
|  | Off by E3 + Failsafe | Error LED lights up at errors of error classes E1 and E2, <br> Failsafe mode on *) |

## Remarks:

${ }^{1}$ ) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission
${ }^{2}$ ) Not for FBP
${ }^{3}$ ) With FBP or CS31 without the parameter "Fast Counter"

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.
${ }^{4}$ ) For counter operating modes, please refer to the description of the fast counter $\Leftrightarrow$ Chapter 5.2.4.3.2.9 "Fast counter" on page 606
${ }^{5}$ ) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe-mode is ON.

## Group parameters for the digital part

## Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for UP (+24 $\mathrm{V} D \mathrm{C}$ ) and 1.9, 2.9, 3.9 and 4.9 for $\mathrm{ZP}(0 \mathrm{~V}$ DC) |
| Protection against reverse voltage | yes |
| Rated protection fuse at UP | 10 A fast |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Current consumption |  |
| From UP | 0.07 A + max. 0.5 A per output |
| From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module | ca. 2 mA |
| Inrush current from UP (at power-up) | $0.04 \mathrm{~A}^{2} \mathrm{~s}$ |
| Galvanic isolation | Yes, per module |
| Max. power dissipation within the module | 6 W (outputs unloaded) |
| Weight (without terminal unit) | ca. 125 g |
| Mounting position | Horizontal mounting or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ ) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 16 |
| Distribution of the channels into groups | 2 groups of 8 channels |

| Parameter | Value |
| :---: | :---: |
| Terminals of the channels DIO ... DI7 | Terminals 1.0 ... 1.7 |
| Terminals of the channels DI8 ... DI15 | Terminals 2.0 ... 2.7 |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (negative pole of the supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Monitoring point of input indicator | LED is part of the input circuitry |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| 0-Signal | $-3 \vee \ldots+5 \mathrm{~V}$ |
| Undefined Signal | > +5V $\ldots<+15 \mathrm{~V}$ |
| 1-Signal | +15 V ... +30 V |
| Ripple with signal 0 | Within $-3 \vee \ldots+5 \mathrm{~V}$ |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | > 1 mA |
| Input voltage +15 V | > 2 mA |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

## Technical data of the configurable digital inputs/outputs

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
|  | Channels DC16 ... DC23 |
| If the channels are used as outputs | Terminals 4.0 ... 4.7 |
|  | Channels DC16 ... DC23 |
| Indication of the input/output signals | Terminals 4.0 ... 4.7 <br> the input/output signal is high (signal 1) |
| Monitoring point of input/output indicator | LED is part of the input circuitry |
| Galvanic isolation | Yes, per module |

Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC16 ... DC23 | Terminals 4.0 ... 4.7 |
| Reference potential for all inputs | Terminals 1.9 ... 4.9 (negative pole of the supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Monitoring point of input/output indicator | LED is part of the input circuitry |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable $0.1 \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| 0-Signal | -3 V ... +5 V |
| Undefined Signal | > +5V ... < +15V |
| 1-Signal | +15V ... +30 V |
| Ripple with signal 0 | Within $-3 \vee \ldots+5 \mathrm{~V}$ |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | > 1 mA |
| Input voltage +15 V | > 2 mA |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| shielded | 1000 m |
| unshielded | 600 m |

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V . Consequently, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \mathrm{~V} . .+30 \mathrm{~V}$ when $\mathrm{UPx}=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC16 ...DC23 | Terminals 4.0 ... 4.7 |
| Reference potential for all outputs | Terminals $1.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminals 1.8, 2.8, 3.8 and 4.8 <br> (positive pole of the supply voltage, signal <br> name UP) |
| Output voltage for signal 1 | UP $(-0.8 \mathrm{~V})$ |

| Parameter | Value |
| :--- | :--- |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
|  | rated value per channel |
| max. value (all channels together) | 400 mA at UP $=24 \mathrm{~V}$ |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this <br> table) |
| Output switching frequency |  |
|  | With resistive load |
| With inductive loads | On request |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
|  | Shielded |
| Unshielded | 1000 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 151: Digital input/output (circuit diagram)
1 Digital input/output
2 For demagnetization when inductive loads are turned off

## Technical data of the fast counter

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

| Parameter | Value |
| :--- | :--- |
| Used inputs | DC16 / DC17 |
| Used outputs | DC18 |
| Counting frequency | Max. 50 kHz |

\& Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{AlO}+\ldots \mathrm{Al} 3+$ | Terminals 3.0 ... 3.3 |
| Reference potential for $\mathrm{AlO}+\ldots \mathrm{Al3+}$ | Terminal 3.4 (AI-) for voltage and RTD measurement <br> Terminal 1.9, 2.9, 3.9 and 4.9 for current measurement |
| Input type |  |
| Unipolar | Voltage 0 V ... 10 V , current or Pt100/ Pt1000/Ni1000 |
| Bipolar | Voltage -10 V ... +10 V |
| Configurability | $0 \vee \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .22 \mathrm{~mA}$, 4 mA ... $20 \mathrm{~mA}, \mathrm{Pt100/1000}, \mathrm{Ni1000} \mathrm{(each}$ input can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |
| Indication of the input signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Conversion cycle | 1 ms (for 4 inputs + 2 outputs); with RTDs Pt/Ni... 1 s |
| Resolution | Range 0 V ... 10 V : 12 bits <br> Range -10 V ... +10 V: 12 bits including sign <br> Range $0 \mathrm{~mA} . .20 \mathrm{~mA}$ : 12 bits <br> Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits <br> Range RTD (Pt100, PT1000, Ni1000): 0.1 ${ }^{\circ} \mathrm{C}$ |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% <br> For XC version below $0^{\circ} \mathrm{C}$ and above +60 ${ }^{\circ} \mathrm{C}$ : on request |
| Relationship between input signal and hex code | ²) Chapter 5.2.4.5.1.1.10.2 "Input ranges resistance temperature detector" on page 864 |
| Unused inputs | Are configured as "unused" (default value) |
| Overvoltage protection | Yes |

Technical data of the analog inputs, if used as digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels $\mathrm{AlO+} . . \mathrm{Al} 3+$ | Terminals $3.0 \ldots 3.3$ |
| Reference potential for the inputs | Terminals $1.9,2.9,3.9$ and 4.9 (ZP) |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Input current per channel | $+50 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Input voltage +24 V |
|  | Input voltage +5 V |
|  | Input voltage +15 V |
|  | Input voltage +30 V |
| Input resistance | Typ. 7 mA |

## Technical data of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 2 |
| Distribution of channels into groups | 1 group for 2 channels |
| Connection of the channels AO0+ ... AO1+ | Terminals 3.5 and 3.6 |
| Reference potential for AO0+ ... AO1+ | Terminal 3.7 (AO-) for voltage output <br> Terminals $1.9,2.9,3.9$ and 4.9 for current <br> output |
| Output type | Current |
|  | Unipolar |
| Bipolar | Against internal supply and other modules |
| Galvanic isolation | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}, 4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ <br> (each output can be configured individually) |
| Configurability | $0 \Omega \ldots 500 \Omega$ |
| Output resistance (load) as current output | $\pm 10 \mathrm{~mA} \mathrm{max}$. |
| Output loadability as voltage output | 1 LED per channel (brightness depends on the <br> value of the analog signal) |
| Indication of the output signals | 12 bits including sign |
| Resolution | Typ. 5 ms |
| Settling time for full range change (resistive <br> load, output signal within specified tolerance) | Typ. $0.5 \%$, max. 1 \% <br> Conversion error of the analog values caused <br> by non-linearity, adjustment error at factory <br> and resolution within the normal range |

| Parameter | Value |
| :--- | :--- |
| Relationship between input signal and hex <br> code | „ Chapter 5.2.4.5.1.1.10.3 "Output ranges <br> voltage and current" on page 866 |
| Unused outputs | Are configured as "unused" (default value) and <br> can be left open-circuited |

## Internal data exchange

|  | Without the fast counter | With the fast counter (only <br> with AC500) |

## DA502 - Digital/Analog input/output module

## Features

- 16 digital outputs, $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD, resolution 12 bits including sign
- 2 analog outputs, voltage and current, resolution 12 bits including sign
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
316 yellow LEDs to display the signal states of the digital outputs DO0 ... DO15
44 yellow LEDs to display the signal states of the analog inputs AIO ... AI3
2 yellow LEDs to display the signal states of the analog outputs AO0 ... AO1
68 yellow LEDs to display the signal states of the configurable digital inputs/outputs DC16 ... DC23
71 green LED to display the state of the process supply voltage UP 4 red LEDs to display errors
Label
10 Terminal unit
11 DIN rail
楛 Sign for XC version

Intended purpose
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

| Parameter | Value |
| :--- | :--- |
| Fast counter | Integrated, many configurable operating <br> modes |
| Power supply | From the process supply voltage UP |
| LED displays | For system displays, signal states, errors and <br> power supply |
| Internal supply voltage | Via the I/O bus interface (I/O bus) |
| External supply voltage | Via terminals UP and ZP (process supply <br> voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |
| Required terminal unit | TU515 or TU516 « Chapter 5.2.5.2 "TU515, <br> TU516, TU541 and TU542 for I/O modules" <br> on page 938 |

## Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 \# $\downarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938.
The assignment of the terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | DO0 | Signal of the digital output DO0 |
| 1.1 | DO1 | Signal of the digital output DO1 |
| 1.2 | DO2 | Signal of the digital output DO2 |
| 1.3 | DO3 | Signal of the digital output DO3 |
| 1.4 | DO4 | Signal of the digital output DO4 |
| 1.5 | DO5 | Signal of the digital output DO5 |
| 1.6 | DO6 | Signal of the digital output DO6 |
| 1.7 | DO7 | Signal of the digital output DO7 |
| 1.8 | ZP | Process voltage UP (24 V DC) |
| 1.9 | DO8 | Process voltage ZP (0 V DC) |
| 2.0 | DO10 | Signal of the digital output DO8 |
| 2.1 | DO11 | Signal of the digigital output DO10 |
| 2.2 | DO12 | Signal of the digital output DO11 |
| 2.3 | DO13 | Signal of the digital output DO12 |
| 2.4 | DO14 | Signal of the digital output DO13 |
| 2.5 | Signal of the digital output DO14 |  |
| 2.6 |  |  |

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 2.7 | DO15 | Signal of the digital output DO15 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | Al0+ | Positive pole of analog input signal 0 |
| 3.1 | Al1+ | Positive pole of analog input signal 1 |
| 3.2 | Al2+ | Positive pole of analog input signal 2 |
| 3.3 | Al3+ | Positive pole of analog input signal 3 |
| 3.4 | Al- | Negative pole of analog input signals 0 ... 3 |
| 3.5 | AOO+ | Positive pole of analog output signal 0 |
| 3.6 | AO1+ | Positive pole of analog output signal 1 |
| 3.7 | AO- | Negative pole of analog output signals 0 and 1 |
| 3.8 | UP | Process voltage UP ( 24 V DC) |
| 3.9 | ZP | Process voltage ZP (0 V DC) |
| 4.0 | DC16 | Signal of the configurable digital input/output DC16 |
| 4.1 | DC17 | Signal of the configurable digital input/output DC17 |
| 4.2 | DC18 | Signal of the configurable digital input/output DC18 |
| 4.3 | DC19 | Signal of the configurable digital input/output DC19 |
| 4.4 | DC20 | Signal of the configurable digital input/output DC20 |
| 4.5 | DC21 | Signal of the configurable digital input/output DC21 |
| 4.6 | DC22 | Signal of the configurable digital input/output DC22 |
| 4.7 | DC23 | Signal of the configurable digital input/output DC23 |
| 4.8 | UP | Process voltage UP ( 24 V DC) |
| 4.9 | ZP | Process voltage ZP (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

Removal or insertion under power is permissible only if all conditions for hot swapping are fullfilled.
« Chapter 4.9.3 "Replace an I/O module with hot swap" on page 153
The devices are not designed for removal or insertion under power when the conditions for hot swap do not apply. Because of unforeseeable consequences, it is not allowed to plug in or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while they are energized in a hazardous location could result in an electric arc, which could create an ignition source resulting in fire or explosion.

Prior to proceeding, make sure that power is been disconnected and that the area has been thoroughly checked to ensure that flammable materials are not present.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

## NOTICE!

Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

## CAUTION!

## Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

Fig. 152: Terminal assignment of the module
The module provides several diagnosis functions ${ }^{\mu}$ Chapter 5.2.4.5.1.2.8 "Diagnosis" on page 895.

## Connection of the digital outputs

Fig. 153: Connection of the digital outputs (DOO ... DO15)
For a description of the meaning of the LEDs, please refer to the Displays chapter $\Leftrightarrow$ Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.

## Connection of the configurable digital inputs/outputs

Fig. 154: Connection of the configurable digital input/outputs (DC16 ... DC23) (DC16 as an input, DC17 as an output)

## O NOTICE!

Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DA502.
Connect a $470 \Omega / 1 \mathrm{~W}$ resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of the meaning of the LEDs, please refer to the Displays $\Leftrightarrow$ Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897 chapter.

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

Fig. 155: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AIO ... Al3)

The following measuring ranges can be configured ${ }^{\wedge}$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \stackrel{\leftrightarrow}{\otimes}$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| $\mathrm{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays « ${ }^{3}$ Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.

The module DA502 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

Fig. 156: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AIO ... Al3)

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
The following measuring ranges can be configured ${ }^{4}$, Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \stackrel{\sharp}{\otimes}$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| $\operatorname{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Ni 1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \& Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.
The module DA502 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 157: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured ${ }^{\wedge}$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \Leftrightarrow$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 158: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AIO ... AI3)

The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \Leftrightarrow$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.
Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 159: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AIO ... AI3)

## CAUTION!

Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

The following measuring ranges can be configured $\Leftrightarrow$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page 890 « Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \# Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of passive-type analog sensors (Current) to the analog inputs

Fig. 160: Connection of passive-type analog sensors (current) to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured ${ }^{4}$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \stackrel{ }{y}$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ${ }^{*}{ }^{*}$ Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.

## NOTICE!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10 -volt Zener diode in parallel to I+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

Fig. 161: Connection of active-type analog sensors (voltage) to differential analog inputs (AIO ... Al3)
The following measuring ranges can be configured ${ }^{4}$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page $890 \Leftrightarrow$ Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ${ }^{*}{ }^{\circ}$ Chapter 5.2.4.5.1.2.9 "State LEDs" on page 897.

To avoid error messages from unused analog input channels, configure them as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 162: connection of digital sensors to the analog input (AIO ... AI3)
The following measuring ranges can be configured $«$ Chapter 5.2.4.5.1.2.7 "Parameterization" on page 890 Chapter 5.2.4.5.1.2.10 "Measuring ranges" on page 898 :

| Counter input data (words) | 0 | 5 |
| Counter output data (words) | 0 | 9 |

## I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| 19 | 3-wire Ni1000-50 ${ }^{\circ} \mathrm{C} \ldots+150{ }^{\circ} \mathrm{C}$ *) |
|  | *) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1). |

| Substitute value for 10 s and <br> then turn off | Substitute value 10 s | Depending on configuration |

## Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltage |  |  |
|  | Connections | Terminals $1.8,2.8,3.8$ and 4.8 for UP $(+24$ <br> V DC) and $1.9,2.9,3.9$ and 4.9 for ZP $(0$ |
|  | Protection against reverse voltage | yes |
|  | Rated protection fuse at UP | 10 A fast |
|  | Rated value | 24 V DC |
|  | Max. ripple | $5 \%$ |
| Current consumption | $0.07 \mathrm{~A}+$ max. 0.5 A per output |  |
|  | From UP | ca. 2 mA |
|  | From 24 V DC power supply at the termi- <br> nals UP/L+ and ZP/M of the CPU/communi- <br> cation interface module | $0.04 \mathrm{~A}^{2} \mathrm{~s}$ |
|  | Inrush current from UP (at power-up) | Yes, per module |
| Galvanic isolation | 6 W (outputs unloaded) |  |
| Max. power dissipation within the module | ca. 125 g |  |
| Weight (without terminal unit) | Horizontal mounting or vertical with <br> derating (output load reduced to 50\% at <br> +40 |  |
| Mounting position | The natural convection cooling must not be <br> hindered by cable ducts or other parts in <br> the control cabinet. |  |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 16 outputs (with transistors) |
| Distribution of the channels into groups | 1 group of 16 channels |
| Connection of the channels |  |
| DO0 ... DO7 | Terminals 1.0 ... 1.7 |
| DO8 ... DO15 | Terminals 2.0 ... 2.7 |
| Indication of the output signals | 1 yellow LED per channel, the LED is ON if the output signal is high (signal 1) |
| Monitoring point of output indicator | LED is controlled by process CPU |
| Reference potential for all outputs | Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP) |
| Output voltage for signal 1 | UP (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value, per channel | 500 mA at $\mathrm{UP}=24 \mathrm{~V}$ |
| Maximum value (channels O0 to O15) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Rated protection fuse on UP | 10 A fast |
| Demagnetization when inductive loads are switched off | With varistors integrated in the module (see figure below) |
| Switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | Max. 11 Hz with max. 5 W |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7 \mathrm{~A}$ ) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

## Technical data of the configurable digital inputs/outputs

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
| Channels DC16 ... DC23 |  |
| If the channels are used as outputs | Terminals $4.0 \ldots 4.7$ |
| Channels DC16 ... DC23 |  |
| Indication of the input/output signals | 1 yerminals $4.0 ~ . . . ~ 4.7 ~$ <br> when the input/output signal is high (signal 1) |
| Monitoring point of input/output indicator | LED is part of the input circuitry |
| Galvanic isolation | Yes, per module |

## Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC16 ... DC23 | Terminals 4.0 ... 4.7 |
| Reference potential for all inputs | Terminals 1.9 ... 4.9 (Negative pole of the supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Monitoring point of input/output indicator | LED is part of the input circuitry |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable from 0.1 ms ... 32 ms |
| Input signal voltage | 24 V DC |
| 0-Signal | -3V ... +5 V |
| Undefined Signal | > +5V ... < +15 V |
| 1-Signal | +15V ... +30 V |
| Ripple with signal 0 | Within $-3 \vee \ldots+5 \mathrm{~V}$ |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | > 1 mA |
| Input voltage +15 V | $>2 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V . Consequently, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \mathrm{~V} \ldots+30 \mathrm{~V}$ when UPx $=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC16 ... DC23 | Terminals 4.0 ... 4.7 |
| Reference potential for all outputs | Terminals $1.9 \ldots 4.9$ (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the supply voltage, signal name UP) |
| Output voltage for signal 1 | UP (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| rated value per channel | 500 mA at $\mathrm{UP}=24 \mathrm{~V}$ |
| max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7 \mathrm{~A}$ ) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 165: Digital input/output (circuit diagram)
1 Digital input/output
2 For demagnetization when inductive loads are turned off

## Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a CS31 bus module.

| Parameter | Value |
| :--- | :--- |
| Counting frequency | Max. 50 kHz |

« Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{AlO}+\ldots \mathrm{Al3+}$ | Terminals 3.0 ... 3.3 |
| Reference potential for $\mathrm{AlO}+\ldots \mathrm{Al} 3+$ | Terminal 3.4 (AI-) for voltage and RTD measurement <br> Terminal 1.9, 2.9, 3.9 and 4.9 for current measurement |
| Input type |  |
| Unipolar | Voltage 0 V ... 10 V, current or Pt100/Pt1000/ Ni1000 |
| Bipolar | Voltage -10 V ... +10 V |
| Configurability | 0 V ... $10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . . .20 \mathrm{~mA}$, 4 mA ... $20 \mathrm{~mA}, \mathrm{Pt} 100 / 1000$, Ni1000 (each input can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ Current: ca. $330 \Omega$ |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |
| Indication of the input signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Conversion cycle | 1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s |
| Resolution | Range 0 V ... 10 V : 12 bits <br> Range $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ : 12 bits including sign <br> Range $0 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits <br> Range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$ : 12 bits <br> Range RTD (Pt100, PT1000, Ni1000): $+0.1^{\circ} \mathrm{C}$ |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% <br> For XC version below $0^{\circ} \mathrm{C}$ and above $+60^{\circ} \mathrm{C}$ : on request |

### 5.2.4.6 Function modules

5.2.4.6.1 S500 and S500-XC

CD522 - Encoder, counter and PWM module

## Features

- 2 encoder inputs with 2 integrated 5 -V-power-supplies for the encoders
- 2 PWM outputs -2 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation of terminal No. and signal name
33 yellow LEDs to display the signal states of the encoder 0 input
43 yellow LEDs to display the signal states of the encoder 1 input
2 green LEDs to display the 5-V-power-supply states
2 yellow LEDs to display the signal state of the digital input I3 and I11 8 yellow LEDs to display the input/output signal states
2 yellow LEDs to display the signal states of the PWM/pulse outputs
1 green LED to display the process voltage UP
103 red LEDs to display errors
11 Label
12 Terminal unit
13 DIN rail
${ }_{x}^{x_{k}+\underbrace{}_{k}}$ Sign for XC version

## Intended purpose

The encoder and PWM module CD522 can be used at the following devices:

- Communication interface modules (e. g. CI501-PNIO, CI541-DP)
- Processor modules

Features:

- 2 independent counting functions with up to 12 configurable modes (including incremental position encoder and frequency input up to 300 kHz )
- 2 independent PWM (pulse-width modulator) or pulse outputs with push-pull driver
- Dedicated inputs/outputs for specific counting functions (e.g. touch, set, reset)
- All unused inputs/outputs can be used with the specifications of standard inputs/outputs range
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Depending on the configuration used, some inputs and outputs are dedicated to specific counting functions (touch, set, reset...). All unused inputs and outputs can be used with the specification of standard inputs/outputs range.

## Functionality

| Digital inputs/outputs | 24 V DC, dedicated inputs/outputs can be used for specific <br> counting functions: <br> - Catch/touch operation, counter value stored in separate vari- <br> able on external event (rising or falling edge) <br> - Set input to preset counter register with predefined value <br> - -Set input to reset counter register <br> - - End value output; the output is set when predefined value is <br> reached <br> - Reference point initialization (RPI) input for incremental <br> encoder initialization <br> All unused inputs/outputs can be used with the specification of <br> standard input/output range. <br> Effect of incorrect input terminal connection: Wrong or no <br> signal detected, no damage up to 35 V. |
| :--- | :--- |
| Fast counter/encoder | integrated, 2 counters (hardware interface with +24 V DC, <br> +5 V DC, differential and 1 Vpp sinus input) with up to 12 <br> configurable operation modes: <br> -32 bits one counter mode |
|  | -16 bits two counter mode <br> - - Incremental position encoder <br> - Absolute SSI encoder <br> - Time frequency meter <br> - Frequency input up to 300 kHz |
|  |  |

| PWM/pulse outputs | 2 pulse-width-modulators or pulse outputs <br> Output specification <br> - Push-pull output: 24 V DC, 100 mA max. <br> - Current limitation (thermal and over current) <br> PWM specification <br> - Frequency from 1 Hz to 100 kHz <br> - Value from 0 to 100 \% <br> Pulse specification <br> - Frequency from 1 Hz to 15 kHz <br> - Pulse emission from 1 to 65535 pulses <br> - Number of pulses emitted indicator (0 to $100 \%$ ) <br> Frequency specification <br> - Frequency output = 100 kHz when duty cycle set to $50 \%$ |
| :---: | :---: |
| Power supply for encoders | 25 V power supplies, max. 100 mA |
| LED displays | For signal states, errors and supply voltage |
| Internal power supply | Via I/O bus |
| External power supply | Via the terminals UP (process voltage 24 V DC ) and $\mathrm{ZP}(0 \mathrm{~V}$ DC) |
| Required terminal unit | TU515 or TU516 Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938 |

How to prepare a device as fast counter and how to connect it to the PLC is described in an application example.

## Connections

The function module CD522 can be connected to the following devices via the I/O bus connector:

- CS31 bus module DC551-CS31
- AC500 CPU
- OtherAC500 I/O devices.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 \# $\downarrow$ Chapter 5.2.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 938.

Table 206: Assignment of the terminals

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | IA0 | Inverted input signal A of encoder 0 |
| 1.1 | IB0 | Inverted input signal B of encoder 0 |
| 1.2 | IZ0 | Inverted input signal Z of encoder 0 |
| 1.3 | 5 V 0 | +5 V DC power supply output 0 for sensors |
| 1.4 | 0 V | 0 V reference input |
| 1.5 | O0 | Output signal of the fast output O0 |
| 1.6 | OV | 0 V reference input |
| 1.7 | O 1 | Output signal of the fast output O1 |

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 1.8 | UP | Process voltage UP (24 V DC) |
| 1.9 | ZP | Process voltage ZP (0 V DC) |
| 2.0 | A0 | Input signal A of encoder 0 |
| 2.1 | B0 | Input signal B of encoder 0 |
| 2.2 | Z0 | Input signal $Z$ of encoder 0 |
| 2.3 | 13 | Input signal I3 (standard input) |
| $2.4 \ldots 2.7$ | C4 ... C7 | Signal of the configurable digital input/output C4 ... C7 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | /A1 | Inverted input signal A of encoder 1 |
| 3.1 | /B1 | Inverted input signal B of encoder 1 |
| 3.2 | IZ1 | Inverted input signal $Z$ of encoder 1 |
| 3.3 | 5V1 | +5 V DC power supply output 1 for sensors |
| 3.4...3.7 | OV | 0 V reference input |
| 3.8 | UP | Process voltage UP (24 V DC) |
| 3.9 | ZP | Process voltage ZP (0 V DC) |
| 4.0 | A1 | Input signal A of encoder 1 |
| 4.1 | B1 | Input signal B of encoder 1 |
| 4.2 | Z1 | Input signal $Z$ of encoder 1 |
| 4.3 | 111 | Input signal I11 (standard input) |
| $4.4 \ldots 4.7$ | C12 ... C15 | Signal of the configurable digital input/output C12 ... C15 |
| 4.8 | UP | Process voltage UP (24 V DC) |
| 4.9 | ZP | Process voltage ZP (0 V DC) |

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a processor module). Thus, the current consumption from $24 \vee$ DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per CD522.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Connection of encoders with differential RS-422 signal

The encoder is powered by the 5 V power supply which is integrated in CD522.

Connection of The encoder is powered by the 5 V power supply which is integrated in the CD522. encoders with 5 V TTL signal

The wires $A, B$ and $Z$ need not to be connected to the module. They are left open.

When using different power supplies for the encoder device and the CD522, make sure that the reference potentials of both power supplies are interconnected.

Connection of encoders with 1 Vpp sine signal

The encoder is powered through the 5 V power supply which is integrated in the CD522.

Connection of absolute encoders with SSI interface and differential RS-422 signal

The encoder is powered by the 5 V power supply which is integrated in the CD522.

Connection of absolute encoders with an SSI interface and an optocoupler interface at CLK input

The encoder can optionally be powered by the 5 V power supply which is integrated in the CD522.

Connection of output loads to the PWM/Pulse putputs

## NOTICE!

Risk of damaging the module
The PWM outputs have no protection against reverse polarity.

Connection of Proceed with the inputs/outputs 111 and $\mathrm{C} 12 \ldots \mathrm{C} 15$ in the same way. standard inputs/ outputs

[^15]

Fig. 166: Example of the connection of sensors with frequency outputs to the input ZO of the CD522

## - NOTICE!

Risk of malfunctions!
The edges of a signal must be strong enough ( $0.4 \mathrm{~V} / \mu \mathrm{s}$ ) to be recognized correctly by the module.

Put a $1 \mathrm{k} \Omega$ resistor between 0 V and the Z terminal when using a standard output as time generator.

Connection of $\quad$ Proceed with the 5 V power supply 1 in the same way.
$\qquad$
Each 5-V-power supply provides a current of 100 mA max. It is possible to parallel both integrated power supplies. In this case, the max. current is 200 $m A$.

## - NOTICE! <br> Risk of damaging the module

The integrated 2 A fuse cannot be replaced. If it blows, the module must be replaced.
Ensure that the current per 0 V connection does not exceed 0.5 A .

## NOTICE!

## Risk of damaging the module

The two 5 V outputs have no protection against reverse polarity.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 0 |
| Digital outputs (bytes) | 0 |
| Analog inputs (words) | 12 |
| Analog outputs (words) | 16 |

The data will be transferred in 16-bit words and not in bytes. Two bytes are packed into one 16-bit word.
The bit strings are transmitted in big-endian byte order, so the bytes within the word are swapped. If several bytes are considered, the first byte (lowest address) is the largest (High Byte).

If used with AC500 please check the chapter how to configure CD522 within Automation Builder and use the CD522 library.

The types "structCD522In" and "structCD522Out" can be added in Automation Builder by using the command "Generate DUT" via the context menu of the CD522 device.

To use CD522 with CI50x-PNIO or CI54x-DP as unbundled IOs with other PLCs find the meaning of the IO-Data in following tables below:

## From CD522 to PLC

## I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

## Parameterization

| Firmware version | Configuration |
| :--- | :--- |
| Firmware version > V2.0.0 | The arrangement of the parameter data is per- <br> formed by Control Builder Plus/ Automation <br> Builder software. |

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

| ${ }^{1}$ ) | In AC500, the following interface identifier applies: $14=\mathrm{I} / \mathrm{O}$ bus, $11=$ COM1 (e.g. CS31 bus), $12=$ COM2. <br> The FBP diagnosis block does not contain this identifier. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> $31=$ module itself, $1 \ldots 10=$ decentralized communication interface module $1 . . .10$, ADR = hardware address (e.g. of the DC551) |
| ${ }^{3}$ ) | With "Module" the following allocation applies depending on the master: <br> Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: $1 \ldots 10=$ expansion 1... 10 <br> Channel error: I/O bus or FBP = module type ( 2 = DO); COM1/COM2: $1 . .10=$ expansion 1... 10 |
| ${ }^{4}$ ) | In case of module errors, with channel "31 = Module itself" is output. |

## State LEDs

During the power-on procedure, the module initializes automatically. All LEDs (except the LEDs for the signal states) are on during the initialization.

## Technical data

The system data of AC500 and S500 are applicable to the standard version \& Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltage |  |
| Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for UP (+24 V DC) and 1.9, 2.9, 3.9 and 4.9 for ZP ( 0 V ) |
| Protection against reverse voltage | Yes |
| Rated protection fuse at UP | 10 A fast |
| Rated value | 24 V DC |
| Max. ripple | 5 \% |
| Current consumption |  |
| From UP | 0.07 A + max. 0.008 A per input + max. 0.5 A per output + 0.01 A for $A, B$ and $Z$ inputs |
| Via I/O bus | Ca. 5 mA |
| Inrush current from UP (at power-up) | $0.04 \mathrm{~A}^{2} \mathrm{~s}$ |
| Galvanic isolation | Yes, per module |
| Max. power dissipation within the module | 6 W (outputs unloaded) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal mounting or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ ) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

| Technical data <br> of the digital <br> inputs/outputs if <br> used as <br> standard inputs | Parameter | Value |
| :--- | :--- | :--- |
|  | Number of channels | $2+8$ configurable digital inputs/outputs |
|  | Reference potential for all <br> inputs | Terminals $1.9 \ldots 4.9$ (negative pole of the process supply <br> voltage, signal name ZP) |
|  | Galvanic isolation | From the rest of the module |
|  |  |  |

| Parameter | Value |
| :--- | :--- |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input <br> signal is high (signal 1) |
| Input type acc. to EN 61131-2 | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 8 ms , configurable from 0.1 to 32 ms |
| Input data length | 24 bytes |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Ripple with signal 0 | $>+5 \mathrm{~V} \ldots+5 \mathrm{~V}$ * +15 V |
| Ripple with signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ * |
|  | Input voltage +24 V |
|  | Input voltage +5 V |
|  | Input voltage +15 V |
|  | Typ. 5 mA |
| Input voltage +30 V | $>5 \mathrm{~mA}$ |
| Max. cable length | $<8 \mathrm{~mA}$ |
|  | Shielded |
|  | Unshielded |

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V . Consequently, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=30 \mathrm{~V}$.

Technical data of the digital inputs/outputs if used as standard outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels | 8 configurable digital inputs/outputs |
| Reference potential for all outputs | Terminals $1.9 \ldots 4.9$ (negative pole of the <br> process supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs: terminals $1.8 \ldots 4.8$ (positive pole <br> of the process supply voltage, signal name UP) |
| Output voltage for signal 1 | UP (-0.8 V) |
| Output delay (0->1 or 1->0) | Typ. $10 \mu \mathrm{~s}$ |
| Output data length | 32 bytes |
| Output current | 500 mA at UP = 24 V |
| Rated value, per channel | 8 A |
| Maximum value (all channels together, <br> PWM included) | $<0.5 \mathrm{~mA}$ |
| Leakage current with signal 0 | 10 A fast |
| Rated protection fuse on UP | With varistors integrated in the module (see <br> figure below) |
| Demagnetization when inductive loads are <br> switched off |  |
| Switching frequency |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
| With resistive load | On request |  |
|  | With inductive loads | Max. 0.5 Hz |
|  | With lamp loads | Max. 11 Hz with max. 5 W |
| Short-circuit-proof / overload-proof | Yes |  |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |  |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |  |
| Resistance to feedback against 24 V signals | Yes |  |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

### 5.2.5 Terminal units for $\operatorname{S500}(-X C)$ I/O modules

### 5.2.5.1 Safety instructions

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules $\mathrm{Cl} 5 x x$ as of index FO.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

## NOTICE!

## Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

## Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.
* Further information about hot swap.

### 5.2.5.2 TU515, TU516, TU541 and TU542 for I/O modules

### 5.2.5.2.1 Features

- TU515, I/O terminal unit, 24 V DC, screw terminals
- TU516, I/O terminal unit, 24 V DC, spring terminals
- TU516-XC, I/O terminal unit, 24 V DC, spring terminals, XC version
- TU516-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU516-H-XC, I/O terminal unit, hot swap, $24 \vee \mathrm{DC}$, spring terminals, XC version
- TU541, I/O terminal unit, 24 V DC, screw terminals
- TU542, I/O terminal unit, 24 V DC, spring terminals
- TU542-XC, I/O terminal unit, 24 V DC , spring terminals, XC version
- TU542-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 V DC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus ( 10 pins, female) to connect other terminal units
3a Plug ( $2 \times 25$ pins) to connect the inserted I/O modules
3b Plug ( $2 \times 19$ pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
5 Holes for screw mounting
640 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

XC version $\quad X C=e X t r e m e$ Conditions

## Extreme conditions

Terminal units for use in extreme ambient conditions have no $\underset{x_{+}^{*}+\underset{*}{*} \text { sign for } X C}{ }$ version.
The figure 4 in the Part no. 1SAP4... (lable) identifies the XC version.

## Terminals

The following terminals are used for connection of the process supply voltage.

|  | Terminals |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Type | 1.8 2.8 | 3.8 | 4.8 | 1.9 | 2.9 | 3.9 | 4.9 |
| TU515, TU516 and TU516-H | These terminals are internally connected with assignment: process supply voltage UP $=+24 \mathrm{~V}$ DC |  |  | These terminals are internally connected with assignment: process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$ |  |  |  |
| $\begin{aligned} & \text { TU541, } \\ & \text { TU542 } \\ & \text { and } \\ & \text { TU542-H } \end{aligned}$ | These terminals are internally connected with assignment: process voltage UP $=+24 \mathrm{~V}$ DC | Separate process supply voltage UP3 = +24 V DC | Separate process supply voltage UP4 = +24 V DC |  | minals <br> ally con- <br> h assigncess <br> tage $\mathrm{ZP}=$ | Separate process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$ | Separate process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$ |

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).

### 5.2.5.2.2 Technical data

The system data of AC500 and S500 are applicable to the standard version ${ }^{\Leftrightarrow}$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{\mu}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 32 |
| Distribution of the channels into groups | 4 groups of 8 channels each $(1.0 \ldots 1.7,2.0 \ldots$ <br> $2.7,3.0 \ldots 3.7,4.0 \ldots 4.7)$, the allocation of the <br> channels is given by the inserted I/O module |
| Rated voltage | 24 V DC |
| Max. permitted total current | 10 A, per separated process voltage terminal <br> or for internal connection of process voltages |

| Parameter | Value |
| :--- | :--- |
| Grounding | Direct connection to the grounded DIN rail or <br> via the screws with wall mounting |
| Screw terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Spring terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Weight | 200 g |
| Mounting position | Horizontal or vertical |

### 5.2.5.2.3 Hot swap

Hot swap

## WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

## WARNING!

Electric shock due to negligent behavior during hot swapping!
To avoid electric shock

- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

## NOTICE! <br> Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

## NOTICE!

Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

## NOTICE!

## Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

| Device | Min. required device index for I/O module as of FW Version 3.0.14 |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### 5.2.5.3 TU531 and TU532 for I/O modules

### 5.2.5.3.1 Features

- TU531, I/O terminal unit, 120/230 V AC, screw terminals
- TU532, I/O terminal unit, 120/230 V AC, spring terminals
- TU532-XC, I/O terminal unit, 120/230 V AC, spring terminals, XC version
- TU532-H, I/O terminal unit, hot swap, 120/230 V AC, spring terminals
- TU532-H-XC, I/O terminal unit, hot swap, 120/230 V AC, spring terminals, XC version

1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to connect other terminal units
3a Plug ( $2 \times 25$ pins) to connect the inserted I/O modules
3b Plug ( $3 \times 19$ pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
5 Holes for screw mounting
640 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

The input/output modules (I/O modules) plug into the I/O terminal unit. When properly pluggedin, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115 V AC ... 230 V AC inputs and/or 120/230 V AC relay outputs.

XC version XC = eXtreme Conditions

## Extreme conditions

 XC version.
The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

## Terminals

| Screw terminals |  |  | Spring terminals |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Conductor |  | Screwdriver | Conductor | $\left\|\left\|\left\|\begin{array}{l} \bigcirc_{1.5}^{1.5} \\ \bigcirc_{1.6} \\ O_{1.7} \\ O_{1.8} \\ O_{1.9} \end{array}\right\|\right.\right.$ | Screwdriver (opens terminal) |

The terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals $1.8 \ldots 4.8$ : process supply voltage UP $=+24 \mathrm{~V}$ DC
- Terminals $1.9 \ldots 4.9$ : process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).
The supply voltage of 24 V DC for the module's circuitry comes from the I/O expansion bus (I/O bus).

### 5.2.5.3.2 Technical data

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1 .2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{\circledR}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 32 |
| Distribution of the channels into groups | 4 groups of 8 channels each $(1.0 \ldots 1.7,2.0 \ldots$ <br> $2.7,3.0 \ldots 3.7,4.0 \ldots 4.7)$, the allocation of the <br> channels is given by the inserted I/O module |
|  |  |
| Terminals $1.8 \ldots 4.8$ and $1.9 \ldots 4.9$ | 30 V DC |
|  | Max. voltage |
| Max. permitted total current | 10 A |
| Terminals $1.0 \ldots 1.7,2.0 \ldots 2.7,3.0 \ldots 3.7,4.0 \ldots 4.7$ |  |
|  | Max. voltage |
| Max. permitted current | 300 V AC ${ }^{1}$ ) |
| Grounding | $\left.3 \mathrm{~A}^{2}\right)$ |
| Screw terminals | Direct connection to the grounded DIN rail or <br> via the screws with wall mounting |
| Spring terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Weight | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Mounting position | 200 g |

${ }^{1}$ ) Only when the voltage is not limited by the specification of the I/O channel or the supply input which is internally connected to the terminal.
${ }^{2}$ ) The terminals are connected to the electronic module via internal connectors (X22 (or 3b), X23 (or 3b), X32, X33 and X34). The current per terminal is limited by the permitted current of these connectors.

### 5.2.5.3.3 Hot swap

## Hot swap

## WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

## WARNING!

## Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

## NOTICE!

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

## NOTICE!

## Risk of damage to I/O modules!

Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

## NOTICE!

## Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

### 5.2.6 Communication interface modules

### 5.2.6.1 Safety instructions

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index FO.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

## NOTICE!

## Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

## Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.
$\rightleftarrows$ Further information about hot swap.

### 5.2.6.3.2 CI581-CN

## Features

- 4 analog inputs (resolution 12 bits including sign)
- 2 analog outputs (resolution 12 bits including sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

I/O bus
2 Allocation between terminal No. and signal name
36 yellow LEDs to display the signal states of the analog inputs/outputs (AIO ... AI3, AO0 ... AO1)
48 yellow LEDs to display the signal states of the digital inputs (DI0 ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
2 green LEDs to display the supply voltage UP and UP3
3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
5 System LEDs: PWR/RUN, CN-RUN, CN-ERR, S-ERR, I/O-Bus
Label
102 rotary switches for setting the CANopen Node ID
10 terminals to connect the CANopen bus signals
Terminal unit
DIN rail
Sign for XC version

## Intended purpose

The CANopen communication interface module $\mathrm{CI} 581-\mathrm{CN}$ is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0 ... 2.3)
- 2 analog outputs (2.5 ... 2.6)
- 8 digital inputs 24 V DC in 1 group (3.0 ... 3.7)
- 8 digital outputs 24 V DC in 1 group (4.0 ... 4.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

| Parameter | Value |
| :---: | :---: |
| Interface | CAN |
| Protocol | CANopen |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the CANopen Node ID for configuration purposes (00h to FFh) |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Transmission rates | 10 / 20 / 50 / 125 / $250 / 500 / 800 \mathrm{kbit} / \mathrm{s} 1$ Mbit/s Auto transmission rate detection is supported |
| Bus connection | Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block |
| Processor | Hilscher NETX 100 |
| Expandability | CI58x can only be used on onboard CAN interface and without any I/O expansion module « Table 215 "CANopen" on page 952. |
| State display | Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus |
| Adjusting elements | 2 rotary switches for generation of the node address |
| Ambient temperature | System data AC500 ${ }^{\star}$ Chapter 5.1.2 "System data AC500" on page 166 <br> System data AC500 XC $\Rightarrow$ Chapter 5.1.3 <br> "System data AC500-XC" on page 169 |
| Current consumption | UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output |

| Parameter | Value |
| :---: | :---: |
| Weight (without terminal unit) | Ca. 125 g |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | CANopen interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 2.8 and 3.8 for +24 V (UP) <br> Terminal 4.8 for +24 V (UP3) <br> Terminals 2.9, 3.9 and 4.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Setting of the CANopen Node ID identifier | With 2 rotary switches at the front side of the module |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU509, TU510, TU517 or TU518 <br> * Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 |

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

CI581-CN: Input/ Output characteristics

| Parameter | Value |
| :---: | :---: |
| Inputs and outputs | 8 digital inputs (24 V DC; delay time configurable via software) <br> 8 digital transistor outputs (24 V DC, 0.5 A max.) <br> 4 analog inputs, configurable as: <br> - $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ <br> - $0 \mathrm{~V} \ldots+10 \mathrm{~V}$ <br> - $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ (differential voltage) <br> - $0 \mathrm{~mA} . .20 \mathrm{~mA}$ <br> - $4 \mathrm{~mA} . .20 \mathrm{~mA}$ <br> - Pt100, Pt1000, Ni1000 (for each 2-wire and 3-wire) <br> - 24 V digital input function <br> 2 analog outputs, configurable as: <br> - $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ <br> - $0 \mathrm{~mA} . .20 \mathrm{~mA}$ <br> - $4 \mathrm{~mA} . .20 \mathrm{~mA}$ |
| Resolution of the analog channels | 12 bits |
| Fast counter | Integrated, configurable operating modes |

## Connections

## General

The CANopen communication interface module is plugged on the I/O terminal units TU517 ² Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 or TU518 $\stackrel{\wedge}{ }{ }^{\circ}$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $2.8,3.8,2.9,3.9$ and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 4.8: process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 2.9, 3.9 and 4.9: process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to the digital outputs!
Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This ist not the intended use.

## CAUTION!

## Risk of malfunctions by unintended use!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7 and DC0 ... DC7.

## Possibilities of connection

| 10 | black |
| 11 | white |
| 12 | blue |
| 13 | bare |

The grounding of the shield should take place at the switchgear $\stackrel{\Perp}{ }$ Chapter 5.1.2 "System data AC500" on page 166.

Mounting on ter- Table 217: Assignment of the terminals minal units TU517 or TU518

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | CAN+ | Non-inverted signal of the CAN bus |
| 1.1 | CAN+ | Non-inverted signal of the CAN bus |
| 1.2 | CAN- | Inverted signal of the CAN bus |
| 1.3 | Term + | Inverted signal of the CAN bus |
| 1.4 | Term- | CAN bus termination for CAN+ (for bus termination, <br> Term+ must be connected with CAN+) |
| 1.5 | CAN bus termination for CAN+ (connecting alterna- <br> tive for terminal 1.4) |  |
| 1.6 | CAN bus termination for CAN- (for bus termination, <br> Term- must be connected with CAN-) |  |
| 1.7 | CAN-GND | CAN bus termination for CAN- (connecting alterna- <br> tive for terminal 1.6) |
| 1.8 | CAN-GND | Ground potential of the CAN bus |
| 1.9 | Ground potential of the CAN bus |  |

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).
The following figures show the different connection options for the CANopen communication interface module:

In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the control cabinet. Please refer to the AC500 System-Data "y Chapter 5.1.2 "System data AC500" on page 166.

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 170: Connection of the communication interface module Cl581-CN
The module provides several diagnosis functions $\stackrel{y}{ } \stackrel{y}{c}$ Chapter 5.2.6.3.2.9 "Diagnosis" on page 979.
For the measuring ranges that can be configured, please refer to the sections Measuring Ranges $\Leftrightarrow$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization Chapter 5.2.6.3.2.8 "Parameterization" on page 974.
The meaning of the LEDs is described in the section for the state LEDs ${ }_{y}{ }^{\mu}$ Chapter 5.2.6.3.2.10 "State $L E D$ " on page 982.

Bus length The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

| Bit Rate (speed) | Bus Length |
| :--- | :--- |
| $1 \mathrm{Mbit} / \mathrm{s}$ | 40 m |
| $800 \mathrm{kbit} / \mathrm{s}$ | 50 m |
| $500 \mathrm{kbit} / \mathrm{s}$ | 100 m |
| $250 \mathrm{kbit} / \mathrm{s}$ | 250 m |

| Bit Rate (speed) | Bus Length |
| :--- | :--- |
| $125 \mathrm{kbit} / \mathrm{s}$ | 500 m |
| $50 \mathrm{kbit} / \mathrm{s}$ | 1000 m |

## Connection of the digital inputs

Fig. 171: Connection of the digital inputs to the module CI581-CN

## Connection of the digital outputs

Fig. 172: Connection of configurable digital outputs to the module CI581-CN

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 173: Connection of resistance thermometers in 2-wire configuration to the analog inputs

| Pt100 | 2-wire configuration, 1 channel used |
| :--- | :--- |
| Pt1000 | 2-wire configuration, 1 channel used |
| Ni1000 | 2-wire configuration, 1 channel used |

For the measuring ranges that can be configured, please refer to sections Measuring Ranges » Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization ${ }^{\star} »$ Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

The module CI581-CN performs a linearization of the resistance characteristic.
To avoid error messages, configure unused analog input channels as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 174: Connection of resistance thermometers in 3-wire configuration to the analog inputs
With 3 -wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1 ).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

| Pt 100 | 3-wire configuration, 2 channels used |
| :--- | :--- |
| Pt 1000 | 3-wire configuration, 2 channels used |
| Ni1000 | 3-wire configuration, 2 channels used |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges * Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization * Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

The module $\mathrm{Cl} 581-\mathrm{CN}$ performs a linearization of the resistance characteristic.
To avoid error messages, configure unused analog input channels as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 175: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges $\stackrel{y}{c}$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization $\Leftrightarrow$ Chapter 5.2.6.3.2.8 "Parameterization" on page 974.
To avoid error messages, configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 176: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AIO (Proceed with the analog inputs Al1 ... AI3 in the same way)

| Current | $0 \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \ldots 20 \mathrm{~mA}$ | 1 channel used |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ${ }^{\wedge} \Rightarrow$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization $\Leftrightarrow$ Chapter 5.2.6.3.2.8 "Parameterization" on page 974.
Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 177: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AO ... AI3)

## NOTICE!

## Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).

Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

For the measuring ranges that can be configured, plese refer to the sections Measuring Ranges ${ }^{\#}$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization ${ }^{\#}$ Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

To avoid error messages, configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current) to the analog inputs

Fig. 178: Connection of passive-type analog sensors (current) to the analog inputs (AO ... A3)

| Current | $4 \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

## CAUTION!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## NOTICE!

## Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).

Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

Fig. 179: Connection of active-type analog sensors (voltage) to differential analog inputs (AIO ... Al3)

| Voltage | $0 \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ${ }^{\wedge}>$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

To avoid error messages, configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 180: Connection of digital sensors to the analog input (AIO ... AI3)

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges $\stackrel{y}{ }{ }^{*}$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization $\left.{ }^{*}\right\rangle$ Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

## Connection of analog output loads (Voltage)

Fig. 181: Connection of analog output loads (voltage) to the analog outputs (AO0 ... AO1)

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load $\pm 10 \mathrm{~mA}$ max. | 1 channel used |
| :--- | :--- | :--- | :--- |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ${ }^{*}$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization \& Chapter 5.2.6.3.2.8 "Parameterization" on page 974.
Unused analog outputs can be left open-circuited.

## Connection of analog output loads (Current)

Fig. 182: Connection of analog output loads (current) to the analog outputs (AOO ... AO1)

| Current | $0 \ldots 20 \mathrm{~mA}$ | Load $0 \ldots 500 \Omega$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $4 \ldots 20 \mathrm{~mA}$ | Load $0 \ldots 500 \Omega$ | 1 channel used |

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges $\stackrel{\wedge}{ } \boldsymbol{y}$ Chapter 5.2.6.3.2.11 "Measuring ranges" on page 984 and Parameterization出 Chapter 5.2.6.3.2.8 "Parameterization" on page 974.

Unused analog outputs can be left open-circuited.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 3 |
| Digital outputs (bytes) | 3 |
| Analog inputs (words) | 4 |
| Analog outputs (words) | 2 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen communication interface module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127 . Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

## I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmision rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, type | Default |

Remarks:

| ${ }^{1}$ ) | In AC500, the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or $10=$ position of the communication module; $14=1 / \mathrm{O}$ bus; $31=$ module itself <br> The identifier is not contained in the CI541-DP diagnosis block. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: $31=$ module itself; $1 \ldots 10=$ decentralized communication interface module |
| ${ }^{3}$ ) | With "Module" the following allocation applies: 31 = module itself <br> Channel error: module type ( $1=\mathrm{Al}, 2=\mathrm{DO}, 3=\mathrm{AO}$ ) |
| ${ }^{4}$ ) | This message appears if external voltages at one or more terminals DO0 ... DO7 cause other digital outputs to be fed by that voltage ${ }^{*} \gg$ Chapter 5.2.6.3.2.4 "Connections" on page 957. All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| ${ }^{5}$ ) | The voltage on digital outputs DO0 ... DO7 has overrun the process supply voltage UP3 ${ }^{*}$ " Chapter 5.2.6.3.2.4 "Connections" on page 957. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears if the output of a channel DOO ... DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel. |
| ${ }^{7}$ ) | Short circuit: After a short circuit has been detected, the output is deactivated for 100 ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel. |

## State LEDs

The state LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

States of the 5 system LEDs
$\left.\begin{array}{|l|l|l|l|l|}\hline \text { LED } & \text { Color } & \text { OFF } & \text { ON } & \text { Flashing } \\ \hline \text { PWR/RUN } & \text { Green } & \begin{array}{l}\text { Process supply } \\ \text { voltage missing }\end{array} & \begin{array}{l}\text { Internal supply } \\ \text { voltage OK, } \\ \text { module ready for } \\ \text { communication } \\ \text { with I/O controller }\end{array} & \begin{array}{l}\text { Start-up / pre- } \\ \text { paring communi- } \\ \text { cation }\end{array} \\ \hline \text { CN-RUN } & \text { Green } & ---- & --- & \begin{array}{l}\text { Device config- } \\ \text { ured, CANopen } \\ \text { bus in OPERRA- } \\ \text { TIONAL state } \\ \text { and cyclic data } \\ \text { exchange run- } \\ \text { ning }\end{array}\end{array} \begin{array}{l}\text { Flashing: } \\ \text { CANopen bus in } \\ \text { PRE-OPERA- } \\ \text { TIONAL state } \\ \text { and slave is } \\ \text { being configured } \\ \text { Single flash: } \\ \text { CANopen bus in } \\ \text { STOPPED state. } \\ \text { Flickering: Auto- } \\ \text { detect is active }\end{array}\right\}$

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| CN-ERR | Red | No system error | CANopen Bus is <br> OFF | Flashing: Config- <br> uration error <br> Single flash: error <br> counter overflow <br> due to too many <br> error frames <br> Double flash: A <br> node-guard or a <br> heartbeat event <br> occurred <br> Flickering: Auto- <br> detect is active |
| S-ERR | Red | No error | Internal error | -- |
| I/O bus | Green | No decentralized <br> I/O modules con- <br> nected or com- <br> munication error | Decentralized I/O <br> modules con- <br> nected and <br> operational | --- |

States of the 27 process LEDs:

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| AIO ... AI3 | Yellow | Input is OFF | Input is ON <br> (brightness <br> depends on the <br> value of the <br> analog signal) | -- |
| AO0 ... AO1 | Yellow | Output is OFF | Output is ON <br> (brightness <br> depends on the <br> value of the <br> analog signal) | -- |
| DIO ... DI7 | Yellow | Input is OFF | Input is ON (the <br> input voltage is <br> even displayed if <br> the supply <br> voltage is OFF) | -- |
| DO0 ... DO7 | Yellow | Output is OFF | Output is ON | -- |
| UP | Green | Process supply <br> voltage missing | Process supply <br> voltage OK and <br> initialization fin- <br> ished | -- |
| UP3 | Green | Process supply <br> voltage missing | Process supply <br> voltage OK | -- |
| CH-ERR1 to CH- <br> ERR3 | Red | No error or <br> process supply <br> voltage missing | Internal error | Error on one <br> channel of the <br> corresponding <br> group |

## Measuring ranges

Input ranges voltage, current and digital input

| Range | 0 V ... +10 | $-10 \mathrm{~V} . .$ | $0 \mathrm{~mA} \ldots$ | $4 \mathrm{~mA} . . .20$ | Digital | Digital value |  |

The represented resolution corresponds to 16 bits.

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

| Parameter | Value |
| :---: | :---: |
| Interface | CAN |
| Protocol | CANopen |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the CANopen Node ID for configuration purposes (00h to FFh) |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Transmission rates | 10 / 20 / 50 / 125 / 250 / 500 / 800 kbit/s 1 Mbit/s Auto transmission rate detection is supported |
| Bus connection | Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block |
| Processor | Hilscher NETX 100 |
| Expandability | CI58x can only be used on onboard CAN interface and without any I/O expansion module « Table 215 "CANopen" on page 952. |
| State display | Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus |
| Adjusting elements | 2 rotary switches for generation of the node address |
| Ambient temperature | System data AC500 « Chapter 5.1.2 "System data AC500" on page 166 <br> System data AC500 XC $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169 |
| Current consumption | UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output |
| Weight (without terminal unit) | Ca. 125 g |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |

| Parameter | Value |
| :---: | :---: |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | CANopen interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 2.8 and 3.8 for +24 V (UP) <br> Terminal 4.8 for +24 V (UP3) <br> Terminals 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Max. power dissipation within the module | 6 W |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Setting of the CANopen Node ID identifier | With 2 rotary switches at the front side of the module |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40{ }^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU509, TU510, TU517 or TU518 <br> \& Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 |

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DIO ... DI7 | Terminals $3.0 \ldots 3.7$ |
| Reference potential for all inputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON <br> when the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |

| Parameter | Value |
| :--- | :--- |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from <br> $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| Signal 0 | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Undefined signal | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | $>1 \mathrm{~mA}$ |
| Input voltage +15 V | $>2 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 to DO7 | Terminals 4.0 to 4.7 |
| Reference potential for all outputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 4.8 (positive pole of <br> the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Rated value per channel | 4 A |
| Max. value (all channels together) | $<0.5 \mathrm{~mA}$ |
| Leakage current with signal 0 | 10 A fast |
| Fuse for UP3 | Via internal varistors (see figure below this <br> table) |
| Demagnetization with inductive DC load |  |
| Output switching frequency | On request |
| With resistive load | Max. 0.5 Hz |
| With inductive loads | 11 Hz max. at 5 W max. |
| With lamp loads | Yes |
| Short-circuit-proof / overload-proof |  |

| Parameter | Value |
| :--- | :--- |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded |  |

Fig. 183: Circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{AlO}+$ to $\mathrm{Al3+}$ | Terminals 2.0 to2.3 |
| Reference potential for $\mathrm{AlO}+$ to $\mathrm{Al3+}$ | Terminal 2.4 (AI-) for voltage and RTD measurement <br> Terminal 2.9, 3.9 and 4.9 for current measurement |
| Input type |  |
| Unipolar | Voltage 0... 10 V, current or Pt100/Pt1000/ Ni1000 |
| Bipolar | Voltage -10...+10 V |
| Galvanic isolation | Against CANopen Bus |
| Configurability | 0... 10 V, -10...+10 V, 0/4... $20 \mathrm{~mA}, \mathrm{Pt} 100 / 1000$, Ni1000 (each input can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |
| Indication of the input signals | 1 LED per channel (brightness depends on the value of the analog signal) |

| Parameter | Value |
| :---: | :---: |
| Conversion cycle | 1 ms (for 4 inputs +2 outputs); with RTDs Pt/ $\mathrm{Ni} . . \mathrm{I}$ s |
| Resolution | Range 0... $10 \mathrm{~V}: 12$ bits <br> Range $-10 \ldots+10 \mathrm{~V}$ : 12 bits including sign <br> Range 0... $20 \mathrm{~mA}: 12$ bits <br> Range 4... $20 \mathrm{~mA}: 12$ bits <br> Range RTD (Pt100, PT1000, Ni1000): $+0.1^{\circ} \mathrm{C}$ |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% |
| Relationship between input signal and hex code | ③) Chapter 5.2.6.3.2.11.2 "Input ranges resistance temperature detector" on page 984 |
| Unused inputs | Are configured as "unused" (default value) |
| Overvoltage protection | Yes |

## Technical data of the analog inputs if used as digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | Max. 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels AI0+ to Al3+ | Terminals 2.0 to 2.3 |
| Reference potential for the inputs | Terminals 2.9, 3.9 and 4.9 (ZP) |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 VDC |
| Signal 0 | -30 V... +5 V |
| Undefined signal | +5V...+15 V |
| Signal 1 | +15 V...+30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 7 mA |
| Input voltage +5 V | Typ. 1.4 mA |
| Input voltage +15 V | Typ. 3.7 mA |
| Input voltage +30 V | < 9 mA |
| Input resistance | Ca. $3.5 \mathrm{k} \Omega$ |

## Technical data of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 2 |
| Distribution of channels into groups | 1 group for 2 channels |
| Connection of the channels AO0+...AO1+ | Terminals 1.5...1.6 |

| Parameter | Value |
| :---: | :---: |
| Reference potential for $\mathrm{AO} 0+$ to $\mathrm{AO} 1+$ | Terminal 2.7 (AO-) for voltage output Terminal 2.9, 3.9 and 4.9 for current output |
| Output type |  |
| Unipolar | Current |
| Bipolar | Voltage |
| Galvanic isolation | Against internal supply and other modules |
| Configurability | $-10 \ldots+10 \mathrm{~V}, 0 \ldots 20 \mathrm{~mA}, 4 \ldots 20 \mathrm{~mA}$ (each output can be configured individually) |
| Output resistance (load), as current output | 0... $500 \Omega$ |
| Output loadability, as voltage output | $\pm 10$ mA max. |
| Indication of the output signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Resolution | 12 bits including sign |
| Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% |
| Relationship between input signal and hex code | ③ Chapter 5.2.6.3.2.11.3 "Output ranges voltage and current" on page 985 |
| Unused outputs | Are configured as "unused" (default value) and can be left open-circuited |

## Technical data of the fast counter

| Parameter | Value |
| :--- | :--- |
| Used inputs | Terminal 3.0 (DI0), 3.1 (DI1) |
| Used outputs | Terminal 4.0 (DO0) |
| Counting frequency | Depending on operation mode: <br> Mode 1-6: max. 200 kHz <br> Mode 7: max. 50 kHz <br> Mode 9: max. 35 kHz <br> Mode 10: max. 20 kHz |
| Detailed description | Fast Counter « Chapter 5.2.4.3.2.9 "Fast <br> counter" on page 606 |
| Operating modes | Operating modes 乡 Chapter 5.2.4.3.2.9 "Fast <br> counter" on page 606 |

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## Ordering data

| Part no. | Description | Product life cycle phase *) |
| :--- | :--- | :--- |
| 1SAP 228 100 <br> R0001 | CI581-CN, CANopen <br> communication interface module with <br> 8 DI, 8 DO, 4 AI and 2 AO | Active |

*) Modules in lifecycle Classic are available from stock but not recommended
for planning and commissioning of new installations.

### 5.2.6.3.3 CI582-CN

Features

- 8 digital inputs 24 V DC
- 8 digital outputs $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs $24 \mathrm{~V} D C, 0.5 \mathrm{~A}$ max.
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states of the configurable digital inputs/outputs (DC0 ... DC7)
48 yellow LEDs to display the signal states of the digital inputs (DI8 ... DI15)
58 yellow LEDs to display the signal states of the digital outputs (DO8 ... DO15)
62 green LEDs to display the supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 System LEDs: PWR/RUN, CN-RUN, CN-ERR, S-ERR, I/O-Bus
9 Label
102 rotary switches for setting the CANopen node ID
1110 terminals to connect the CANopen bus signals
12 Terminal unit
13 DIN rail

## Intended purpose

The CANopen communication interface module $\mathrm{Cl} 582-\mathrm{CN}$ is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

| Parameter | Value |
| :---: | :---: |
| Interface | CAN |
| Protocol | CANopen |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the CANopen Node ID for configuration purposes (00h to FFh) |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Transmission rates | 10 / 20 / 50 / 125 / $250 / 500 / 800$ kbit/s 1 Mbit/s Auto transmission rate detection is supported |
| Bus connection | Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block |
| Processor | Hilscher NETX 100 |
| Expandability | CI58x can only be used on onboard CAN interface and without any I/O expansion module « Table 215 "CANopen" on page 952. |
| State display | Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus |
| Adjusting elements | 2 rotary switches for generation of the node address |
| Ambient temperature | System data AC500 ${ }^{\text {y }}$ Chapter 5.1.2 "System data AC500" on page 166 <br> System data AC500 XC $\stackrel{y}{c}$ Chapter 5.1.3 "System data AC500-XC" on page 169 |
| Current consumption | UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output |
| Weight (without terminal unit) | Ca. 125 g |

| Parameter | Value |
| :---: | :---: |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | CANopen interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 2.8 and 3.8 for +24 V (UP) <br> Terminal 4.8 for +24 V (UP3) <br> Terminals 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Max. power dissipation within the module | 6 W |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Setting of the CANopen Node ID identifier | With 2 rotary switches at the front side of the module |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU509, TU510, TU517 or TU518 <br> * Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 |

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

CI582-CN: Input/ Output characteristics

| Parameter | Value |
| :--- | :--- |
| Inputs and outputs | 8 digital inputs (24 V DC) |
|  | 8 digital transistor outputs (24 V DC, 0.5 A |
|  | max.) |
|  | 8 configurable digital inputs/outputs (24 V DC, |
|  | 0.5 A max.) |

## Connections

## General

The CANopen communication interface module is plugged on the I/O terminal units TU517 « Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 or TU518 $\Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals $2.8,3.8,2.9,3.9$ and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 4.8: process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 2.9, 3.9 and 4.9: process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

## Possibilities of connection

Mounting on ter- The assignment of the 9-pin female D-sub for the CANopen signals minal units TU509 or TU510

|  | 1 | --- | Reserved |
| :---: | :---: | :---: | :---: |
|  | 2 | CAN- | Inverted signal of the CAN bus |
|  | 3 | CAN_GND | Ground potential of the CAN bus |
|  | 4 | --- | Reserved |
|  | 5 | --- | Reserved |
|  | 6 | --- | Reserved |
|  | 7 | CAN+ | Non-inverted signal of the CAN bus |
|  | 8 | --- | Reserved |
|  | 9 | --- | Reserved |
|  | Shield | Cable shield | Functional earth |

Bus terminating The ends of the data lines have to be terminated with a $120 \Omega$ bus terminating resistor. The bus resistors

| 13 | bare |

The grounding of the shield should take place at the switchgear $«$ Chapter
5.1.2 "System data AC500" on page 166.

Mounting on ter- Table 225: Assignment of the terminals minal units TU517 or TU518

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | CAN+ | Non-inverted signal of the CAN bus |
| 1.1 | CAN+ | Non-inverted signal of the CAN bus |
| 1.2 | CAN- | Inverted signal of the CAN bus |
| 1.3 | Term + | Inverted signal of the CAN bus |
| 1.4 | Term- | CAN bus termination for CAN+ (for bus termination, <br> Term+ must be connected with CAN+) |
| 1.5 | CAN bus termination for CAN+ (connecting alterna- <br> tive for terminal 1.4) |  |
| 1.6 | CAN-GND | CAN bus termination for CAN- (for bus termination, <br> Term- must be connected with CAN-) |
| 1.7 | CAN-GND | CAN bus termination for CAN- (connecting alterna- <br> tive for terminal 1.6) |
| 1.8 | Ground potential of the CAN bus |  |
| 1.9 | Ground potential of the CAN bus |  |

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).
The following figures show the different connection options for the CANopen communication interface module:

In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the control cabinet. Please refer to the AC500 System-Data $\stackrel{\text { ® }}{ }$ Chapter 5.1.2 "System data AC500" on page 166.

| 4.8 | UP3 | Process voltage UP3 (24 V DC) |
| 4.9 | ZP | Process voltage ZP (0 V DC) |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 186: Connection of the communication interface module Cl582-CN
For a description of the meaning of the LEDs, please refer to the section for the state LEDs * Chapter 5.2.6.3.3.10 "State LEDs" on page 1010.

Bus length The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

| Bit Rate (speed) | Bus Length |
| :--- | :--- |
| $1 \mathrm{Mbit} / \mathrm{s}$ | 40 m |
| $800 \mathrm{kbit} / \mathrm{s}$ | 50 m |
| $500 \mathrm{kbit} / \mathrm{s}$ | 100 m |
| $250 \mathrm{kbit} / \mathrm{s}$ | 250 m |
| $125 \mathrm{kbit} / \mathrm{s}$ | 500 m |
| $50 \mathrm{kbit} / \mathrm{s}$ | 1000 m |

## Connection of the digital inputs

## Connection of the digital outputs

Fig. 188: Connection of configurable digital outputs (DO8 ... DO15) to the module CI582-CN

## Connection of the configurable digital inputs/outputs

Fig. 189: Connection of configurable digital inputs/outputs (DCO ... DC7) to the module CI582CN

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 5 |
| Digital outputs (bytes) | 5 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen communication interface module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.
The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

## I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmision rate (automatic detection).
The digital I/O channels and the fast counter are configured via software.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Module ID ${ }^{1}$ ) | Internal | 0x1C89 | WORD | 0x1C89 |
| Parameter length | Internal | 38 | BYTE | 38 |
| Error LED / failsafe function table error LED / failsafe function Table 227 "Err or LED / Failsafe function" on page 1005) | On | 0 | BYTE | 0 |
|  | Off by E4 | 1 |  |  |
|  | Off by E3 | 2 |  |  |
|  | On + failsafe | 16 |  |  |
|  | Off by E4 + failsafe | 17 |  |  |
|  | Off by E3 + failsafe | 18 |  |  |
| Reserved | 0 | 0 | ARRAY of 24 BYTES |  |
| Check supply | On | 0 | BYTE |  |
|  | Off | 1 |  | 1 |

| Fast counter | 0 | 0 | BYTE | 0 |
|  | $:$ | $:$ |  |  |
|  | $\left.10^{2}\right)$ | 10 |  |  |

${ }^{1}$ ) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.
${ }^{2}$ ) For a description of the counter operating modes, please refer to the 'Fast Counter' section ${ }^{2}$ Chapter 5.2.4.3.2.9 "Fast counter" on page 606.

Table 227: Error LED / Failsafe function

| Setting | Description |
| :--- | :--- |
| On | Error LED (S-ERR) lights up at errors of all <br> error classes, failsafe mode off |
| Off by E4 | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, failsafe mode off |
| Off by E3 | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, failsafe mode off |
| On + Failsafe | Error LED (S-ERR) lights up at errors of all <br> error classes, failsafe mode on *) |
| Off by E4 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, failsafe mode on *) |
| Off by E3 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, failsafe mode on *) |
| *) The parameter Behavior DO at comm. error is only analyzed if the failsafe mode is ON. |  |

## Group parameters for the digital part

$\left.\begin{array}{|l|l|l|l|l|}\hline \text { Name } & \text { Value } & \text { Internal value } & \begin{array}{l}\text { Internal value, } \\ \text { type }\end{array} & \text { Default } \\ \hline \text { Input delay } & 0.1 \mathrm{~ms} & 0 & \text { BYTE } & 0.1 \mathrm{~ms} \\ & 1 \mathrm{~ms} \\ 8 \mathrm{~ms} \\ 32 \mathrm{~ms}\end{array} \quad \begin{array}{l}2 \\ 3\end{array}\right)$

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Substitute value <br> at output | $0 \ldots 65535$ | $0000 \mathrm{~h} \ldots$ FFFFh | WORD | 0 |
| Preventive <br> voltage feedback <br> monitoring for <br> DC0 ... DC7 ${ }^{2}$ ) | Off <br> On | 1 <br> 0 | BYTE | Off <br> $0 \times 00$ |
| Detect voltage <br> overflow at out- <br> puts ${ }^{3}$ ) | Off <br> On | 0 | BYTE | Off <br> $0 \times 00$ |

Remarks:

| $\left.{ }^{1}\right)$ | The parameter Behavior DO at comm. error is applied to DC and DO <br> channels and only analyzed if the failsafe mode is ON. |
| :--- | :--- |
| $\left.{ }^{2}\right)^{2}$ | The state "externally voltage detected" appears if the output of a channel <br> DC0 ... DC7 is to be switched on while an external voltage is connected. <br> In this case, start-up is disabled while the externally voltage is con- <br> nected. The monitoring of this state and the resulting diagnosis message <br> can be disabled by setting the parameters to "OFF". |
| $\left.{ }^{3}\right)^{2}$ | The error state "voltage overflow at outputs" appears if external voltage <br> at digital outputs DC0 ... DC7 and DO0 ... DO7 has exceeded the <br> process supply voltage UP3 Chapter 5.2.6.3.3.4 "Connections" <br> on page 996. The according diagnosis message "Voltage overflow on <br> outputs " can be disabled by setting the parameters to "OFF". This <br> parameter should only be disabled in exceptional cases as voltage over- <br> flow may produce reverse voltage. |

## Diagnosis

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 1 | Diagnosis byte, slot number | $31=\mathrm{CI} 582-\mathrm{CN}$ (e. g. error at integrated 8 DI / <br> $8 \mathrm{DO})$ <br> $1=1$ st connected S500 I/O module <br> $\ldots$ |
| 2 | Diagnosis byte, module <br> number | According to the I/O bus specification passed <br> on by modules to the fieldbus master |
| 3 | Diagnosis byte, channel | According to the I/O bus specification passed <br> on by modules to the fieldbus master |

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 4 | Diagnosis byte, error code | According to the I/O bus specification |
|  |  | Bit 7 and bit 6, coded error class <br> $0=\mathrm{E} 1$ <br>  |
|  |  | $1=\mathrm{E} 2$ |
|  | $2=\mathrm{E} 3$ |  |
|  |  | $3=\mathrm{E} 4$ |
|  | Bit 0 to Bit 5, coded error description |  |
| 5 | According to the I/O bus specification |  |
|  |  | Bit 7: 1 = coming error |
| Bit 6: 1 = leaving error |  |  |

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

## State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

States of the 5 system LEDs

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| PWR/RUN | Green | Process supply <br> voltage missing | Internal supply <br> voltage OK, <br> module ready for <br> communication <br> with I/O controller | Start-up / pre- <br> paring communi- <br> cation |
|  |  |  | ---1 | --- |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\mu}$ Chapter 5.1.2 "System data AC500" on page 166
The system data of AC500-XC are applicable to the XC version ${ }^{\Perp}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

| Parameter | Value |
| :---: | :---: |
| Interface | CAN |
| Protocol | CANopen |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O modules attached | Through the I/O bus interface (I/O bus) |

| Signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Typ. 5 mA |
| Input voltage +24 V | $>1 \mathrm{~mA}$ |
| Input voltage +5 V | $>2 \mathrm{~mA}$ |
| Input voltage +15 V | $<8 \mathrm{~mA}$ |
| Input voltage +30 V |  |

| Parameter | Value |
| :--- | :--- |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 to DO7 | Terminals 4.0 to 4.7 |
| Reference potential for all outputs | Terminals 2.9 ... 4.9 (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 4.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( l 0 0.7 A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
| Channels DC0...DC07 | Terminals 2.0...2.7 |
| If the channels are used as outputs | Terminals 2.0...2.7 |
| Channels DC0...DC07 | 1 yellow LED per channel, the LED is ON <br> when the input/output signal is high (signal 1) |
| Indication of the input/output signals | From the CANopen network |
| Galvanic isolation |  |

Technical data of the digital inputs/outputs if used as inputs

Please refer to the Technical Data of the Digital Inputs $\Leftrightarrow$ Chapter 5.2.6.3.3.11 "Technical data" on page 1011. Deviation:
Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7
Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V . Consequently, the input voltage must range from -12 V to +30 V when $\mathrm{UPx}=24 \mathrm{~V}$ and from -6 V to +30 V when $U P x=30 \mathrm{~V}$.

Please refer to the Technical Data of the Digital Outputs ${ }^{\circledR}>$ Chapter 5.2.6.3.3.11 "Technical data" on page 1011. Deviation:
Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

### 5.2.6.4.1 CI511-ETHCAT

## Features

- 4 analog inputs (resolution 12 bits including sign)
- 2 analog outputs (resolution 12 bits including sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *) (see also Extended Cam Switch Library)
- Module-wise galvanically isolated - Expandability with up to 10 S500 I/O Modules *)
*) Applicable for device index C0 and above.

1 I/O bus
2 Allocation between terminal number and signal name
36 yellow LEDs to display the signal states of the analog inputs/outputs (AIO ... AI3, AO0 ... AO1)
48 yellow LEDs to display the signal states of the digital inputs (DIO ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
62 green LEDs to display the supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 system LEDs: PWR/RUN, NET, DC, S-ERR, I/O-Bus
92 rotary switches (reserved for future extensions)
10 Label

11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

## Intended purpose

The EtherCAT communication interface module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)
- Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Interface | Ethernet |
| Protocol | EtherCAT |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O <br> expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | Not used; reserved for future extensions |
| Analog inputs | 4 (configurable via software) |
| Analog outputs | 2 (configurable via software) |
| Digital inputs | 8 (24 V DC; delay time configurable via soft- <br> ware) |
| Digital outputs | 8 (24 V DC, 0.5 A max.) |
| LED displays | For system displays, signal states, errors and <br> power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply <br> voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |
| Required terminal unit | TU507 or TU508 « Chapter 5.2.7.2 "TU507- <br> ETH and TU508-ETH for Ethernet communica- <br> tion interface modules" on page 1270 |

## Connections

## General

The Ethernet communication interface module CI511-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.3$ | AIO ... AI3 | Positive pole of the 4 analog <br> inputs |
| 1.4 | AI- | Negative pole of the analog <br> inputs |
| $1.5 \ldots 1.6$ | AO0 ... AO1 | Positive pole of the 2 analog <br> outputs |
| 1.7 | AO- | Negative pole of the analog <br> outputs |
| $2.0 \ldots 2.7$ | DI0 $\ldots$ DI7 | 8 digital inputs |
| $3.0 \ldots 3.7$ | DO0 ... DO7 | 8 digital outputs |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## CAUTION!

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

## CAUTION!

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (wire break), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can also be omitted.

Fig. 192: Connection of the communication interface module CI511-ETHCAT
14 analog inputs, configurable for $0 \ldots 10 \mathrm{~V},-10 \ldots+10 \mathrm{~V}, 0 / 4 \ldots 20 \mathrm{~mA}, \mathrm{Pt100/Pt} 1000$, Ni1000 and digital signals
22 analog outputs, configurable for -10 ... +10 V, 0/4 ... 20 mA
38 digital inputs 24 V DC
48 digital outputs 24 V DC, 0.5 A max.

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active

The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.
2. The outputs are not active

Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

## NOTICE!

## Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

## CAUTION!

The process supply voltage must be included within the grounding concept of the plant (e. g. grounding of the negative pole).

The module provide several diagnosis functions $\Leftrightarrow$ Chapter 5.2.6.4.1.9 "Diagnosis" on page 1039.
The measuring ranges are described in the section Measuring Ranges ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.4.1.8 "Parameterization" on page 1033 \& Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.

The function of the LEDs is described in the section State LEDs $\Leftrightarrow>$ Chapter 5.2.6.4.1.9 "Diagnosis" on page 1039.

## Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 193: Connection of resistance thermometers in 2-wire configuration
1 Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| $\operatorname{Pt1000}$ | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

The measuring ranges are described in the section Measuring Ranges ${ }^{\mu} \Rightarrow$ Chapter 5 .2.6.4.1.8 "Parameterization" on page 1033 ${ }^{〔}$ Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 194: Connection of resistance thermometers in 3-wire configuration
1 Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2 Twisted pair within the cable
3 Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).
In order to keep measuring errors as small as possible, it is necessary, to have all the involved conductors in the same cable. All the conductors must have the same cross section.

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

The measuring ranges are described in the section Measuring Ranges ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.4.1.8 "Parameterization" on page 1033 出 Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.
The module CI511-ETHCAT performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

Fig. 195: Connection of active-type analog sensors (voltage) with galvanically isolated power supply

11 analog sensor requires 1 channel
2 By connecting to AI-, the galvanically isolated voltage source of the sensor is referred to ZP
3 Galvanically isolated power supply for the analog sensor

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The measuring ranges are described in the section Measuring Ranges ${ }_{\mu}^{\mu}$ Chapter $5 \cdot 2 \cdot 6 \cdot 4.1 .8$ "Parameterization" on page 1033 \& $\stackrel{y}{ }$ Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of active-type analog sensors (Current) with galvanically isolated power supply

Fig. 196: Connection of active-type analog sensors (current) with galvanically isolated power supply

11 analog sensor requires 1 channel
2 Galvanically isolated power supply for the analog sensor

| :--- | :--- | :--- |
| Current | $4 \ldots 20 \mathrm{~mA}$ | 1 channel used |

The measuring ranges are described in the section Measuring Ranges $\Leftrightarrow$ Chapter 5 2.2.6.4.1.8 "Parameterization" on page 1033 \& Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042. Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

Fig. 197: Connection of active-type sensors (voltage) with no galvanically isolated power supply
11 analog sensor requires 1 channel
2 Power supply not galvanically isolated
3 The connection between the negative pole of the sensor and ZP has to be performed
4 Long cable

## NOTICE!

## Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ ) | 1 channel used |

*) if the sensor can provide this signal range
The measuring ranges are described in the section Measuring Ranges $\Longleftrightarrow$ Chapter $5 \cdot 2 \cdot 6 \cdot 4.1 .8$ "Parameterization" on page 1033 出 Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Connection of passive-type analog sensors (Current)

Fig. 198: Connection of passive-type analog sensors (current)
11 analog sensor requires 1 channel

| Current | $4 \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

The measuring ranges are described in the section Measuring Ranges ${ }^{\mu}$ Chapter 5 .2.6.4.1.8 "Parameterization" on page $1033 \Leftrightarrow$ Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.

## CAUTION!

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10 -volt Zener diode (in parallel to I+ and ZP). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA .

Unused input channels can be left open-circuited, because they are of low resistance.

## Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
Important: The ground potential at the sensors must not have a too big potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs

Fig. 199: Connection of active-type analog sensors (voltage) to differential inputs
11 analog sensor requires 2 channels
2 Galvanically isolated power supply for the analog sensor
3 Grounding at the sensor
$40 \vee \ldots 10 \vee /-10 \vee \ldots+10 \mathrm{~V}$ connected to differential inputs

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

The measuring ranges are described in the section Measuring Ranges $\Rightarrow$ Chapter 5.2.6.4.1.8 "Parameterization" on page 1033 $\Rightarrow$ Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.
In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital input. The inputs are not galvanically isolated against the other analog channels.

Fig. 200: Use of analog inputs as digital inputs
11 digital signal requires 1 channel

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |

The measuring ranges are described in the section Measuring Ranges $\Rightarrow$ Chapter 5.2.6.4.1.8 "Parameterization" on page 1033 « Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.

## Connection of analog output loads (Voltage, current)

Fig. 201: Connection of analog output loads (voltage, current)
11 analog load requires 1 channel

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load $\pm 10 \mathrm{~mA}$ max. | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $0 \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| Current | $4 \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

 "Parameterization" on page 1033 y Chapter 5.2.6.4.1.11 "Measuring ranges" on page 1042.
Unused analog outputs can be left open-circuited.

## Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.

| Pin assignment | Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | TxD+ | Transmit data + |
|  |  | 2 | TxD- | Transmit data - |
|  |  | 3 | RxD+ | Receive data + |
|  |  | 4 | NC | Not connected |
|  |  | 5 | NC | Not connected |
|  |  | 6 | RxD- | Receive data - |
|  |  | 7 | NC | Not connected |
|  |  | 8 | NC | Not connected |
|  |  | Shield | Cable shield | Functional earth |

In corrosive environment, please protect unused connectors using the TA535 accessory.
Not supplied with this device.
*3 Further information about wiring and cable types

The EtherCAT network differentiates between input-connectors (IN) and outputconnectors (OUT):
At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.
At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 1 |
| Digital outputs (bytes) | 1 |
| Analog inputs (words) | 4 |
| Analog outputs (words) | 2 |

## Addressing

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.

## I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

## Parameterization

## Module parameter

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |

## Group parameters of the cam switch

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| numOfUsedCams ${ }^{1}$ ) | $\begin{array}{\|l\|} \hline 0 \ldots 32 \\ 128 \ldots 160 \end{array}$ | $\begin{aligned} & \hline 0 \ldots 32 \\ & 218 \ldots 160 \end{aligned}$ | WORD | 0 |
| resolution ${ }^{2}$ ) | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | DWORD | 36000 |
| zeroShift ${ }^{3}$ ) | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | DWORD | 0 |
| EncoderBitResolution ${ }^{4}$ ) | $8 \ldots 32$ | 8 ... 32 | WORD | 18 |
| Reserve | - | - | WORD | - |

${ }^{1}$ ) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

| Parameter setting <br> for numOfUsed- <br> Cams | Number of cams <br> used | Interrupt cycle time | Behavior if DC infor- <br> mation is lost |
| :--- | :--- | :--- | :--- |
| 0 | 0 | $50 \mu \mathrm{~s}$ | Module changes <br> to "safe-operational" <br> state; the outputs are <br> activated trough the <br> user program |
| $1 \ldots 8$ | $1 \ldots 8$ | $80 \mu \mathrm{~s}$ | $100 \mu \mathrm{~s}$ |
| $9 \ldots 16$ | $9 \ldots 16$ | $200 \mu \mathrm{~s}$ | Module keeps in <br> "operational" state; <br> the outputs are acti- <br> vated trough the user <br> program |
| $17 \ldots 32$ | $17 \ldots 32$ | $50 \mu \mathrm{~s}$ | Module keeps in <br> "operational" state; <br> the cam switch out- |
| 128 | 0 | $80 \mu \mathrm{~s}$ | puts are activated <br> according to an inter- <br> polated timing infor- <br> mation |
| $129 \ldots 136$ | $1 \ldots 8$ | $100 \mu \mathrm{~s}$ | $200 \mu \mathrm{~s}$ |
| $137 \ldots 144$ | $9 \ldots 16$ | $17 \ldots 32$ |  |
| $145 \ldots 170$ |  |  |  |

${ }^{2}$ ) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to $360^{\circ}$; e. g. the value 36,000 corresponds to an angle resolution of $0.01^{\circ}$.
${ }^{3}$ ) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.
${ }^{4}$ ) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

Channel parameters for the cam switch (max. 32x)

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| camToTrack0 *) | Digital Output <br> $0 \ldots 7$, none | $0 \ldots 7$, FF | BYTE | FF |
| $:$ | $:$ | $:$ | $:$ | $:$ |
| camToTrack31 | Digital Output <br> $0 \ldots 7$, none | $0 \ldots 7$, FF | BYTE | FF |

*) The value of the parameter camToTrack\# defines which DO (digital output) is assigned to the track. camToTrack0 $=3$ for example means that track 0 is assigned to the digital output 3 . If the value FFh is set to a track, no digital output is assigned to it.

| Name | Value | Referred FB from extended Cam Switch Library ${ }^{2}$ ) | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: | :---: |
| camType[0] ${ }^{1}$ ) ... | Common <br> Pulsed <br> Timed <br> Comfort <br> Cam shift <br> Binary shift <br> Multiturn cam <br> Time timed <br> Reference <br> Multiturn timed | MCX_CamSwitchSimple_c <br> MCX_CamSwitchSimple_dc <br> MCX_PulseSwitch_dc <br> MCX_CamSwitchTimed_dc <br> MCX_CamSwitchCom- <br> fort_dc <br> MCX_CamShift_dc <br> MCX_BinaryShift_dc <br> MCX_CamSwitchMulti_dc <br> MCX_SwitchTimeTimed_dc <br> MCX_BinaryReference_dc <br> MCX_CamSwitchMulti- <br> Timed_dc | 0 <br> 1 <br> 2 <br> 3 <br> 4 <br> 5 <br> 6 <br> 7 <br> 8 <br> 9 | BYTE | 0 |

${ }^{1}$ ) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.
${ }^{2}$ ) camType parameters and the Extended Camswitch Library are only available for CI511ETHCAT and CI512-ETHCAT with device index C0 and above.

## Group parameters for the analog part

## Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

| ${ }^{2}$ ) | With "Device" the following allocation applies: <br> $31=$ Module itself or ADR = Hardware address (e. g. of the DC551) |

| ${ }^{3}$ ) | With "Module" the following allocation applies dependent of the master: <br> $31=$ Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel <br> error) |
| :--- | :--- |
| ${ }^{4}$ ) | Diagnosis message appears for the whole output group and not per channel. <br> The message occurs if the output channel is already active. |
| $\left.{ }^{5}\right)$ | Diagnosis message appears per channel. The message occurs if the output <br> channel is not active. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 233: States of the 5 system LEDs

| LED | Color | Off | On | Flashing | 1x Flash | 2x Flash |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Bus connection | $2 \times \mathrm{RJ45}$ |
| Technology | Hilscher NETX 100 |
| Transfer rate | 10/100 Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, $2 \times$ RJ45 socket |
| Expandability (S500 I/O modules) | Up to 10 S500 I/O modules (Index C0 and above), not available (Index below C0) |
| Indicators | 5 LEDs for state indication |
| Adjusting elements | 2 rotary switches (used for future topology extensions) |
| Quantity of input/output data | CI512-ETHCAT: 10 bytes input and 14 bytes output <br> CI511-ETHCAT: 18 bytes input and 18 bytes output |
| Limit of data for input and output | 144 byte |

| Protective functions (according to CODESYS) | Protected against: <br> - short circuit <br> - reverse supply <br> - overvoltage <br> - reverse polarity <br> Galvanic isolation to network |

| Parameter | Value |
| :---: | :---: |
| Process supply voltage UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | Ethernet interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of analog inputs | 4 |

| Parameter | Value |
| :--- | :--- |
| Number of analog outputs | 2 |
| Reference potential for all digital inputs and <br> outputs | Negative pole of the supply voltage, signal <br> name ZP |
| Diagnosis | See Diagnosis and Displays «\% Chapter <br> $5.2 .6 .4 .1 .9 ~ " D i a g n o s i s " ~ o n ~ p a g e ~ 1039 ~$ |
| Operation and error displays | 32 LEDs (totally) |
| Weight (without terminal unit) | ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to <br> $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hin- <br> dered by cable ducts or other parts in the con- <br> trol cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DI0 ... DI7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (Negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | $0-$ Signal |
| Undefined Signal | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | 1-Signal |
| Ripple with signal 0 | $+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripple with signal 1 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Input current per channel | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +24 V |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Input voltage +5 V | $>1 \mathrm{~mA}$ |
|  | Input voltage +15 V | $>2 \mathrm{~mA}$ |
|  | Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals 3.0 ... 3.7 |
| Reference potential for all outputs | Terminals 1.9 ... 3.9 (Negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 202: Digital input/output (circuit diagram)
1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{AlO}+\ldots \mathrm{Al} 3+$ | Terminals 1.0 ... 1.3 |
| Reference potential for $\mathrm{AlO}+\ldots \mathrm{Al} 3+$ | Terminal 1.4 (AI-) for voltage and RTD measurement <br> Terminals 1.9, 2.9 and 3.9 for current measurement |
| Input type |  |
| Unipolar | Voltage 0 V ... 10 V, current or Pt100/Pt1000/ Ni1000 |
| Bipolar | Voltage -10 V ... +10 V |
| Galvanic isolation | Against Ethernet network |
| Configurability | 0 V ... $10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 / 4 \mathrm{~mA} . . .20 \mathrm{~mA}$, Pt100/1000, Ni1000 (each input can be configured individually) |

### 5.2.6.4.2 CI512-ETHCAT

Features

- 8 digital inputs 24 V DC
- 8 digital outputs $24 \mathrm{~V} D, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *)
(see also Extended Cam Switch Library)
- Module-wise galvanically isolated
- Expandability with up to 10 S 500 I/O modules *)
*) Applicable for device index C0 and above.

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states of the digital configurable inputs/outputs (DC0 ... DC7)
48 yellow LEDs to display the signal states of the digital inputs (DIO ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
62 green LEDs to display the supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 System LEDs: PWR/RUN, NET, DC, S-ERR, I/O-Bus
92 rotary switches (reserved for future extensions)
10 Label
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

## Intended purpose

The EtherCAT communication interface module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)
- Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

## Functionality

| Parameter | Value |
| :---: | :---: |
| Interface | Ethernet |
| Protocol | EtherCAT |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | Not used; reserved for future extensions |
| Configurable digital inputs/outputs | 8 (configurable via software) |
| Digital inputs | 8 (24 V DC; delay time configurable via software) |
| Digital outputs | 8 (24 V DC, 0.5 A max.) |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU507 or TU508 ${ }^{\aleph}$ Chapter 5.2.7.2 "TU507ETH and TU508-ETH for Ethernet communication interface modules" on page 1270 |

## Connections

The Ethernet communication interface module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

| Terminals | Signal | Description |
| :--- | :--- | :--- |
| $1.0 \ldots 1.7$ | DC0 $\ldots$ DC7 | 8 digital inputs/outputs (con- <br> figurable via software) |
| $2.0 \ldots 2.7$ | DI0 ... DI7 | 8 digital inputs (delay time <br> configurable via software) |
| $3.0 \ldots 3.7$ | DO0 ... DO7 | 8 digital outputs |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

DC 01.0
DC 11.1

DC 41.4

DC 51.5

DC 61.6

DC 71.7
DC 71.7

Fig. 203: Connection of the communication interface module CI512-ETHCAT
18 digital configurable inputs/outputs 24 V DC
28 digital inputs 24 V DC
38 digital outputs 24 V DC

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active

The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.
2. The outputs are not active

Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

## CAUTION!

The process supply voltage must be included within the grounding concept of the plant (e. g. grounding of the negative pole).

The module provides several diagnosis functions ${ }^{*} \geqslant$ Chapter 5.2.6.4.2.10 "Diagnosis" on page 1060.

## Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.

| Pin assignment | Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | TxD+ | Transmit data + |
|  |  | 2 | TxD- | Transmit data - |
|  |  | 3 | RxD+ | Receive data + |
|  |  | 4 | NC | Not connected |
|  |  | 5 | NC | Not connected |
|  |  | 6 | RxD- | Receive data - |
|  |  | 7 | NC | Not connected |
|  |  | 8 | NC | Not connected |
|  |  | Shield | Cable shield | Functional earth |

In corrosive environment, please protect unused connectors using the TA535 accessory.
Not supplied with this device.
*3 Further information about wiring and cable types

The EtherCAT network differentiates between input-connectors (IN) and outputconnectors (OUT):
At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.
At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 1 |
| Digital outputs (bytes) | 1 |
| Configurable digital inputs/outputs (bytes) | $1+1$ |

## Addressing

The Ethernet communication interface module $\mathrm{Cl} 512-\mathrm{ETHCAT}$ does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.

## I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI512-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

## Parameterization

## Module parameter

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |

## Group parameters of the cam switch

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| numOfUsedCams ${ }^{1}$ ) | $\begin{aligned} & \hline 0 \ldots 32 \\ & 128 \ldots 160 \end{aligned}$ | $\begin{aligned} & \hline 0 \ldots 32 \\ & 218 \ldots 160 \end{aligned}$ | WORD | 0 |
| resolution ${ }^{2}$ ) | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | DWORD | 36000 |
| zeroShift ${ }^{3}$ ) | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | $\begin{aligned} & 0 \ldots 2 \\ & -1 \end{aligned}$ | DWORD | 0 |
| EncoderBitResolution ${ }^{4}$ ) | $8 \ldots 32$ | 8 ... 32 | WORD | 18 |
| Reserve | - | - | WORD | - |

## Remarks:

${ }^{1}$ ) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

| Parameter setting <br> for numOfUsed- <br> Cams | Number of cams <br> used | Interrupt cycle time | Behavior if DC infor- <br> mation is lost |
| :--- | :--- | :--- | :--- |
| 0 | 0 | $50 \mu \mathrm{~s}$ | Module changes <br> to "safe-operational" <br> state; the outputs are <br> activated trough the <br> user program |
| $1 \ldots 8$ | $1 \ldots 8$ | $80 \mu \mathrm{~s}$ | $100 \mu \mathrm{~s}$ |
| $9 \ldots 16$ | $9 \ldots 16$ | $200 \mu \mathrm{~s}$ | Module keeps in <br> "operational" state; <br> the outputs are acti- <br> vated trough the user <br> program |
| $17 \ldots 32$ | $17 \ldots 32$ | $50 \mu \mathrm{~s}$ | Module keeps in <br> "operational" state; |
| 128 | 0 | $80 \mu \mathrm{~s}$ | the cam switch out- <br> puts are activated <br> according to an inter- <br> polated timing infor- <br> mation |
| $129 \ldots 136$ | $1 \ldots 8$ | $200 \mu \mathrm{~s}$ | s |
| $137 \ldots 144$ | $9 \ldots 16$ | $17 \ldots 32$ |  |
| $145 \ldots 170$ |  |  |  |

${ }^{2}$ ) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to $360^{\circ}$; e. g. the value 36,000 corresponds to an angle resolution of $0.01^{\circ}$.
${ }^{3}$ ) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.
${ }^{4}$ ) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

Channel parameters for the cam switch (max. 32x)

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| camToTrack0 ${ }^{1}$ ) | Digital Output <br> $0 \ldots 15$, none | $0 \ldots 15$, FF | BYTE | FF |
| $:$ | $:$ | $:$ | $:$ | $:$ |
| camToTrack31 | Digital Output <br> $0 \ldots 15$, none | $0 \ldots 15$, FF | BYTE | FF |

${ }^{1}$ ) The value of the parameter camToTrack\# defines which DO (digital output) is assigned to the track. camToTrack0 $=3$ for example means that track 0 is assigned to the digital output 3 . If the value FFh is set to a track, no digital output is assigned to it.

| Name | Value | Referred FB from extended Cam Switch Library ${ }^{2}$ ) | Internal value | Internal value, type |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| cam- <br> Type[0] <br> ${ }^{1}$ ) <br> ... | Common <br> Pulsed <br> Timed <br> Comfort <br> Cam shift <br> Binary shift <br> Multiturn cam <br> Time timed <br> Reference <br> Multiturn timed | MCX_CamSwitchSimple_c <br> MCX_CamSwitchSimple_dc <br> MCX_PulseSwitch_dc <br> MCX_CamSwitchTimed_dc <br> MCX_CamSwitchComfort_dc <br> MCX_CamShift_dc <br> MCX_BinaryShift_dc <br> MCX_CamSwitchMulti_dc <br> MCX_SwitchTimeTimed_dc <br> MCX_BinaryReference_dc <br> MCX_CamSwitchMulti- <br> Timed dc | $\begin{array}{\|l} \hline 0 \\ 1 \\ 2 \\ 3 \\ 4 \\ 4 \\ 5 \\ 6 \\ 7 \\ 7 \\ 8 \\ 9 \end{array}$ | BYTE | 0 |

${ }^{1}$ ) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.
${ }^{2}$ ) camType parameters and the Extended Camswitch Library are only available for $\mathrm{CI} 511-$ ETHCAT and CI512-ETHCAT with device index C0 and above.

## Group parameters for the digital part

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Input delay | 0.01 ms | 0 | BYTE | 0.01 ms |
|  | 1 ms | 1 | 2 | $0 x 00$ |
|  | 8 ms | 3 | ms | 0 |

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Behaviour DO at comm. error *) | Off <br> Last value <br> Last value 5 sec <br> Last value 10 sec <br> Substitute value <br> Substitute value <br> 5 sec <br> Substitute value 10 sec | $\begin{aligned} & 0 \\ & 0 \\ & 1 \\ & 6 \\ & 11 \\ & 2 \\ & 2 \\ & 7 \\ & 12 \end{aligned}$ | BYTE | $\begin{array}{\|l\|} \hline \text { Off } \\ 0 \times 00 \end{array}$ |
| Substitute values DO | 0 ... 65535 | 0000h ... FFFFh | WORD | $\begin{aligned} & 0 \\ & 0 \times 0000 \end{aligned}$ |
| *) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON. |  |  |  |  |

## Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

| E1 ... E4 | d1 | d2 | d3 | d4 | Identifier $000 \text {... } 063$ | <- Display in |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 4 | - | 31 | 2 | $8 \ldots 15$ | 47 | Short circuit at digital output | Check terminals |

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the <br> Communication Module; 14 = I/O bus; 31 = Module itself <br> The identifier is not contained in the CI512-ETHCAT diagnosis block. |
| :--- | :--- |
| $\left.{ }^{2}\right)$ | With "Device" the following allocation applies: <br> $31=$ Module itself or ADR = Hardware address (e. g. of the DC551) |
| $\left.{ }^{3}\right)$ | With "Module" the following allocation applies dependent of the master: <br> $31=$ Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel <br> error) |
| $\left.{ }^{4}\right)$ | Diagnosis message appears for the whole output group and not per channel. <br> The message occurs if the output channel is already active. |
| 5 | Diagnosis message appears per channel. The message occurs if the output <br> channel is not active. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 236: States of the 5 system LEDs

| LED | Color | Off | On | Flashing | 1x flash | 2x flash |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PWR/RUN | Green | Error in the internal supply voltage or process voltage missing | Internal supply voltage OK | Module is not configured | -- | -- |
|  | Yellow | -- | -- | -- | -- | -- |
| NET | Green | Init | Operational | Pre-operational | Safe-operational | -- |
|  | Red | No error | PDI <br> Watchdog Timeout | Invalid Configuration | Unsolicited State Change | Application time out |
| DC *) | Green | Distributed Clock not active | Distributed Clock active | -- | -- | -- |
|  | Red | -- | -- | -- | -- | -- |
| S-ERR | Red | No error | Internal error | -- | -- | -- |
| I/O-Bus | Green | No communication interface modules connected or communication error | --- | --- | -- | -- |
| ETH1 | Green | No EtherCAT connection | Link OK No data transfer | Link OK <br> Data transfer OK | -- | -- |
|  | Yellow | -- | -- | -- | -- | -- |
| ETH2 | Green | No EtherCAT connection | Link OK No data transfer | Link OK <br> Data transfer OK | -- | -- |
|  | Yellow | -- | -- | -- | -- | -- |
| ${ }^{*}$ ) The state of this LED is only significant if the camswitch functionality is enabled |  |  |  |  |  |  |

Table 237: States of the 29 process LEDs

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| DC0 ... DC7 | Yellow | Input/Output is <br> OFF | Input/Output is <br> ON | -- |
| DI8 ... DI15 | Yellow | Input is OFF | Input is ON (the <br> input voltage is <br> even displayed if <br> the supply <br> voltage is OFF) | -- <br> DO8 ... DO15 Yellow |
| UP | Green | Output is OFF <br> voltage missing | Output is ON | Process supply <br> voltage OK and <br> initialization fin- <br> ished |
| UP3 | Green | Process supply <br> voltage missing | Process supply <br> voltage OK | -- |
| CH-ERR1 to CH- <br> ERR3 | Red | No error or <br> process supply <br> voltage missing | Internal error | Error on one <br> channel of the <br> corresponding <br> group |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\mu}$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{\Perp}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Bus connection | 2 x RJ45 |
| Technology | Hilscher NETX 100 |
| Transfer rate | $10 / 100$ Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, 2x RJ45 socket |
| Expandability (S500 I/O modules) | Up to 10 S500 I/O modules (Index C0 and <br> above), not available (Index below C0) |
| Indicators | 5 LEDs for state indication |
| Adjusting elements | 2 rotary switches (used for future topology <br> extensions) |
| Quantity of input/output data | CI512-ETHCAT: 10 bytes input and 14 bytes <br> output <br> CI511-ETHCAT: 18 bytes input and 18 bytes <br> output |
| Limit of data for input and output | 144 byte |

| Parameter | Value |
| :---: | :---: |
| Acyclic services | SDO (1500 bytes max.) <br> Emergency ECAT_SLV_DIAG |
| Protective functions (according to CODESYS) | Protected against: <br> - short circuit <br> - reverse supply <br> - overvoltage <br> - reverse polarity <br> Galvanic isolation to network |

| Parameter | Value |
| :---: | :---: |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | Ethernet interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.15 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of configurable digital inputs/outputs | 8 |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Diagnosis | See Diagnosis and Displays $\stackrel{y}{\Rightarrow}$ Chapter 5.2.6.4.2.10 "Diagnosis" on page 1060 |
| Operation and error displays | 34 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DI0 ... DI7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1 ) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | $0-$ Signal |
|  | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | 1-Signal |
| Ripple with signal 0 | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripple with signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +15 V |
| Input voltage +30 V | $>1 \mathrm{~mA}$ |
| Max. cable length | $>2 \mathrm{~mA}$ |
|  | Shielded |
| Unshielded | $<8 \mathrm{~mA}$ |
|  | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |

| Parameter | Value |
| :---: | :---: |
| Terminals of the channels DO0 ... DO7 | Terminals 3.0 ... 3.7 |
| Reference potential for all outputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7 \mathrm{~A}$ ) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 204: Digital input/output (circuit diagram)
1 Digital output
2 Varistors for demagnetization when inductive loads are turned off
Figure:

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
|  | Channels DC0 $\ldots$ DC07 | Terminals $1.0 \ldots 1.7$.

## Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals 1.0 ... 1.7 |
| Reference potential for all inputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1 ) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| 0-Signal | -3 V ... +5 V *) |
| Undefined Signal | > +5V ... $<+15 \mathrm{~V}$ |
| 1-Signal | +15V ... +30 V |
| Ripple with signal 0 | Within -3 V ... +5V *) |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | $>1 \mathrm{~mA}$ |
| Input voltage +15 V | $>2 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V . Following this, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when UPx $=24 \mathrm{~V}$ and from $-6 \vee \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals 1.0 ... 1.7 |
| Reference potential for all outputs | Terminals $1.9 \ldots 3.9$ (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 205: Digital input/output (circuit diagram)
1 Digital input/output

### 5.2.6.5 Modbus

### 5.2.6.5.1 Cl521-MODTCP

## Features

- 4 analog inputs (resolution 12 bits including sign)
- 2 analog outputs (resolution 12 bits including sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
36 yellow LEDs to display the signal states of the analog inputs/outputs (AIO ... AI3, AOO ... AO1)
48 yellow LEDs to display the signal states of the digital inputs (DIO ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
62 green LEDs to display the process supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
102 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

## Intended purpose

The Modbus TCP communication interface module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

| Parameter | Value |
| :--- | :--- |
| Interface | Ethernet |
| Protocol | Modbus TCP |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O <br> expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | for setting the last BYTE of the IP (00h to FFh) |
| Analog inputs | 4 (configurable via software) |
| Analog outputs | 2 (configurable via software) |
| Digital inputs | 8 (24 V DC; delay time configurable via soft- <br> ware) |
| Digital outputs | 8 (24 V DC, 0.5 A max.) |
| LED displays | For system displays, signal states, errors and <br> power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply <br> voltage 24 V DC) |
| Required terminal unit | TU507 or TU508 \& Chapter 5.2.7.2 "TU507- <br> ETH and TU508-ETH for Ethernet communica- <br> tion interface modules" on page 1270 |

## Connections

## General

The Ethernet communication interface module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH $\Leftrightarrow$ Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{\circ}$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

## Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

| S500 I/O module type | First index with firmware version above 1.9 |
| :--- | :--- |
| Al523 | D0 |
| AI523-XC | D0 |
| AI531 | A3 |
| A1531-XC | A0 |
| AO523 | D0 |
| AO523-XC | D0 |
| AX521 | D0 |
| AX521-XC | D0 |
| AX522 | D0 |
| AX522-XC | D0 |
| CD522 | A2 |
| CD522-XC | A0 |
| DA501 | A2 |
| DA501-XC | A0 |
| DA502 | A1 |
| DA502-XC | A1 |
| DC522 | D0 |
| DC522-XC | D0 |
| DC523 | D0 |

| S500 I/O module type | First index with firmware version above $\mathbf{1 . 9}$ |
| :--- | :--- |
| DC523-XC | D0 |
| DC532 | D0 |
| DC532-XC | D0 |
| DI524 | D0 |
| DI524-XC | D0 |
| DO524 | A2 |
| DO524-XC | A2 |
| DX522 | D0 |
| DX522-XC | D0 |
| DX531 | D0 |
| AC522 | D0 |
| PD501 | D0 |

Do not connect any voltages externally to digital outputs!
Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This ist not intended usage.

## CAUTION!

Risk of malfunction by unintended usage!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DOO..DO7.

Table 238: Assignment of the other terminals

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | AI0+ | Positive pole of analog input signal 0 |
| 1.1 | Al1+ | Positive pole of analog input signal 1 |
| 1.2 | Al2+ | Positive pole of analog input signal 2 |
| 1.3 | Al3+ | Positive pole of analog input signal 3 |
| 1.4 | AO0+ | Negative pole of analog input signals 0 to 3 |
| 1.5 | AO1+ | Positive pole of analog output signal 0 |
| 1.6 | AI- | Positive pole of analog output signal 1 |
| 1.7 | ZP | Negative pole of analog output signals 0 and 1 |
| 1.8 | DI0 | Process voltage UP (24 V DC) |
| 1.9 | DI1 | Process voltage ZP (0 V DC) |
| 2.0 | DI2 | Signal of the digital input DI0 |
| 2.1 | DI3 | Signal of the digital input DI1 |
| 2.2 | DI4 | Signal of the digital input DI2 |
| 2.3 |  | Signal of the digital input DI4 |
| 2.4 |  |  |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 2.5 | DI5 | Signal of the digital input DI5 |
| 2.6 | DI6 | Signal of the digital input DI6 |
| 2.7 | DI7 | Signal of the digital input DI7 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | DO0 | Signal of the digital output DO0 |
| 3.1 | DO2 | Signal of the digital output DO1 |
| 3.2 | DO3 | Signal of the digital output DO2 |
| 3.3 | SO5 | Signal of the digital output DO4 |
| 3.4 | DO6 | Signal of the digital output DO5 |
| 3.5 | DO7 | Signal of the digital output DO6 |
| 3.6 | UP3 | Signal of the digital output DO7 |
| 3.7 | ZP | Process voltage UP3 (24 V DC) |
| 3.8 | Process voltage ZP (0 V DC) |  |
| 3.9 |  |  |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Fig. 206: Connection of the communication interface module CI521-MODTCP * Chapter 6.8.4.1 "Modbus communication interface module" on page 4568

## Connection of the digital inputs

Fig. 207: Connection of the digital inputs (DOO ... DO7) to the module CI521-MODTCP The meaning of the LEDs is described in Displays ${ }^{\circ}$ Chapter 5.2.6.5.1.10 "State LEDs" on page 1101.

## Connection of the digital outputs

Fig. 208: Connection of configurable digital inputs/outputs (DOO ... DO7) to the module CI521MODTCP

The meaning of the LEDs is described in Displays ${ }^{\circ}$ Chapter 5.2.6.5.1.10 "State LEDs" on page 1101.

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 209: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AIO ... Al3)
The following measuring ranges can be configured ${ }^{\wedge} \Rightarrow$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \Leftrightarrow$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{\wedge}{ }^{\mu}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

The module CI521-MODTCP performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module $\mathrm{Cl} 521-$ MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 210: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AIO ... Al3)
With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ${ }^{\geqslant}$Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 and $\xi^{\xi}$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{幺}{ }^{\circ}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

The module CI521-MODTCP performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

Fig. 211: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured ${ }^{\wedge} \Rightarrow$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \stackrel{ }{\mu} \stackrel{y}{c}$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{\nu} \Rightarrow$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 212: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured $\left.{ }^{\psi}\right\rangle$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \Leftrightarrow$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays $\Leftrightarrow$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 213: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs (AIO ... AI3)

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).

Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$ (also not with long cable lengths).

The following measuring ranges can be configured ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \Leftrightarrow$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102.

| Voltage | $0 \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{幺}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AIO. Proceed with the analog inputs AI1 ... AI3 in the same way.

Fig. 214: Connection of passive-type analog sensors (current) to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured ${ }^{\geqslant}$Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 出 Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu} \boldsymbol{y}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

## CAUTION!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10 -volt Zener diode in parallel to Alx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).

Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AIO and AI1. Proceed with AI2 and AI3 in the same way.

Fig. 215: Connection of active-type analog sensors (voltage) to differential analog inputs (AIO ... Al3)

The following measuring ranges can be configured $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \Leftrightarrow$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | With differential inputs, 2 <br> channels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | With differential inputs, 2 <br> channels used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

To avoid error messages from unused analog input channels, configure them as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs ${ }_{y}{ }^{\circ}$ Chapter $5 \cdot 2 \cdot 6 \cdot 5 \cdot 1 \cdot 12.5$ "Technical data of the analog inputs if used as digital inputs" on page 1108. The inputs are not galvanically isolated against the other analog channels.

Fig. 216: Connection of digital sensors to the analog inputs (AIO ... AI3)
The following measuring ranges can be configured ${ }_{y}{ }^{4}$ Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 and $\left.{ }^{\mu}\right\rangle$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102 :

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

## Connection of analog output loads (Voltage)

Fig. 217: Connection of analog output loads (voltage) to the analog outputs (AO0 ... AO1)
The following measuring ranges can be configured ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.5.1.8 "Parameterization" on page $1090 \Leftrightarrow$ Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load $\pm 10 \mathrm{~mA}$ max. | 1 channel used |
| :--- | :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{\circ} \Rightarrow$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

Unused analog outputs can be left open-circuited.

## Connection of analog output loads (Current)

Fig. 218: Connection of analog output loads (current) to the analog outputs (AOO and AO1)
The following measuring ranges can be configured Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 \& Chapter 5.2.6.5.1.11 "Measuring ranges" on page 1102:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \ldots 500 \Omega$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $4 \ldots 20 \mathrm{~mA}$ | Load $0 \ldots 500 \Omega$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{\wedge} \Rightarrow$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096.

Unused analog outputs can be left open-circuited.

## Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

| Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | TxD+ | Transmit data + |
|  | 2 | TxD- | Transmit data - |
|  | 3 | RxD+ | Receive data + |
|  | 4 | NC | Not connected |
|  | 5 | NC | Not connected |
|  | 6 | RxD- | Receive data - |

| Interface | Pin | Signal | Description |
| :--- | :--- | :--- | :--- |
|  | 7 | NC | Not connected |
|  | 8 | NC | Not connected |
|  | Shield | Cable shield | Functional earth |

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

③ Further information about wiring and cable types

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 3 |
| Digital outputs (bytes) | 3 |
| Analog inputs (words) | 4 |
| Analog outputs (words) | 2 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

Replacement of a Modbus TCP communication interface module:
The module must be powered off before it is replaced. If the configuration data is stored in the module, then the configuration data must be downloaded into the new module, either by using Modbus communication or by using the Modbus configurator which is contained in the Automation Builder distribution.
ⓨ Chapter 6.3.2.12.2 "Unbundled CI52x-MODTCP configuration" on page 1565

## Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The IP address of the CI521-MODTCP Module can be set with the "ABB IP Configuration Tool" $\Leftrightarrow$ Chapter 6.3.2.2.4.3 "Configuration of the IP settings with the IP configuration tool" on page 1457.
If the last byte of the IP is set to 0 , the address switch will be used instead.
Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the "ABB IP Configuration Tool".

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

I/O configuration
The Cl521-MODTCP stores configuration parameters (IP address configuration, module parameters).
The analog/digital I/O channels are configured via software.
Details about configuration are described in Parameterization * Chapter 5.2.6.5.1.8 "Parameterization" on page 1090.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Module ID ${ }^{1}$ ) | Internal | 7400 | WORD | 7000 |
| Ignore Module | Internal | 0 | BYTE | 0 |
| Parameter length | Internal | 63 | BYTE | 63 |
| Error LED / Failsafe function see table Error LED / Failsafe function * Table 239 "Err or LED / Failsafe function" on page 1091 | On | 0 | BYTE | 0 |
|  | Off by E4 | 1 |  |  |
|  | Off by E3 | 3 |  |  |
|  | On + failsafe | 16 |  |  |
|  | $\begin{aligned} & \text { Off by E4 + fail- } \\ & \text { safe } \end{aligned}$ | 17 |  |  |
|  | Off by E3 + failsafe | 19 |  |  |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0.3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0..3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0.3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0..3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0..3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0.3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | $\begin{aligned} & \text { ARRAY[0..3] OF } \\ & \text { BYTE } \end{aligned}$ | 0,0,0,0 |

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X, y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Timeout for Bus supervision | No supervision 10 ms timeout 20 ms timeout | $\begin{aligned} & 0 \\ & 1 \\ & 2 \end{aligned}$ | BYTE | No supervision |
| IO Mapping Structure ${ }^{3}$ ) | Fixed Mapping Dynamic Mapping | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | 0 |
| Reserved | Internal | 0 | ARRAY[0..2] OF BYTE | 0,0,0 |
| Check supply | off on | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | 1 |
| Fast counter | $0$ $\left.10^{3}\right)$ | 0 $:$ 10 | BYTE | 0 |
| ${ }^{1}$ ) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission. |  |  |  |  |
| ${ }^{2}$ ) Counter operating modes $\stackrel{\xi}{ }{ }^{\circ}$ Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536. |  |  |  |  |
| ${ }^{3}$ ) Fixed Mapping means each module has its own Modbus registers for data transfer independent of the IO bus constellation $\stackrel{\text { H Chapter 6.8.4.1.2 "Modbus TCP registers" }}{ }$ on page 4570. |  |  |  |  |
| Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word address. |  |  |  |  |
| ${ }^{4}$ ) If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules. |  |  |  |  |
| If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52xMODTCP device. |  |  |  |  |

Table 239: Error LED / Failsafe function

| Setting | Description |
| :--- | :--- |
| On | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode off |
| Off by E4 | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode off |
| Off by E3 | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode off |
| On +Failsafe | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode on *) |
| Off by E4 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode on *) |

| Setting | Description |
| :--- | :--- |
| Off by E3 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode on *) |
| *) The parameters Behaviour AO at comm. error and Behaviour DO at comm. error are only <br> analyzed if the Failsafe-mode is ON. |  |

## Group parameters for the analog part

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Analog data format | Standard Reserved | $\begin{aligned} & \hline 0 \\ & 255 \end{aligned}$ | BYTE | 0 |
| Behaviour AO at comm. error *) | Off <br> Last value <br> Last value 5 s <br> Last value 10 s <br> Substitute value <br> Substitute value <br> 5 s <br> Substitute value 10 s | $\begin{aligned} & \hline 0 \\ & 1 \\ & 6 \\ & 6 \\ & 11 \\ & 2 \\ & 7 \\ & 12 \end{aligned}$ | BYTE | 0 |

Channel parameters for the analog inputs (4x)

| Name | Value | Internal value | Internal value, type | Default |

Table 240: Channel configuration

| Internal value | Operating modes of the analog inputs, individually configurable |
| :---: | :---: |
| 0 (default) | Not used |
| 1 | 0 ... 10 V |
| 2 | Digital input |
| 3 | 0 ... 20 mA |
| 4 | $4 \ldots 20 \mathrm{~mA}$ |
| 5 | -10 V ... +10 V |
| 8 | 2-wire Pt100-50 ... $+400^{\circ} \mathrm{C}$ |
| 9 | 3-wire Pt100-50 ... $+400^{\circ} \mathrm{C}$ *) |
| 10 | 0 ... 10 V (voltage diff.) *) |
| 11 | -10 V ... +10 V (voltage diff.) *) |
| 14 | 2-wire Pt100-50 ... $+70^{\circ} \mathrm{C}$ |
| 15 | 3 -wire Pt100 -50 ... $+70^{\circ} \mathrm{C}$ *) |
| 16 | 2-wire Pt1000-50 ... $+400{ }^{\circ} \mathrm{C}$ |
| 17 | 3 -wire Pt1000-50 ... $+400{ }^{\circ} \mathrm{C}$ *) |
| 18 | 2-wire Ni1000-50 ... $+150^{\circ} \mathrm{C}$ |
| 19 | 3-wire Ni1000-50 ... $+150^{\circ} \mathrm{C}$ *) |
| *) In the operating modes with 3 -wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1 ). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0 ). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1). |  |

Table 241: Channel monitoring

| Internal Value | Check Channel |
| :--- | :--- |
| 0 (default) | Plausibility, wire break, short circuit |
| 3 | Not used |

## Channel parameters for the analog outputs (2x)

| Substitute value for 10 s and <br> then turn off | Substitute value 10 sec | Depending on configuration |

## Group parameters for the digital part

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Input delay | $\begin{aligned} & \hline 0.1 \mathrm{~ms} \\ & 1 \mathrm{~ms} \\ & 8 \mathrm{~ms} \\ & 32 \mathrm{~ms} \end{aligned}$ | $\begin{array}{\|l\|} \hline 0 \\ 1 \\ 2 \\ 3 \end{array}$ | BYTE | $\begin{aligned} & 0.1 \mathrm{~ms} \\ & 0 \times 00 \end{aligned}$ |
| Detect short circuit at outputs | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | $\begin{aligned} & \text { On } \\ & 0 \times 01 \end{aligned}$ |
| Behaviour DO at comm. error ${ }^{1}$ ) | Off <br> Last value <br> Last value 5 sec <br> Last value 10 sec <br> Substitute value <br> Substitute value 5 sec <br> Substitute value 10 sec | $\begin{aligned} & \hline 0 \\ & 1 \\ & 6 \\ & 6 \\ & 11 \\ & 2 \\ & 7 \\ & 12 \end{aligned}$ | BYTE | $\begin{aligned} & \text { Off } \\ & 0 \times 00 \end{aligned}$ |
| Substitute value at output | 0 ... 255 | 00h ... FFh | BYTE | $\begin{aligned} & 0 \\ & 0 \times 0000 \end{aligned}$ |
| Detect voltage overflow at outputs ${ }^{2}$ ) | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | $\begin{aligned} & \mathrm{On} \\ & 0 \times 01 \end{aligned}$ |
| ${ }^{1}$ ) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON. <br> ${ }^{2}$ ) The state "externally voltage detected" appears, if the output of a channel DC0 ... DC7 should be switched on while an externally voltage is connected ${ }^{\mu}$ Chapter 5.2.6.5.1.4 "Connections" on page 1072. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF". |  |  |  |  |

## Diagnosis

Table 245: Structure of the diagnosis block

| Byte Number | Description | Possible Values |
| :---: | :---: | :---: |
| 1 | Diagnosis Byte, slot number | $31=$ CI521-MODTCP (e. g. error at integrated 8 DI / 8 DO) <br> 1 = 1st connected S500 I/O Module <br> ... <br> $10=10$ th connected S500 I/O Module |
| 2 | Diagnosis Byte, module number | According to the I/O bus specification passed on by modules to the fieldbus master |
| 3 | Diagnosis Byte, channel | According to the I/O bus specification passed on by modules to the fieldbus master |
| 4 | Diagnosis Byte, error code | According to the I/O bus specification Bit 7 and bit 6, coded error class $\begin{aligned} & 0=\mathrm{E} 1 \\ & 1=\mathrm{E} 2 \\ & 2=\mathrm{E} 3 \\ & 3=\mathrm{E} 4 \end{aligned}$ <br> Bit 0 to bit 5, coded error description |
| 5 | Diagnosis Byte, flags | According to the I/O bus specification <br> Bit 7: 1 = coming error <br> Bit 6: 1 = leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version $\geq 3.2 .6$ is required.

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or $10=$ Position of the Communication Module;14 = I/O bus; $31=$ Module itself <br> The identifier is not contained in the CI521-MODTCP diagnosis block. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: $31=$ Module itself; $1 . .10=$ Expansion module |
| ${ }^{3}$ ) | With "Module" the following allocation applies: 31 = Module itself <br> Module type (1 = AI, 2 = DO, 3 = AO) |
| ${ }^{4}$ ) | This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage © Chapter 5.2.6.5.1.4 "Connections" on page 1072. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| ${ }^{5}$ ) | The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3 « Chapter 5.2.6.5.1.4 "Connections" on page 1072. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DOO...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 100 ms . Then a new start up will be executed. This diagnosis message appears per channel. |

| ${ }^{8}$ ) | In case of an I/O module doesn't support hot swapping, do not perform any <br> hot swap operations (also not on any other terminal units (slots)) as modules <br> may be damaged or I/O bus communication may be disturbed. |
| :--- | :--- |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index FO. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 246: States of the 5 system LEDs

| LED | Color | OFF | ON | Flashing |
| :---: | :---: | :---: | :---: | :---: |
| PWR/RUN | Green | Process supply voltage missing | Internal supply voltage OK, module ready for communication with IO Controller | Start-up / preparing communication |
|  | Yellow | --- | --- | --- |
| STA1 ETH <br> (System LED "BF") | Green | --- | Device configured, cyclic data exchange running | Device configured, acyclic data exchange running |
|  | Red | -- | Communication error (timeout) appeared | IP address error |
| STA2 ETH(System LED"SF") | Green | Device has valid parameters | Device is running parameterization sequenze | Device has no parameters |
|  | Red | --- | --- | Device has invalid parameters |
| S-ERR | Red | No error | Internal error | -- |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version $\&$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltages UP/UP3 |  |  |
|  | Rated value | $24 \mathrm{~V} \mathrm{DC} \mathrm{(for} \mathrm{inputs} \mathrm{and} \mathrm{outputs)}$ |
|  | Max. load for the terminals | 10 A |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP/UP3 | 10 A fast |
|  | Galvanic isolation | Ethernet interface against the rest of the <br> module |
|  | Inrush current from UP (at power up) | On request |
|  | Current consumption via UP (normal <br> operation) | 0.2 A |
|  | Current consumption via UP3 | $0.06 \mathrm{~A}+0.5$ A max. per output |

| Parameter | Value |
| :---: | :---: |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of analog inputs | 4 |
| Number of analog outputs | 2 |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Ethernet | 10/100 base-TX, internal switch, $2 \times$ RJ45 socket |
| Setting of the IP address | With ABB IP config tool and 2 rotary switches at the front side of the module |
| Diagnose | See Diagnosis and Displays $\stackrel{\mu}{ }{ }^{\mu}$ Chapter 5.2.6.5.1.9 "Diagnosis" on page 1096 |
| Operation and error displays | 32 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Extended ambient temperature (XC version) | > +60 ${ }^{\circ} \mathrm{C}$ on request |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DI0 ... DI7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1$)$ |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | $0-$ Signal |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | Undefined Signal | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
|  | 1-Signal | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |  |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |  |
| Input current per channel |  |  |
|  | Input voltage +24 V | Typ. 5 mA |
|  | Input voltage +5 V | $>1 \mathrm{~mA}$ |
|  | Input voltage +15 V | $>2 \mathrm{~mA}$ |
|  | Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals 3.0 ... 3.7 |
| Reference potential for all outputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |

| Parameter | Value |
| :--- | :--- |
| Max. cable length |  |
|  | Shielded |
|  | Unshielded |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 219: Digital input/output (circuit diagram)
1 Digital Output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the analog inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{AlO}+\ldots \mathrm{Al3+}$ | Terminals 1.0 ... 1.3 |
| Reference potential for $\mathrm{AlO}+\ldots \mathrm{Al3+}$ | Terminal 1.4 (AI-) for voltage and RTD measurement <br> Terminal 1.9, 2.9 and 3.9 for current measurement |
| Input type |  |
| Unipolar | Voltage 0 V ... 10 V , current or Pt100/Pt1000/ Ni1000 |
| Bipolar | Voltage -10 V ... +10 V |
| Galvanic isolation | Against Ethernet network |
| Configurability | $0 \vee \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 / 4 \mathrm{~mA} . . .20 \mathrm{~mA}$, Pt100/1000, Ni1000 (each input can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ Current: $100 \mu \mathrm{~s}$ |
| Indication of the input signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Conversion cycle | 1 ms (for 4 inputs +2 outputs); with RTDs Pt/Ni ... 1 s |

| Parameter | Value |
| :--- | :--- |
| Resolution | Range $0 \mathrm{~V} \ldots .10 \mathrm{~V}: 12$ bits <br> Range $-10 \mathrm{~V} \ldots+10 \mathrm{~V}: 12$ bits including sign <br> Range $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range RTD (Pt100, PT1000, Ni1000): +0.1 ${ }^{\circ} \mathrm{C}$ |

### 5.2.6.5.2 CI522-MODTCP

Features

- 8 digital inputs 24 V DC
- 8 digital outputs $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs $24 \mathrm{~V} D C, 0.5 \mathrm{~A}$ max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states of the digital configurable inputs/outputs (DC0 ... DC7)
8 yellow LEDs to display the signal states of the digital inputs (DI8 ... DI15)
8 yellow LEDs to display the signal states of the digital outputs (DO8 ... DO15)
2 green LEDs to display the process supply voltage UP and UP3
3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
Label

102 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
${ }_{*}^{*}+{ }_{*}^{*}$ Sign for XC version

## Intended purpose

Modbus TCP communication interface module CI522-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0 ... 1.7)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special $X C$ version of the device is available.

## Functionality

| Interface | Ethernet |
| :--- | :--- |
| Protocol | Modbus TCP |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O <br> expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | for setting the last BYTE of the IP ADDRESS <br> $(00 h ~ . . . ~ F F h) ~$ |
| Configurable digital inputs/outputs | 8 (configurable via software) |
| Digital inputs | $8(24$ V DC; delay time configurable via soft- <br> ware) |
| Digital outputs | 8 (24 V DC, 0.5 A max.) |
| LED displays | For system displays, signal states, errors and <br> power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply <br> voltage 24 V DC) |

## Connections

## General

The Ethernet communication interface module CI522-MODTCP is plugged on the I/O terminal unit TU507-ETH $\Rightarrow$ Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270 or TU508-ETH $\Leftrightarrow$ Chapter 5.2.7.2 "TU507-ETH and TU508ETH for Ethernet communication interface modules" on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting $\Leftrightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

## Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

| S500 I/O module type | First index with firmware version above 1.9 |
| :--- | :--- |
| Al523 | D0 |
| Al523-XC | D0 |
| AI531 | A3 |
| AI531-XC | A0 |
| AO523 | D0 |
| AO523-XC | D0 |
| AX521 | D0 |
| AX521-XC | D0 |
| AX522 | D0 |
| AX522-XC | D0 |
| CD522 | A2 |

| S500 I/O module type | First index with firmware version above 1.9 |
| :--- | :--- |
| CD522-XC | A0 |
| DA501 | A2 |
| DA501-XC | A0 |
| DA502 | A1 |
| DA502-XC | A1 |
| DC522 | D0 |
| DC522-XC | D0 |
| DC523 | D0 |
| DC523-XC | D0 |
| DC532 | D0 |
| DC532-XC | D0 |
| D5524 | D0 |
| DI524-XC | D0 |
| DO524 | A2 |
| DO524-XC | A2 |
| DX522 | D0 |
| DX522-XC | D0 |
| DX531 | D0 |
| AC522 | D0 |
| PD501 | D0 |

Do not connect any voltages externally to digital outputs!
This ist not intended usage.
Reason: Externally voltages at one or more terminals DC0 ... DC7 or DO8 ... DO15 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.
This limitation does not apply for the input channels DIO ... DI7.

## CAUTION!

## Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO8 ... DO15 and DC0 ... DC7.

The assignment of the other terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | DC0 | Signal of the configurable digital input/output <br> DC0 |
| 1.1 | DC1 | Signal of the configurable digital input/output <br> DC1 |

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 1.2 | DC2 | Signal of the configurable digital input/output DC2 |
| 1.3 | DC3 | Signal of the configurable digital input/output DC3 |
| 1.4 | DC4 | Signal of the configurable digital input/output DC4 |
| 1.5 | DC5 | Signal of the configurable digital input/output DC5 |
| 1.6 | DC6 | Signal of the configurable digital input/output DC6 |
| 1.7 | DC7 | Signal of the configurable digital input/output DC7 |
| 1.8 | UP | Process voltage UP (24 V DC) |
| 1.9 | ZP | Process voltage ZP (0 V DC) |
| 2.0 | DI8 | Signal of the digital input DI8 |
| 2.1 | DI9 | Signal of the digital input DI9 |
| 2.2 | DI10 | Signal of the digital input DI10 |
| 2.3 | DI11 | Signal of the digital input DI11 |
| 2.4 | DI12 | Signal of the digital input DI12 |
| 2.5 | DI13 | Signal of the digital input DI13 |
| 2.6 | DI14 | Signal of the digital input DI14 |
| 2.7 | DI15 | Signal of the digital input DI15 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | DO8 | Signal of the digital output DO8 |
| 3.1 | DO9 | Signal of the digital output DO9 |
| 3.2 | DO10 | Signal of the digital output DO10 |
| 3.3 | DO11 | Signal of the digital output DO11 |
| 3.4 | DO12 | Signal of the digital output DO12 |
| 3.5 | DO13 | Signal of the digital output DO13 |
| 3.6 | DO14 | Signal of the digital output DO14 |
| 3.7 | DO15 | Signal of the digital output DO15 |
| 3.8 | UP3 | Process voltage UP3 (24 V DC) |
| 3.9 | ZP | Process voltage ZP (0 V DC) |

WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 220: Connection of the communication interface module CI522-MODTCP
\& Chapter 6.8.4.1 "Modbus communication interface module" on page 4568

## Connection of the digital inputs

Fig. 221: Connection of the digital inputs (DI8 ... DI15) to the module CI522-MODTCP The meaning of the LEDs is described in Displays $\stackrel{\xi}{ }{ }^{\circ}$ Chapter 5.2.6.5.2.10 "State LEDs" on page 1128.

## Connection of the digital outputs

Fig. 222: Connection of the digital output DO8. Proceed with the digital outputs DO9 ... DO15 in the same way
The meaning of the LEDs is described in Displays ${ }^{\mu}$ Chapter 5.2.6.5.2.10 "State LEDs" on page 1128.

## Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 ... DC7 in the same way.

## CAUTION!

If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device $\left.{ }^{\star}\right\rangle$ Chapter 5.2.6.5.2.4 "Connections" on page 1113.

The meaning of the LEDs is described in Displays ${ }^{\leftrightarrows}$ Chapter 5.2.6.5.2.10 "State LEDs" on page 1128.

## Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

| Pin assignment | Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1 | TxD+ | Transmit data + |
|  |  | 2 | TxD- | Transmit data - |
|  |  | 3 | RxD+ | Receive data + |
|  | RJ45 | 4 | NC | Not connected |
|  | $\square 8$ | 5 | NC | Not connected |
|  |  | 6 | RxD- | Receive data - |
|  |  | 7 | NC | Not connected |
|  |  | 8 | NC | Not connected |
|  |  | Shield | Cable shield | Functional earth |

In corrosive environment, please protect unused connectors using the TA535 accessory.
Not supplied with this device.

②) Further information about wiring and cable types

## Internal data exchange

| Digital inputs (bytes) | 5 |
| :--- | :--- |
| Digital outputs (bytes) | 5 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Replacement of a Modbus TCP communication interface module:

The module must be powered off before it is replaced. If the configuration data is stored in the module, then the configuration data must be downloaded into the new module, either by using Modbus communication or by using the Modbus configurator which is contained in the Automation Builder distribution.
ⓨ Chapter 6.3.2.12.2 "Unbundled CI52x-MODTCP configuration" on page 1565

## Addressing

The IP address of the CI5221-MODTCP Module can be set with the "ABB IP Configuration Tool" $\Leftrightarrow$ Chapter 6.3.2.2.4.3 "Configuration of the IP settings with the IP configuration tool" on page 1457.
If the last byte of the IP is set to 0 , the address switch will be used instead.
Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the "ABB IP Configuration Tool".
Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.
The factory setting for the IP is 192.168.0.x (last byte is address switch).

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

## I/O configuration

The CI522-MODTCP stores configuration parameters (IP address configuration, module parameters).
The digital I/O channels are configured via software.
Details about configuration are described in Parameterization $\Leftrightarrow$ Chapter 5.2.6.5.2.8 "Parameterization" on page 1120.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Module ID ${ }^{1}$ ) | Internal | 7405 | WORD | 7405 |
| Ignore Module | Internal | 0 | BYTE | 0 |
| Parameter length | Internal | 47 | BYTE | 47 |

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |

|  | Off by E4 | 1 |  |  |
|  | Off by E3 | 3 |  |  |
|  | On + failsafe | 16 |  |  |
|  | Off by E4 + failsafe | 17 |  |  |
|  | Off by E3 + failsafe | 19 |  |  |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X, y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X, y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, $\mathrm{X}, \mathrm{y}, \mathrm{z}$ | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W,X,y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X, y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, $\mathrm{X}, \mathrm{y}, \mathrm{z}$ | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X,y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Master IP for Write restriction ${ }^{4}$ ) | No master IP Master IP | 0,0,0,0 W, X, y,z | ARRAY[0..3] OF BYTE | 0,0,0,0 |
| Timeout for Bus supervision | No supervision 10 ms timeout 20 ms timeout | $\begin{aligned} & 0 \\ & 1 \\ & 2 \end{aligned}$ | BYTE | No supervision |
| IO Mapping Structure ${ }^{3}$ ) | Fixed Mapping Dynamic Mapping | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | 0 |
| Reserved | Internal | 0 | ARRAY[0..2] OF BYTE | 0,0,0 |
| Check supply | off on | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | 1 |
| Fast counter | 0 $10^{2} \text { ) }$ | $\begin{aligned} & 0 \\ & : \\ & 10 \end{aligned}$ | BYTE | 0 |

Remarks:

| $\left.{ }^{1}\right)$ | With a faulty ID, the module reports a "parameter error" and does not <br> perform cyclic process data transmission. |
| :--- | :--- |
| $\left.{ }^{2}\right)$ | Counter operating modes $\leadsto$ Chapter 5.2.4.3.2.9 "Fast counter" <br> on page 606 |
| $\left.{ }^{3}\right)$ | Fixed Mapping means each module has its own Modbus registers <br> for data transfer independent of the I/O bus constellation description <br> G Chapter 6.8.4.1.2 "Modbus TCP registers" on page 4570. <br> Dynamic mapping means the structure of the IO Date is dependent on <br> the I/O bus constellation. Each I/O bus expansion module starts directly <br> after the module before on the next Word address. |
| $\left.{ }^{4}\right)$ | If none of the parameters is set all masters / clients in the network have <br> read and write rights on the CI52x-MODTCP device and its connected <br> expansion modules. <br> If at least one parameter is set only the configured masters / clients have <br> write rights on the CI52x-MODTCP device, all other masters / clients still <br> have read access to the CI52x-MODTCP device. |

Table 248: Table Error LED / Failsafe function

| Setting | Description |
| :--- | :--- |
| On | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode off |
| Off by E4 | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode off |
| Off by E3 | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode off |
| On + Failsafe | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode on *) |
| Off by E4 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode on *) |
| Off by E3 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode on *) |
| *) The parameter Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON. |  |

## Group parameters for the digital part

| Name | Value | Internal <br> value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Input delay | 0.1 ms | 0 | BYTE | 0.1 ms |
|  | 1 ms | 2 | $0 \times 00$ |  |
|  | 8 ms |  |  |  |
| 32 ms |  |  |  |  |$\quad 3$|  |  |  |
| :--- | :--- | :--- |
| Detect short cir- <br> cuit at outputs | Off <br> On | 0 |

| Name | Value | Internal <br> value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Behaviour DO at <br> comm. error ${ }^{1}$ ) | Off <br> Last value <br> Last value 5 sec <br> Last value 10 sec <br> Substitute value <br> Substitute value 5 <br> sec <br> Substitute value 10 <br> sec | 11 <br> 6 | BYTE <br> 12 | Off <br> $0 \times 00$ |
| Substitute value <br> at output | $0 \ldots 65535$ | $0000 \mathrm{~h} \ldots$ FFFFWVORD | 0 |  |
| Preventive <br> voltage feedback <br> monitoring for <br> DC0 ... DC7 ${ }^{2}$ ) | Off <br> On | 0 | 1 | 0x0000 |
| Detect voltage <br> overflow at out- <br> puts ${ }^{3}$ ) | Off <br> On | 0 | Off |  |

Remarks:

| ${ }^{1}$ ) | The parameter Behaviour DO at comm. error is apply to DC and DO <br> channels and only analyzed if the Failsafe-mode is ON. |
| :--- | :--- |
| ${ }^{2}$ ) | The state "externally voltage detected" appears, if the output of a <br> channel DC0 ... DC7 should be switched on while an externally voltage <br> is connected. In this case the start up is disabled, as long as the exter- <br> nally voltage is connected. The monitoring of this state and the resulting <br> diagnosis message can be disabled by setting the parameters to "OFF". |
| $\left.{ }^{3}\right)^{2}$ | The error state "voltage overflow at outputs" appears, if externally <br> voltage at digital outputs DC0 ... DC7 and accordingly DO8 ... DO15 <br> has exceeded the process supply voltage UP3 』 Chapter 5.2.6.5.2.4 <br> "Connections" on page 1113. The according diagnosis message "Voltage <br> overflow on outputs " can be disabled by setting the parameters on <br> "OFF". This parameter should only be disabled in exceptional cases for <br> voltage overflow may produce reverse voltage. |

## Diagnosis

Table 249: Structure of the Diagnosis Block

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 1 | Diagnosis Byte, slot <br> number | $31=\mathrm{CI} 502-\mathrm{PNIO}$ (e. g. error at integrated <br> $8 \mathrm{DI} / 8 \mathrm{DO})$ <br> $1=1$ st connected S500 I/O Module <br> $\ldots$ |
| 2 | Diagnosis Byte, module <br> number | According to the I/O bus specification <br> passed on by modules to the fieldbus <br> master |

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 3 | Diagnosis Byte, channel | According to the I/O bus specification <br> passed on by modules to the fieldbus <br> master |
| 4 | Diagnosis Byte, error code | According to the I/O bus specification <br> Bit 7 and bit 6, coded error class <br> $0=\mathrm{E} 1$ <br> $1=\mathrm{E} 2$ <br> $2=\mathrm{E} 3$ <br> $3=\mathrm{E} 4$ |
| 5 |  | Biagnosis Byte, flags 0 to bit 5, coded error description |
|  |  | According to the I/O bus specification <br> Bit $7: 1=$ coming error |
|  |  | Bit 6: $1=$ leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version $\geq 3.2 .6$ is required.

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or $10=$ Position of the Communication Module; $14=1 / \mathrm{O}$ bus; $31=$ Module itself <br> The identifier is not contained in the CI502-PNIO diagnosis block. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: 31 = Module itself, $1 . .10=$ Expansion module |
| ${ }^{3}$ ) | With "Module" the following allocation applies dependent of the master: <br> Module error: 31 = Module itself <br> Channel error: Module type ( 1 = AI, 2 = DO, 3 = AO) |
| ${ }^{4}$ ) | This message appears, if externally voltages at one or more terminals DC0 ... DC7 oder DO8 ... DO15 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' * Chapter 5.2.6.5.2.4 "Connections" on page 1113. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| ${ }^{5}$ ) | The voltage at digital outputs DC0 ... DC7 and accordingly DO8 ... DO15 has exceeded the process supply voltage UP3 $\%$ Chapter 5.2.6.5.2.4 "Connections" on page 1113. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DC0 ... DC7 or DO8 ... DO15 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 2000 ms . Then a new start up will be executed. This diagnosis message appears per channel. |
| $\left.{ }^{8}\right)$ | In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed. |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index F0. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 250: States of the 5 system LEDs

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| PWR/RUN | Green | Process supply <br> voltage missing | Internal supply <br> voltage OK, <br> module ready for <br> communication <br> with I/O Con- <br> troller | Start-up / pre- <br> paring communi- <br> cation |
|  | Yellow | --- | --- |  |

| LED | Color | OFF | ON | Flashing |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{\circledR}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | Ethernet interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.15 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of configurable digital inputs/outputs | 8 |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Ethernet | 10/100 base-TX, internal switch, $2 \times$ RJ45 socket |
| Setting of the I/O device identifier | With 2 rotary switches at the front side of the module |
| Diagnosis | See Diagnosis and Displays $\stackrel{H}{ }$ Chapter 5.2.6.5.2.9 "Diagnosis" on page 1123 |
| Operation and error displays | 34 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Extended ambient temperature (XC version) | > +60 ${ }^{\circ} \mathrm{C}$ on request |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DI8 ... DI15 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (negative pole of the supply <br> voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
| Undefined Signal | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripnal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 1 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
| Input current per channel | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Typ. 5 mA |
|  | Input voltage +15 V |
| Input voltage +30 V | $>1 \mathrm{~mA}$ |
| Max. cable length | $>2 \mathrm{~mA}$ |
|  | Shielded |
| Unshielded | $<8 \mathrm{~mA}$ |
|  | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |

| Parameter | Value |
| :---: | :---: |
| Terminals of the channels DO8 ... DO15 | Terminals 3.0 ... 3.7 |
| Reference potential for all outputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

Fig. 223: Digital input/output (circuit diagram)
1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the configurable digital inputs/outputs
Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
|  | Channels DC0 ... DC7 |
| If the channels are used as outputs | Terminals $1.0 \ldots 1.7$ |
| Channels DC0 ... DC7 |  |
| Indication of the input/output signals | 1 yellow LED per channel, the LED is ON when <br> the input/output signal is high (signal 1) |
| Galvanic isolation | From the Ethernet network |

## Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals 1.0 ... 1.7 |
| Reference potential for all inputs | Terminals 1.9 ... 3.9 (negative pole of the supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable from 0.1 ms .. 32 ms |
| Input signal voltage | 24 V DC |
| Signal 0 | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ ) |
| Undefined Signal | > +5 V ... < +15 V |
| Signal 1 | +15 V ... +30 V |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ *) |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5 V | $>1 \mathrm{~mA}$ |
| Input voltage +15 V | $>2 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

[^20]
## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :---: | :---: |

### 5.2.6.6 PROFIBUS

### 5.2.6.6.1 CI541-DP

## Features

- 4 configurable analog inputs (2-wire/single-ended) or 2 configurable analog inputs (3-wire/ differential)
Resolution 12 bits including sign
- 2 analog outputs

Resolution 12 bits including sign

- 8 digital inputs 24 V DC in 1 group
- 8 digital outputs 24 V DC in 1 group, 0.5 A max.
- Fast counter
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
36 yellow LEDs to display the signal states of the analog inputs/outputs (AIO ... AI3, AO0 ... AO1)
48 yellow LEDs to display the signal states of the digital inputs (DIO ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
62 green LEDs to display the process supply voltage UP and UP3
3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
5 system LEDs: PWR/RUN, STA1 DP, STA2 DP, S-ERR, I/O-Bus
Label
2 rotary switches for setting the PROFIBUS ID
9-pin D-SUB connector to connect the PROFIBUS DP signals
Terminal unit
DIN rail
Sign for XC version

## Intended purpose

The PROFIBUS DP communication interface module is used as decentralized I/O module in PROFIBUS DP networks. Depending on the used terminal unit the network connection is performed either via 9-pole female D-sub or via 10 terminals (screw-type or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels.
The inputs/outputs are galvanically isolated from the PROFIBUS DP network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.
For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

- 4 configurable analog inputs (2-wire/single-ended) or 2 configurable analog inputs (3-wire/ differential)
Resolution 12 bits including sign
- 2 analog outputs

Resolution 12 bits including sign

- 8 digital inputs 24 V DC in 1 group
- 8 digital outputs 24 V DC in 1 group, 0.5 A max.
- Fast counter
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

## Diagnosis settings

The current CI54x does not run in combination with a V3 PLC if in the "General" tab the parameter "Diagnosis behavior" is set to "AC500 V3 compatible". How to change the setting in your $A B$ project is described below.

1. Double click in the "Device" tree on "CI541_IO".
$\Rightarrow$ The tab for the various settings opens.
2. Double click on the "General" tab.
3. Double click on the "Value" of the parameter "Diagnosis behavior".
4. Click on the small arrow.
$\Rightarrow$ A submenu with two values opens.
5. Click on "AC500 V2 compatible" as setting.
6. Close the tab.

After changing the parameter to "AC500 V2 compatible" the CI54x get in "RUN".
If the CI54x indicates a S500 diagnosis message, following AC500 diagnosis entry (" 655374 CI54x communication interface module is sending not supported diagnosis format - Check configuration and FW revision of communication interface module") is shown in the diagnosis editor and history. This diagnosis message does not have impact to cyclic data exchange between the master and the CI 54 x .

In case of a parameter change from V 2 to V 3 the parameter at the Cl 54 x of V 3 has the same value than at the CI54x below V2 (that means AC500 V2 compatible).

## Functionality

| Parameter | Value |
| :--- | :--- |
| Interface | PROFIBUS |
| Protocol | PROFIBUS DP (DP-V0 and DP-V1) |

| Parameter | Value |
| :---: | :---: |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the PROFIBUS ID for configuration purposes (00h to FFh) |
| Expandability | Max. 10 S500 I/O modules |
| Fast counter | Integrated, configurable operating modes |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU509, TU510, TU517 or TU518 $\stackrel{y}{ }{ }^{\wedge}$ Chapter 5.2.7.3 "TU509 and TU510 for communication interface modules" on page $1274 \Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 |

## Connections

## General

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The PROFIBUS DP communication interface module CI541-DP is plugged on the I/O terminal units TU509 ${ }^{\mu}$ chapter 5.2.7.3 "TU509 and TU510 for communication interface modules" on page 1274 or TU510 $\&$ Chapter 5.2.7.3 "TU509 and TU510 for communication interface modules" on page 1274 and accordingly TU517 $\Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 or TU518 $\Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting $\stackrel{y}{ }{ }^{\circ}$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8 and 3.8 as well as 2.9, 3.9 and 4.9 are interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 2.8 and 3.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 4.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 2.9, 3.9 and 4.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

## Do not connect any voltages externally to digital outputs!

Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This ist not intended usage.

## CAUTION!

## Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0 ... DO7.

## Possibilities of connection

## Connection on terminal units TU509 or TU510

The assignment of the 9-pole female D-sub for the PROFIBUS signals:

|  | 1 | --- | Reserved |
| :---: | :---: | :---: | :---: |
|  | 2 | --- | Reserved |
|  | 3 | B | Data line B (receive and send line, positive) |
|  | 4 | --- | Reserved |
|  | 5 | DGND | Reference potential for data transmissions and +5 V |
|  | 6 | VP (5 V) | +5 V (Power supply voltage for terminating resistors) |
|  | 7 | --- | Reserved |
|  | 8 | A | Data line A (receive and send line, negative) |
|  | 9 | --- | Reserved |
|  | Shield | Shield | Shield, functional earth |

## Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. Normally, these resistors are integrated in the interface connectors.

The grounding of the shield should take place at the control cabinet $\&$ Chapter 5.1.2 "System data AC500" on page 166.

## Mounting on terminal units TU517 or TU518

The assignment of the terminals 1.0 ... 1.9:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | B | Data line B (receive and send line, positive) |
| 1.1 | B | Data line B (receive and send line, positive) |
| 1.2 | A | Data line A (receive and send line, negative) |
| 1.3 | A | Data line A (receive and send line, negative) |
| 1.4 | TermB | Bus termination data line B |
| 1.5 | TermB | Bus termination data line B |
| 1.6 | TermA | Bus termination data line A |
| 1.7 | TermA | Bus termination data line A |
| 1.8 | DGND | Reference potential for data transmission |
| 1.9 | DGND | Reference potential for data transmission |

At the line ends of a bus segment, terminating resistors must be connected. If using TU517/ TU518, the bus terminating resistors can be enabled by connecting the terminals TermA and TermB to the data lines $A$ and $B$ (no external terminating resistors are required, see figure below).

If using TU517/TU518, note that the terminating resistors are not located inside the TU, but inside the communication interface module CI541-DP. I. e. when removing the device from the TU, the bus terminating resistors are not connected to the bus any more. The bus itself will not be disconnected if a device is removed.

If using TU517/TU518 the max. permitted transmission rate is limited to 1.5 MBaud.

The grounding of the shield should take place at the control cabinet ${ }^{\wedge} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

## Technical data bus cable

| Parameter | Value |
| :--- | :--- |
| Type | Twisted pair (shielded) |
| Characteristic impedance | $135 \ldots . .165 \Omega$ |
| Cable capacitance | $<30 \mathrm{pF} / \mathrm{m}$ |
| Conductor diameter of the cores | $\geq 0.64 \mathrm{~mm}$ |
| Conductor cross section of the cores | $\geq 0.34 \mathrm{~mm}^{2}$ |
| Cable resistance per core | $\leq 55 \Omega / \mathrm{km}$ |
| Loop resistance (resistance of two cores) | $\leq 110 \Omega / \mathrm{km}$ |

## Cable length

The maximum possible cable length of a PROFIBUS subnet within a segment depends on the transmission rate (baud rate).

| Transmission rate | Maximum cable length |
| :--- | :--- |
| 9.6 kBaud to 93.75 kBaud | 1200 m |
| 187.5 kBaud | 1000 m |
| 500 kBaud | 400 m |
| 1.5 MBaud | 200 m |
| 3 MBaud to 12 MBaud | 100 m |

The assignment of the other terminals:

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 2.0 | Al0+ | Positive pole of analog input signal 0 |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.
For simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

Fig. 225: Connection of the PROFIBUS DP communication interface module CI541-DP

## Connection of the digital inputs

Fig. 226: Connection of the digital input DIO (Proceed with the digital inputs DI1 ... DI7 in the same way)
The meaning of the LEDs is described in Displays ${ }^{\mu}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

## Connection of the digital outputs

Fig. 227: Connection of the digital output DO0 (Proceed with the digital outputs DO1 ... DO7 in the same way)

The meaning of the LEDs is described in Displays $\Leftrightarrow$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers ( $\mathrm{Pt} 100, \mathrm{Pt} 1000, \mathrm{Ni} 1000$ ) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI541-DP provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 228: Connection of resistance thermometers in 2-wire configuration to the analog input AIO (Proceed with the analog inputs Al1 ... Al3 in the same way)

The following measuring ranges can be configured ${ }^{4}$ " Chapter 5.2.6.6.1.9 "Parameterization" on page $1155{ }^{\wedge}>$ Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

The function of the LEDs is described under Diagnosis and displays / Displays $\Leftrightarrow$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

The module CI541-DP performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI541-DP provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 229: Connection of resistance thermometers in 3-wire configuration to the analog inputs AIO and AI1 (Proceed with the analog inputs AI2 and AI3 in the same way)

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ${ }^{\mu}$ Chapter 5.2.6.6.1.9 "Parameterization" on page $1155{ }^{\star} \Rightarrow$ Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

The function of the LEDs is described under Diagnosis and displays / Displays $\Leftrightarrow$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

The module CI541-DP performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

Fig. 230: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AIO (Proceed with the analog inputs AI1 ... AI3 in the same way)

The following measuring ranges can be configured $\stackrel{\star}{ }{ }^{\circ}$ Chapter 5.2.6.6.1.9 "Parameterization" on page $\left.1155{ }^{*}\right\rangle$ Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }_{幺}{ }^{\circ}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

Fig. 231: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AIO (Proceed with the analog inputs Al1 ... AI3 in the same way)
The following measuring ranges can be configured ${ }^{\mu} \Rightarrow$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155 * Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |

The function of the LEDs is described under 'State LEDs' $\Longleftrightarrow$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \ldots 20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AIO. Proceed with the analog inputs $\mathrm{Al} 1 . . \mathrm{Al} 3$ in the same way.

Fig. 232: Connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AIO (Proceed with the analog inputs Al1 ... AI3 in the same way)

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$ (also not with long cable lengths).

The following measuring ranges can be configured $\left.{ }^{\$}\right\rangle$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155 * Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of passive-type analog sensors (Current) to the analog inputs

Fig. 233: Connection of passive-type analog sensors (current) to the analog input AIO (Proceed with the analog inputs Al1 ... Al3 in the same way)
The following measuring ranges can be configured ${ }_{y}{ }^{\mu}$ Chapter 5.2.6.6.1.9 "Parameterization" on page $1155 \stackrel{\mu}{\mu}$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155 :

| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu} \boldsymbol{y}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

## CAUTION!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10 -volt Zener diode in parallel to Alx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1 ). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0 ), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.
The converted analog value is available at the odd channel (higher address).

## CAUTION!

## Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

Fig. 234: Connection of active-type analog sensors (voltage) to differential analog inputs AIO and Al1 (Proceed with AI2 and AI3 in the same way)
The following measuring ranges can be configured ${ }^{\sharp}$ Chapter 5.2.6.6.1.9 "Parameterization" on page $1155 \Leftrightarrow$ Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Voltage | $0 \vee \ldots 10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | with differential inputs, 2 chan- <br> nels used |

The function of the LEDs is described under Diagnosis and displays / Displays $\Leftrightarrow$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

To avoid error messages from unused analog input channels, configure them as "unused".

## Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

Fig. 235: Connection of digital sensors to the analog input AIO (Proceed with the analog inputs Al1 ... Al3 in the same way)
The following measuring ranges can be configured ${ }^{\leftrightarrows}$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155 出 Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Digital input | 24 V | 1 channel used |
| :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

## Connection of analog output loads (Voltage)

Fig. 236: Connection of analog output loads (voltage) to the analog output AOO (Proceed with the analog output AO1 in the same way)

The following measuring ranges can be configured ${ }^{\mu}$ Chapter 5.2.6.6.1.9 "Parameterization" on page $1155{ }^{\wedge}>$ Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | Load $\pm 10 \mathrm{~mA}$ max. | 1 channel used |
| :--- | :--- | :--- | :--- |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.6.6.1.11 "State LEDs" on page 1165.

Unused analog outputs can be left open-circuited.

## Connection of analog output loads (Current)

Fig. 237: Connection of analog output loads (current) to the analog output AOO (Proceed with the analog output AO1 in the same way)
The following measuring ranges can be configured ${ }^{\wedge} \Rightarrow$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155 \& Chapter 5.2.6.6.1.12 "Measuring ranges" on page 1166:

| Current | $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |
| :--- | :--- | :--- | :--- |
| Current | $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$ | Load $0 \Omega \ldots 500 \Omega$ | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays ${ }^{\mu}$ Chapter 5.2.6.6.1.10 "Diagnosis" on page 1160.

Unused analog outputs can be left open-circuited.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 3 |
| Digital outputs (bytes) | 3 |
| Analog inputs (words) | 4 |
| Analog outputs (words) | 2 |

| Parameter | Value |
| :--- | :--- |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

## I/O configuration

The CI541-DP PROFIBUS DP bus configuration is handled by PROFIBUS DP master with the exception of the slave bus ID (via rotary switches) and the transmission rate (automatic detection).

The analog/digital I/O channels and the fast counter are configured via software.
Details about configuration are described in Parameterization ${ }^{\mu} y$ Chapter 5.2.6.6.1.9 "Parameterization" on page 1155.

## Parameterization

## Parameters of the module

Table 252: Parameters of the module:

| Detect short cir- <br> cuit at outputs | 32 ms | Off | On | 1 |

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Behaviour digital outputs at communcation error ${ }^{1}$ ) | Off <br> Last value <br> Last value 5 sec <br> Last value 10 sec <br> Substitute value <br> Substitute value <br> 5 sec <br> Substitute value 10 sec | $\begin{aligned} & \hline 0 \\ & 1 \\ & 6 \\ & 11 \\ & 2 \\ & 7 \\ & 12 \end{aligned}$ | BYTE | $\begin{array}{l\|l\|} \hline \text { Off } \\ 0 \times 00 \end{array}$ |
| Substitute value at output | $0 \ldots 255$ | 00h ... FFh | BYTE | $\begin{aligned} & \hline 0 \\ & 0 \times 00 \end{aligned}$ |
| Detect voltage overflow at outputs ${ }^{2}$ ) | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | $\begin{array}{\|l\|} \hline \text { Off } \\ 0 \times 00 \end{array}$ |

${ }^{1}$ ) The parameters Behaviour digital outputs at communcation error is only analyzed if the Failsafe-mode is ON.
${ }^{2}$ ) The state "externally voltage detected" appears, if the output of a channel DC0 ... DC7 should be switched on while an externally voltage is connected ${ }^{\xi}$ Chapter 5.2.6.6.1.5 "Connections" on page 1139. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

## Diagnosis

Structure of the diagnosis block via DPM_SLV_DIAG function block.

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 1 | Data length (header included) | 7 |
| 2 | PROFIBUS DP V1 coding: <br> Vendor specific | 129 |
| 3 | Diagnosis Byte, slot number | $31=\mathrm{CI} 541-\mathrm{DP}$ (e. g. error at integrated 8 <br> $\mathrm{DI} / 8 \mathrm{DO})$ <br> $1=1$ st connected S500 I/O Module <br> $\ldots$ |
| 4 | Diagnosis Byte, module <br> number | According to the I/O bus specification <br> passed on by modules to the fieldbus <br> master |
| 5 | Diagnosis Byte, channel | According to the I/O bus specification <br> passed on by modules to the fieldbus <br> master |

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 6 | Diagnosis Byte, error code | According to the I/O bus specification |
|  |  | Bit 7 and bit 6, coded error class |
|  |  | $0=\mathrm{E} 1$ |
|  |  | $1=\mathrm{E} 2$ |
|  |  | $2=\mathrm{E} 3$ |
|  | $3=\mathrm{E} 4$ |  |
|  |  | Bit 0 to bit 5, coded error description |
| 7 | Diagnosis Byte, flags | According to the I/O bus specification |
|  |  | Bit 7: 1 = coming error |
|  | Bit 6: $1=$ leaving error |  |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

| $\left.{ }^{1}\right)$ | In AC500 the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; $0 \ldots 4$ or $10=$ Position of <br> the Communication Module; 14 = I/O bus; 31 = Module itself <br> The identifier is not contained in the CI541-DP diagnosis block. |
| :--- | :--- |
| $\left.{ }^{2}\right)$ | With "Device" the following allocation applies: $31=$ Module itself; $1 \ldots . .10=$ <br> Expansion module |
| $\left.{ }^{3}\right)$ | With "Module" the following allocation applies: <br> $31=$ Module itself <br> Channel error: Module type ( $1=$ AI, $2=$ DO, $3=$ AO $)$ |

| ${ }^{4}$ ) | This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in section 'Connection' \# Chapter 5.2.6.6.1.5 "Connections" on page 1139). All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| :---: | :---: |
| ${ }^{5}$ ) | The voltage on digital outputs DOO ... DO7 has overrun the process supply voltage UP3 (see description in section 'Connection' ${ }^{*}$ Chapter 5.2.6.6.1.5 "Connections" on page 1139). Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 100 ms . Then a new start up will be executed. This diagnosis message appears per channel. |
| ${ }^{8}$ ) | In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed. |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index F0. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1-DP, STA2-DP, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 259: States of the 5 system LEDs:

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| PWR/RUN | Green | Process supply <br> voltage missing | Internal supply <br> voltage OK, <br> module ready for <br> communication <br> with I/O Con- <br> troller | Start-up / pre- <br> paring communi- <br> cation |
|  |  | Yellow | --- | --- |
| STA1-DP | Green | --- | PROFIBUS run- <br> ning | Invalid device <br> parameters |
| STA2-DP | Red | No error | Bus timeout | No communica- <br> tion to master |
| S-ERR | Red | No error | Internal error | -- |
| I/O-Bus | Green | No communica- <br> tion interface <br> modules con- <br> nected or com- <br> munication error | Communication <br> interface <br> modules con- <br> nected and <br> operational | --- |

Table 260: States of the 27 process LEDs:

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| AIO to AI3 | Yellow | Input is OFF | Input is ON <br> (brightness <br> depends on the <br> value of the <br> analog signal) | -- |
| AO0 to AO1 | Yellow | Output is OFF | Output is ON <br> (brightness <br> depends on the <br> value of the <br> analog signal) | -- |
| DI0 to DI7 | Yellow | Input is OFF | Input is ON (the <br> input voltage is <br> even displayed if <br> the supply <br> voltage is OFF) | -- |
| DO0 toDO7 | Yellow | Green | Output is OFF <br> Process supply <br> voltage missing | Output is ON <br> Poltage OK and <br> initialization fin- <br> ished |
| UP | Green | Process supply <br> voltage missing | Process supply <br> voltage OK | --- |
| UP3 | No error or <br> process supply <br> voltage missing | Internal error <br> CH-ERR1 to CH- <br> ERR3 | Red | Error on one <br> channel of the <br> corresponding <br> group |

## Measuring ranges

Input ranges voltage, current and digital input

| Range | $\begin{aligned} & \mathrm{O} \text { V } \ldots+10 \\ & \mathrm{~V} \end{aligned}$ | $\begin{aligned} & -10 \mathrm{~V} \ldots \\ & +10 \mathrm{~V} \end{aligned}$ | $\begin{aligned} & 0 \mathrm{~mA} . . \\ & 20 \mathrm{~mA} \end{aligned}$ | $\begin{aligned} & 4 \mathrm{~mA} \ldots 20 \\ & \mathrm{~mA} \end{aligned}$ | Digital input | Digital value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version ${ }^{\wedge} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{\leftrightarrows}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltages UP/UP3 |  |  |
|  | Rated value | 24 V DC (for inputs and outputs) |
|  | Max. load for the terminals | 10 A |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP/UP3 | 10 A fast |
|  | Galvanic isolation | PROFIBUS interface against the rest of the <br> module |
|  | Inrush current from UP (at power up) | On request |
|  | Current consumption via UP (normal <br> operation) | 0.2 A |
|  | Current consumption via UP3 | $0.06 \mathrm{~A}+0.5 \mathrm{~A}$ max. per output |

| Parameter | Value |
| :---: | :---: |
| Connections | Terminals 2.8 and 3.8 for +24 V (UP) <br> Terminal 4.8 for +24 V (UP3) <br> Terminals 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Max. power dissipation within the module | 6 W |
| Configurable digital inputs/outputs | 8 |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Setting of the PROFIBUS DP identifier | With 2 rotary switches at the front side of the module |
| Diagnose | See Diagnosis ${ }^{〔}$ Chapter 5.2.6.6.1.10 "Diagnosis" on page 1160 |
| Operation and error displays | 32 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DIO ... DI7 | Terminals $3.0 \ldots 3.7$ |
| Reference potential for all inputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1$)$ |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |

| Parameter |  | Value |
| :--- | :--- | :--- |
| Input signal voltage | 24 V DC |  |
|  | 0 -Signal | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Undefined Signal | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
|  | 1-Signal | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |  |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |  |
| Input current per channel |  |  |
|  | Input voltage +24 V | Typ. 5 mA |
|  | Input voltage +5 V | $>1 \mathrm{~mA}$ |
|  | Input voltage +15 V | $>2 \mathrm{~mA}$ |
|  | Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals 4.0 ... 4.7 |
| Reference potential for all outputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 4.8 (positive pole of the <br> supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 500 mA at UP3 = 24 V |
|  | Rated value per channel |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5$ mA |
|  | Fuse for UP3 |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this <br> table) |
| Output switching frequency |  |
|  | With resistive load |
| With inductive loads | On request |
|  | With lamp loads |
| Short-circuit-proof / overload-proof | Max. 0.5 Hz |
| Overload message (I > 0.7 A) | 11 Hz max. at 5 W max. |

| Parameter | Value |
| :--- | :--- |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
|  | Shielded |
|  | Unshielded |

The module provides several diagnosis functions ${ }^{\circledR} \Rightarrow$ Chapter 5.2.6.6.1.10 "Diagnosis" on page 1160.

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels Al0+ ... Al3+ | Terminals $2.0 \ldots 2.3$ |
| Reference potential for Al0+ ... Al3+ | Terminal 2.4 (AI-) for voltage and RTD meas- <br> urement <br> Terminal $2.9,3.9$ and 4.9 for current measure- <br> ment |
| Input type | Unipolar <br> Bipolar <br> Valtage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$, current or Pt100/Pt1000/ <br> Ni1000 |
| Configurability | Voltage $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ |
| Channel input resistance | Against PROFIBUS <br> Pt100/1000, Ni1000 (each input can be config- <br> ured individually) |
| Time constant of the input filter | Voltage: $>100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |
| Indication of the input signals | Voltage: $100 \mu \mathrm{~s}$ <br> Current: $100 ~ \mu \mathrm{~s}$ |
|  | 1 LED per channel (brightness depends on the <br> value of the analog signal) |

| Parameter | Value |
| :--- | :--- |
| Conversion cycle | 1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ <br> $\mathrm{Ni} . . .1 \mathrm{~s}$ |
| Resolution | Range $0 \mathrm{~V} \ldots 10 \mathrm{~V}: 12$ bits <br> Range $-10 \mathrm{~V} \ldots+10 \mathrm{~V}: 12$ bits including sign <br> Range $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range RTD (Pt100, PT1000, Ni1000): +0.1 ${ }^{\circ} \mathrm{C}$ |
| Conversion error of the analog values <br> caused by non-linearity, adjustment error <br> at factory and resolution within the normal <br> range | Typ. 0.5 \%, max. $1 \%$ |
| Relationship between input signal and hex <br> code | Tables Input Ranges Voltage, Current and Dig- <br> ital Input and Input range resistance temper- <br> ature detector $\_$Chapter 5.2.6.6.1.12 "Meas- <br> uring ranges" on page 1166 |
| Unused inputs | Are configured as "unused" (default value) |
| Overvoltage protection | Yes |

Technical data of the analog inputs if used as digital inputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | Max. 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels $\mathrm{AlO}+\ldots \mathrm{Al3+}$ | Terminals 2.0 ... 2.3 |
| Reference potential for the inputs | Terminals 2.9, 3.9 and 4.9 (ZP) |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
| Signal 0 | -30 V ... +5 V |
| Undefined signal | +5 V ... +15 V |
| Signal 1 | +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 7 mA |
| Input voltage +5 V | Typ. 1.4 mA |
| Input voltage +15 V | Typ. 3.7 mA |
| Input voltage +30 V | < 9 mA |
| Input resistance | Ca. $3.5 \mathrm{k} \Omega$ |

## Technical data of the analog outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 2 |
| Distribution of channels into groups | 1 group for 2 channels |

| Parameter | Value |
| :---: | :---: |
| Connection of the channels $\mathrm{AO}+{ }^{\text {+ }}$. $\mathrm{AO} 1+$ | Terminals 2.5 ... 2.6 |
| Reference potential for $\mathrm{AO} 0+\ldots \mathrm{AO}+$ | Terminal 2.7 (AO-) for voltage output Terminal 2.9, 3.9 and 4.9 for current output |
| Output type |  |
| Unipolar | Current |
| Bipolar | Voltage |
| Galvanic isolation | Against PROFIBUS |
| Configurability | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} . .20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$ (each output can be configured individually) |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |
| Output loadability, as voltage output | $\pm 10 \mathrm{~mA}$ max. |
| Indication of the output signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Resolution | 12 bits including sign |
| Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% |
| Relationship between input signal and hex code | Table Output Ranges Voltage and Current ⓨ Chapter 5.2.6.6.1.12.3 "Output ranges voltage and current" on page 1168 |
| Unused outputs | Are configured as "unused" (default value) and can be left open-circuited |

## Technical data of the fast counter

| Parameter | Value |
| :--- | :--- |
| Used inputs | Terminal 3.0 (DIO), 3.1 (DI1) |
| Used outputs | Terminal 4.0 (DO0) |
| Counting frequency | Depending on operation mode: <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  Mode 1-6: 7ax. max. 200 kHz |
| Mode 10: max. 35 kHz |  |

³ Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

## Ordering data

| Ordering No. | Scope of delivery | Product life cycle phase *) |
| :--- | :--- | :--- |

### 5.2.6.6.2 CI542-DP

Features

- 8 digital inputs 24 V DC
- 8 digital outputs $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs $24 \mathrm{~V} D C, 0.5 \mathrm{~A}$ max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states of the configurable digital inputs/outputs (DC0 ... DC7)
48 yellow LEDs to display the signal states of the digital inputs (DI8 ... DI15)
58 yellow LEDs to display the signal states of the digital outputs (DO8 ... DO15)
62 green LEDs to display the process supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 system LEDs: PWR/RUN, STA1 DP, STA2 DP, S-ERR, I/O-Bus
9 Label
102 rotary switches for setting the PROFIBUS ID
11 9-pin D-SUB connector to connect the PROFIBUS DP signals
12 Terminal unit
13 DIN rail
${ }_{x}^{*}+{ }_{*}^{*}$ Sign for XC version

## Intended purpose

The PROFIBUS DP communication interface module is used as decentralized I/O module in PROFIBUS networks. Depending on the used terminal unit the network connection is performed either via 9-pole female D-sub or via 10 terminals (screw-type or spring terminals) which are integrated in the terminal unit.
The inputs/outputs are galvanically isolated from the PROFIBUS network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.
For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Diagnosis settings

The current CI54x does not run in combination with a V3 PLC if in the "General" tab the parameter "Diagnosis behavior" is set to "AC500 V3 compatible". How to change the setting in your $A B$ project is described below.

1. Double click in the "Device" tree on "Cl541_IO". $\Rightarrow$ The tab for the various settings opens.
2. Double click on the "General" tab.
3. Double click on the "Value" of the parameter "Diagnosis behavior".
4. Click on the small arrow. $\Rightarrow$ A submenu with two values opens.
5. Click on "AC500 V2 compatible" as setting.
6. Close the tab.

After changing the parameter to "AC500 V2 compatible" the CI54x get in "RUN".
If the Cl 54 x indicates a S500 diagnosis message, following AC500 diagnosis entry ("655374 CI54x communication interface module is sending not supported diagnosis format - Check configuration and FW revision of communication interface module") is shown in the diagnosis editor and history. This diagnosis message does not have impact to cyclic data exchange between the master and the CI 54 x .

In case of a parameter change from V2 to V3 the parameter at the Cl 54 x of V 3 has the same value than at the $\mathrm{Cl} 54 x$ below V 2 (that means AC 500 V 2 compatible).

## Connections

## General

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The PROFIBUS DP communication interface module CI542-DP is plugged on the I/O terminal units TU509 \& Chapter 5.2.7.3 "TU509 and TU510 for communication interface modules" on page 1274 or TU510 $\Leftrightarrow$ Chapter 5.2.7.3 "TU509 and TU510 for communication interface modules" on page 1274 and accordingly TU517 $\Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278 or TU518 $\Leftrightarrow$ Chapter 5.2.7.4 "TU517 and TU518 for communication interface modules" on page 1278. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting ${ }^{*}$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8 and 3.8 as well as $2.9,3.9$ and 4.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
Terminals 2.8 and 3.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 4.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 2.9, 3.9 and 4.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
This ist not intended usage.
Reason: Externally voltages at one or more terminals DC0...DC7 or DOO...DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.
This limitation does not apply for the input channels DIO...DI7.

## CAUTION!

## Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0...DO7 and DC0...DC7.

## Possibilities of connection

## Assignment

Mounting on terminal units TU509 or TU510:
The assignment of the 9-pole female D-sub for the PROFIBUS DP signals.

| Serial Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | --- | Reserved |
|  | 2 | --- | Reserved |
|  | 3 | B | PROFIBUS DP signal B |
|  | 4 | --- | Reserved |
|  | 5 | DGND | Ground for 5 V power supply |
|  | 6 | VP (5 V) | 5 V power supply |
|  | 7 | --- | Reserved |
|  | 8 | A | PROFIBUS DP signal A |
|  | 9 | --- | Reserved |
|  | Shield | Cable shield | Functional earth |

## Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. Normally, these resistors are integrated in the interface connectors.

The grounding of the shield should take place at the control cabinet, see System-Data AC500 « Chapter 5.1.2 "System data AC500" on page 166.

Mounting on terminal units TU517 or TU518:
The assignment of the terminals 1.0-1.9:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | B | Data line B (receive and send line, posi- <br> tive) |
| 1.1 | B | Data line B (receive and send line, posi- <br> tive) |
| 1.2 | A | Data line A (receive and send line, nega- <br> tive) |
| 1.3 | A | Data line A (receive and send line, nega- <br> tive) |
| 1.4 | TermB | Bus termination data line B |
| 1.5 | TermB | Bus termination data line B |
| 1.6 | TermA | Bus termination data line A |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.7 | TermA | Bus termination data line A |
| 1.8 | DGND | Reference potential for data transmis- <br> sion |
| 1.9 | DGND | Reference potential for data transmis- <br> sion |

At the line ends of a bus segment, terminating resistors must be connected. If using TU517/ TU518, the bus terminating resistors can be enabled by connecting the terminals TermA and TermB to the data lines $A$ and $B$ (no external terminating resistors are required, see figure below).

If using TU517/TU518, note that the terminating resistors are not located inside the TU, but inside the communication interface module CI541-DP. I. e. when removing the device from the TU, the bus terminating resistors are not connected to the bus any more. The bus itself will not be disconnected if a device is removed.

If using TU517/TU518 the max. permitted transmission rate is limited to 1.5 MBaud.

## Technical data bus cable

| Parameter | Value |
| :--- | :--- |
| Type | Twisted pair (shielded) |
| Characteristic impedance | $135 \Omega \ldots . .165 \Omega$ |
| Cable capacitance | $<30 \mathrm{pF} / \mathrm{m}$ |
| Conductor diameter of the cores | $\geq 0.64 \mathrm{~mm}$ |
| Conductor cross section of the cores | $\geq 0.34 \mathrm{~mm}^{2}$ |
| Cable resistance per core | $\leq 55 \Omega / \mathrm{km}$ |
| Loop resistance (resistance of two cores) | $\leq 110 \Omega / \mathrm{km}$ |

## Cable length

The maximum possible cable length of a PROFIBUS subnet within a segment depends on the transmission rate (baud rate).

| Transmission rate | Maximum cable length |
| :--- | :--- |
| 9.6 kBaud to 93.75 kBaud | 1200 m |
| 187.5 kBaud | 1000 m |
| 500 kBaud | 400 m |
| 1.5 MBaud | 200 m |
| 3 MBaud to 12 MBaud | 100 m |

The assignment of the other terminals:

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 2.0 | DC0 | Signal of the configurable digital input/output DC0 |
| 2.1 | DC1 | Signal of the configurable digital input/output DC1 |
| 2.2 | DC2 | Signal of the configurable digital input/output DC2 |
| 2.3 | DC3 | Signal of the configurable digital input/output DC3 |
| 2.4 | DC4 | Signal of the configurable digital input/output DC4 |
| 2.5 | DC5 | Signal of the configurable digital input/output DC5 |
| 2.6 | DC6 | Signal of the configurable digital input/output DC6 |
| 2.7 | DC7 | Signal of the configurable digital input/output DC7 |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | DI9 | Signal of the digital input DI8 |
| 3.1 | DI10 | Signal of the digital input DI9 |
| 3.2 | DI12 | Signal of the digital input DI10 |
| 3.3 | DI13 | Signal of the digital input DI11 |
| 3.4 | DI14 | Signal of the digital input DI12 |
| 3.5 | UP | Signal of the digital input DI13 |
| 3.6 | DO8 | Signal of the digital input DI14 |
| 3.7 | DO9 | Process voltage UP (24 V DC) |
| 3.8 | DO10 | Process voltage ZP (0 V DC) |
| 3.9 | DO11 | Signal of the digital output DO8 |
| 4.0 | DO12 | Signal of the digital output DO9 |
| 4.1 | DO13 | Signal of the digital output DO10 |
| 4.2 | DO14 | Signal of the digital output DO11 |
| 4.3 | DO15 | Signal of the digital output DO13 |
| 4.4 | Signal of the digital output DO14 |  |
| 4.5 | Signal of the digital output DO15 |  |
| 4.6 | Process voltage UP3 (24 V DC) |  |
| 4.7 | Process voltage ZP (0 V DC) |  |
| 4.8 | DP |  |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 238: Connection of the PROFIBUS DP communication interface module CI542-DP

## Connection of the digital inputs

Fig. 239: Connection of the digital input DI8 (Proceed with the digital inputs DI9 to DI15 in the same way)

The meaning of the LEDs is described in Displays ${ }^{\circledR}>$ Chapter 5.2.6.6.2.10 "State LEDs" on page 1193.

## Connection of the digital outputs

Fig. 240: Connection of the digital output DO8 (Proceed with the digital outputs DO9-DO15 in the same way)
The meaning of the LEDs is described in Displays "y Chapter 5.2.6.6.2.10 "State LEDs" on page 1193.

## Connection of the configurable digital inputs/outputs

## CAUTION!

If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device ${ }^{\star} \Rightarrow$ Chapter 5.2.6.6.2.4 "Connections" on page 1178.

Fig. 241: Connection of the configurable digital input/output DC0 and DC1 (Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way)
The meaning of the LEDs is described in Displays $\stackrel{y}{ }$ Chapter 5.2.6.6.2.10 "State LEDs" on page 1193.

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 5 |
| Digital outputs (bytes) | 5 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

## I/O configuration

The CI542-DP PROFIBUS DP bus configuration is handled by PROFIBUS DP master with the exception of the slave bus ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.
Details about configuration are described in Parameterization.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |

Remarks:

| ${ }^{1}$ ) | The parameter Behaviour DO at comm. error is apply to DC and DO channels <br> and only analyzed if the Failsafe-mode is ON. |
| :--- | :--- |
| ${ }^{2}$ ) | The state "externally voltage detected" appears, if the output of a channel <br> DCO ... DC7 should be switched on while an externally voltage is connected. In <br> this case the start up is disabled, as long as the externally voltage is connected. <br> The monitoring of this state and the resulting diagnosis message can be disabled <br> by setting the parameters to "OFF". |
| ${ }^{3}$ ) | The error state "voltage overflow at outputs" appears, if externally voltage at dig- <br> ital outputs DC0 .. DC7 and accordingly DOO ... DO7 has exceeded the process <br> supply voltage UP3 \& Chapter 5.2.6.6.2.4 "Connections" on page 1178. The <br> according diagnosis message "Voltage overflow on outputs " can be disabled <br> by setting the parameters on "OFF". This parameter should only be disabled in <br> exceptional cases for voltage overflow may produce reverse voltage. |

## Diagnosis

Structure of the diagnosis block via DPM_SLV_DIAG function block.
$\left.\begin{array}{|l|l|l|}\hline \text { Byte Number } & \text { Description } & \text { Possible Values } \\ \hline 1 & \begin{array}{l}\text { Data length (header } \\ \text { included) }\end{array} & 7 \\ \hline 2 & \begin{array}{l}\text { PROFIBUS DP V1 coding: } \\ \text { Vendor specific }\end{array} & 129 \\ \hline 3 & \text { Diagnosis Byte, slot number } & \begin{array}{l}\text { l1 = CI542-DP (e. g. error at integrated 8 DI / } \\ 8 \text { DO) } \\ 1=1 \text { st connected S500 I/O module }\end{array} \\ \hline 4 & \begin{array}{l}\text { Diagnosis Byte, module } \\ \text { number }\end{array} & \begin{array}{l}\text { According to the I/O bus specification passed } \\ \text { on by modules to the fieldbus master }\end{array} \\ \hline 5 & \text { Diagnosis Byte, channel } & \begin{array}{l}\text { According to the I/O bus specification passed } \\ \text { on by modules to the fieldbus master }\end{array} \\ \hline 6 & \text { Diagnosis Byte, error code } & \begin{array}{l}\text { According to the I/O bus specification } \\ \text { Bit } 7 \text { and bit } 6, \text { coded error class } \\ 0=\text { E1 }\end{array} \\ \hline 1=\text { E2 } \\ 2=\text { E3 } \\ 3=\text { E4 } \\ \text { Bit } 0 \text { to bit 5, coded error description }\end{array}\right]$

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

DO7 cause that other digital outputs are supplied through that voltage. <br> All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| ${ }^{5}$ ) | The voltage at digital outputs DC0 .. DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3 ${ }^{*}$ 攵 Chapter 5.2.6.6.2.4 "Connections" on page 1178. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DC0 ... DC7 or DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 100 ms . Then a new start up will be executed. This diagnosis message appears per channel. |
| $\left.{ }^{8}\right)$ | In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed. |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index F0. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 DP, STA2 DP, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 262: States of the 5 system LEDs:

| LED | Color | OFF | ON | Flashing |
| :--- | :--- | :--- | :--- | :--- |
| PWR/RUN | Green | Process supply <br> voltage missing | Internal supply <br> voltage OK, <br> module ready for <br> communication <br> with I/O Con- <br> troller | Start-up / pre- <br> paring communi- <br> cation |
| STA1-DP | Green | --- | --- | --- |
|  | Yellow | PROFIBUS run- <br> ning | Invalid device <br> parameters |  |

| LED | Color | OFF | ON | Flashing |

| UP | Process supply <br> voltage OK and <br> initialization fin- <br> ished | --- |  |  |
| UP3 | Green | Process supply <br> voltage missing | Process supply <br> voltage OK | --- |
| CH-ERR1 to CH- <br> ERR3 | Red | No error or <br> process supply <br> voltage missing | Internal error | Error on one <br> channel of the <br> corresponding <br> group |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter |  | Value |
| :--- | :--- | :--- |
| Process supply voltages UP/UP3 |  |  |
|  | Rated value | 24 V DC (for inputs and outputs) |
|  | Max. load for the terminals | 10 A |
|  | Protection against reversed voltage | Yes |
|  | Rated protection fuse on UP/UP3 | 10 A fast |

| Parameter | Value |
| :---: | :---: |
| Galvanic isolation | PROFIBUS interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 2.8 and 3.8 for +24 V (UP) <br> Terminal 4.8 for +24 V (UP3) <br> Terminals 2.9, 3.9 and 4.9 for $0 \mathrm{~V}(\mathrm{ZP})$ |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of analog inputs | 4 |
| Number of analog outputs | 2 |
| Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP |
| Setting of the PROFIBUS DP identifier | With 2 rotary switches at the front side of the module |
| Diagnose | See Diagnosis « ${ }^{\mu}$ Chapter 5.2.6.6.2.9 "Diagnosis" on page 1189 |
| Operation and error displays | 34 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal <br> Or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## - NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |

| Parameter | Value |
| :--- | :--- |
| Terminals of the channels DI0 ... DI7 | Terminals $3.0 \ldots 3.7$ |
| Reference potential for all inputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined Signal |
|  | Signal 1 |
| Ripple with signal 0 | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripple with signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Input voltage +24 V |
|  | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +5 V |
|  | Input voltage +30 V |
| Max. cable length | Typ. 5 mA |
|  | Shielded |
|  | Unshielded |
|  | $>2 \mathrm{~mA}$ |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals $4.0 \ldots 4.7$ |
| Reference potential for all outputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 4.8 (positive pole of the <br> supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 500 mA at UP3 = 24 V |
|  | Rated value per channel |
|  | Max. value (all channels together) |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 |  |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this <br> table) |
| Output switching frequency |  |

| Parameter |  | Value |
| :--- | :--- | :--- |
|  | With resistive load | On request |
|  | With inductive loads | Max. 0.5 Hz |
|  | With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |  |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |  |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |  |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |  |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
| Channels DC0 ... DC07 | Terminals 2.0 ... 2.7 |
| If the channels are used as outputs |  |
| Channels DC0 ... DC07 | Terminals 2.0 ... 2.7 |
| Indication of the input/output signals | 1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1) |
| Galvanic isolation | From the PROFIBUS network |

Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1 ) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Signal 1 |
| Ripple with signal 0 | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripple with signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +15 V |
| Input voltage +30 V | $>1 \mathrm{~mA}$ |
| Max. cable length | $>2 \mathrm{~mA}$ |
|  | Shielded |
| Unshielded | $<8 \mathrm{~mA}$ |

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V . Following this, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \vee \ldots+30 \vee$ when UPx $=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all outputs | Terminals $2.9 \ldots 4.9$ (negative pole of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 4.8 (positive pole of the <br> supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or $1->0)$ | On request |
| Output current |  |

| Parameter | Value |
| :---: | :---: |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital input/output
2 For demagnetization when inductive loads are turned off

## Technical data of the fast counter

| Parameter | Value |
| :--- | :--- |
| Used inputs | Terminal 3.0 (DI0),Terminal 3.1 (DI1) |
| Used outputs | Terminal 4.0 (DO0) |
| Counting frequency | Depending on operation mode: |
|  | Mode 1- 6: max. 200 kHz |
|  | Mode 7: max. 50 kHz |
|  | Mode 9: max. 35 kHz |
|  | Mode 10: max. 20 kHz |

### 5.2.6.7 PROFINET

### 5.2.6.7.1 Comparison of the CI5xx-PNIO modules

The PROFINET IO devices combine the advantages of decentralized I/O modules with the reaction time of AC500 mounted central I/O modules. The devices for PROFINET provide the extension -PNIO in the device name.

The communication module CM579-PNIO acts as I/O controller in a PROFINET network. It is connected to the processor module via an internal communication bus. Depending on the terminal base, several communication modules can be used for one processor module.

The communication interface modules $\mathrm{CI} 5 x x-$ PNIO act as I/O devices in a PROFINET network.
Additionally the communication module CM589-PNIO(-4) can be used to setup a AC500 PLC to act as I/O module in a PROFINET network.

The difference of the CI5xx-PNIO devices can be found in their input and output characteristics Chapter 5.2.6.7.1.1 "Characteristics of CI50x-PNIO" on page 1201.

## Characteristics of CI50x-PNIO

| Parameter | Value |
| :--- | :--- |
| Bus connection | 2 x RJ45 |
| Switch | Integrated |
| Technology | Hilscher NETX 100 |
| Transfer rate | $10 / 100$ Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, 2x RJ45 socket |
| Expandability | Max. 10 S500 I/O modules |
| Adjusting elements | 2 rotary switches for generation of an explicit <br> name |
| Supported protocols | RTC - real time cyclic protocol, class 1 *) <br> RTA - real time acyclic protocol <br> DCP - discovery and configuration protocol <br> CL-RPC - connectionless remote procedure <br> Call <br> LLDP - link layer discovery protocol <br> MRP - MRP Client |
| Acyclic services | PNIO read / write sequence (max. 1024 bytes <br> per telegram) <br> Process-Alarm service |
| Supported alarm types | Process Alarm, Diagnostic Alarm, Return of <br> SubModule, Plug Alarm, Pull Alarm |
| Min. bus cycle | 1 ms |

| Parameter | Value |
| :--- | :--- |
| Conformance class | CC A |

| IEC 61131-3) | - short circuit |
|  | - reverse supply |
|  | - overvoltage |
|  | - reverse polarity |
|  | Galvanic isolation from the rest of the module |

[^23]
## Input/Output characteristics of CI501-PNIO

The PROFINET communication interface module $\mathrm{Cl} 501-\mathrm{PNIO}$ is used as decentralized I/O module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0 ... 1.3), configurable as:
- $-10 \mathrm{~V} . . .+10 \mathrm{~V}$
- $0 \vee \ldots+10 \mathrm{~V}$
- $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ (differential voltage)
- $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- Pt100, Pt1000, Ni1000 (for each 2-wire and 3-wire)
- 24 V digital input function
- 2 analog outputs (1.5 ... 1.6), configurable as:
- $-10 \mathrm{~V} . .+10 \mathrm{~V}$
- $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$
- $4 \mathrm{~mA} . . .20 \mathrm{~mA}$
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital transistor outputs 24 V DC ( 0.5 A max.) in 1 group (3.0 ... 3.7)
- Resolution of the analog channels: 12 bits

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.
For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Input/Output characteristics of CI502-PNIO

- 8 digital inputs 24 V DC
- 8 digital transistor outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

## Technical data of the serial interfaces of CI504-PNIO

| Parameter | Value |
| :--- | :--- |
| Number of serial interfaces | 3 |
| Connectors for serial interfaces | X11 for COM1 |
|  | X12 for COM2 |
|  | X13 for COM3 |
| Supported physical layers | RS-232 |
|  | RS-422 |
|  | RS-485 |
| Supported protocols | ASCII |
| Transmission rate | Configurable from 300 bit/s to $115.200 \mathrm{bit/s}$ |

### 5.2.6.7.2 CI501-PNIO

## Features

- 4 analog inputs, 2 analog outputs, 8 digital inputs, 8 digital outputs
- Resolution 12 bits including sign
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
36 yellow LEDs to display the signal states of the analog inputs/outputs (AIO ... AI3, AOO ... AO1)
48 yellow LEDs to display the signal states of the digital inputs (DIO ... DI7)
58 yellow LEDs to display the signal states of the digital outputs (DO0 ... DO7)
62 green LEDs to display the process supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
102 rotary switches for setting the I/O device identifier
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
Sign for XC version

## Intended purpose

The PROFINET communication interface modules $\mathrm{CI} 501-\mathrm{PNIO}$ and $\mathrm{Cl} 502-\mathrm{PNIO}$ are used as communication interface modules in PROFINET networks. The network connection is performed by Ethernet cables which are inserted in the RJ45 connectors in the terminal unit. An Ethernet switch in the communication interface module allows daisy chaining of the network.
For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

The communication interface module contains 22 I/O channels with the following properties:

- 4 configurable analog inputs (2-wire / single-ended) or 2 configurable analog inputs (3-wire / differential) (1.0 ... 1.3)
- 2 analog outputs (1.5 ... 1.6)
- 8 digital inputs 24 V DC in 1 group (2.0 ... 2.7)
- 8 digital outputs 24 V DC, 0.5 A max. in 1 group (3.0 ... 3.7)

The inputs/outputs are galvanically isolated from the PROFINET network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

| Parameter | Value |
| :--- | :--- |
| Interface | Ethernet |
| Protocol | PROFINET IO RT |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O <br> expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the I/O device identifier for configu- <br> ration purposes (00h to FFh) |
| LED displays | For system displays, signal states, errors and <br> power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply <br> voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to <br> 35 V |
| Required terminal unit | TU507 or TU508E <br> ETH and TU50pter 5.2.7.2 "TU507- <br> tion interface modules" on page 1270 |

## Connections

## General

The Ethernet communication interface module $\mathrm{CI} 501-\mathrm{PNIO}$ is plugged on the I/O terminal unit TU507-ETH or TU508-ETH $\Leftrightarrow$ Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting $\Leftrightarrow$ Chapter 5.2.8.2.5 "TA526 - Wall mounting accessory" on page 1324.
The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
Reason: External voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is unintended usage.

## CAUTION!

## Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0 ... DO7.

Table 264: Assignment of the other terminals

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 1.0 | AI0+ | Positive terminal of analog input signal 0 |
| 1.1 | Al1+ | Positive terminal of analog input signal 1 |
| 1.2 | Al2+ | Positive terminal of analog input signal 2 |
| 1.3 | Al3+ | Positive terminal of analog input signal 3 |
| 1.4 | AO0+ | Negative terminal of analog input signals 0 to 3 |
| 1.5 | AO1+ | Positive terminal of analog output signal 0 |
| 1.6 | AI- | Positive terminal of analog output signal 1 |
| 1.7 | ZP | Negative terminal of analog output signals 0 and 1 |
| 1.8 | DI0 | Process voltage UP (24 V DC) |
| 1.9 | DI1 | Process voltage ZP (0 V DC) |
| 2.0 | DI2 | Signal of the digital input DI0 |
| 2.1 | DI3 | Signal of the digital input DI2 |
| 2.2 | DI4 | Signal of the digital input DI3 |
| 2.3 | DI5 | Signal of the digital input DI4 |
| 2.4 |  | Signal of the digital input DI5 |
| 2.5 |  |  |

| Terminal | Signal | Description |
| :--- | :--- | :--- |
| 2.6 | DI6 | Signal of the digital input DI6 |
| 2.7 | DI7 | Signal of the digital input DI7 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |
| 3.0 | DO0 | Signal of the digital output DO0 |
| 3.1 | DO1 | Signal of the digital output DO1 |
| 3.2 | DO2 | Signal of the digital output DO2 |
| 3.3 | DO3 | Signal of the digital output DO3 |
| 3.4 | DO4 | Signal of the digital output DO4 |
| 3.5 | DO6 | Signal of the digital output DO5 |
| 3.6 | DO7 | Signal of the digital output DO6 |
| 3.7 | UP3 | Signal of the digital output DO7 |
| 3.8 | ZP | Process voltage UP3 (24 V DC) |
| 3.9 |  |  |

## WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

## Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (wire break), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

## Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 245: Connection of resistance thermometers in 2-wire configuration to the analog inputs (AIO ... Al3)

Table 265: Configurable measuring ranges

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| :--- | :--- | :--- |
| Pt1000 | $-50^{\circ} \mathrm{C} \ldots+400^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |
| Ni1000 | $-50^{\circ} \mathrm{C} \ldots+150^{\circ} \mathrm{C}$ | 2-wire configuration, 1 <br> channel used |

« Chapter 5.2.6.7.2.8 "Parameterization" on page 1222

* ${ }^{2}$ Chapter 5.2.6.7.2.9 "Diagnosis" on page 1228

The module CI501-PNIO performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".

## Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

Fig. 246: Connection of resistance thermometers in 3-wire configuration to the analog inputs (AIO ... Al3)
With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Table 266: Configurable measuring ranges

| Pt100 | $-50^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$ | 3-wire configuration, 2 chan- <br> nels used |

\# Chapter 5.2.6.7.2.8 "Parameterization" on page 1222
\# Chapter 5.2.6.7.2.9 "Diagnosis" on page 1228
Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

Fig. 249: Connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog inputs (AIO ... AI3)

## CAUTION!

Risk of faulty measurements!
The negative pin at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).
Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$ (also not with long cable lengths).

Table 269: Configurable measuring ranges

| Voltage | $0 \mathrm{~V} \ldots 10 \mathrm{~V}$ | 1 channel used |
| :--- | :--- | :--- |
| Voltage | $-10 \mathrm{~V} \ldots+10 \mathrm{~V}$ | 1 channel used |

${ }^{*}$ Chapter 5.2.6.7.2.8 "Parameterization" on page 1222

* $\boldsymbol{y}^{\prime}$ Chapter 5.2.6.7.2.9 "Diagnosis" on page 1228

## CAUTION!

## Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA . If not possible, connect a 10 -volt zener diode in parallel to Alx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.
To avoid error messages through unused analog input channels in measuring range $4 \mathrm{~mA} . . .20 \mathrm{~mA}$, these channels should be configured as "Not used".

## Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).
The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

## CAUTION!

## Risk of faulty measurements!

The negative pin at the sensors must not have too big a potential difference with respect to ZP (max. $\pm 1 \mathrm{~V}$ ).

Make sure that the potential difference never exceeds $\pm 1 \mathrm{~V}$.

| Digital outputs (bytes) | 3 |
| Analog inputs (words) | 4 |
| Analog outputs (words) | 2 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

The module has 2 rotary switches to set an explicit name to the PROFINET IO device before commissioning. No engineering tool is needed in this case.
The device gets its name (including the fixed part of the device name) with the switch settings ( $01 \mathrm{~h} . . . \mathrm{FFh}$ ). This name can be used directly within the device configuration: "CI5xx-pn-yy"
"CI5xx-pn-yy" xx is the fixed part of the device name (e.g. CI501) and yy represents the position of the rotary switch (0..FFh). The rotary switch values must be entered in hexadecimal format. For example, to set the name to "Cl5xx-pn-08", set the upper rotary switch to "0" and the lower switch to " 8 ".

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

## I/O configuration

The CI501-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.
The analog/digital I/O channels are configured via software.

| Off by E4 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode on *) |
| Off by E3 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode on *) |
| *) The parameters Behaviour AO at comm. error and Behaviour DO at comm. error are only |  |
| analyzed if the Failsafe-mode is ON. |  |

IO-BUS reset after PROFINET reconnection

IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET CI modules in relation to connected I/O modules (both safety and non-safety I/O modules).

- IO-BUS reset after PROFINET reconnection = "On" resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.
Note that if the parameter is set to "On" then:
- The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to " 0 " values during the re-connection and re-parameterization time and after that go to new output values.
- Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.
- IO-BUS reset after PROFINET reconnection = "Off" will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.
Note that if the parameter is set to "Off" then:
- The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from failsafe values to " 0 " values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
- Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

Remarks:

| ${ }^{1}$ ) | In AC500 the following interface identifier applies: <br> "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or $10=$ Position of the communication module; $14=1 / \mathrm{O}$ bus; $31=$ Module itself <br> The identifier is not contained in the CI501-PNIO diagnosis block. |
| :---: | :---: |
| ${ }^{2}$ ) | With "Device" the following allocation applies: $31=$ Module itself; $1 \ldots 10=$ Expansion module |
| ${ }^{3}$ ) | With "Module" the following allocation applies: $31=$ Module itself Module type ( 1 = AI, 2 = DO, 3 = AO) |
| ${ }^{4}$ ) | This message appears, if externally voltages at one or more terminals DO0 ... DO7 cause that other digital outputs are supplied through that voltage ${ }^{\circledR}$ Chapter 5.2.6.7.2.4 "Connections" on page 1205. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| ${ }^{5}$ ) | The voltage on digital outputs DO0 ... DO7 has overrun the process supply voltage UP3 ") Chapter 5.2.6.7.2.4 "Connections" on page 1205. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DO0 ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 100 ms . Then a new start up will be executed. This diagnosis message appears per channel. |
| ${ }^{8}$ ) | In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed. |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index FO. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 282: States of the 5 system LEDs

| LED | Color | OFF | ON | Flashing |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{\circledR}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | Ethernet interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.2 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of analog inputs | 4 |
| Number of analog outputs | 2 |
| Input data length | 19 bytes |
| Output data length | 23 bytes |
| Reference potential for all digital inputs and outputs | Negative terminal of the supply voltage, signal name ZP |
| Setting of the I/O device identifier | With 2 rotary switches at the front side of the module |
| Diagnose | See Diagnosis and Displays ${ }^{4} \Rightarrow$ Chapter 5.2.6.7.2.9 "Diagnosis" on page 1228 |
| Operation and error displays | 32 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Extended ambient temperature (XC version) | >+60 ${ }^{\circ} \mathrm{C}$ on request |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

| Parameter | Value |
| :---: | :---: |
| Bus connection | $2 \times \mathrm{RJ} 45$ |
| Switch | Integrated |
| Technology | Hilscher NETX 100 |
| Transfer rate | 10/100 Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, 2x RJ45 socket |
| Expandability | Max. 10 S500 I/O modules |
| Adjusting elements | 2 rotary switches for generation of an explicit name |
| Supported protocols | RTC - real time cyclic protocol, class $1^{*}$ ) <br> RTA - real time acyclic protocol <br> DCP - discovery and configuration protocol <br> CL-RPC - connectionless remote procedure Call <br> LLDP - link layer discovery protocol <br> MRP - MRP Client |
| Acyclic services | PNIO read / write sequence (max. 1024 bytes per telegram) <br> Process-Alarm service |
| Supported alarm types | Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm |
| Min. bus cycle | 1 ms |
| Conformance class | CC A |
| Protective functions (according to IEC 61131-3) | Protected against: <br> - short circuit <br> - reverse supply <br> - overvoltage <br> - reverse polarity <br> Galvanic isolation from the rest of the module |

[^24]
## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DI0 ... DI7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (negative terminal of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
|  | 0-Signal |
|  | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | 1-Signal |
| Ripple with signal 0 | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
| Ripple with signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Input current per channel | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Input voltage +24 V |
| Input voltage +5 V | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
|  | Input voltage +15 V |
| Input voltage +30 V | $>1 \mathrm{~mA}$ |
| Max. cable length | $>2 \mathrm{~mA}$ |
|  | Shielded |
| Unshielded | $<8 \mathrm{~mA}$ |
|  | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals $3.0 \ldots 3.7$ |
| Reference potential for all outputs | Terminals $1.9 \ldots 3.9$ (negative terminal of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive terminal of <br> the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 500 mA at UP3 = 24 V |
|  | Rated value per channel |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |

| Parameter | Value |
| :---: | :---: |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( $1>0.7$ A) | Yes, after ca. 100 ms |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the analog inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 4 |
| Distribution of channels into groups | 1 group with 4 channels |
| Connection if channels $\mathrm{Al0}+\ldots \mathrm{Al3+}$ | Terminals $1.0 \ldots 1.3$ |
| Reference potential for $\mathrm{Al0}+\ldots \mathrm{Al3+}$ | Terminal 1.4 (AI-) for voltage and RTD meas- <br> urement <br> Terminal 1.9, 2.9 and 3.9 for current measure- <br> ment |
| Input type | Voltage $0 \mathrm{~V} \ldots 10 \mathrm{~V}$, current or Pt100/Pt1000/ <br> Ni1000 |
| Unipolar | Vipolar |
| Galvanic isolation | Against Ethernet network |

| Parameter | Value |
| :--- | :--- |
| Configurability | $0 \mathrm{~V} \ldots 10 \mathrm{~V},-10 \mathrm{~V} \ldots+10 \mathrm{~V}, 0 \mathrm{~mA} \ldots 20 \mathrm{~mA}$, <br> $4 \mathrm{~mA} \ldots 20 \mathrm{~mA} \mathrm{Pt100/1000}, \mathrm{Ni1000} \mathrm{(each} \mathrm{input}$ <br> can be configured individually) |
| Channel input resistance | Voltage: > $100 \mathrm{k} \Omega$ <br> Current: ca. $330 \Omega$ |
| Time constant of the input filter | Voltage: $100 \mu \mathrm{~s}$ <br> Current: $100 \mu \mathrm{~s}$ |
| Indication of the input signals | 1 LED per channel (brightness depends on the <br> value of the analog signal) |
| Conversion cycle | 1 ms (for 4 inputs +2 outputs); with RTDs Pt/ <br> Ni... 1 s |
| Resolution | Range $0 \mathrm{~V} \ldots 10 \mathrm{~V}: 12$ bits <br> Range $-10 \mathrm{~V} \ldots+10 \mathrm{~V}: 12$ bits including sign <br> Range $0 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range $4 \mathrm{~mA} \ldots 20 \mathrm{~mA}: 12$ bits <br> Range RTD (Pt100, PT1000, Ni1000): +0.1 ${ }^{\circ} \mathrm{C}$ |
| Conversion error of the analog values <br> caused by non-linearity, adjustment error <br> at factory and resolution within the normal <br> range | Typ. $0.5 \%$, max. $1 \%$ |
| Relationship between input signal and hex <br> code | Are configured as "unused" (default value) <br> Unused inputs <br> Overvoltage protection |

## Technical data of the analog inputs, if used as digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | Max. 4 |
| Distribution of channels into groups | 1 group of 4 channels |
| Connections of the channels $\mathrm{AlO+} \ldots \mathrm{Al} 3+$ | Terminals $1.0 \ldots 1.3$ |
| Reference potential for the inputs | Terminals $1.9,2.9$ and $3.9(\mathrm{ZP})$ |
| Indication of the input signals | 1 LED per channel |
| Input signal voltage | 24 V DC |
|  | Signal 0 |
|  | Undefined signal |
|  | Signal 1 |
| Input current per channel | $+5 \mathrm{~V} \ldots+13 \mathrm{~V}$ |
|  | Input voltage +24 V |
|  | Input voltage +5 V |
|  | Input voltage +15 V |
|  | Input voltage +30 V |
| Input resistance | Typ. 7 mA |

Technical data of the analog outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 2 |
| Distribution of channels into groups | 1 group for 2 channels |
| Connection of the channels $\mathrm{AO} 0+\ldots \mathrm{AO}++$ | Terminals 1.5 ... 1.6 |
| Reference potential for $\mathrm{AO} 0+\ldots \mathrm{AO}+$ | Terminal 1.7 (AO-) for voltage output terminal 1.9, 2.9 and 3.9 for current output |
| Output type |  |
| Unipolar | Current |
| Bipolar | Voltage |
| Galvanic isolation | Against internal supply and other modules |
| Configurability | -10 V ... +10 V, 0 mA ... $20 \mathrm{~mA}, 4 \mathrm{~mA} . . .20 \mathrm{~mA}$ (each output can be configured individually) |
| Output resistance (load), as current output | $0 \Omega \ldots 500 \Omega$ |
| Output loadability, as voltage output | $\pm 10 \mathrm{~mA}$ max. |
| Indication of the output signals | 1 LED per channel (brightness depends on the value of the analog signal) |
| Resolution | 12 bits including sign |
| Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms |
| Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 \%, max. 1 \% |
| Relationship between input signal and hex code | Table Output ranges voltage and current $\Leftrightarrow$ Chapter 5.2.6.7.2.11.3 "Output ranges voltage and current" on page 1236 |
| Unused outputs | Are configured as "unused" (default value) and can be left open-circuited |

## Technical data of the fast counter

| Parameter | Value |
| :--- | :--- |
| Used inputs | Terminal 2.0 (DIO), 2.1 (DI1) |
| Used outputs | Terminal 3.0 (DO0) |
| Counting frequency | Depending on operation mode: |
|  | Mode 1-6: max. 200 kHz |
|  | Mode 7: max. 50 kHz |
|  | Mode 9: max. 35 kHz |
|  | Mode 10: max. 20 kHz |

[^25]
## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

Ordering data

| Part no. | Description | Product life cycle phase *) |

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### 5.2.6.7.3 CI502-PNIO

Features

- 8 digital inputs 24 V DC
- 8 digital outputs $24 \mathrm{~V} \mathrm{DC}, 0.5 \mathrm{~A}$ max.
- 8 configurable digital inputs/outputs $24 \mathrm{~V} D C, 0.5 \mathrm{~A}$ max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal name
38 yellow LEDs to display the signal states of the digital configurable inputs/outputs (DC0 ... DC7)
48 yellow LEDs to display the signal states of the digital inputs (DI8 ... DI15)
58 yellow LEDs to display the signal states of the digital outputs (DO8 ... DO15)
62 green LEDs to display the process supply voltage UP and UP3
73 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
85 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
102 rotary switches for setting the I/O device identifier
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

## Intended purpose

The PROFINET communication interface module $\mathrm{Cl} 502-\mathrm{PNIO}$ is used as communication interface module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

## Functionality

The CI502 communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs
- 8 digital inputs: 24 V DC
- 8 digital outputs: 24 V DC, 0.5 A max.

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

| Parameter | Value |
| :---: | :---: |
| Interface | Ethernet |
| Protocol | PROFINET IO RT |
| Power supply | From the process supply voltage UP |
| Supply of the electronic circuitry of the I/O expansion modules attached | Through the I/O bus interface (I/O bus) |
| Rotary switches | For setting the IO device identifier for configuration purposes (00h to FFh) |
| Configurable digital inputs/outputs | 8 (configurable via software) |
| Digital inputs | 8 (24 V DC; delay time configurable via software) |
| Digital outputs | 8 (24 V DC, 0.5 A max.) |
| LED displays | For system displays, signal states, errors and power supply |
| External supply voltage | Via terminals ZP, UP and UP3 (process supply voltage 24 V DC) |
| Effect of incorrect input terminal connection | Wrong or no signal detected, no damage up to 35 V |
| Required terminal unit | TU507-ETH or TU508-ETH « Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270 |

## Connections

## General

The Ethernet communication interface module $\mathrm{Cl} 502-\mathrm{PNIO}$ is plugged on the I/O terminal unit TU507-ETH ${ }^{\mu}$ Chapter 5.2.7.2 "TU507-ETH and TU508-ETH for Ethernet communication interface modules" on page 1270 or TU508-ETH $\Leftrightarrow$ Chapter 5.2.7.2 "TU507-ETH and TU508ETH for Ethernet communication interface modules" on page 1270. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting $\Leftrightarrow$ Chapter 5.2.8.2.5 "TA526-Wall mounting accessory" on page 1324.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the installation instructions.

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$.
The assignment of the other terminals:

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
This ist not intended usage.
Reason: Externally voltages at one or more terminals $D C 0 \ldots D C 7$ or DO0 ... DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DIO ... DI7.

## CAUTION!

## Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0 ... DO7 and DC0 ... DC7.

Table 284: Assignment of the other terminals

| Terminal | Signal | Description |
| :---: | :---: | :---: |
| 1.0 | DC0 | Signal of the configurable digital input/output DCO |
| 1.1 | DC1 | Signal of the configurable digital input/output DC1 |
| 1.2 | DC2 | Signal of the configurable digital input/output DC2 |
| 1.3 | DC3 | Signal of the configurable digital input/output DC3 |
| 1.4 | DC4 | Signal of the configurable digital input/output DC4 |
| 1.5 | DC5 | Signal of the configurable digital input/output DC5 |
| 1.6 | DC6 | Signal of the configurable digital input/output DC6 |
| 1.7 | DC7 | Signal of the configurable digital input/output DC7 |
| 1.8 | UP | Process voltage UP (24 V DC) |
| 1.9 | ZP | Process voltage ZP (0 V DC) |
| 2.0 | DI8 | Signal of the digital input DI8 |
| 2.1 | DI9 | Signal of the digital input DI9 |
| 2.2 | DI10 | Signal of the digital input DI10 |
| 2.3 | DI11 | Signal of the digital input DI11 |
| 2.4 | DI12 | Signal of the digital input DI12 |
| 2.5 | DI13 | Signal of the digital input DI13 |
| 2.6 | DI14 | Signal of the digital input DI14 |
| 2.7 | DI15 | Signal of the digital input DI15 |
| 2.8 | UP | Process voltage UP (24 V DC) |
| 2.9 | ZP | Process voltage ZP (0 V DC) |

WARNING!

## Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

## NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Fig. 255: Connection of the Ethernet communication interface module Cl502-PNIO
ⓨ Chapter 6.8.4.2 "PROFINET communication interface module" on page 4596

## Connection of the Digital inputs

Fig. 256: Connection of the digital inputs (DI8 ... DI15)
The meaning of the LEDs is described in 'Displays' « Chapter 5.2.6.7.3.10 "State LEDs" on page 1261.

## Connection of the Digital outputs

Fig. 257: Connection of the digital outputs (DO8 ... DO15)
The meaning of the LEDs is described in 'Displays' « Chapter 5.2.6.7.3.10 "State LEDs" on page 1261.

## Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 ... DC7 in the same way.

## CAUTION!

If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device $\Leftrightarrow$ Chapter 5.2.6.7.3.4 "Connections" on page 1246.

Fig. 258: Connection of the configurable digital inputs/outputs (DC0 ... DC7)(DC0 as input, DC1 as output)
The meaning of the LEDs is described in 'Displays' ${ }^{\mu}$ 解 Chapter 5.2.6.7.3.10 "State LEDs" on page 1261.

## Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

| Interface | Pin | Signal | Description |
| :---: | :---: | :---: | :---: |
|  | 1 | TxD+ | Transmit data + |
|  | 2 | TxD- | Transmit data - |
|  | 3 | RxD+ | Receive data + |
|  | 4 | NC | Not connected |
|  | 5 | NC | Not connected |
|  | 6 | RxD- | Receive data - |
|  | 7 | NC | Not connected |
|  | 8 | NC | Not connected |
|  | Shield | Cable shield | Functional earth |

In corrosive environment, please protect unused connectors using the TA535 accessory.
Not supplied with this device.

* Further information about wiring and cable types

## Internal data exchange

| Parameter | Value |
| :--- | :--- |
| Digital inputs (bytes) | 5 |
| Digital outputs (bytes) | 5 |
| Counter input data (words) | 4 |
| Counter output data (words) | 8 |

## Addressing

The module has 2 rotary switches to set an explicit name to the PROFINET IO device before commissioning. No engineering tool is needed in this case.
The device gets its name (including the fixed part of the device name) with the switch settings ( $01 \mathrm{~h} . . \mathrm{FFh}$ ). This name can be used directly within the device configuration: "Cl5xx-pn-yy"
"CI5xx-pn-yy" xx is the fixed part of the device name (e.g. CI501) and yy represents the position of the rotary switch (0..FFh). The rotary switch values must be entered in hexadecimal format. For example, to set the name to "CI5xx-pn-08", set the upper rotary switch to " 0 " and the lower switch to " 8 ".

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

## I/O configuration

The CI502-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.
The digital I/O channels are configured via software.
Details about configuration are described in 'Parameterization' $\Leftrightarrow$ Chapter 5.2.6.7.3.8 "Parameterization" on page 1253.

## Parameterization

## Parameters of the module

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Module ID ${ }^{1}$ ) | Internal | 7005 | WORD | 7005 |
| Parameter length | Internal | 8 | BYTE | 8 |
| Error LED / Failsafe function (Table Error LED / Failsafe function ${ }^{4}$ Further information on page 1253) | On | 0 | BYTE | 0 |
|  | Off by E4 | 1 |  |  |
|  | Off by E3 | 3 |  |  |
|  | On + failsafe | 16 |  |  |
|  | Off by E4 + failsafe | 17 |  |  |
|  | Off by E3 + failsafe | 19 |  |  |
| Process cycle time | 1 ms process cycle time | 1 | BYTE | 1 ms |
|  | 2 ms process cycle time | 2 |  |  |
|  | 3 ms process cycle time | 3 |  |  |
|  | 4 ms process cycle time | 4 |  |  |
|  | 5 ms process cycle time | 5 |  |  |
|  | 6 ms process cycle time | 6 |  |  |
|  | 7 ms process cycle time | 7 |  |  |
|  | 8 ms process cycle time | 8 |  |  |
|  | 9 ms process cycle time | 9 |  |  |
|  | 10 ms process cycle time | 10 |  |  |
|  | 11 ms process cycle time | 11 |  |  |
|  | 12 ms process cycle time | 12 |  |  |
|  | 13 ms process cycle time | 13 |  |  |

|  | 16 ms process cycle time | 16 |  |  |
| Check supply | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | 1 |

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Fast counter | 0 | a <br> $:$ <br> $\left.10^{2}\right)$ | 10 | BYTE |
| I/O-Bus reset | Off | 0 | 0 |  |
|  | On | 1 | BYTE | Off |

${ }^{1}$ ) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.
${ }^{2}$ ) Counter operating modes $\stackrel{\text { \& Chapter 5.2.4.3.2.9 "Fast counter" on page } 606}{ }$

Table 285: Table Error LED / Failsafe function

| Setting | Description |
| :--- | :--- |
| On | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode off |
| Off by E4 | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode off |
| Off by E3 | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode off |
| On + Failsafe | Error LED (S-ERR) lights up at errors of all <br> error classes, Failsafe-mode on *) |
| Off by E4 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1, E2 and E3, Failsafe-mode on *) |
| Off by E3 + Failsafe | Error LED (S-ERR) lights up at errors of error <br> classes E1 and E2, Failsafe-mode on *) |
| *) The parameter Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON. |  |

IO-BUS reset after PROFINET reconnection

IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET Cl modules in relation to connected I/O modules (both safety and non-safety I/O modules).

- IO-BUS reset after PROFINET reconnection = "On" resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.
Note that if the parameter is set to "On" then:
- The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to " 0 " values during the re-connection and re-parameterization time and after that go to new output values.
- Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.
- IO-BUS reset after PROFINET reconnection = "Off" will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.
Note that if the parameter is set to "Off" then:
- The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from failsafe values to " 0 " values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
- Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

## Group parameters for the digital part

| Name | Value | Internal value | Internal value, <br> type | Default |
| :--- | :--- | :--- | :--- | :--- |
| Input delay | 0.1 ms <br> 1 ms <br> 8 ms <br> 32 ms | 0 | 1 | BYTE |
| Detect short cir- <br> cuit at outputs | Off <br> On | 2 | 0.1 ms |  |
| Behaviour DO at <br> comm. error ${ }^{1}$ ) | Off <br> Last value <br> Last value 5 sec <br> Last value 10 sec <br> Substitute value <br> Substitute value <br> 5 sec <br> Substitute value <br> 10 sec | 2 | 7 | 11 |

| Name | Value | Internal value | Internal value, type | Default |
| :---: | :---: | :---: | :---: | :---: |
| Preventive voltage feedback monitoring for DC0..DC7 2 ${ }^{2}$ ) | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | $\begin{aligned} & \mathrm{Off} \\ & 0 \times 00 \end{aligned}$ |
| Detect voltage overflow at outputs ${ }^{3}$ ) | $\begin{aligned} & \text { Off } \\ & \text { On } \end{aligned}$ | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | BYTE | $\begin{aligned} & \text { Off } \\ & 0 \times 00 \end{aligned}$ |

Remarks:

| ${ }^{1}$ ) | The parameter Behaviour DO at comm. error is apply to DC and DO channels <br> and only analyzed if the Failsafe-mode is ON. |
| :--- | :--- |
| ${ }^{2}$ ) | The state "externally voltage detected" appears, if the output of a channel <br> DCO ... DC7 should be switched on while an externally voltage is connected. In <br> this case the start up is disabled, as long as the externally voltage is connected. <br> The monitoring of this state and the resulting diagnosis message can be disabled <br> by setting the parameters to "OFF". |
| ${ }^{3}$ ) | The error state "voltage overflow at outputs" appears, if externally voltage at dig- <br> ital outputs DC0 ... DC7 and accordingly DOO ... DO7 has exceeded the process <br> supply voltage UP3 $\#$ Chapter 5.2.6.7.3.4 "Connections" on page 1246 (see <br> description in section). The according diagnosis message "Voltage overflow on <br> outputs " can be disabed by setting the parameters on "OFF". This parameter <br> should only be disabled in exceptional cases for voltage overflow may produce <br> reverse voltage. |

## Diagnosis

Structure of the Diagnosis Block via function block PNIO_DEV_ALARM.

| Byte Number | Description | Possible Values |
| :---: | :---: | :---: |
| 1 | Diagnosis Byte, slot number | ```31 = CI502-PNIO (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O module 10 = 10th connected S500 I/O module``` |
| 2 | Diagnosis Byte, module number | According to the I/O bus specification passed on by modules to the fieldbus master |
| 3 | Diagnosis Byte, channel | According to the I/O bus specification passed on by modules to the fieldbus master |

| Byte Number | Description | Possible Values |
| :--- | :--- | :--- |
| 4 | Diagnosis Byte, error code | According to the I/O bus specification |
|  |  | Bit 7 and bit 6, coded error class |
|  |  | $0=\mathrm{E} 1$ |
|  |  | $1=\mathrm{E} 2$ |
|  |  | $2=\mathrm{E} 3$ |
|  | $3=\mathrm{E} 4$ |  |
|  |  | Bit 0 to bit 5, coded error description |
| 5 | Diagnosis Byte, flags | According to the I/O bus specification |
|  |  | Bit $7: 1$ = coming error |
|  |  | Bit 6: $1=$ leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

| $\left.{ }^{3}\right)$ | With "Module" the following allocation applies dependent of the master: <br> Module error: $31=$ Module itself <br> Channel error: Module type $(1=\mathrm{AI}, 2=\mathrm{DO}, 3=\mathrm{AO})$ |

| ${ }^{4}$ ) | This message appears, if externally voltages at one or more terminals DC0 ... DC7 oder DO0 ... DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' \# Chapter 5.2.6.7.3.4 "Connections" on page 1246. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group. |
| :---: | :---: |
| ${ }^{5}$ ) | The voltage at digital outputs DC0 ... DC7 and accordingly DO0 ... DO7 has exceeded the process supply voltage UP3 © Chapter 5.2.6.7.3.4 "Connections" on page 1246. Diagnosis message appears for the whole module. |
| ${ }^{6}$ ) | This message appears, if the output of a channel DC0 ... DC7 or DOO ... DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel. |
| ${ }^{7}$ ) | Short circuit: After a detected short circuit, the output is deactivated for 2000 ms . Then a new start up will be executed. This diagnosis message appears per channel. |
| ${ }^{8}$ ) | In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed. |
| ${ }^{9}$ ) | Diagnosis for hot swap available as of version index F0. |

## State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 286: States of the 5 system LEDs

| LED | Color | OFF | ON | Flashing |
| :---: | :---: | :---: | :---: | :---: |
| PWR/RUN | Green | Process supply voltage missing | Internal supply voltage OK, module ready for communication with IO Controller | Start-up / preparing communication |
|  | Yellow | --- | --- | --- |
| STA1 ETH <br> (System-LED "BF") | Green | --- | Device configured, cyclic data exchange running | --- |
|  | Red | --- | --- | Device is not configured |
| STA2 ETH <br> (System LED "SF") | Green | --- | --- | Got identification request from I/O controller |
|  | Red | No system error | System error (collective error) | --- |
| S-ERR | Red | No error | Internal error | -- |

## Technical data

## Technical data of the module

The system data of AC500 and S500 are applicable to the standard version $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version $\Leftrightarrow$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :---: | :---: |
| Process supply voltages UP/UP3 |  |
| Rated value | 24 V DC (for inputs and outputs) |
| Max. load for the terminals | 10 A |
| Protection against reversed voltage | Yes |
| Rated protection fuse on UP/UP3 | 10 A fast |
| Galvanic isolation | Ethernet interface against the rest of the module |
| Inrush current from UP (at power up) | On request |
| Current consumption via UP (normal operation) | 0.15 A |
| Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
| Connections | Terminals 1.8 and 2.8 for +24 V (UP) <br> Terminal 3.8 for +24 V (UP3) <br> Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
| Max. power dissipation within the module | 6 W |
| Number of digital inputs | 8 |
| Number of digital outputs | 8 |
| Number of configurable digital inputs/outputs | 8 |
| Input data length | 12 bytes |
| Output data length | 20 bytes |
| Reference potential for all digital inputs and outputs | Negative terminal of the supply voltage, signal name ZP |
| Setting of the I/O device identifier | With 2 rotary switches at the front side of the module |
| Diagnosis | See Diagnosis and Displays $\stackrel{y}{c}$ Chapter 5.2.6.7.3.9 "Diagnosis" on page 1256 |
| Operation and error displays | 34 LEDs (totally) |
| Weight (without terminal unit) | Ca. 125 g |
| Mounting position | Horizontal or vertical with derating (output load reduced to $50 \%$ at $+40^{\circ} \mathrm{C}$ per group) |
| Extended ambient temperature (XC version) | > +60 ${ }^{\circ} \mathrm{C}$ on request |
| Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the control cabinet. |

## NOTICE!

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and temporary overvoltage up to 30 V DC.

## Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

| Parameter | Value |
| :---: | :---: |
| Bus connection | $2 \times \mathrm{RJ} 45$ |
| Switch | Integrated |
| Technology | Hilscher NETX 100 |
| Transfer rate | 10/100 Mbit/s (full-duplex) |
| Transfer method | According to Ethernet II, IEEE 802.3 |
| Ethernet | 100 base-TX, internal switch, $2 \times$ RJ45 socket |
| Expandability | Max. 10 S500 I/O modules |
| Adjusting elements | 2 rotary switches for generation of an explicit name |
| Supported protocols | RTC - real time cyclic protocol, class 1 *) <br> RTA - real time acyclic protocol <br> DCP - discovery and configuration protocol <br> CL-RPC - connectionless remote procedure Call <br> LLDP - link layer discovery protocol <br> MRP - MRP Client |
| Acyclic services | PNIO read / write sequence (max. 1024 bytes per telegram) <br> Process-Alarm service |
| Supported alarm types | Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm |
| Min. bus cycle | 1 ms |
| Conformance class | CC A |
| Protective functions (according to IEC 61131-3) | Protected against: <br> - short circuit <br> - reverse supply <br> - overvoltage <br> - reverse polarity <br> Galvanic isolation from the rest of the module |

[^26]
## Technical data of the digital inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DIO ... DI7 | Terminals $2.0 \ldots 2.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (Negative terminal of the <br> supply voltage, signal name ZP) |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when <br> the input signal is high (signal 1$)$ |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or $1->0)$ | Typ. 0.1 ms, configurable from $0.1 \mathrm{~ms} \ldots 32 \mathrm{~ms}$ |

| Parameter |  | Value |
| :--- | :--- | :--- |
| Input signal voltage | 24 V DC |  |
|  | Signal 0 | $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |
|  | Undefined Signal | $>+5 \mathrm{~V} \ldots<+15 \mathrm{~V}$ |
|  | Signal 1 | $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |
| Ripple with signal 0 | Within $-3 \mathrm{~V} \ldots+5 \mathrm{~V}$ |  |
| Ripple with signal 1 | Within $+15 \mathrm{~V} \ldots+30 \mathrm{~V}$ |  |
| Input current per channel |  |  |
|  | Input voltage +24 V | Typ. 5 mA |
|  | Input voltage +5 V | $>1 \mathrm{~mA}$ |
|  | Input voltage +15 V | $>2 \mathrm{~mA}$ |
|  | Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

## Technical data of the digital outputs

| Parameter | Value |
| :---: | :---: |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DO0 ... DO7 | Terminals 3.0 ... 3.7 |
| Reference potential for all outputs | Terminals 1.9 ... 3.9 (negative terminal of the supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive terminal of the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current |  |
| Rated value per channel | 500 mA at UP3 $=24 \mathrm{~V}$ |
| Max. value (all channels together) | 4 A |
| Leakage current with signal 0 | $<0.5 \mathrm{~mA}$ |
| Fuse for UP3 | 10 A fast |
| Demagnetization with inductive DC load | Via internal varistors (see figure below this table) |
| Output switching frequency |  |
| With resistive load | On request |
| With inductive loads | Max. 0.5 Hz |
| With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload-proof | Yes |
| Overload message ( l 0.7 A) | Yes, after ca. 100 ms |

| Parameter | Value |
| :---: | :---: |
| Output current limitation | Yes, automatic reactivation after short circuit/overload |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

## Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 inputs/outputs (with transistors) |
| Distribution of the channels into groups | 1 group for 8 channels |
| If the channels are used as inputs |  |
|  | Channels DC0 ... DC07 |
| If the channels are used as outputs |  |
| Channels DC0 ... DC07 |  |
| Indication of the input/output signals | Terminals 1.0 ... 1.7 |
| Galvanic isolation | 1 yellow LED per channel, the LED is ON when <br> the input/output signal is high (signal 1) |

## Technical data of the digital inputs/outputs if used as inputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals $1.0 \ldots 1.7$ |
| Reference potential for all inputs | Terminals $1.9 \ldots 3.9$ (Negative terminal of the <br> supply voltage, signal name ZP) |

| Parameter | Value |
| :---: | :---: |
| Indication of the input signals | 1 yellow LED per channel, the LED is ON when the input signal is high (signal 1) |
| Input type (according EN 61131-2) | Type 1 |
| Input delay (0->1 or 1->0) | Typ. 0.1 ms , configurable from $0.1 \mathrm{~ms} . . .32 \mathrm{~ms}$ |
| Input signal voltage | 24 V DC |
| Signal 0 | -3 V ... +5 V |
| Undefined Signal | > +5 V ... < +15 V |
| Signal 1 | +15V ... +30 V |
| Ripple with signal 0 | Within -3V ... +5V |
| Ripple with signal 1 | Within +15 V ... +30 V |
| Input current per channel |  |
| Input voltage +24 V | Typ. 5 mA |
| Input voltage +5V | > 1 mA |
| Input voltage +15 V | $>2 \mathrm{~mA}$ |
| Input voltage +30 V | $<8 \mathrm{~mA}$ |
| Max. cable length |  |
| Shielded | 1000 m |
| Unshielded | 600 m |

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V . Following this, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when UPx $=24 \mathrm{~V}$ and from $-6 \mathrm{~V} . . .+30 \mathrm{~V}$ when UPx $=30 \mathrm{~V}$.

## Technical data of the digital inputs/outputs if used as outputs

| Parameter | Value |
| :--- | :--- |
| Number of channels per module | 8 |
| Distribution of the channels into groups | 1 group of 8 channels |
| Terminals of the channels DC0 ... DC7 | Terminals $1.0 \ldots 1.7$ |
| Reference potential for all outputs | Terminals $1.9 \ldots 3.9$ (negative terminal of the <br> supply voltage, signal name ZP) |
| Common power supply voltage | For all outputs terminal 3.8 (positive terminal of <br> the supply voltage, signal name UP3) |
| Output voltage for signal 1 | UP3 (-0.8 V) |
| Output delay (0->1 or 1->0) | On request |
| Output current | 5 |
| Rated value per channel |  |
|  | Max. value (all channels together) |
| Leakage current with signal 0 | 4 A |
| Fuse for UP3 |  |
| Demagnetization with inductive DC load | < 0.5 mA |

| Parameter |  | Value |
| :--- | :--- | :--- |
| Output switching frequency |  |  |
|  | With resistive load | On request |
|  | With inductive loads | Max. 0.5 Hz |
|  | With lamp loads | 11 Hz max. at 5 W max. |
| Short-circuit-proof / overload proof | Yes |  |
| Overload message (I > 0.7 A) | Yes, after ca. 100 ms |  |
| Output current limitation | Yes, automatic reactivation after short cir- <br> cuit/overload |  |
| Resistance to feedback against 24 V signals | Yes (software-controlled supervision) |  |
| Max. cable length |  |  |
|  | Shielded | 1000 m |
|  | Unshielded | 600 m |

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

1 Digital input/output
2 For demagnetization when inductive loads are turned off

## Technical data of the fast counter

| Parameter | Value |
| :--- | :--- |
| Used inputs | Terminal 2.0 (DI8),Terminal 2.1 (DI9) |
| Used outputs | Terminal 3.0 (DO8) |
| Counting frequency | Depending on operation mode: |
|  | Mode 1- 6: max. 200 kHz |
|  | Mode 7: max. 50 kHz |
|  | Mode 9: max. 35 kHz |
|  | Mode 10: max. 20 kHz |

Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

## Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

### 5.2.7 Terminal units for communication interface modules

### 5.2.7.1 Safety instructions

## Hot swap

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index FO.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

## NOTICE!

## Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

## Conditions for hot swapping

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.
$\star$ Further information about hot swap.

### 5.2.7.2 TU507-ETH and TU508-ETH for Ethernet communication interface modules

### 5.2.7.2.1 Features

- TU507-ETH, Ethernet terminal unit, 24 V DC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 V DC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 V DC, spring terminals, XC version

1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug ( $2 \times 25$ pins) to connect the inserted Ethernet communication interface module
2b Plug ( $3 x 19$ pins) to connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
42 holes for wall mounting
52 RJ45 interfaces with indication LEDs for connection with the Ethernet network
630 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.
The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e. g. CI501-PNIO).

## Extreme conditions

Terminal units for use in extreme ambient conditions have no $\stackrel{*+k}{*+k}$ sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

## Terminals

| Screw terminals |  |  | Spring terminals |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Conductor |  | Screwdriver | Conductor |  | Screwdriver (opens terminal) |
|  |  |  |  |  |  |

The terminals 1.8 and 2.8 as well as $1.9,2.9$ and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 3.8: Process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

The assignment of the other terminals is dependent on the inserted communication interface module.

## NOTICE!

Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices Chapter 5.2.8.3.6 "TA535-Protective caps for XC devices" on page 1332.

### 5.2.7.2.2 Technical data

The system data of AC500 and S500 are applicable to the standard version ${ }^{*} \Rightarrow$ Chapter 5.1.2 "System data AC500" on page 166.

The system data of AC500-XC are applicable to the XC version ${ }^{〔}$ Chapter 5.1.3 "System data AC500-XC" on page 169.
Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Number of I/O channels per module | Max. 24 (depending on the inserted communi- <br> cation interface module) |
| Distribution of the channels into groups | 3 groups of max. 8 channels each (1.0 ... 1.7, <br> $2.0 \ldots 2.7,3.0 \ldots 3.7)$, the allocation of the <br> channels is given by the inserted Ethernet bus <br> module |
| Network interface connector | 2 RJ45, 8-pole |
| Rated voltage | 24 V DC |
| Max. permitted total current | 10 A via the supply terminals (UP, UP3 and <br> ZP) |
| Ethernet | $10 / 100$ base-TX or 100 base-TX (depending <br> on CI5xx module plugged in), 2 RJ45 socket |
| Grounding | Direct connection to the grounded DIN rail or <br> via the screws with wall mounting |
| Screw terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Spring-type terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Weight | 200 g |
| Mounting position | Horizontal or vertical |

### 5.2.7.2.3 Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

The dimensions are in mm and in brackets in inch.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### 5.2.7.3 TU509 and TU510 for communication interface modules

### 5.2.7.3.1 Features

- TU509, terminal unit, 24 V DC, screw terminals
- TU510, terminal unit, 24 V DC, spring terminals
- TU510-XC, terminal unit, 24 V DC, spring terminals, XC version

1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2 25 pins) to connect the inserted communication interface module
2b Plug (3 19 pins) to connect the inserted communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
42 holes for wall mounting
5 D-sub 9 (female) for connection with the PROFIBUS network
630 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.
The terminal units TU509 and TU510 are specifically designed for use with AC500/S500 communication interface modules (e. g. CI451-DP).

## Extreme conditions

Terminal units for use in extreme ambient conditions have no ${ }^{x_{+}+\ldots}$ sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

## Terminals

| Screw terminals |  |  | Spring terminals |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Conductor |  | Screwdriver | Conductor |  | Screwdriver (opens terminal) |
|  |  |  |  |  |  |

The terminals $2.8,3.8,2.9,3.9$ and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP $=+24 \mathrm{~V}$ DC
Terminal 4.8: process supply voltage UP3 $=+24 \mathrm{~V}$ DC
Terminals 2.9, 3.9 and 4.9: process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

The assignment of the other terminals depends on the inserted communication interface module (see communication interface modules for CANopen and PROFIBUS).

## NOTICE!

Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices Chapter 5.2.8.3.6 "TA535-Protective caps for XC devices" on page 1332.

### 5.2.7.3.2 Technical data

53 removable connectors to connect the subordinated bus systems
62 RJ45 interfaces with indication LEDs for connection with the PROFINET network
76 spring terminals for process supply voltage (UP)
8 DIN rail

The PROFINET communication interface modules plug into the PROFINET IO terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the PROFINET IO terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the PROFINET IO terminal unit.

The PROFINET IO terminal unit TU520-ETH are specifically designed for use with AC500/S500 PROFINET communication interface modules (e. g. CI504-PNIO, CI506-PNIO).

## Extreme conditions

Terminal units for use in extreme ambient conditions have no ${ }_{x_{k}+\ldots}^{*}$ sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

## NOTICE!

Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.
Protect unused connectors and slots with TA535 protective caps for XC devices Chapter 5.2.8.3.6 "TA535-Protective caps for XC devices" on page 1332.

| Spring terminals | Conductor |  | Screwdriver (opens terminal) |
| :---: | :---: | :---: | :---: |

The terminals $1.0,2.0,3.0,1.1,2.1$ and 3.1 are electrically interconnected within the PROFINET IO terminal unit and always have the same assignment, irrespective of the inserted PROFINET communication interface module:

- Terminals 1.0, 2.0 and 3.0: process supply voltage UP $=+24 \mathrm{~V} D C$
- Terminals 1.1, 2.1 and 3.1: process supply voltage $\mathrm{ZP}=0 \mathrm{~V}$

The assignment of the bus system terminals depends on the inserted PROFINET communication interface module (see Ethernet communication interface modules overview).

### 5.2.7.5.2 Technical data

The system data of AC500 and S500 are applicable to the standard version $\Leftrightarrow$ Chapter 5.1.2 "System data AC500" on page 166.
The system data of AC500-XC are applicable to the XC version ${ }^{\leftrightarrows}$ Chapter 5.1.3 "System data AC500-XC" on page 169.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

| Parameter | Value |
| :--- | :--- |
| Ethernet | $10 / 100$ base-TX or 100 base-TX (depending <br> on the plugged CI5xx module), 2 RJ45 socket |
| Number of bus system connectors | 3 (the type of bus system depends on <br> the PROFINET IO communication interface <br> module) |
| Rated voltage | 24 V DC |
| Max. permitted total current | 10 A via the supply terminals (UP and ZP) |
| Grounding | Direct connection to the grounded DIN rail or <br> via the screws with wall mounting |
| Spring terminals | Front terminal, conductor connection vertically <br> with respect to the printed circuit board |
| Weight | 200 g |
| Mounting position | Horizontal or vertical |

### 5.2.7.5.3 Dimensions

1 Din rail 15 mm
2 Din rail 7.5 mm

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### 5.2.8 Accessories

### 5.2.8.1 AC500-eCo

### 5.2.8.1.1 MC5102 - Micro memory card with adapter

- Solid state flash memory storage

1 Micro memory card
2 TA5350-AD micro memory card adapter, necessary for use in AC500 processor modules

The MC5102 micro memory card has no write protect switch.
The TA5350-AD micro memory card adapter has a write protect switch.
In the position "LOCK", the inserted micro memory card can only be read.

| Memory card type | AC500 V2 | AC500-XC <br> V2 | AC500 V3 | AC500-XC <br> V3 | AC500-eCo <br> V3 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| MC5141 | x | x | x | x | - |
| MC5102 with TA5350-AD micro memory <br> card adapter | $\left.\mathrm{x}^{1}\right)^{2}$ | $\left.\left.\mathrm{x}^{1}\right)^{2}\right)^{2}$ | x | $\left.\mathrm{x}^{2}\right)$ | - |
| MC5102 without TA5350-AD micro <br> memory card adapter | - | - | - | - | x |

${ }^{1}$ ) As of firmware 2.5.x
${ }^{2}$ ) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Processor modules can be operated with and without (micro) memory card.
Processor modules are supplied without (micro) memory card. It must be ordered separately.

The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.
The micro memory card can only be used temporarily in standard and XC applications.
The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.
② Further information on using the micro memory card in AC500 PLCs

## Dimensions

Micro memory card

The dimensions are in mm and in brackets in inch.

Micro memory card adapter

2.1
(0.082)

Insert the micro memory card AC500 V3

Fig. 259: Insert micro memory card into PM56xx
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

## Remove the micro memory card

## NOTICE!

Disturbed PLC operation
Do not remove the micro memory card when it is working!
Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- AC500 V3: Remove the micro memory card only when no black square ( is shown next to MC in the display.
- AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Fig. 260: Remove micro memory card from PM56xx
1 Micro memory card
2 Micro memory card adapter
3 Memory card slot

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.
2. By this, the micro memory card adapter is unlocked and can be removed.

## NOTICE!

## Disturbed PLC operation

Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- Remove the memory card only when no black square ( $\square$ ) is shown next to MC in the display.

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

## Technical data

| Parameter | Value |
| :--- | :--- |
| Memory capacity | 8 GB |
| Total bytes written (TBW) | On request |
| Data retention |  |
|  | at beginning |
| when number of write processes has been <br> $90 \%$ of lifetime of each cell | 10 years at $+40^{\circ} \mathrm{C}$ |
| Write protect switch | year at $+40^{\circ} \mathrm{C}$ |
|  | Micro memory card |
|  | Micro memory card adapter |
| Weight | Yes |
| Dimensions | 0.25 g |

It is not possible to use 100 \% of a device's memory space. About $10 \%$ of the total available space must remain unused at any time to maintain normal device operation.

## Ordering data

### 5.2.8.1.2 TA52xx(-x) - Terminal block sets

Intended pur- Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 pose processor modules PM50x2.
For option boards there are different removable terminal blocks in spring version.

For the AC500-eCo V3 Basic CPUs a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.
For the AC500-eCo V3 Standard CPUs and Pro CPUs a 3-pin terminal block for power supply, a 13 -pin terminal block and a 12 -pin terminal block for I/O connectors are used.

For all CPUs there is a screw and a spring variant available.

| Basic CPU |  | Standard and Pro CPUs |  |
| :---: | :---: | :---: | :---: |
| Spring terminal TA5211-TSPF-B | Screw terminal TA5211-TSCL-B | Spring terminal TA5212-TSPF | Screw terminal <br> TA5212-TSCL |
|  |  |  |  |

Various removable spring terminal blocks are available for option boards.
The following spare parts are available (depending on the number of pins).

| Spring terminals |  |  |  |
| :---: | :---: | :---: | :---: |
| TA5220-SPF5 | TA5220-SPF6 | TA5220-SPF7 | TA5220-SPF8 |
|  |  |  |  |

## CAUTION!

Risk of injury and damaging the product!
Improper installation and maintenance may result in injury and can damage the product!

- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

## CAUTION!

Risk of injury and damaging the module when using unapproved terminal blocks!
Only use terminal blocks approved by ABB to avoid injury and damage to the module.

## Terminal block set for PM50x2

Processor modules PM50x2 CPU are not delivered with terminal blocks.
Screw terminal block set:

- TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH
- TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH

Spring terminal block set:

- TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH
- TA5212-TSPF (1SAP187400R0005) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH

### 5.2.8.1.3 TA5300-CVR - Option board slot cover

Intended pur- TA5300-CVR option board slot covers for PM50xx processor modules are necessary to protect pose not used option board slots.

## CAUTION!

## Risk of injury and damaging the product!

Always plug in the option board slot cover when the option board is not inserted.
If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).

Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

The AC500-eCo V3 processor modules are delivered with option board slot cover(s).
The option board slot cover has to be removed before inserting an option board.
The TA5300-CVR option board slot covers are available as spare parts.

## Dimensions

The dimensions are in mm and in brackets in inch.

Inserting of the option board slot cover

1. Press on the option board slot cover to insert it in the not used option board slot of the processor module PM50xx.
2. The option board slot cover must click into the not used option board slot.

## Removing of the

 option board slot cover

1. Press the side of the inserted option board slot cover.
2. At the same time, pull the option board slot cover out of the option board slot of the processor module PM50xx.

Technical data The system data of AC500-eCo V3 apply ${ }^{4}$ ) Chapter 5.1.1 "System data AC500-eCo" on page 159

Only additional details are therefore documented below.

### 5.2.8.1.4 TA5400-SIM - Input simulator

- TA5400-SIM input simulator for 6 digital inputs 24 V DC
- For usage with AC500-eCo V3 processor modules

1 Contacts for connecting the input simulator to the terminal block for I/O connectors
26 switches for the digital inputs DIO ... DI5 (0 means opened switch, 1 means closed switch)
3 Screw terminal block for power supply
4 Screw terminal block(s) for I/O connectors

Intended purpose

## TA5400-SIM

The TA5400-SIM input simulator is only intended for testing and training purposes for AC500-eCo V3 processor modules PM50x2.
Continuous operation in a productive system is not permitted.
The TA5400-SIM input simulator may only be used with screw-type terminal blocks.

The TA5400-SIM input simulator must not be used with spring-type terminal blocks.

## Environmental conditions for testing and training purposes

In order not to impair the functionality of the product, avoid any kind of disturbing environmental influences:

- mechanical disturbances
- climatic influences

Make sure that the parameters are within the normal range:

- temperature
- air pressure
- humidity
- altitude

The TA5400-SIM input simulator can simulate 6 digital 24 V DC input signals to the digital inputs IO ... I5 of onboard I/Os.

With the TA5400-SIM input simulator, the digital 24 V DC inputs $10 \ldots 15$ can be turned OFF and ON separately:

- If the lever of the switch is on the right side (1), the input is ON.
- If the lever of the switch is on the left side (0), the input is OFF.

## Dimensions

The dimensions are in mm and in brackets in inch.

## Electrical diagram

The diagram below shows the connection of the TA5400-SIM input simulator.

## NOTICE!

Risk of damage to the TA5400-SIM input simulator!
Do not remove the terminal block while the TA5400-SIM input simulator is connected.

Do not apply mechanical forces to the input simulator when it is connected to the terminal block.

In both cases the input simulator could be damaged.

## Assembly

Insertion of the input simulator

1. Make sure that the power supply of the processor module is turned off.

## CAUTION!

Risk of damaging the PLC modules!
The PLC modules can be damaged by overvoltages and short circuits.
Make sure, that all voltage sources (supply and process voltage) are switched off before you start working on the system.

Never connect voltages > 24 V DC to the terminal block of the TA5400SIM input simulator.

## Risk of damaging the input simulator and/or PLC modules!

CAUTION!

The TA5400-SIM input simulator may only be used with AC500-eCo V3 processor modules PM50x2.

Never use the input simulator with other devices.
The input simulator may only be used with screw-type terminal blocks.
The input simulator is only intended for testing and training purposes.
Never use it within productive sytems.
2. Make sure that all clamps of the onboard I/Os are totally open.
3. Insert the TA5400-SIM input simulator into the screw terminal block as shown in the figure.

4. Tighten all screws of the onboard I/O clamps.
5. Make sure all switches are in OFF state (0).
6. Connect 24 V DC to the power supply of the TA5400-SIM ( $L+$ and M). Tighten the screws.
7. Connect the processor module power supply wires (24 V DC) ${ }^{\wedge}$ "Pin assignment" on page 184.

## Disassembly

Removal of the input simulator

1. Make sure that the power supply of the processor module is turned off.

## CAUTION!

## Risk of damaging the PLC modules!

The PLC modules can be damaged by overvoltages and short circuits.
Make sure that all voltage sources (supply and process voltage) are switched off before you start working on the system.
2. Disconnect the TA5400-SIM power supply wires ( 24 V DC) with a flat-blade screwdriver from the terminal block for power supply ( $L+$ and $M$ ).
3. Loosen all screws of the onboard I/Os.
4. Remove the input simulator by pulling it to the left side.

Technical data The system data of AC500-eCo V3 apply ${ }^{4}$ ) Chapter 5.1.1 "System data AC500-eCo" on page 159
Only additional details are therefore documented below.

Table 296: Technical data of the module

| Parameter |  |

### 5.2.8.2 AC500 and AC500-XC

### 5.2.8.2.1 MC5102 - Micro memory card with adapter

- Solid state flash memory storage

1 Micro memory card
2 TA5350-AD micro memory card adapter, necessary for use in AC500 processor modules

The MC5102 micro memory card has no write protect switch.
The TA5350-AD micro memory card adapter has a write protect switch. In the position "LOCK", the inserted micro memory card can only be read.

| Memory card type | AC500 V2 | AC500-XC <br> V2 | AC500 V3 | AC500-XC <br> V3 | AC500-eCo <br> V3 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| MC5141 | x | x | x | x | - |
| MC5102 with TA5350-AD micro memory <br> card adapter | $\mathrm{x}^{1}$ ) | $\left.\left.\mathrm{x}^{1}\right)^{2}\right)^{2}$ | x | $\mathrm{x}^{2}$ ) | - |
| MC5102 without TA5350-AD micro <br> memory card adapter | - | - | - | - | x |

${ }^{1}$ ) As of firmware 2.5.x
${ }^{2}$ ) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

The use of other micro memory cards is prohibited. $A B B$ is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose
Processor modules can be operated with and without (micro) memory card.
Processor modules are supplied without (micro) memory card. It must be ordered separately.

The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.
The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.
« Further information on using the micro memory card in AC500 PLCs

## Dimensions

Micro memory card

The dimensions are in mm and in brackets in inch.

Micro memory card adapter

2.1

The dimensions are in mm and in brackets in inch.

Insert the micro
memory card
AC500 V3

Fig. 261: Insert micro memory card into PM56xx
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

## Remove the micro memory card

## NOTICE!

Disturbed PLC operation
Do not remove the micro memory card when it is working!
Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- AC500 V3: Remove the micro memory card only when no black square ( is shown next to MC in the display.
- AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Fig. 262: Remove micro memory card from PM56xx
1 Micro memory card
2 Micro memory card adapter
3 Memory card slot

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.
2. By this, the micro memory card adapter is unlocked and can be removed.

## NOTICE!

## Disturbed PLC operation

Do not remove the memory card when it is working!
Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

- Remove the memory card only when no black square ( $\square$ ) is shown next to MC in the display.

1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

## Technical data

| Parameter | Value |
| :--- | :--- |
| Memory capacity | 8 GB |
| Total bytes written (TBW) | On request |
| Data retention |  |
|  | at beginning |
| when number of write processes has been <br> $90 \%$ of lifetime of each cell | 10 years at $+40^{\circ} \mathrm{C}$ |
| Write protect switch | year at $+40^{\circ} \mathrm{C}$ |
|  | Micro memory card |
|  | Micro memory card adapter |
| Weight | Yes |
| Dimensions | 0.25 g |

It is not possible to use 100 \% of a device's memory space. About $10 \%$ of the total available space must remain unused at any time to maintain normal device operation.

### 5.2.8.2.3 TA521 - Battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

Purpose The TA521 battery is the only applicable battery for the AC500 processor modules ${ }^{\wedge} \Rightarrow$ Chapter 5.2.1.2.2 "PM56xx-2ETH for AC500 V3 products" on page 313. It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.
※ Chapter 6.8.2.3.2 "AC500 battery" on page 4445
The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

Battery lifetime The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

## Insertion

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

## WARNING!

## Risk of fire or explosion!

Use of incorrect Battery may cause fire or explosion.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = positive pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

| In order to prevent data losses or problems, the battery should be replaced after |
| :--- |
| 3 years of utilisation or at least as soon as possible after receiving the "low |
| battery warning" indication. |
| Do not use a battery older than 3 years for replacement, do not keep batteries <br> too long in stock. |

## Replacement of the battery

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front view of the processor module and cannot be removed.
2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

## CAUTION!

## Risk of explosion!

Do not open, re-charge or disassemble lithium batteries. Attempting to charge lithium batteries will lead to overheating and can cause explosions.
Protect them from heat and fire and store them in a dry place.
Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid unintentional short circuiting do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.
Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

## Technical data

| Parameter | Value |

### 5.2.8.3 S500 and S500-XC

### 5.2.8.3.1 CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to $90 \%$
- Low power dissipation and low heating
- Wide ambient temperature range from $-40^{\circ} \mathrm{C} \ldots+70^{\circ} \mathrm{C}$
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

Table 297: Ordering data

### 5.2.8.3.2 CP-C. 1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C. 1 power supplies are ABB's high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a $50 \%$ integrated power reserve and operate at an efficiency of up to $94 \%$. They are equipped with overheat protection and active power factor correction. Combinded with a broad AC and DC input range and extensive worldwide approvals the CP-C. 1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to $94 \%$
- Power reserve design delivers up to $150 \%$ of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

5.2.8.3.3 TA523-Pluggable label mounting

For labelling the channels of S500 I/O modules.

1 Pluggable label mounting TA523
2 Plastic labels to be inserted into the holder

Purpose $\quad$ The pluggable label mounting is used to hold 4 plastic labels, on which the meaning of the I/O channels of I/O modules can be written down. The holder is transparent so that after snapping it onto the module the LEDs shine through.

Handling instructions

The plastic labels can be printed out from TA523.doc.

### 5.2.9.2 Functionalities

| Filesystem Name | As of CPU firmware | Description |
| :---: | :---: | :---: |
| userdisk | V3.0.0 | Boot project (size depends on PLC type) WebVisu files for web server <br> Symbol file for OPC server and CP600 panels <br> User data via CAA_File_xxx.lib *) <br> Files via Automation Builder file download <br> Files via FTP server |
|  | V3.1.0 | Save persistent data |
| SRAM | V3.1.0 | Save retain and persistent data |
| system | V3.0.0 | Load / save boot project |
|  |  | Firmware update |
|  |  | Internal system files |
| flash disk | V3.1.0 | User data via CAA_File_xxx.lib *) <br> Files via Automation Builder file download Files via FTP server |
| sdcard | V3.0.0 | Firmware update, <br> User data via CAA_File_xxx.lib *) <br> Files via Automation Builder file download <br> Files via FTP server |
|  | V3.1.0 | Save persistent data <br> Boot project (size depends on PLC type) |

*) Examples for the filename with path (sFileName for FILE.Open) specified by the user ('mydir' is optional, but must be an existing directory):

- 'userdisk/myfile.txt'
- 'sdcard/mydir/myfile.txt'
- 'flashdisk/myfile.txt'

The maximum number of files opened at the same time is limited to 1007.
The max. length of the user string (path and filename) is 241 characters.

Unlike the PLC's memory areas like \%M or Retain, where 1 byte actually consumes 1 byte, all storage device utilize a file system.

That means there is a difference between a files size and its size on the disk.
On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk's size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

### 5.2.9.3 Memory sizes

AC500-eCo V3 processor modules

Chapter 5.2.8.2.1 <br> "MC5102 Micro memory card with adapter" on page 1309 |
| $\begin{aligned} & \text { PM5650-2ET } \\ & \text { H } \end{aligned}$ | Dynamically /max. 16 MB | $\begin{aligned} & 246 \mathrm{MB} \text { (as } \\ & \text { of V3.0.x) } \\ & 381 \mathrm{MB} \text { (as } \\ & \text { of V3.1) } \\ & 285.75 \text { (as of } \\ & \text { V3.4.0) } \end{aligned}$ |  |  |  |

| PLC type | system RAM disk | userdisk <br> PlcLogic | SRAM <br> Retain, \%M area | flash disk | memory card |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{array}{\|l} \text { PM5670-2ET } \\ \mathrm{H} \end{array}$ | Dynamically /max. 69 MB | $\begin{array}{\|l\|} \hline 858 \mathrm{MB} \\ 643.50 \mathrm{MB} \\ \text { (as of V3.4.0) } \end{array}$ | 1536 MB <br> 1 MB retain and persistent (of which 68 byte are reserved for allocation table and are not available to the user) <br> 512 kB \%M |  |  |
| $\begin{array}{\|l} \hline \text { PM5675-2ET } \\ \mathrm{H} \end{array}$ |  |  |  | 8 GB |  |

It is not possible to use 100 \% of a device's memory space. About 10 \% of the total available space must remain unused at any time to maintain normal device operation.

### 5.2.9.4 Storage device details

### 5.2.9.4.1 SRAM

The SRAM is a battery-buffered, nonvolatile RAM and is used for the retain/persistent and the \%M variables. If a battery is inserted into the processor module, the data stored in the SRAM will not get lost during a power-down cycle.
During PLC startup, the SRAM will be deleted automatically if no or an empty battery is inserted into the processor module. In this case the information
ABBInitSram_SetupMemory : SRAM cleared
and the warning
Retain size in config changed, or retain area got corrupted
are written into the log file.
$\boldsymbol{y}$ Chapter 6.8.2.1 "Handling of remanent variables for AC500 V3 products" on page 4412

### 5.2.9.4.2 Flash disk

The flash disk is an internal persistent mass storage device and can be used for any application purpose.

It has a memory capacity of 8 GB (preformatted).
The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases. If the performance seems to get insufficient, check the following:

- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.

Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require $10 * 4 \mathrm{kB}$ disk space, while 1 file with 100 byte requires only 4 kB .

Number of max. Technically, the flash chip used in the V3 flash disk has 20000 erase cycles (Write cycles). write cycles

Due to the produced write overhead, the optimum achievable number of write cycles is 10000 (for typical payload sizes of 256 kB ).

Example The write overhead is indicated by the write amplification factor (WAF).

$$
\text { WAF }=\frac{\text { Flash Write (in Bytes) }}{\text { Host Write (in Bytes) }}
$$

Table 299: Rule of thumb for assessing the flash lifetime for an application:

| Typical payload sizes | WAF | Max. write cycles |
| :---: | :---: | :---: |
| 256 kB | 2 | 10000 |
| 128 kB | 4 | 5000 |
| 64 kB | 8 | 2500 |
| $\ldots$ | $\ldots$ | $\ldots$ |
| 1024 Byte | 512 | $<40$ |
| 512 Byte | 1024 | $<20$ |

For monitoring the status

It is recommended to use the respective function blocks to monitor the status of the flash disk.
«y Chapter 6.8.2.2.1.4 "Health monitoring" on page 4424
Since FW version 3.3.0, there is also a diagnosis event supported when the user flash memory reaches the end of its life cycle.

Lifetime of flash disk will also depend on the operating environment.
E.g. high ambient temperatures will impose stress on the user flash memory and reduce the total overwrites achievable.

- Max. write speed is $20 \mathrm{MB} / \mathrm{s}$ (continuous write of sequential data)
- Read cycles are unlimited.

### 5.2.9.4.3 Memory card

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card.
\& Chapter 6.3.1.4.5 "Firmware installation and update with memory card" on page 1426

| Size | Product specific <br> 乡 Chapter 5.2.9.3 "Memory sizes " <br> on page 1335 |

$\leadsto$ Further details on the storage device sizes
*) Further details on the FTP access
«) Further details on the PLC shell commands

### 5.3 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- Status LEDs:

Indicates the availability of devices and components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- I/O LEDs:

Displays the status of the inputs and outputs.

- Display:

Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.
« Chapter 6.8.2.5 "Display, LEDs and function keys on the front panel" on page 4452
๕ Chapter 6.9.1.3 "Diagnosis in CPU display" on page 4607
(y) Chapter 4.8 "Troubleshooting" on page 149

- Function keys and switches:

Allows to change the current operating modes/status manually ${ }^{4} \Rightarrow$ Chapter 6.8.2.5.5 "Description of the function keys" on page 4457.

## 6 Configuration and programming

### 6.1 Cyber security

### 6.1.1 General

Cyber security This product is designed to be connected to and to communicate information and data via a disclaimer network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware exchanges, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected. This also applies to the operating system. Security measures (such as but not limited to the installation of latest patches, installation of firewalls, application of authentication measures, installation of anti-virus programs, etc.) are in your responsibility. You have to be aware that operating systems provide a considerable number of open ports that should be monitored carefully for any threats.

It has to be considered that online connections to any devices are not secured. It is your responsibility to assure that connections are established to the correct device (and e.g. not to an unknown device pretending to be a known device type). Furthermore you have to take care that confidential data exchanged with the PLC is either compiled or encrypted.

Security related Security details for industrial automation is provided on ABB website in a whitepaper. deployment guidelines for industrial automation
Signed firmware The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During updates the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

Open ports and As part of the ABB security concept the AC500 V3 PLC comes with minimal services opened by services default. Only the services needed for initial setup and programming are open before any user application is downloaded $\stackrel{y}{c}$ Chapter 5.2.1.2.1.3 "Ethernet protocols and ports for AC500 V3 products" on page 307.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

| Encrypted and | An application can be encrypted and signed in order to protect a running application in an |
| :--- | :--- |
| signed applica- | AC500 V3 PLC and to protect a configured project. How to set-up the user management, the |
| tions | communication and the boot application in order to prevent unauthorized access is explained in |
| the application note $A C 500$ V3-Encrypt and sign your application. |  |

Secure commu- Whenever possible, use an encrypted communication between AC500 V3 devices and third nication party devices, such as HMI devices. This is necessary to protect passwords and other data.

## Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

Frequently For more information around cyber security please see our AC500 cyber security FAQ. asked questions

### 6.1.2 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor's recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:

- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks

Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

## References: CODESYS Security Whitepaper

Security zones IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewalls Fig. 265. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.

Cooperate network
Available for all employees

## Company intranet

Available to local employees

Firewall

> Automation system
> Available to operators and process engineers only

Firewall

## Fig. 265: Security zones

Fig. 265 shows three safety zones, but the number of zones is not necessarily decisive, there can also be more or less - depending on the safety requirement. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.

High-security zones should be kept small and independent. They need to be physically protected, i.e. physical access to computers, network equipment and network cables must be limited by physical means to authorized persons only. A high-security zone should obviously not depend on resources in a less secure zone for its security. Therefore, it should form its own domain that is administered from the inside, and not depend on, e.g., a domain controller in a less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compromised resource that is inside the trusted zone, or by an outside user or resource that succeeds to penetrate the secure interconnection. Trust therefore depends also upon the types of measures taken to detect and prevent compromise of resources and violation of the security policy.
References: Security for industrial automation and control systems

### 6.1.3 Secure operation

The controller must be located in a protected environment in order to avoid accidental or intended access to the controller or the application.
A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers and field devices via standard communication protocols (fieldbus systems) using appropriate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional measures, such as encryption. Open physical or data access to fieldbus systems and their components is a serious security risk.
- Physically protect all equipment, i.e., ensure that physical access to computers, network equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized persons
- When connecting a trusted network zone to outer networks, make sure that all connections are through properly configured secure interconnections only, such as a firewall or a system of firewalls, which is configured for "deny by default", i.e., blocks everything except traffic that is explicitly needed to fulfill operational requirements.
- Allow only authorized users to log on to the system, and enforce strong passwords that are changed regularly.
\& Chapter 6.3.1.2.1.1 "General" on page 1409
- Continuously maintain the definitions of authorized users, user groups, and access rights, to properly reflect the current authorities and responsibilities of all individuals at all times. Users should not have more privileges than they need to do their job.
- Do not use the system for e-mail, instant messaging, or internet browsing. Use separate computers and networks for these functions if they are needed.
- Do not allow installation of any unauthorized software in the system.
- Restrict temporary connection of portable computers, USB memory sticks and other removable data carriers. Computers that can be physically accessed by regular users should have ports for removable data carriers disabled.
- If portable computers need to be connected, e.g., for service or maintenance purposes, they should be carefully scanned for viruses immediately before connection.
- All CDs, DVDs, USB memory sticks and other removable data carriers, and files with software or software updates, should also be checked for viruses before being introduced into the trusted zone.
- Continuously monitor the system for intrusion attempts.
- Define and maintain plans for incident response, including how to recover from potential disasters.
- Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.
A protected local control cabinet could look like in figure 266, page 1343. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.

Fig. 266: Isolated automation system
Servers and workplaces that are not directly involved in the control and monitoring of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.

Fig. 267: Plant information network connected to an automation system
For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.

Fig. 268: Automation system and IS network

### 6.1.4 Hardening

System hardening means to eliminate as many security risks as possible. Hardening your system is an important step to protect your personal data and information. This process intends to eliminate attacks by patching vulnerabilities and turning off inessential services. Hardening a system involves several steps to form layers of protection.
Commissioning phase

- Protect the hardware from unauthorized access
- Be sure the hardware is based on a secure environment
- Disable unused software and services (network ports)
- Install firewalls
- Disallow file sharing among programs
- Install virus and spyware protection
- Use containers or virtual machines
- Create strong passwords by applying a strong password policy
- Create and keep backups
- Use encryption when possible
- Disable weak encryption algorithms
- Separate data and programs
- Enable and use disk quotas
- Strong logical access control
- Adjust default settings, especially passwords

Verification phase

- Verification of antivirus - Check antivirus is active and updated
- Verification of the identification - Check that test and unauthorized accounts are removed
- Verification of intrusion detection systems - Check malicious traffic is blocked
- Verification of audit logging - Check audit log is enabled
- You can use the checklist out of the cyber security white paper

Operation phase

- Keep software up-to-date, especially by applying security patches
- Keep antivirus up and running
- Keep antivirus definitions up-to-date
- Delete unused user accounts
- Lock an active session whenever it is unattended, e.g., lock the screen of the PC or of the control panel (HMI)
Decommissioning phase
- Delete all credentials stored in the device like certificates and user data $\xi^{*}$ Chapter 4.10 "Decommissioning" on page 157.
References: Hardening in Wikipedia (2021)

### 6.1.5 Certificates factory default - no encryption

As of Automation Builder Release 2.6.0, the encryption of the AC500 communication policy is set to "No encryption" by default. The reason for that is that the PLC clock defaults to 01/01/1970 when shipped from the factory, any pre-installed certificate would already be expired when the user attempts to connect.

## Preliminary

 work$\checkmark$ Connection of the PLC to the Automation Builder and internet access.
$\checkmark$ The PLC must be equipped with a battery to keep the date in case of power off. (4) Chapter 5.2.8.2.3 "TA521-Battery" on page 1319
$\checkmark$ The PLC must be set to the current date and time. ${ }^{\wedge} \Rightarrow$ Chapter 6.3.4.9.3.5.6 "Time syncronisation" on page 1746

1. If necessary reboot the PLC.
2. Connect the PLC to the Automation Builder again.

## Create an CAsigned certifi- <br> cate

The basis for an official trusted signed certificate is the creation of a Certificate Signing Request.
As an example, the creation of a certificate for a FTP server is described.

1. Double-click to the PLC main node and select the "PLC Shell" tab. Command line input is on the bottom. Find the index number for the FTP server and type [cert-getapplist] in the below command line.

2. Type [cert-createcsr <index number> encoding=Base64] in the command line e.g. here: [cert-createcsr 1 encoding=Base64] and press [ENTER].

For some users it may be necessary to swap "Base64" for "ASN1" if the user's PKI needs this format.
3. Change to the "Log" tab.
4. Click the $₫$ refresh button.
$\Rightarrow$ Wait until the log entry of CSR file created pops up.

|  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Communication Settings <br> PLC Settings | (\%) Components - |  |  |  |
|  | Severity | Time Stamp | Description | Component |
|  |  | 04.08.2022 09:45:27 |  | CmpopenssL |
| Version information | - | 04.08.2022 09:42:27 |  | CmpopenssL |
|  | - | 04.08.2022 07:44:56 | [1] CSR file created, subject='commonName=FTPServer@PM5670-2ETH unstucturedName=Vendor: ABB AG unstucturedName=Device:' | CmpopenssL |

|  | - | 04.08.2022 07:43:55 | [4] CSR file created, subject='commonName=PM5670-2ETH' | CmpOPenssL |
| Files | - | 04.08.2022 07:43:45 | [3] CSR file created, subject='commonName=PM5670-2ETH unstructuredName=Vendor: ABB AG unstructuredName=Device: AC500 PMS' | CmpopenssL |
|  | - |  | [2] CSR file created, subject=commonName=MQTTClient@PM5670-2ETH' | CmpOPenssL |
| Log | - | 04.08.2022 07743:08 04.08.2022 07:22:28 | [1] CSR fie created, subject='commonName=FTPServer @PM5670-2ETH unstucturedName=Vendor: ABE AG unstucturedName=Device:' | CmpOPenssL |

5. Change to the "Files" tab.
6. Click the $\$$ refresh button.
7. Open the "cert" folder in the PLC.
8. Open the "export" folder.
9. Copy the certificate request file [1_IoDrvFTPServer.csr] to any folder on your PC.

10. This file, here [1_loDrvFTPServer.csr] must then be signed by your Public Key Infrastructure ( PKI ).

The signing process itself is outside the scope of this documentation. There are sufficient sources on the internet for building your own PKI (e.g. PKI tutorial) - or get in touch with your IT department.

Integrate a cer- After the signed certificate comes back from the PKI and is stored on the PC, it has to be tificate imported into the controller.

## Be sure to import into the "Own Certificates" folder.

1. Change to the "Security Screen".
2. Select tab "Devices", the folder "Own Certificates" and press the ${ }^{0}$ import button.

3. Select the certificate ([1_IoDrvFTPServer.cer]) to be imported in the opening file manager.
4. Press the "Open" button.
$\Rightarrow$ The new certificate will be shown as "loDrvFTPServer" in the information column. The previous self-signed certificate will lose its name and is therefore not valid anymore.

5. Check the validation and "Issued by" of the new certificate by activating the top PLC branch.
6. Download and reboot the PLC (repower or use "PLC Shell" and command [reboot].)

Encrypted and An application can be encrypted and signed in order to protect a running application in an signed applica- AC500 V3 PLC and to protect a configured project. How to set-up the user management, the tions

We recommend changing the communication policy accordingly so that only encrypted connections are allowed. communication and the boot application in order to prevent unauthorized access is explained in the application note AC500 V3 - Encrypt and sign your application.

## Enforced signing

As of Automation Builder 2.6 .0 there is also the possibility to activate the "Enforced signing" mode in the "Change Runtime Security Policy". Then the controller accepts ONLY signed downloads.
"Tab Communication Settings $\rightarrow$ Device $\rightarrow$ Change Runtime Security Policy... $\rightarrow$ Code Signing
$\rightarrow$ New policy $\rightarrow$ Enforced signing"

White Paper - More information about certificates and cyber security can be found in the white paper AC500 cyber security AC500 cyber security.

### 6.2 Engineering software Automation Builder

### 6.2.1 Introduction

ABB $\quad$ ABB Automation Builder is the integrated software suite for machine builders and system inte-

Automation
Builder - One
holistic suite grators wanting to automate their machines and systems in a productive way. Combining the tools required for configuring, programming, debugging and maintaining automation projects from a common intuitive interface, Automation Builder addresses the largest single cost element of most of today's industrial automation projects: software. ABB Automation Builder covers the engineering of ABB PLCs, Safety PLCs, control panels, drives, motion and robots.

## Automation

 Builder ReadMeBefore starting Automation Builder configuration read the version specific information provided in the Automation Builder readme file. It describes new features and functions as well as workarounds on known problems. The readme file is stored in the installation directory of Automation Builder, however can be downloaded as well from ABB website http://new.abb.com/plc/automationbuilder.

### 6.2.2 Automation Builder updates

An update notification dialog will be shown during Automation Builder startup in case there are any updates available for the installed version.

The user has the possibility to check for updates manually: "Help $\rightarrow$ Check for Updates"
${ }^{4}$ ) Chapter 4.8.3 "Execution of a hotfix" on page 151

### 6.2.3 Use of open source components

ABB Automation Builder and AC500 V3 firmware are using open source components. A detailed overview of these open source components and the corresponding licenses are available from Automation Builder via "Help $\rightarrow$ About... $\rightarrow$ License Terms".

There are separate lists available for Automation Builder and AC500 V3 firmware.

### 6.2.4 Managing your licenses

### 6.2.4.1 Identifying the installed license

The title bar of the Automation Builder shows the version and the license information (Basic, Standard or Premium).

Be aware of the following rule for this information:
The info in the title bar is taken in this order from the first found license.

- local licenses (on PC)
- on a dongle (USB key)
- network licenses

So if a local license is only basic and a dongle with premium license is inserted the functionality is premium (the highest available) but the information in the title bar is basic.

To check your installed licenses, the CodeMeter Control Center tool can be used.
${ }^{\star}{ }^{\star}$ Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center"" on page 1352

### 6.2.4.2 Selecting the license used on Automation Builder startup

You can select, which license the Automation Builder should use on startup.

To select which license should be used:

1. In the Automation Builder menu select "Tools $\rightarrow$ Options".
$\Rightarrow$ The "Options" window is opened.
2. In "Startup settings" under "License" select which license should be used.

- Default: The most comprehensive available license will be selected
- Use only local license: Network licenses will never be selected
- Display licenses selection dialog if shared licenses are available: On every Automation Builder startup, you will be asked to select a license

3. To apply the setting select [OK].

### 6.2.4.3 Checking licenses with "CodeMeter Control Center"

1. Open the "CodeMeter Control Center" via the "Windows start menu $\rightarrow$ CodeMeter $\rightarrow$ CodeMeter Control Center".

CodeMeter Control Center
File Process View Help
License
Events

ABB Automation Builder Trial 128-8843150

ABB R\&D non-bind License
128-17149280

Name: ABB Automation Builder Trial

Serial: 128-8843150

Version: CmActLicense 1.19

Status: License activated

## Remove License

CodeMeter service is running.
2. In the "CodeMeter Control Center" window you can see the different license "tickets" / "CmContainers" that are installed on your PC.

To see more details, open the "CodeMeter WebAdmin" by selecting [WebAdmin]

### 6.2.4.4 Setting dedicated network servers in search list

In case of a new installation CodeMeter will check for licenses also in the network. If there is a run-out or wrongly installed license found, the service is closed without any further hint. This looks like Automation Builder starts and closes after a few moments.

To set the search for licenses to your local machine only follow these steps:

1. Open the CodeMeter Control Center $\stackrel{y}{4}$ Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center"" on page 1352.
2. Open the CodeMeter WebAdmin by selecting [WebAdmin]

3. Select "Configuration $\rightarrow$ Basic $\rightarrow$ Server Search List"

4. Select "add new Server"

5. Restart the license check
6. Add more servers to the search list by entering the IP address or name of the license servers you know.

### 6.2.4.5 Restarting license check with a dongle bound license

In case of using a dongle bound license it might be necessary to restart the check for license on the PC, e.g. if the dongle was removed and reinserted.

1. Open the CodeMeter Control Center ${ }^{\star} \stackrel{y}{c}$ Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center"" on page 1352.
2. Select "Process $\rightarrow$ Restart CodeMeter Service"

CodeMeter Control Center
File Process View Help

Name: ABB R\&D non-bind License

Serial: 128-17149280

Version: CmActLicense 1.19

Status: C License activated

License Update Remove License

CodeMeter service is running.

### 6.2.4.6 Removing trial license to remove expiring message

If an unlimited license is installed after having a trial license activated, the warning message for expiring date of the trial license still pops up at the Startup of the Automation Builder.

To avoid this message the trial license can be removed.

## CAUTION!

- If you remove a license from your PC it will be permanently lost.
- Be aware that the trial license includes all premium functionalities, which will not be available any more if your unlimited license is not a premium license, e.g. standard.

1. Check for the Trial CmContainer number in CodeMeter WebAdmin InterfaceCheck for the Trial CmContainer number in CodeMeter WebAdmin Interface
2. Search CmContainer number in CodeMeter Control Center

3. Remove this selected license in CodeMeter Control Center

### 6.2.4.7 Network licenses

### 6.2.4.7.1 General

It allows sharing of licenses between team members, easy switchover between several workstations with a single license and allows centralized administration (ordering, registration, activation).

The Automation Builder License Manager and CodeMeter need to be used to configure the network server.

- In a typical office LAN (Local Area Network) setup on Client side the default settings of the Automation Builder (and CodeMeter) are sufficient to get the Network Licenses working.
- If an opened Automation Builder is loosing contact to the network server (e.g. due to network problems) Automation Builder will prompt the user to restore the network. After 30 minutes without connection to the network server Automation Builder will fall back to basic edition. Opened editors for non-basic features stay open and usable. So your work will not be lost in case of troubles with the network.
«2 Information on how to borrow and return a network license.
The network lincenses can be used as of Automation Builder 1.2.0.

### 6.2.4.7.2 Setting up a network license

## General

The following setup works in typical environments.

## Configuring a network license server

$\checkmark$ Network license must be registered.
$\square$ Automation Builder license must be activated.

1. Launch CodeMeter WebAdmin as described in chapter 'Managing your licenses' \& Chapter 6.2.4 "Managing your licenses" on page 1350
2. Select "Configuration $\rightarrow$ Server $\rightarrow$ Server Access"

3. Enable Network Server

Keep the default port settings. These should work in most cases.
4. Select [Apply]

5. For the changes to take effect, restart CodeMeter Control Center ${ }^{〔}$ Chapter 6.2.4.5 "Restarting license check with a dongle bound license" on page 1355

## NOTICE!

- In case you want to control usage of network licenses please refer to chapter 'View network server license usage' «y Chapter 6.2.4.7.4 "View network server license usage" on page 1360
- Activation keys for network licenses are valid for one network license each. This one license can be shared among many people but only one Automation Builder instance at the same time. If you want to run more than one Automation Builder instance at the same time you have to activate more than one network license. This means you have to purchase and enter more than one activation key (one per license).

## Configuring the client side

The default settings of Automation Builder and the CodeMeter (on client side) are sufficient in most cases to get the network licenses working. In case of problems accessing the network license, please set the server search list on the client side.

## -Server Search List

1. Automatic server search ( 255.255 .255 .255 )
```
add new Server
```

### 6.2.4.7.3 View network server licenses

On the Network Server side you can find information on existing network licenses and their current allocation.

1. Launch CodeMeter WebAdmin ${ }^{4}$, Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center'"' on page 1352.
2. Select "License Monitoring $\rightarrow$ All Licenses"

6.2.4.7.4 View network server license usage
3. Launch CodeMeter WebAdmin ${ }^{\mu}$ Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center'"' on page 1352.
4. Select "License Monitoring $\rightarrow$ Sessions"

Sessions

| Client | CmContainer | Firm Item | Product Item | Access Mode |

| localhost | ABB R\&D non-bind License (128-17149280) | 5000460 : ABB Automation Products GmbH | 1002 : ECAD Import Export | Station Share |

### 6.2.4.7.5 Controlling network server license usage

On the Network Server side you can define settings managing the client access to CodeMeter License Server on a network.

1. Launch CodeMeter WebAdmin $\triangleq$ Chapter 6.2.4.3 "Checking licenses with "CodeMeter Control Center"'" on page 1352.
2. Select "Configuration $\rightarrow$ Server $\rightarrow$ Server Access"

3. Add entries of PCs you want to share licenses with by adding client computers and IP addresses for accessing CodeMeter License Server on a network.

### 6.2.4.8 License borrowing manager

### 6.2.4.8.1 Introduction

The license borrowing manager allows you to borrow a network license for offline use and return it.

The license borrowing manager is supported as of Automation Builder 2.2.3.

### 6.2.4.8.2 Borrowing a network license

$\checkmark$ Network access to the license server required.
$\checkmark$ Opened the license borrowing manager.

1. Select the license you want to borrow.

2. Select [Borrow License].
3. Select the target CmContainer.

Alternatively a new CmContainer can be created.
4. Select the end of the borrowing period.

| Choose Transfer Options |  |
| :--- | :--- |
| Choose Target CmContainer |  |
| CmContainer Server <br> Create new CmContainer (2000) localhost <br>   <br>  Cnd of borrowing period <br> $5 / 12 / 2020$ Longest borrowing period until <br> Ok Cancel |  |

5. Select [OK].
$\Rightarrow$ The license has sucessfully been borrowed.
The list of available licenses has been updated.

### 6.2.4.8.3 Returning a network license

Automatical Network licenses will be returned automatically after the expiration of the maximum borrwoing return of a license period. No licenses server access is required.

Manual return of Network licenses can be returned anytime manually.

## a network

license
$\square \quad$ Network access to the license server required.
$\checkmark$ Opened the license borrowing manager.

1. Select a borrowed license.

2. Select [Return License]
$\Rightarrow$ The license has sucessfully been returned.

### 6.2.4.9 Transfering an Automation Builder license

### 6.2.4.9.1 General

It is possible to transfer normal licenses from a PC to another PC or dongle (DM-Key).
This is not possible for ABB internal or temporary licenses, e.g. the 30 day Trial license.
The process consists of two main steps:

1. Return the actual license from the actual PC
2. Reactivate the license on the new PC

### 6.2.4.9.2 Getting activation code

For all license transfer processes the activation code is required. It is available from the license paper from purchasing the license.
For Automation Builder licenses purchased April 2020 or later, the activation code is available from the activated license:

1. Open CodeMeter Control Center and navigate to the [WebAdmin].

2. Identify the right product code.

Automation Builder editions consist of multiple product codes. The activation ID is available from the product code containing the edition name, e.g. "Automation Builder Standard".

3. Select product code to access the product code details. Under "License Information" you can find the activation code.

### 6.2.4.9.3 Returning an Automation Builder license

$\square \quad$ You need the License Activation code of the license you want to return.

1. Go to the following website: http:///c.codemeter.com/32838/depot-return/index.php

The website is also availaible through the Automation Builder menu under "Help $\rightarrow$ Return of Automation Builder license".
2. Insert your Activation code in the field "Ticket"
3. Select [Next]

## Welcome to CodeMeter License Central WebDepot

### 6.2.4.9.6 Return of unconfirmed license

If customers do not complete the offline activation process by uploading the receipt file, they won't be able to return the license. However, working with Automation Builder is possible.
When the customer tries to return the license, they will see that the license is available, but they won't be able to rehost the license because the button is not visible.
The only way to proceed here is to either create a receipt file from "CodeMeter" and upload it, or contact ABB Support who will manually confirm the activation after reviewing the "CmDust".

Below are the steps to enable the "Re-Host" button again.

Initial situation: No [Re-Host Licenses] button is visible in the "CodeMeter License Central WebDepot".

1. Open the "CodeMeter Control Center" on the PC.
2. Select the correct container under the "License" tab so that it is grayed out.
3. Click the [License Update] button.

$\Rightarrow$ The "CmFAS Assistant" opens.
$\leftarrow$ © CmFAS Assistant

## Welcome to the CmFAS Assistant!

The CodeMeter Field Activation Service (CmFAS) assistant helps you adding, changing and deleting licenses from the license management system CodeMeter.

With the CmFAS assistant you can create license request files, which you can send to the vendor of the software by email. You can also import the received license update files with the CmFAS assistant into the license management and create a receipt of the import for the vendor.
4. Click the [Next >] button.
5. In the window which appears, select the option [Create receipt].

## ? $\times$

$\leftarrow$ C CmFAS Assistant

## Please select the desired action

## Re-Host Licenses

6.2.4.10 Generating license information file for support

To create a license information file which includes all license information for the support:

1. Select "Windows start menu $\rightarrow$ CodeMeter $\rightarrow$ Tools $\rightarrow$ CmDust".
$\Rightarrow$ The explorer window opens and shows the folder where the created log file CmDustResult.log is stored.
2. Please attach this file to any support request regarding your licenses.

### 6.2.4.11 Generating log files for support

Sometimes more detailed log files are needed to analyse a situation.
Then please also zip the following folder and attach it to your support request.
C:IProgramDatalCodeMeterlLogs
This folder includes

- CmActDiagLogyyyy-mm-dd-hhmmss.log
- CodeMeteryyyy-mm-dd-hhmmss.log

To make it easier to distinguish when the files were created, they are named as follows:

- yyyy - year, mm - month, hh - hour; mm - minutes, ss - seconds.

### 6.2.4.12 Further information

For more information about the installation and activation of the Automation Builder see: Automation Builder Installation and Activation

### 6.2.5 Setting up of communication parameters in Windows

Setting up of communication parameters

To set up the communication between the PC and the PLC, e.g., for downloading the compiled program, you have to set up the communication parameters.
