\section*{Tab 'Visualization Manager' - 'Font'}

Symbol:
Function: This tab provides settings for adapting the font and font size in the visualization according to the language. The settings apply to all visualizations of the application, including the visualization manager.

Table 710: "Language Specific Font Settings"
\begin{tabular}{|l|l|}
\hline "Language" & \begin{tabular}{l} 
Language used in the project. A column is created for each language. All text \\
lists, including those from integrated libraries, are scanned for this.
\end{tabular} \\
\hline "Font" & Font used by the visualization depending on the language. \\
\hline "Size factor" & \begin{tabular}{l} 
The factor affects the type size of all texts in the visualization. \\
Preset: 1 \\
If the factor is smaller than 1, this leads to a reduction of the type size. If the \\
factor is 1, all texts are displayed unchanged as defined in "Properties".
\end{tabular} \\
\hline Red highlighting of a cell & \begin{tabular}{l} 
The highlighted language is no longer present in the text lists of the project or the \\
libraries. \\
This highlighting is not available in runtime mode.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Context menu of a selected table row \\
\hline "Delete Language" & \begin{tabular}{l} 
The associated column is removed. This is advisable above all if settings in the \\
column are highlighted in red.
\end{tabular} \\
\hline "Copy Language Settings" & All settings in the column are copied to the clipboard. \\
\hline "Paste Language Settings" & All settings in the column are overwritten with the values from the clipboard. \\
\hline
\end{tabular}

Table 711: "General Font Settings"
\begin{tabular}{|l|l} 
"Automatic decrease of font \\
size" & \begin{tabular}{l} 
V: If the text to be displayed does not fit in the text field in the set format, then \\
the font size is decreased automatically until the text fits completely in the text \\
field. \\
Tip: This prevents a text from being truncated when changing to a language \\
that needs more space. The requirement is that a font is available which has a \\
sufficiently small font.
\end{tabular} \\
\hline
\end{tabular}

\section*{Object 'TargetVisu'}

\section*{Symbol: 圆}

Function: The object is used for configuring CODESYS TargetVisu in order to display the visualization directly on the controller of an integrated or connected panel.
Requirement: The CODESYS control runtime environment is equipped with the CODESYS TargetVisu component. The object itself is inserted below the visualization manager.
CODESYS TargetVisu can be executed on different platforms, from embedded controllers to powerful PC-based systems on different operating systems. Therefore, it can be run on Windows, Windows Embedded CE, Linux, QNX, or VxWorks. A ready-made adaptation to the graphics interface of the systems is available on these operating systems. An adaptation is required for embedded controllers or other operating systems. In addition, there are device manufacturers that integrate visualizations into external applications by means of ActiveX controls.
\begin{tabular}{|l|l|}
\hline "Start Visualization" & \begin{tabular}{l} 
Name of the visualization where the start is displayed as CODESYS TargetVisu. \\
Hint: Use input assistance for selecting another visualization.
\end{tabular} \\
\hline "Update rate (ms)" & \begin{tabular}{l} 
Refresh rate (in milliseconds) in the visualization \\
Example: 200
\end{tabular} \\
\hline "Show used visualizations" & \begin{tabular}{l} 
The link opens the "Visualizations" tab in the "Visualization manager" editor. \\
The tab provides information of the visualizations loaded on the display variants.
\end{tabular} \\
\hline \multicolumn{2}{c}{ See also }
\end{tabular}

Table 712: "Scaling Options"
\begin{tabular}{|c|c|}
\hline "Fixed" & O: Fixed size of the visualization (original size). \\
\hline "Isotropic": & The size of the visualization is adapted to the dimensions of the display device, retaining the proportions of the visualization. \\
\hline "Anisotropic": & The size of the visualization is adjusted to the size of the display device, for example a screen. \\
\hline "Use scaling options for dialogs" & The dialogs, also for keypad and numpad, are scaled like the visualization (drawn with the same scaling factor). This is an advantage when a dialog was created to match the visualization because then they are scaled together. \\
\hline "Use automatically detected client size" & \(\checkmark\) : The visualization fills the screen of the display device completely. \\
\hline "Use specified client size" & The values in "Client height" and "Client width" are used for the size of the visualization. The visualization fills this screen area only. \\
\hline "Client height" & Height of the visualization (in pixels). \\
\hline "Client width" & Width of the visualization (in pixels). \\
\hline
\end{tabular}

Table 713: "Presentation Options"
\begin{tabular}{|l|l|}
\hline "Antialiased drawing" & \begin{tabular}{l} 
V: Antialiasing is used in the visualization editor for drawing a visualization as a \\
TargetVisu and a TargetVisu variant. \\
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization \\
platform, then this can be corrected by an offset of 0.5px in the direction of the \\
line thickness (see element property "Absolute movement", option "Use REAL \\
values"). Requirement: The platform in use supports using REAL coordinates.
\end{tabular} \\
\hline
\end{tabular}

Table 714: "Default Text Input"
\begin{tabular}{|l|l|}
\hline "Input with" & \\
\hline "Touchscreen" & \begin{tabular}{l} 
Text input on the display variant with touchscreen. The keypad or numpad dialog \\
opens.
\end{tabular} \\
\hline "Keyboard" & \begin{tabular}{l} 
Text input on the display variant with an ordinary keyboard or a virtual keyboard \\
(on Linux for example)
\end{tabular} \\
\hline \begin{tabular}{l} 
Effect: \\
When you configure a user input for default text input, select an input configuration for input action "Write \\
variable", and configure the "Input type" as "Default", then the settings are used here.
\end{tabular} \\
\hline
\end{tabular}

\section*{Object 'WebVisu'}

\section*{Symbol: 6}

Function: The object is used to configure the web-based display variant for remote display of the visualization of the controller in a web browser. This allows for remote access, remote monitoring, as well as service and diagnostics of an application over the Internet.
Requirement: The object is inserted below the Visualization Manager, and the target system has a web server with CODESYS WebVisu support. The web server allows for the communication between the target system and the web browser.
See also
- « Chapter 6.4.5.18.2 "Executing as CODESYS WebVisu" on page 2974
\begin{tabular}{|l|l|}
\hline "Start Visualization" & \begin{tabular}{l} 
Name of the visualization where the start is displayed as CODESYS WebVisu. \\
Hint: Use the Input Assistant to select another visualization.
\end{tabular} \\
\hline "Name of the .htm file" & \begin{tabular}{l} 
Base URL of the web page. The URL is also specified as the address in the web \\
browser. \\
Example: http: / /localhost: \(8080 /\) webvisu.htm \\
\\
\\
\begin{tabular}{l} 
Note: If you use a BeagleBone Black as a visualization device, then you have \\
to note that a BeagleBone Black uses port 9090 for its web server. A valid IP \\
address is as follows: http://192.168.7.2:9090/webvisu.htm
\end{tabular} \\
\hline
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Use as default page" & \begin{tabular}{l}
\(\boxed{V}\) : The page specified in "Name of .htm file" is preset as the default page. \\
Now this page will always open when a user specified in the web browser \\
the IP address and port of the web server that is running on the controller: \\
http://<IP address web server>: <port web server>. \\
Example: http://localhost: 8080 \\
Notice: Even if you have created multiple web visualizations, you can activate \\
this option for exactly one web page only and therefore preset only one page as \\
the default page.
\end{tabular} \\
\hline "Update rate (ms)" & Refresh rate (in milliseconds) in the web browser \\
\hline \begin{tabular}{ll} 
"Default communication buffer \\
size"
\end{tabular} & \begin{tabular}{l} 
Default size for communication buffer (in bytes). Defines the maximum available \\
memory for data transfer between the web client and the web server. \\
Example: 50000
\end{tabular} \\
\hline "Show Used Visualizations" & \begin{tabular}{l} 
The link opens the "Visualizations" tab in the "Visualization Manager" editor. \\
The tab provides information about the visualizations downloaded to the display \\
variants.
\end{tabular} \\
\hline
\end{tabular}

\section*{Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'}

Symbol:

Category: "Basic"
The "Rectangle", "Rounded Rectangle", and "Ellipse" are the same type of element. They can be converted into another element type by changing the "Element type" property.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional \\
Example: Werkstueck_3 \\
\\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" "Rectangle", "Rounded Rectangle"," "Ellipse" \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|c|c|}
\hline " \(X\) " & \begin{tabular}{l}
The x-coordinate of the upper left corner of the element Specified in pixels \\
Example: 10
\end{tabular} \\
\hline "Y" & \begin{tabular}{l}
The y-coordinate of the upper left corner of the element Specified in pixels \\
Example: 10
\end{tabular} \\
\hline "Width" & Specified in pixels Example: 150 \\
\hline "Height" & \begin{tabular}{l}
Specified in pixels \\
Example: 30
\end{tabular} \\
\hline & Tip: You can change the values in " \(X\) ", " \(Y\) ", "Width", and "Height" by dragging the corresponding symbols 龺- to another position in the editor. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Angle" & \begin{tabular}{l} 
Static angle of rotation (in degrees) \\
Example: 35 \\
The element is displayed rotated in the editor. The point of rotation is the center \\
of the element. A positive value rotates clockwise. \\
Tip: You can change the value in the editor by focusing the element to the \\
handle. When the cursor is displayed as a rotating arrow \\
element about its center as a handle.
\end{tabular} \\
& \begin{tabular}{l} 
(1): Handle can rotate the \\
"Abe: If a dynamic angle of rotation is also configured in the property \\
"Absolute movement \(\rightarrow\) Internal rotation", then the static and dynamic angles \\
of rotation are added in runtime mode. The static angle of rotation acts as an \\
offset.
\end{tabular} \\
\hline
\end{tabular}

See also
- \(\boldsymbol{y y}^{4}\) Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Radius setting Visible only when "Rounded Rectangle" is selected in the "Type of element" property.
\begin{tabular}{|l|l|}
\hline "Radius" & \begin{tabular}{l} 
Rounding of the corners. \\
"From style" \\
"Relative to the element size" \\
"Explicit": Allows for specifying a custom value in the "Value" setting.
\end{tabular} \\
\hline "Value" & \begin{tabular}{l} 
Radius of the rounded corners (in pixels) \\
Example: 5 \\
Requirement: "Explicit" is selected in the "Radius" setting.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & \(Y\)-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

\section*{Element property 'Colors'}
\begin{tabular}{|l|l|}
\hline "Normal state" & \begin{tabular}{l} 
The normal state is in effect if the variable in "Color variables \(\boldsymbol{\rightarrow}\) Toggle color" is \\
not defined or it has the value FALSE.
\end{tabular} \\
\hline "Frame color" & Frame and fill color for the corresponding state of the variable. \\
\hline "Fill color" & \begin{tabular}{l} 
Transparency value (0 to 255) for defining the transparency of the selected color. \\
Example: 255: The color is opaque. 0: The color is completely transparent.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
The alarm state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" has \\
the value TRUE.
\end{tabular} \\
\hline "Alarm state" & 目: The element is displayed with a gradient of two colors. \\
\hline "Use gradient color" & The "Gradient editor" dialog box opens. \\
\hline "Gradient setting" & \\
\hline
\end{tabular}

- © Chapter 6.4.5.21.3.5 "Dialog 'Gradient Editor'" on page 3369

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appear-
ance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Fill attributes" & \begin{tabular}{l}
The way in which the element is filled. \\
- "Filled":The element is filled with the color from property "Colors \(\boldsymbol{\rightarrow}\) Fill color". \\
- "Invisible": The fill color is invisible.
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

\section*{See also}
- * "Element property 'Appearance variables"' on page 3476

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses: \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties.
erty 'Text prop-
erties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
: The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
: The "Color" dialog box opens.
: Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ "Movement" } \\
\hline " \(X "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline "Use REAL values" & \begin{tabular}{l}
Note: Only available if the device supports the use of REAL coordinates. \\
: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. \\
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. \\
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5 px in the direction of the line thickness.
\end{tabular} & \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

See also

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element ("Position" property). The shape of the element can change.
\begin{tabular}{|c|c|}
\hline "Movement top-left" & \\
\hline "X" & \begin{tabular}{l}
Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. \\
Example: PLC_PRG.iDeltaX
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l}
Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. \\
Example: PLC_PRG.iDeltaY
\end{tabular} \\
\hline "Movement bottom-right" & \\
\hline "X" & \begin{tabular}{l}
Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. \\
Example: PLC_PRG.iDeltaWidth
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l}
Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. \\
Example: PLC_PRG.iDeltaHeight
\end{tabular} \\
\hline
\end{tabular}

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
*: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

- \(\quad \stackrel{y}{c}\) Chapter 6.4.1.21.2.28 "Object 'Text List"" on page 2532

\footnotetext{
Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
}
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

- \& Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - 0 : Solid line \\
& - 1: Dashed line \\
& - \(2:\) Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- \& "Element property 'Appearance"' on page 3427

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

\section*{The "Invisible" property is supported by the "Client Animation" functionality.}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\(\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}\)
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Line'}

Symbol:

\section*{Category: "Basic"}

The element draws a simple line.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional. \\
Example: Separator_Header_ \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Line" \\
\hline
\end{tabular}

Element prop- The following properties define the position and length of the element in the visualization erty 'Position' window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|c|c|}
\hline "Dots" & \begin{tabular}{l}
"[0]": Coordinates of the starting point \\
"[1]": Coordinate of the end point \\
You can also change the values by dragging the box symbols (마-) to other positions in the editor.
\end{tabular} \\
\hline "Angle" & \begin{tabular}{l}
Static angle of rotation (in degrees). \\
Example: 35 \\
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. \\
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow \(\cdot\), you can rotate the element about its center as a handle. \\
Example: \\
(1): Handle \\
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement \(\rightarrow\) Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.
\end{tabular} \\
\hline
\end{tabular}

\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline "X" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\boldsymbol{\rightarrow}\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline "Use REAL values" & \begin{tabular}{l}
Note: Only available if the device supports the use of REAL coordinates. \\
The properties of the absolute movement are interpreted as REAL values. The values are not rounded. \\
The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. \\
Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5 px in the direction of the line thickness.
\end{tabular} & \\
\hline
\end{tabular}
 erty 'Relative movement'
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|c|}{ "Movement point[0]" } & \begin{tabular}{l} 
Variable (numeric data type). It contains the number (in pixels) that the starting \\
point of the line is moved. \\
Incrementing the \(X\) value moves the element to the right. \\
- "X"
\end{tabular} \\
Incrementing the Y value moves the element to the down.
\end{tabular}

Element prop- These properties are variables with contents that replace a format definition.
erty 'Text varia-
bles'
\begin{tabular}{|c|c|}
\hline "Text variable" & \begin{tabular}{l}
Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. \\
Example: PLC_PRG.iAccesses \\
Note: The format definition is part of the text in the property "Texts \(\boldsymbol{\rightarrow}\) Text". \\
Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar <enumeration name>. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline "Tooltip variable" & \begin{tabular}{l}
Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. \\
Example: PLC_PRG.iAccessesInTooltip \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\text {• }}\), Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
pt \\
pt \\
px \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable in the alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

\section*{Element prop- The variables control the element behavior dynamically. erty 'State variables'}
\begin{tabular}{|l|l|}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element. \\
& \begin{tabular}{l} 
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

Element prop- Dynamic definition of the weight of a line element using a variable. erty 'Line width variable'
\begin{tabular}{|l|l|}
\hline "Integer value" & \begin{tabular}{l} 
Variable (integer data type). Defines the line weight of the element (in pixels)., \\
This overwrites the fixed value that is defined in "Appearance \(\rightarrow\) Line weight". \\
Note: The value 0 codes the same as 1 and sets the line weight to one pixel.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Line style variable'}
\begin{tabular}{|c|c|}
\hline "Integer value" & \begin{tabular}{l}
Variable (integer data type). Defines the appearance of the line at runtime. \\
- 1: Solid \\
- 2: Dashes \\
- 3: Dots \\
- 4: Dash Dot \\
- 5: Dash Dot Dot \\
- 6: Invisible: The line is not drawn.
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code":
\end{tabular} \\
\hline "Onc__PRG.i_x \(:=0 ;\) \\
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseDown" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseEnter" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer to the element. \\
\hline
\end{tabular}
\(\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}\)
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A t t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Polygon', 'Polyline', 'Bézier Curve'}

Symbol:

Category: "Basic"
The "Polygon", "Polyline", and "Bézier Curve" are the same element type. They can be converted into another type by changing the "Element type" property.

Elements can be dragged to the editor. The element is then drawn with five points: [0] to [4].
Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold [Ctrl] and click the left mouse button, another point is created. You can delete a point by pressing and holding [Shift]+[Ctrl] and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional. \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list. \\
Example: Werkstueck_1
\end{tabular} \\
\hline "Type of element" & \begin{tabular}{l} 
- "Polygon" \\
- "Polyline" \\
- "Bézier Curve"
\end{tabular} \\
\hline
\end{tabular}

Element prop- The following properties define the position of the corner points in the visualization window. erty 'Position' These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|c|c|}
\hline "Dots" & \begin{tabular}{l}
[0]..[n]: Coordinates of the corner points \\
Specified in pixels \\
You can also change the values by dragging the box symbols ([世-) to other positions in the editor.
\end{tabular} \\
\hline "Angle" & \begin{tabular}{l}
Static angle of rotation (in degrees). \\
Example: 35 \\
The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. \\
Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow \(\mathcal{A}\), you can rotate the element about its center as a handle. \\
(1): Handle \\
Note: If a dynamic angle of rotation is also configured in the property "Absolute movement \(\rightarrow\) Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.
\end{tabular} \\
\hline
\end{tabular}

See also
- 乡y Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus}\) ) to other positions in the editor.

\section*{Element prop- \\ erty 'Colors'}
\begin{tabular}{|l|l|}
\hline "Normal state" & \begin{tabular}{l} 
The normal state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" is \\
not defined or it has the value FALSE.
\end{tabular} \\
\hline "Frame color" & Frame and fill color for the corresponding state of the variable. \\
\hline "Fill color" & "Transparency" \\
\hline Transparency value (0 to 255) for defining the transparency of the selected color. \\
Example: \(255:\) The color is opaque. \(0:\) The color is completely transparent.
\end{tabular}\(|\)\begin{tabular}{ll} 
"Alarm state" & \begin{tabular}{l} 
The alarm state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" has \\
the value TRUE.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Use gradient color" & \(\boxed{\square}:\) The element is displayed with a gradient of two colors. \\
\hline "Gradient setting" & The "Gradient editor" dialog box opens. \\
\hline
\end{tabular}

See also
- \(y^{\text {® }}\) Chapter 6.4.5.21.3.5 "Dialog 'Gradient Editor"' on page 3369

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Fill attributes" & \begin{tabular}{l}
The way in which the element is filled. \\
- "Filled":The element is filled with the color from property "Colors \(\boldsymbol{\rightarrow}\) Fill color". \\
- "Invisible": The fill color is invisible.
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

\section*{See also}
- « "Element property 'Appearance variables'" on page 3476

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [CtrI] + [Enter]. \\
Example: Accesses: \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & \begin{tabular}{l}
Example: "Default"
The "Font" dialog box opens. \\
- Drop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
The "Color" dialog box opens. \\
*: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular} erty 'Absolute movement'

Element prop- The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001. \\
to its original size.
\end{tabular} \\
\hline \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
property "Position \(\rightarrow\) Angle", then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
"Use REAL values" & \begin{tabular}{l} 
Note: Only available if the device supports the use \\
of REAL coordinates. \\
l: The properties of the absolute movement are \\
interpreted as REAL values. The values are not \\
rounded. \\
The option allows for the individual fine-tuning of \\
drawing the element, for example for the visualiza- \\
tion of a smoother rotation. \\
Hint: If a horizontal or vertical line is drawn blurry \\
on a specific visualization platform, then this can \\
be corrected by an offset of 0.5px in the direction \\
of the line thickness.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

\author{
The properties " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

\section*{Element property 'Dynamic points'}
\begin{tabular}{|l|l|}
\hline "Array of points" & \begin{tabular}{l} 
Variable (POINTER TO). Points to an array of the structure \\
VisuElems.VisuStructPoint. The elements ix and iY of \\
VisuStructPoint contain the xy-coordinates of a point The current number of \\
array elements implicitly contains the variable in the property "Number of points". \\
The variable that is assigned to the property "Number of points" contains the \\
number of array elements and therefore the number of corner points. \\
Example: pPoints : POINTER TO ARRAY [0..100] OF \\
VisuElems.VisuStructPoint;
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable (integer data type): Contains the number of array elements and there- \\
fore the number of corner points for displaying the element. \\
Example: PLC_PRG. iNumberOfPoints : \(=24 ;\) \\
In the example, the element has 24 points. This definition is necessary because
\end{tabular} \\
the individual points are defined by a pointer and this does not allow control over \\
the number of points. \\
Note: In this way, it is possible to adapt the display of the element dynamically by \\
updating the number of corner points.
\end{tabular}

Element prop- These properties are variables with contents that replace a format definition.
erty 'Text varia-
bles'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses
\end{tabular} \\
& \begin{tabular}{l} 
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text". \\
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC PRG. enVar <enumeration name> \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip". \\
\hline
\end{tabular}

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- \(0:\) Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

\section*{See also}
- \& Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - 2: Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- ©s "Element property 'Appearance"' on page 3468

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

Example: "Execute ST Code": ßPLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist. \\
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FA: During user input, it is also taken into consideration whether the mouse \\
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\begin{tabular}{|l|l|l|}
\hline "Begin" & \begin{tabular}{l} 
Start angle of the pie. If you also define a variable \\
for the start, then the start angle is calculated from \\
the sum of the values for "Begin" and "Variable for \\
begin".
\end{tabular} & \begin{tabular}{l} 
Example: \\
"Begin": 330 \\
"End": 90
\end{tabular} \\
\hline & \begin{tabular}{l} 
End angle of the pie. If you also define a variable \\
for the end, then the end angle is calculated from \\
the sum of the values for "End" and "Variable for \\
end". \\
The pie is drawn clockwise from the start angle to \\
the end angle.
\end{tabular} \\
\hline "Variable for begin" & The start of the sector is defined dynamically by a variable. \\
\hline "Variable for end" & The end of the sector is defined dynamically by a variable. \\
\hline "Only show circle & V: The pie is drawn without the radius line or filling color. \\
line"
\end{tabular}

\section*{Element prop- \\ erty 'Center'}
\begin{tabular}{|l|l|}
\hline " X " & \begin{tabular}{l} 
Display of the center coordinates. You cannot modify these values here in the \\
properties. \\
If the Pie is selected in the editor, then the center of the Pie (as well as the \\
center of the enveloping box) is visualized with the symbol \(\boldsymbol{\oplus}\). Moreover, the \\
element is decorated with a position, begin, and end boxes that you can move.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Colors'}
\begin{tabular}{|l|l|}
\hline "Normal state" & \begin{tabular}{l} 
The normal state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" is \\
not defined or it has the value FALSE.
\end{tabular} \\
\hline "Frame color" & Frame and fill color for the corresponding state of the variable. \\
\hline "Fill color" & \\
\hline "Transparency" & \begin{tabular}{l} 
Transparency value (0 to 255) for defining the transparency of the selected color. \\
Example: \(255:\) The color is opaque. 0: The color is completely transparent.
\end{tabular} \\
\hline "Alarm state" & \begin{tabular}{l} 
The alarm state is in effect if the variable in "Color variables \(\rightarrow\) Toggle color" has \\
the value TRUE.
\end{tabular} \\
\hline "Use gradient color" & \(\boxed{\checkmark}:\) The element is displayed with a gradient of two colors. \\
\hline "Gradient setting" & The "Gradient editor" dialog box opens. \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Fill attributes" & \begin{tabular}{l}
The way in which the element is filled. \\
- "Filled":The element is filled with the color from property "Colors \(\rightarrow\) Fill color". \\
- "Invisible": The fill color is invisible.
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also
- « "Element property 'Appearance variables'" on page 3476

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses: \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties.
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
The "Color" dialog box opens.
Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|c|}{\begin{tabular}{l} 
"X" \\
\hline Variable (integer data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline V" & \begin{tabular}{l} 
Variable (integer data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element \\
to its original size.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (integer data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center"according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
If a static angle of rotation is specified in "Position \\
\(\rightarrow\) Angle", then the static angle of rotation and the \\
angle of rotation are added.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element prop- These properties are variables with contents that replace a format definition. erty 'Text varia-
bles'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text".
\end{tabular} \\
& \begin{tabular}{l} 
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC_PRG.enVar <enumeration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip
\end{tabular} \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip". \\
\hline
\end{tabular}

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

- \({ }^{\text {• }}\), Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
pt \\
pt \\
px \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF0 0
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- \& Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element prop- The properties contain IEC variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|l|l|}
\hline "Line width" & Variable (integer data type). Contains the line weight (in pixels). \\
\hline "Fill attributes" & Variable (DWORD). Controls whether the fill color of the element is visible. \\
& - Variable value = 0: Filled \\
& - Variable value > 0: Invisible; no fill color \\
\hline "Line style" & Variable (DWORD). Controls the line style. \\
& Coding: \\
& - \(0:\) Solid line \\
& - 1: Dashed line \\
& - 2: Dotted line \\
& - 3: Line type "Dash Dot" \\
& - 3: Line type "Dash Dot Dot" \\
& - 8: Invisible; no line \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

\section*{See also}
- „y "Element property 'Appearance"' on page 3468

Element prop- The variables control the element behavior dynamically. erty 'State varia-

\section*{bles'}
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code":
\end{tabular} \\
\hline "Onc__PRG.i_x \(:=0 ;\) \\
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseDown" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseEnter" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer to the element. \\
\hline
\end{tabular}
\(\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}\)
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG . bI sTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released.
\end{tabular} \\
& \begin{tabular}{l} 
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline \begin{tabular}{l} 
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: \([A I t]+[T]\). \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Image'}

Symbol:

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. You can also change the displayed image dynamically by using a variable instead of the static ID.

Directories that contain the images for use in visualizations can be defined in the project settings (category "Visualization").

\section*{Element proper-}
ties
\begin{tabular}{|c|c|}
\hline "Element name" & \begin{tabular}{l}
Example: Status bar \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the element list.
\end{tabular} \\
\hline "Type of element" & "Image" \\
\hline "Static ID" & \begin{tabular}{l}
Identifier of the image file for a static assignment \\
ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: imagepool2.button_image. \\
When a new ID is specified, a file selection dialog opens. The selected file is saved to the "GloballmagePool". \\
See also: Help for the "Image Pool" object.
\end{tabular} \\
\hline "Show frame" & \(\square\) : The image file is displayed with a frame. \\
\hline "Clipping" & Requirement: The "Scaling type" property is "Fixed".
Only part of the visualization is displayed that fits in the element frame. \\
\hline "Transparent" & The image pixels that have the "Transparent color" are displayed as transparent. \\
\hline "Transparent color" & \begin{tabular}{l}
Effective only if the "Transparent" option is activated. \\
The... button opens the color selection dialog. This is where you select the transparent color.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Scaling type" & \begin{tabular}{l}
Definition of how an image fits in the element frame. \\
- "Isotropic": The entire image is displayed in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties "Horizontal alignment" and "Vertical alignment" to "Centered". The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized. \\
- "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained. \\
- "Fixed": The image retains its original size, even if the element frame is resized. Note also that the "Clipping" option is selected. \\
For each reassignment of an image ID, the element size is adapted automatically to the image size.
\end{tabular} \\
\hline "Horizontal alignment" & \begin{tabular}{l}
Horizontal alignment of the element within the element frame: \\
- "Left" \\
- "Centered" \\
- "Right" \\
Requirement: The scaling type of the image is "Isotropic" or "Fixed". \\
Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. \\
*: The "Variable" property is shown below this.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l}
Enumeration variable (ENUM \\
VisuElemBase.VisuEnumVerticalAlignment). Contains the horizontal alignment. \\
Example: PLC_PRG.eHorizontalAlignment
\end{tabular} \\
\hline "Vertical alignment" & \begin{tabular}{l}
Vertical alignment of the element within the element frame: \\
- "Top" \\
- "Centered" \\
- "Bottom" \\
Requirement: The scaling type of the image is "Isotropic" or "Fixed". \\
Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. \\
中: The "Variable" property is shown below this.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l}
Enumeration variable (ENUM \\
VisuElemBase.VisuEnumVerticalAlignment). Contains the vertical alignment. \\
Example: PLC_PRG.eVerticalAlignment
\end{tabular} \\
\hline
\end{tabular}

Element prop- You can use this element property for animating a series of image files. erty 'Dynamic image'
\begin{tabular}{|l|l|}
\hline "Bitmap version" & \begin{tabular}{l} 
Variable (integer data type). Contains the version of the image. \\
If the variable changes, then the visualization re-reads the image referenced in \\
the "Image ID" property and displays it. \\
The visualization displays animations when the image file on the controller is \\
updated continuously, thus incrementing the version variable. The application \\
must be programmed for this. \\
Possible applications \\
- Displaying graphics that are generated by the application \\
- Displaying images that are refreshed by a camera
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(X\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

Element prop- The variables allow for dynamic control of the text display.
erty 'Font varia-
bles'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px>: Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType \(:=6\);
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Requirement: "Show frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\rightarrow\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element prop- The properties contain variables for controlling the appearance of the element dynamically. erty 'Appearance variables'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Variable (integer data type). Contains the line weight (in pixels). \\
Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Variable (DWORD). Controls the line style. Coding: \\
- 0 : Solid line \\
- 1: Dashed line \\
- 2: Dotted line \\
- 3: Line type "Dash Dot" \\
- 3: Line type "Dash Dot Dot" \\
- 8: Invisible: The line is not drawn.
\end{tabular} \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- « "Element property 'Appearance"' on page 3468

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- User input is a user event from the perspective of the element. figuration'

The "Configure" button opens the "Input configuration" dialog box for creating or modifying a user input configuration.
A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.
Example: "Execute ST code": З PLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog box. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: A user clicks the element completely. The mouse button is clicked \\
and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: A user clicks down on the element only. \\
\hline "OnMouseEnter" & Input event: A user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: A user drags the mouse pointer away from the element. \\
\hline "OnMouseMove" & Input event: A user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & Input event: The user releases the mouse button over the element area. \\
\hline
\end{tabular}

\section*{Visualization Element 'Frame'}

Symbol:

\section*{Category: "Basic"}

The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: refVisUserInfo \\
\hline "Type of element" & "Frame" \\
\hline "Clipping" & \begin{tabular}{l} 
冋: Fixed size. Only that part of the referenced visualization that fits inside the \\
frame is displayed. \\
Requirement: The "Scaling type" property is "Fixed".
\end{tabular} \\
\hline "Show frame" & \begin{tabular}{l} 
Displays the frame \\
- "No frame": The displayed area of the frame does not have borders. \\
- "Frame": The displayed area of the frame has borders. \\
- "No frame with offset": The displayed area of the frame does not have a \\
border and the displayed area of the referenced visualization is reduced \\
inwards by one pixel as compared to the frame area. The gap prevents the \\
referenced visualization from touching any adjacent elements.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Scaling type" & \begin{tabular}{l} 
The method with which the height and width of the referenced visualization are \\
scaled. \\
- "Isotropic": The visualization is scaled to the size of the element. The visuali- \\
- zation retains its proportions with a fixed height/width ratio. \\
- "Anisotropic": The visualization is scaled to the size of the element. The \\
height and width are adapted to the element independently of each other. \\
- "Fixed": the visualization is displayed in its original size without taking into \\
account the size of the element. \\
- "Fixed and scrollable": The visualization is displayed fixed in the element. If it \\
is larger than the element, the element will be provided with scrollbars. \\
Please note: assign variales to the properties "Scroll position variable \\
horizontal" or "Scroll position variable vertical". You can then edit the data \\
of the scrollbar position in the application.

- ② Chapter 6.4.5.5.4 "Assigning a color" on page 2876

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also
- « "Element property 'Appearance variables"' on page 3489

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses : \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the text properties.
erty 'Text prop-
erties'
\begin{tabular}{|c|c|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Text format" & \begin{tabular}{l}
Definition for displaying texts that are too long \\
- "Default": The long text is truncated. \\
- "Line break": The text is split into parts. \\
- "Ellipsis": The visible text ends with "..." indicating that it is not complete.
\end{tabular} \\
\hline "Font" & Example: "Default"
: The "Font" dialog box opens.
Drop-down list with style fonts. \\
\hline "Font color" & Example: "Black"
: The "Color" dialog box opens.
: Drop-down list with style colors. \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" \\
\hline " \(X "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\boldsymbol{\oplus}\) \\
symbol. \\
In runtime mode, the alignnent of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Scaling" & \begin{tabular}{l} 
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG. iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001. \\
to its original size.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

Element property 'Relative movement'

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

\section*{See also}
\begin{tabular}{|l|l|}
\hline "Movement top-left" & \\
\hline " \(X\) " & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the left edge \\
is moved horizontally. Incrementing the value moves the element to the right. \\
Example: pLC_PRG.iDeltax
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l} 
Variable (integer data type). It contains the number (in pixels) that the top edge \\
is moved vertically. Incrementing the value moves the element to the down. \\
Example: PLC_PRG.iDeltaY
\end{tabular} \\
\hline "Movement bottom-right" & \\
\hline
\end{tabular}

- \(y^{2}\) Chapter 6.4.1.20.5.18 "Enumerations" on page 2263

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.
\begin{tabular}{|c|c|}
\hline "Text list" & \begin{tabular}{l}
Variable (string) or name of the text list as a fixed string in single straight quotation marks. \\
Example: 'Errorlist' \\
: Drop-down list with the dialogs available in the text lists.
\end{tabular} \\
\hline "Text index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. Example: '1' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strTextID \\
Sample assignment: PLC_PRG.strTextID := '1';
\end{tabular} \\
\hline "Tooltip index" & \begin{tabular}{l}
Text list ID. This refers to the desired output text. \\
- As fixed string with the ID in single straight quotation marks. \\
Example: '2' \\
- As a variable (STRING) for dynamically controlling the text output. \\
Example: strToolTipID \\
Sample assignment: PLC_PRG.strToolTipID := '2';
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\wedge} \boldsymbol{y}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- \(0:\) Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the Frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Requirement: "Show Frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\boldsymbol{\rightarrow}\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the Frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\boldsymbol{\rightarrow}\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- \& Chapter 6.4.5.21.4.2 "Object 'Visualization manager'" on page 3398

Element property 'Appearance variables'
\begin{tabular}{|c|c|}
\hline \multirow[t]{2}{*}{"Line width"} & Variable (integer data type). Contains the line weight (in pixels). \\
\hline & Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible". \\
\hline "Line style" & \begin{tabular}{l}
Variable (DWORD). Controls the line style. \\
Coding: \\
- \(0:\) Solid line \\
- 1: Dashed line \\
- 2: Dotted line \\
- 3: Line type "Dash Dot" \\
- 3: Line type "Dash Dot Dot" \\
- 8: Invisible: The line is not drawn.
\end{tabular} \\
\hline
\end{tabular}

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also
- © "Element property 'Appearance"' on page 3482

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.
\begin{tabular}{|c|c|}
\hline "Variable" & \begin{tabular}{l}
- Variable (integer data type) that contains the index of the active visualization Example: PLC_PRG.uiIndexVisu \\
Hint: The "Frame Configuration" dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. \\
Note: This variant of switching usually affects all connected display variants. \\
- Array element (integer data type) for index access via CURRENTCLIENTID Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID] \\
Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).
\end{tabular} \\
\hline
\end{tabular}

See also
- \& Chapter 6.4.5.21.2.9 "Command 'Frame Selection"' on page 3348

Element prop- The variables control the element behavior dynamically.
erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element. \\
& \begin{tabular}{l} 
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
\\
\\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.
Example: "Execute ST Code": 3 PLC_PRG.i_x := 0;
\begin{tabular}{|l|l|}
\hline "OnDialogClosed" & Input event: The user closes the dialog. \\
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- The user releases the mouse button within the element area. It is irrelevant
\end{tabular} \\
\hline
\end{tabular}
- The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.
- The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.

Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for "OnMouseDown" and ends the action for "OnMouseUp".

Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because "OnMouseUp" is triggered.
\begin{tabular}{|c|c|}
\hline "Tap" & When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the "Tap FALSE" and "Tap on enter if captured" options. \\
\hline "Variable" & \begin{tabular}{l}
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG.bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l}
The mouse click event leads to a complementary value in "Variable". TRUE: A mouse click event does not exist. \\
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l}
During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOoL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: [AIt]+[T]. \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Label'}

Symbol:

Category: "Common Controls"
The element is used to label visualizations.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list. \\
Example: Header_Parameter
\end{tabular} \\
\hline "Type of element" & "Label" \\
\hline
\end{tabular}

Element prop- The property requires a character string.
erty 'Texts'
This text is entered automatically into the GlobalTextList text list and can be localized there.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) \\
Example: Main page
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{2}\) Chapter 6.4.5.5 "Designing a visualization with elements" on page 2872
- \({ }^{*}\) Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329

Element prop-
erty 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X "\) & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline " \(\mathrm{Y} "\) & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (■-) to other positions in the editor.

The "Font" dialog box opens. \\
- : Drop-down list with style fonts.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline \multirow[t]{3}{*}{"Font color"} & Example: "Black" \\
\hline & ...): The "Color" dialog box opens. \\
\hline & - Drop-down list with style colors. \\
\hline \multirow[t]{4}{*}{"Transparency"} & Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
\hline & Example: 255: The color is opaque. \\
\hline & 0 : The color is completely transparent. \\
\hline & Please note: If the color is a style color and already has a transparency value, then this property is write-protected. \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

\section*{You can link the variables to a unit conversion.}

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element property 'Columns'

The "Combo box - Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Twodimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the "Data array" property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].
\begin{tabular}{|c|c|}
\hline \begin{tabular}{l}
"Columns" \\
- [<n>]
\end{tabular} & \begin{tabular}{l}
Due to the structure of the variable that is defined in "Data array", CODESYS determines the number of columns and defines them with the index <n>. \\
Example: StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW','Audi','Mercedes','VW','Fiat', \\
'150','150','150','150','100','blue','gray','silver','blue' \\
'red'];: three columns are formed [0], [1] and [2].
\end{tabular} \\
\hline "Max. array index" & Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed. \\
\hline "Row height" & Height of the rows (in pixels). \\
\hline "Number visible rows" & Optional. If the array is larger than the number of visible rows, then a scrollbar is included. \\
\hline "Scrollbar size" & Width of the vertical scrollbar (in pixels). \\
\hline
\end{tabular}

Table 718: "Element property 'Columns: Column [<n>]""
\begin{tabular}{|l|l|}
\hline "Width" & Column width (in pixels). \\
\hline "Image column" & \begin{tabular}{l} 
局: Images can be displayed in the column. Images are used from the global \\
image pool or user-defined image pools. The image IDs are shown in the cells of \\
the table as defined in the image pool.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{ "Image configuration" }
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Fill mode" & \begin{tabular}{l} 
- "Fill cell" \\
The image resizes to the dimensions of the cell without fixing the height/ \\
width ratio. \\
"Centered" \\
The image is centered in the cell and retains its proportions (height-width \\
ratio).
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
When the "The color that is specified in "Transparent color" is displayed as transparent. \\
displayed. Pixels with this color are transparent.
\end{tabular} \\
\hline "Transparent color" "Text alignment in column" & \begin{tabular}{l}

Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ( \(\left(\Phi^{-}\right)\)) to other positions in the editor.

See also
- \# Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X "\) & X-coordinate of the point of rotation \\
\hline " \(Y\) " & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\oplus\) ) to other positions in the editor.

Element property 'Switch frame variable'
\begin{tabular}{|l|l|}
\hline "Variable"" & \begin{tabular}{l} 
Variable (integer data type). Specifies the index of the active visualization. \\
Example: PLC_PRG. uiActiveVisuID. \\
\\
\\
Tip: The "Frame Configuration" dialog box includes a list of selected visualiza- \\
tions. The visualizations are ordered automatically in numeric order in the list.
\end{tabular} \\
\hline
\end{tabular}
- ② Chapter 6.4.5.21.2.9 "Command 'Frame Selection'" on page 3348

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(X\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the "Position \(\rightarrow\) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

\section*{You can link the variables to a unit conversion.}

X, "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- \(0:\) Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Color variable for the Frame \\
- Variable (DWORD) for the color \\
Example: PLC_PRG.dwColor \\
- Color literal \\
Example of gray and opaque: 16\#FF888888 \\
Requirement: "Show Frame" property is activated. \\
Please note that the normal state is in effect if the expression in the "Colorvariables \(\boldsymbol{\rightarrow}\) Toggle color" property is not defined or it has the value FALSE.
\end{tabular} \\
\hline "Alarm color" & \begin{tabular}{l}
Color variable for the Frame in alarm state \\
- Variable (DWORD) for the alarm color \\
Example: PLC_PRG.dwAlarmColor \\
- Color literal \\
Example of red and opaque: 16\#FFFF0000 \\
Please note that the alarm state is in effect if the expression in the "Colorvariables \(\boldsymbol{\rightarrow}\) Toggle color" property has the value TRUE.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Element prop- The variables control the element behavior dynamically. erty 'State variables'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

> The "Invisible" property is supported by the "Client Animation" functionality.

\section*{Element prop- \\ erty 'Button \\ state variable'}
\begin{tabular}{|c|c|}
\hline "Digital variable" & \begin{tabular}{l}
At runtime, the property controls whether the Button is displayed as pressed or not. \\
Values: \\
- FALSE: The Button is displayed as not pressed. \\
- tRUE: The Button is displayed as pressed. \\
Argument passed to the property: \\
- Placeholder for the user input variable to couple the representation of the Button with the input variable. \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the Button. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: prgA.xButtonState \\
Note: Implement a value assignment in the code for the variable specified here.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Image ID variable'}
\begin{tabular}{|l|l|}
\hline "Image ID" & \begin{tabular}{l} 
Variable (STRING). Contains the image ID. The contents of the string corre- \\
sponds to the description of the "Static ID" property. \\
Example: PLC_PRG.stImageID \(:=\) 'ImagePool_A.Image3'; \\
\hline
\end{tabular} \\
\hline
\end{tabular}

See also
- " \({ }^{2}\) Chapter 6.4.5.21.5.5 "Visualization Element 'Image'" on page 3463
- \({ }^{\bullet}\), Chapter 6.4.1.21.2.15 "Object 'Image Pool'" on page 2468

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. \\
Configured user inputs are listed below the events. They each include the action that is triggered and the setting \\
in short form. \\
Example: "Execute ST Code":
\end{tabular} \\
\hline "OnDialogClosed" PRG.i_x \(:=0 ;\) \\
\hline "OnMouseClick" & Input event: The user closes the dialog. \\
\hline "OnMouseDown" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseEnter" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer to the element. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseMove" & Input event: The user moves the mouse pointer over the element area. \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
- \begin{tabular}{l} 
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area.
\end{tabular} \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown"" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
V: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist. \\
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
FA: During user input, it is also taken into consideration whether the mouse \\
pointer is dragged within the element area or not while the mouse button is \\
pressed. \\
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: [AIt]+[T]. \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Whole number (value range from 0 to 255). This determines the transparency of \\
the respective color. \\
Example: \(255:\) The color is opaque. \\
\(0:\) The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, \\
then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Absolute movement'}

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(\times\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline " \(Y\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Scaling" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (integer data type). Causes centric stretching. \\
Example: PLC_PRG.iScaling. \\
The reference point is the "Center" property. \\
The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size.
\end{tabular}} \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the property "Position \(\rightarrow\) Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

- Variable (integer data type) \\
Example: PLC_PRG.iUpperIndexBoundToDisplay \\
- Integer literal \\
Example: 4 is displayed as 5 in the row of the table.
\end{tabular} \\
\hline
\end{tabular}

See also
- Data Type 'ARRAY'

Element property 'Columns'

The "Table" element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the "Data array" property. When a variable is assigned there, you can specify the display of the Table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [ \(<n>]\).
\begin{tabular}{|l|l|}
\hline "Show row header" & \(\boxed{\checkmark}\) : The row header is visible. \\
& Example: For an array, the index of the array element is displayed in the header. \\
\hline "Show column header" & \(\boxed{\text { : }}\) : The column label is visible. \\
\hline "Row height" & Height of the rows (in pixels) \\
\hline "Row header width" & Width of the row label \\
\hline "Scroll bar size" " & Size of the scroll bar (in pixels) \\
\hline
\end{tabular}

Table 719: "Element property 'Columns: Column [<n>]""
\begin{tabular}{|c|c|}
\hline "Column header" & \begin{tabular}{l}
By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for "Data array", then the name of the array is applied to the column header with the local variables of the function block that belong to the column. \\
The column label can be changed here by specifying a new title.
\end{tabular} \\
\hline "Width" & Column width (in pixels) \\
\hline "Image column" & Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the Table as they are defined in the image pool. \\
\hline \multicolumn{2}{|l|}{"Image configuration"} \\
\hline "Fill mode" & \begin{tabular}{l}
- Fill cell: The image resizes to the dimensions of the cell without fixing the height/width ratio. \\
- Centered: The image is centered in the cell and retains its proportions (height/width ratio).
\end{tabular} \\
\hline "Transparency" & The color which is specified in "Transparent color" is displayed as transparent. \\
\hline "Transparent color" & \begin{tabular}{l}
This color is displayed as transparent. \\
Requirement: The "Transparency" property is activated.
\end{tabular} \\
\hline "Text alignment of header" & \begin{tabular}{l}
Alignment of the column header: \\
- Left \\
- Centered \\
- Right
\end{tabular} \\
\hline "Use template" & Another visualization element (type "Rectangle", "Rounded Rectangle", or "Ellipse") is inserted into each line of this Table column. The properties list is extended automatically with the properties of this element in "Template". \\
\hline "Text alignment of the headline from the template" & \begin{tabular}{l}
Requirement: The "Use template" property is activated. \\
When activated, the settings for font (size) and alignment in the inserted template are also applied to the column header.
\end{tabular} \\
\hline "Template" & \begin{tabular}{l}
Requirement: The "Use template" property is activated. \\
The properties of all elements assigned to the column are listed in "Template". They can be modified there as described in "Rectangle", "Rounded Rectangle", and "Ellipse".
\end{tabular} \\
\hline
\end{tabular}

- \#Chapter 6.4.5.21.5.1 "Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'" on page 3413

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline " \(Y\) " & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols ( ( - ) to other positions in the editor.

- E"Element property 'Text properties"' on page 3541

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" \\
\hline "X" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular}
\end{tabular}

You can link the variables to a unit conversion.
"Client Animation" functionality.

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

Element prop-
erty 'Selection'
\begin{tabular}{|c|c|}
\hline "Background color on selection" & Fill color of the selected row. \\
\hline "Selection font color" & Font color of the selected row. \\
\hline "Selection type" & \begin{tabular}{l}
Selection when clicking the table row. \\
- No selection: No selection \\
- Cell selection: The clicked cell only. \\
- Row selection: Row of the clicked cell. \\
- Column selection: Column of the clicked cell. \\
- Row and column selection: Row and column of the clicked cell.
\end{tabular} \\
\hline "Frame around selected cells" & \(\checkmark\) : A frame is drawn around the selected cells. \\
\hline "Variable for selected column" & \begin{tabular}{l}
Variable (INT). Contains the array index of the "Column" of the selected cell. If the data array points to a structure, then the structure components are indexed, starting at 0 . \\
Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.
\end{tabular} \\
\hline "Variable for selected row" & Variable (INT). Contains the array index of the "Row" of the selected cell. \\
\hline "Variable for valid column selection" & \begin{tabular}{l}
Variable (BOOL). \\
TRUE: The "Variable for selected column" variable contains a valid value.
\end{tabular} \\
\hline "Variable for valid row selection" & \begin{tabular}{l}
Variable (BOOL). \\
TRUE: The "Variable for selected row" variable contains a valid value.
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- Requirement: User management is set up for the visualization. erty 'Access
rights'
\begin{tabular}{|l|l|}
\hline "Access rights" & \begin{tabular}{l} 
Opens the "Access rights" dialog. There you can edit the access privileges for \\
the element. \\
Status messages:
\end{tabular} \\
& \begin{tabular}{l} 
- "Not set. Full rights.": Access rights for all user groups : "operable" \\
\(\bullet\) \\
"Rights are set: Limited rights": Access is restricted for at least one group.
\end{tabular} \\
\hline
\end{tabular}

\section*{Visualization Element 'Text Field'}

Symbol:

Category: "Common Controls"

The element is used for the following purposes:
- Static output of text. The contents of a variable can be part of the text.
- Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
- Dynamic output of text. Texts of a text list are displayed dynamically.
- Input of text. For example, a user can input a number or a text literal.

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'
\begin{tabular}{|c|c|}
\hline "Line width" & \begin{tabular}{l}
Value in pixels \\
Example: 2 \\
Note: The values 0 and 1 both result in a line weight of 1 pixel. If no line should be displayed, then the "Line style" property must be set to the option "Invisible".
\end{tabular} \\
\hline "Fill attributes" & \begin{tabular}{l}
The way in which the element is filled. \\
- "Filled":The element is filled with the color from property "Colors \(\rightarrow\) Fill color". \\
- "Invisible": The fill color is invisible.
\end{tabular} \\
\hline "Line style" & \begin{tabular}{l}
Type of line representation \\
- "Solid" \\
- "Dashes" \\
- "Dots" \\
- "Dash Dot" \\
- "Dash Dot Dot" \\
- "not visible"
\end{tabular} \\
\hline
\end{tabular}

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

\section*{See also}
- "Element property 'Appearance variables'" on page 3489

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
Character string (without single straight quotation marks) for the labeling the \\
element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter]. \\
Example: Accesses : \%i \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Text".
\end{tabular} \\
\hline "Tooltip" & \begin{tabular}{l} 
Character string (without single straight quotation marks) that is displayed as the \\
tooltip of an element. \\
Example: Number of valid accesses. \\
The variable that contains the current value for the placeholder is specified in the \\
property "Text variable \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

- 0 : Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

See also
- * "Element property 'Text properties"' on page 3541

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color \\
Example: PLC_PRG.dwFillColor \\
- Color literal \\
Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- \({ }^{4}\) Chapter 6.4.5.10.4 "Animating a color display" on page 2914

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(X\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(X\) position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

Element prop- The variables control the element behavior dynamically.
erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element. \\
& \begin{tabular}{l} 
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Selection and caret configuration'

The "Invisible" property is supported by the "Client Animation" functionality.

The variables allow for controlling the caret position and the selection of the text.
\begin{tabular}{|l|l|}
\hline "Caret position" & Variable (integer data type). Contains the position of the cursor. \\
\hline "Selection start" & \begin{tabular}{l} 
Variable (integer data type). Contains the position of the first selected character. \\
Example: PLC_PRG. iselStart
\end{tabular} \\
\hline "Selection end" & \begin{tabular}{l} 
Variable (integer data type). Contains the position of the last selected character. \\
Example: PLC_PRG. iSelEnd
\end{tabular} \\
\hline "All selected" & \begin{tabular}{l} 
Variable (BOOL). Toggles the selection of the entered text. \\
TRUE: The text in the text field is selected. \\
FALSE: The selection starts with the value in "Selection start" and ends with \\
"Selection end".
\end{tabular} \\
\hline
\end{tabular}

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", " \(X\) ", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs.
Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.
Example: "Execute ST Code": ЗPLC_PRG.i_x := 0;
\begin{tabular}{|l|l} 
"OnDialogClosed" & Input event: The user closes the dialog.
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OnMouseClick" & \begin{tabular}{l} 
Input event: The user clicks the mouse button completely in the element area. \\
The mouse button is clicked and released.
\end{tabular} \\
\hline "OnMouseDown" & Input event: The user clicks down on the mouse button. \\
\hline "OnMouseEnter" & Input event: The user drags the mouse pointer to the element. \\
\hline "OnMouseLeave" & Input event: The user drags the mouse pointer away from the element. \\
\hline "OnMouseMove" & \begin{tabular}{l} 
Input event: The user moves the mouse pointer over the element area.
\end{tabular} \\
\hline "OnMouseUp" & \begin{tabular}{l} 
Input events: \\
The user releases the mouse button within the element area. It is irrelevant \\
whether the user has previously pressed the mouse button inside or outside \\
the element area. \\
- The user presses the mouse button within the element area, leaves the \\
element area, and then releases the mouse button. \\
Note: This CODESYS-specific triggering behavior guarantees that actions for \\
key elements are completed. A key element starts an action for "OnMouseDown" \\
and ends the action for "OnMouseUp". \\
Example: A visualization user presses the mouse button within the element area \\
of the key element and then moves the cursor position so that it lies outside the \\
element area. The action is ended anyway because "OnMouseUp" is triggered.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Tap" & \begin{tabular}{l} 
When a mouse click event occurs, the variable defined in "Variable" is described \\
in the application. The coding depends on the "Tap FALSE" and "Tap on enter if \\
captured" options.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL) that is set on mouse click event. \\
Example: PLC_PRG. bIsTapped \\
TRUE: A mouse click event exists. It lasts as long as the user presses the mouse \\
button over the element. It ends when the button is released. \\
FALSE: A mouse click event does not exist. \\
Requirement: The "Tap FALSE" option is not activated.
\end{tabular} \\
\hline "Tap FALSE" & \begin{tabular}{l} 
Q: The mouse click event leads to a complementary value in "Variable". \\
TRUE: A mouse click event does not exist. \\
FALSE: While the mouse click event exists.
\end{tabular} \\
\hline "Tap on enter if captured" & \begin{tabular}{l} 
V: During user input, it is also taken into consideration whether the mouse \\
pointer is dragged within the element area or not while the mouse button is \\
pressed.
\end{tabular} \\
\begin{tabular}{l} 
TRUE: While the mouse click event exists and the mouse pointer is moved over \\
the element area. \\
FALSE: A mouse click event does not exist. Or the user moves the mouse \\
pointer outside of the element area while the mouse button is pressed. \\
The value is TRUE again as soon as the user moves the pointer back to the \\
element area. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Toggle" & \begin{tabular}{l} 
With the onset of a mouse click event, the variable is set; when the mouse click \\
event is completed, the variable is reset.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l} 
Variable (BOOL). Its value toggled when the mouse click event is ended. This is \\
when the user releases the mouse button while the mouse pointer is over the \\
element area. \\
If the user releases the mouse button while the mouse pointer is outside of the \\
element area, then the mouse click event is not ended and the value is not \\
toggled. \\
Hint: The user can cancel a started toggle input by dragging the mouse pointer \\
out of the element area.
\end{tabular} \\
\hline "Toggle on up if captured" & \begin{tabular}{l} 
V: The value toggles regardless of where the mouse pointer is when the mouse \\
button is released. The mouse is then captured.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Hotkey" & \begin{tabular}{l}
Keyboard shortcut on the element for triggering specific input actions. \\
When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
\end{tabular} \\
\hline "Key" & \begin{tabular}{l}
Key pressed for input action. \\
Example: [T] \\
Note: The following properties appear when a key is selected.
\end{tabular} \\
\hline "Events" & \begin{tabular}{l}
- "None" \\
- "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. \\
- "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. \\
- "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property.
\end{tabular} \\
\hline "Shift" & Combination with the Shift key Example: [Shift]+[T]. \\
\hline "Control" & Combination with the Ctrl key Example: [Ctrl]+[T]. \\
\hline "Alt" & Combination with the Alt key Example: [AIt]+[T]. \\
\hline
\end{tabular}

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

\section*{Visualization Element 'Scroll Bar'}

Symbol:

Category: "Common Controls"
The element sets the value of a variable, depending on the position of the scroll bar.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: Speed Conveyor Belt 1 \\
Optional \\
& \begin{tabular}{l} 
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Scroll Bar" \\
\hline
\end{tabular}

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center' rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\boldsymbol{\oplus})\) to other positions in the editor.
\begin{tabular}{|l|l|}
\hline "Value" & Variable as type integer that includes the position of the scroll bar. \\
\hline "Minimum value" & Smallest value of the scroll bar (fixed value or variable). \\
\hline "Maximum value" & Largest value of the scroll bar (fixed value or variable). \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Page size" & Page size \\
& - As a fixed value, for example 10 \\
& - As a variable of data type integer \\
Requirement: Visible when the "Move to click" property is not selected. \\
\hline "Move to click" & \begin{tabular}{l} 
Behavior of the scroll bar at visualization runtime when it is clicked: \\
\\
\\
\\
\\
\\
: The scrollbar moves to the clicked position. \\
\(\square\)
\end{tabular} \\
\hline
\end{tabular} erty 'Position'

Element prop- The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x -axis runs to the right. The positive vertical y -axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X\) " & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (ए) (\%) other positions in the editor.

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'
\begin{tabular}{|l|l|}
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Font" & \begin{tabular}{l} 
Example: "Default" \\
\(\ldots .\). \\
\hline v: The "Font" dialog box opens. \\
vrop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l} 
Example: "Black" \\
\hline\(\ldots .:\) The "Color" dialog box opens. \\
v: Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l} 
Whole number (value range from 0 to 255). This determines the transparency of \\
the respective color. \\
Example: \(255:\) The color is opaque. \\
\(0:\) The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, \\
then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element prop- These properties are variables with contents that replace a format definition. erty 'Text variables'
\begin{tabular}{|l|l|}
\hline "Text variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses
\end{tabular} \\
& Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Text". \\
& \begin{tabular}{l} 
Note: If you specify a variable of type enumeration with text list support, then \\
the name of the enumeration data type is added automatically in angle brackets \\
after the variable name. Example: PLC_PRG. enVar <enumeration name>. \\
Then the symbolic value of the enumeration component is printed instead of the \\
numeric value when text is printed. Refer to the help page for the enumerations.
\end{tabular} \\
\hline "Tooltip variable" & \begin{tabular}{l} 
Variable (data type compliant with the format definition). It contains what is \\
printed instead of the format definition. \\
Example: PLC_PRG. iAccesses InTooltip \\
Note: The format definition is part of the text in the property "Texts \(\rightarrow\) Tooltip".
\end{tabular} \\
\hline
\end{tabular}

- \({ }^{\bullet}>\) Chapter 6.4.1.20.5.18 "Enumerations" on page 2263

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.
\begin{tabular}{|l|l|}
\hline "Text list" & \begin{tabular}{l} 
Variable (string) or name of the text list as a fixed string in single straight quota- \\
tion marks. \\
Example: ' Errorlist'
\end{tabular} \\
& : Drop-down list with the dialogs available in the text lists.
\end{tabular}

See also
- \({ }^{\text {• }}\) Chapter 6.4.1.21.2.28 "Object 'Text List"' on page 2532

Element prop- The variables allow for dynamic control of the text display. erty 'Font variables'
\begin{tabular}{|c|c|}
\hline "Font name" & \begin{tabular}{l}
Variable (STRING). Includes the font of the text. \\
Example: PLC_PRG.stFontVar := 'Arial'; \\
The selection of fonts corresponds to the default "Font" dialog.
\end{tabular} \\
\hline "Size" & \begin{tabular}{l}
Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. \\
- <pt>: Points (default) \\
Example: PLC_PRG.iFontHeight <pt> \\
Code: iFontHeight : INT := 12; \\
- <px> : Pixels \\
Example: PLC_PRG.iFontHeight <px> \\
Code: iFontHeight : INT := 19; \\
If you click in the value field, a drop-down list opens on the right for setting the unit. \\
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property \(\rightarrow\) Font".
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Flags" & \begin{tabular}{l}
Variable (DWORD). Contains the flags for displaying fonts. \\
Flags: \\
- 1: Italics \\
- 2: Bold \\
- 4: Underline \\
- 8: Strikethrough \\
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6;
\end{tabular} \\
\hline "Character set" & \begin{tabular}{l}
Variable (DWORD). Contains a character set number for the font. \\
The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog.
\end{tabular} \\
\hline "Color" & \begin{tabular}{l}
Variable (DWORD). Includes the color of the text. \\
Example: PLC_PRG.dwColorFont:= 16\#FF000000;
\end{tabular} \\
\hline "Flags for text alignment" & \begin{tabular}{l}
Variable (integer data type). Contains the coding for text alignment. \\
Example: PLC_PRG.dwTextAlignment. \\
Coding: \\
- \(0:\) Top left \\
- 1: Horizontal center \\
- 2: Right \\
- 4: Vertical center \\
- 8: Bottom \\
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5;
\end{tabular} \\
\hline
\end{tabular}

Fixed values for displaying texts are set in "Text properties".

See also
- « "Element property 'Text properties'" on page 3541

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assignment options: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline \begin{tabular}{l}
"Normal state" \\
"Alarm state"
\end{tabular} & The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle color" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. \\
\hline "Frame color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor \\
- Color literal Example of green and opaque: 16\#FF00FF00
\end{tabular} \\
\hline "Filling color" & \begin{tabular}{l}
Assignment options: \\
- Variable (DWORD) for the fill color Example: PLC_PRG.dwFillColor \\
- Color literal Example of gray and opaque: \(16 \#\) FF888888
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG. iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\boldsymbol{\oplus}\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Slider'}

\section*{Symbol:}

\section*{Category: "Common Controls"}

The element changes the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & \begin{tabular}{l} 
Example: Speed controller conveyor belt 1 \\
Optional \\
Hint: Assign individual names for elements so that they are found faster in the \\
element list.
\end{tabular} \\
\hline "Type of element" & "Slider" \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (ए) to other positions in the editor.

- Left and right: Two scales frame the slider on the left and the right.
\end{tabular} \\
\hline "Orientation" \begin{tabular}{l} 
Alignment of the slider; defined by the ratio of width to height. \\
- "Horizontal" \\
- "Vertical" \\
You can modify the alignment in the visualization editor by using the pointing \\
device to adjust the width and height of the scrollbar.
\end{tabular} \\
\hline \begin{tabular}{ll} 
The drop-down list varies depending on the alignment of the slider. \\
Horizontal \\
- "Left to right": Scale starts at the left. \\
- "Right to left": Scale starts at the right. \\
Vertical \\
- "Bottom to top": Scale starts at the bottom. \\
- "Top to bottom": Scale starts at the top.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ "Movement" } & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PPRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular}
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " "", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\begin{tabular}{|c|c|}
\hline "Usage of" & \begin{tabular}{l}
- "Default style values": The values of the visualization style are used. \\
- "Individual settings": The "Individual text properties" property group is shown The values can be customized here.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{\multirow[t]{2}{*}{\begin{tabular}{l}
"Individual text properties" \\
Requirement: The "Individual settings" text property is defined.
\end{tabular}}} \\
\hline & \\
\hline "Horizontal alignment" & Horizontal alignment of the text within the element. \\
\hline "Vertical alignment" & Vertical alignment of the text within the element. \\
\hline "Font" & \begin{tabular}{l}
Example: "Default"
The "Font" dialog box opens. \\
*: Drop-down list with style fonts.
\end{tabular} \\
\hline "Font color" & \begin{tabular}{l}
Example: "Black"
The "Color" dialog box opens. \\
- : Drop-down list with style colors.
\end{tabular} \\
\hline "Transparency" & \begin{tabular}{l}
Whole number (value range from 0 to 255). This determines the transparency of the respective color. \\
Example: 255: The color is opaque. \\
0 : The color is completely transparent. \\
Please note: If the color is a style color and already has a transparency value, then this property is write-protected.
\end{tabular} \\
\hline
\end{tabular}

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'
\begin{tabular}{|c|c|}
\hline "Toggle color" & \begin{tabular}{l}
The property controls the toggled color at runtime. \\
Value assignment: \\
- FALSE: The element is displayed with the color specified in the "Color" property. \\
- TRUE: The element is displayed with the color specified in the "Alarm color" property. \\
Assigning the property: \\
- Placeholder for the user input variable \\
- "<toggle/tap variable>" \\
- "<NOT toggle/tap variable>" \\
The color change is not controlled by its own variable, but by a user input variable. \\
Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. \\
Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration"," "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. \\
- Instance path of a project variable (BOOL) \\
Example: PLC_PRG.xColorIsToggeled \\
Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
\end{tabular} \\
\hline
\end{tabular}

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|l|}{ "Movement" } \\
\hline " \(X\) " & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline " \(\mathrm{Y} "\) & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
"Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the
"Client Animation" functionality.

- \({ }^{\text {® }}\), Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the \(\boldsymbol{\oplus}\) symbol. The point is used as the center for rotating and scaling.
\begin{tabular}{|l|l|}
\hline "X" & X-coordinate of the point of rotation \\
\hline "Y" & Y-coordinate of the point of rotation \\
\hline
\end{tabular}

You can also change the values by dragging the symbols ( \(\mathbf{\oplus})\) to other positions in the editor.

Element prop-
erty 'Texts'
\begin{tabular}{|l|l|}
\hline "Text" & \begin{tabular}{l} 
String label for the element. \\
Example: Zoom
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{|l|}{\begin{tabular}{ll} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG. iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\oplus\) symbol. \\
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Visualization Element 'Alarm Table'}

Symbol:

\section*{Category: "Alarm Manager"}

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column - even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.
If an alarm history has been created, then you can programmatically delete it at runtime. The recording starts again from the time of deletion. See the help page for "Visualizing Alarm Management".

\section*{Element proper- \\ ties}
\begin{tabular}{|c|c|}
\hline "Element name" & Example: GenElemInst_1 \\
\hline "Type of element" & "Alarm Table" \\
\hline "Data source" & \begin{tabular}{l}
Selection of the device and the application where the data to be visualized and the alarms are generated \\
- Remote data source which accesses a remote device, accesses a remote application, and then transfers the data to the alarm configuration \\
Example: \(\mathbb{x}^{\text {PI }}\) DataSource_A \\
Below the (now visible) "Application" property, the remote application is displayed as configured in the data source. \\
Example: \\
Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder. \\
- Local application below which the alarm configuration is located Example: "<local application>"
\end{tabular} \\
\hline
\end{tabular}

- Object 'Data Source'

Element property 'Alarm con-
figuration'
\begin{tabular}{|l|l|}
\hline "Alarm groups" & \begin{tabular}{l} 
Opens the "Select Alarm Group" dialog where you define the alarm groups that \\
you want to display.
\end{tabular} \\
\hline "Priority from" & Least priority for alarm display. (0 to 255). \\
\hline "Priority to" & Greatest priority for alarm display. (0 to 255). \\
\hline "Alarm classes" & \begin{tabular}{l} 
Opens the "Select Class Group" dialog where you define the alarm classes that \\
you want to display.
\end{tabular} \\
\hline "Filter criterion" & \begin{tabular}{l} 
For the "Alarm Banner" element only \\
- "Most important": The alarm with the highest priority (lowest value) is dis- \\
played. \\
- "Newest": The most recent alarm is displayed.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Filter by latch 1" & \begin{tabular}{l}
The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value. \\
- "Filter variable": Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples:PLC_PRG.strFilterVariable, 'STRING'. \\
- "Filter type": Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2). \\
Possible values: \\
- 0: No filtering \\
- 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1 ' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed. \\
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T\#1h2s, DINT\#15, REAL\#1.5, FALSE \\
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of \(9,223,372,036,854,775,808\) to 9,223,372,036,854,775,807. \\
- All other values: The behavior is not defined and can change in the future.
\end{tabular} \\
\hline "Filter by time range" & \begin{tabular}{l}
The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled. \\
- "Filter variable, from": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed. \\
- "Filter variable, to": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed. \\
- "Filter type": Variable of integer data type that determines whether "Filter by time range" is enabled or disabled. \\
Possible values: \\
- 1: Filtering is enabled \\
- 0 : Filtering is disabled
\end{tabular} \\
\hline
\end{tabular}

erty 'Control Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

\section*{variables'}
\begin{tabular}{|l|l|}
\hline "Acknowledge selected" & \begin{tabular}{l} 
Variable (BOOL) \\
Example: PLC_PRG. bAckSelectedAlarms \\
If the assigned variable is TRUE, then the selected alarm is acknowledged.
\end{tabular} \\
\hline "Acknowledge all visible" & \begin{tabular}{l} 
Variable (BOOL) \\
Example: PLC_PRG. bAckVisi.bleAlarms \\
If the assigned variable is TRUE, then all alarms are acknowledged that are \\
visible in the alarm table.
\end{tabular} \\
\hline "History" & \begin{tabular}{l} 
Variable (BOOL) \\
Example: PLC_PRG. bShowHistory \\
If the assigned variable is TRUE, then the history alarms are displayed in addition \\
to the active alarms. In the classic view, the same sort options apply as in normal \\
mode. \\
Note: Acknowledgment is not possible in this view.
\end{tabular} \\
\hline "Freeze scroll position" & \begin{tabular}{l} 
Variable (BOOL) \\
Example: PLC_PRG . bFreezeScrollPosition \\
"Variable for sorting direction"
\end{tabular} \\
\hline Variable (BOOL) \\
Example: PLC_PRG. xSortAscending \\
is retained, even if a new alarm is active. If not, then the scroll position jumps to \\
the first table row (the newest alarm).
\end{tabular}

You can also use the "Insert Elements for Acknowledging Alarms" command to define buttons with predefined control variables.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|c|c|c|}
\hline \multicolumn{3}{|l|}{"Movement"} \\
\hline " \(\times\) " & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline "Y" & \multicolumn{2}{|l|}{\begin{tabular}{l}
Variable (numeric data type). Defines the \(Y\) position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular}} \\
\hline "Rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle1. \\
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
\end{tabular} &  \\
\hline "Interior rotation" & \begin{tabular}{l}
Variable (numeric data type). Defines the angle of rotation (in degrees). \\
Example: PLC_PRG.iAngle2. \\
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol. \\
Note: If a static angle of rotation is specified in the "Position \(\rightarrow\) Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.
\end{tabular} &  \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

Element prop- The variables control the element behavior dynamically. erty 'State variables'
\begin{tabular}{|l|l}
\hline "Invisible" & Variable (BOOL). Toggles the visibility of the element.
\end{tabular}

TRUE: The element is not visible at runtime.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.
\begin{tabular}{|c|c|}
\hline "Animation duration" & \begin{tabular}{l}
Defines the duration (in milliseconds) in which the element runs an animation \\
- Variable (integer value) \\
Example: Menu.tContent with VAR tContent : INT := 500; END_VAR \\
- Integer literal \\
Example: 500 \\
Animatable properties \\
- "Absolute movement", "Movement", "X", " \(Y\) " \\
- "Absolute movement", "Rotation" \\
- "Absolute movement", "Interior rotation" \\
- "Absolute movement", "Exterior rotation" \\
The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
\end{tabular} \\
\hline "Move to foreground" & \begin{tabular}{l}
Moves the visualization element to the foreground \\
Variable (BOOL) \\
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR \\
TRUE: At runtime, the visualization element is displayed in the foreground. \\
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

\section*{Visualization Element 'Alarm Banner'}

Symbol:

\section*{Category: "Alarm Manager"}

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

\section*{Element proper-}
ties
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElem Inst_1 \\
\hline "Type of element" & "Alarm Banner" \\
\hline "Data source" & \begin{tabular}{l} 
If you intend to use a remote alarm configuration, then you have to specify the \\
name of the remote application here. If you do not specify anything, the alarm \\
configuration will be located locally.
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop- \\ erty 'Alarm con- \\ figuration'}
\begin{tabular}{|l|l|}
\hline "Alarm groups" & \begin{tabular}{l} 
Opens the "Select Alarm Group" dialog where you define the alarm groups that \\
you want to display.
\end{tabular} \\
\hline "Priority from" & Least priority for alarm display. (0 to 255). \\
\hline "Priority to" & Greatest priority for alarm display. (0 to 255). \\
\hline "Alarm classes" & \begin{tabular}{l} 
Opens the "Select Class Group" dialog where you define the alarm classes that \\
you want to display.
\end{tabular} \\
\hline "Filter criterion" & \begin{tabular}{l} 
For the "Alarm Banner" element only \\
- "Most important": The alarm with the highest priority (lowest value) is dis- \\
played. \\
-"Newest": The most recent alarm is displayed.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|c|c|}
\hline "Filter by latch 1" & \begin{tabular}{l}
The generated alarms (previous and current) can be filtered by the contents of "Latch variable 1 ", which is specified in the configuration of the alarm group. In "Filter type", you define whether or not the filtering is performed by a string value or a numerical value. \\
- "Filter variable": Indicates what the alarms are filtered by. Possible entries: Application variable of data type STRING or WSTRING, or a literal value directly. Examples:PLC_PRG.strFilterVariable, 'STRING'. \\
- "Filter type": Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: PLC_PRG.diFilterType, or a value directly (example: 2). \\
Possible values: \\
- 0: No filtering \\
- 1: Filter by alarms whose latch variable 1 contains the string specified in "Filter variable". Example: The filter variable contains 'Error 1 ' which is the latch variable 1 of different alarms of type STRING and has the value 'Error 1' ->. Only these alarms are displayed. \\
- 2: Filter by alarms whose latch variable 1 contains the typed literal specified in "Filter variable" according to IEC 61131-3. Examples: T\#1h2s, DINT\#15, REAL\#1.5, FALSE \\
- 3: Filter by alarms whose latch variable 1 contains the LINT literal value specified in "Filter variable". Therefore, the value of the latch variables has to be in the range of \(9,223,372,036,854,775,808\) to 9,223,372,036,854,775,807. \\
- All other values: The behavior is not defined and can change in the future.
\end{tabular} \\
\hline "Filter by time range" & \begin{tabular}{l}
The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the "Filter type" to define whether filtering by time range is enabled or disabled. \\
- "Filter variable, from": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeFrom) for the start time that the alarms are displayed. \\
- "Filter variable, to": Variable of data type DT or DATE_AND_TIME (example: PLC_PRG.filterTimeTo) for the end time that the alarms are displayed. \\
- "Filter type": Variable of integer data type that determines whether "Filter by time range" is enabled or disabled. \\
Possible values: \\
- 1: Filtering is enabled \\
- 0 : Filtering is disabled
\end{tabular} \\
\hline
\end{tabular}

Element prop- By default, columns [0] and [1] are preconfigured: "Time stamp" and "Message text". You create erty 'Columns: Column [<n>]' more columns by clicking "Create new". You remove columns by clicking "Delete".
Animations (dynamic text, font variables), texts, and tooltips are not supported.
\begin{tabular}{|c|c|}
\hline "Width" & Width of the column (in pixels) \\
\hline "Type of data" & \begin{tabular}{l}
About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library Alarmmanager.library: AlarmGlobals.g_sDateFormat (example: AlarmGlobals.g_sDateFormat := 'MM. уyyy') and AlarmGlobals.g_sTimeFormat (example: AlarmGlobals.g_sTimeFormat := 'HH:mm'). \\
Here you define the information to be displayed in the column. \\
- "Bitmap" \\
- "Time stamp": Date and time of the last status change of the alarm \\
- "Time stamp active": Date and time of the last activation of the alarm \\
- "Time stamp inactive": Date and time of the last deactivation of the alarm \\
- "Time stamp acknowledge": Date and time of the last acknowledgement \\
- "Value": Actual value of the expression \\
- "Message": Output of the message text \\
- "Priority": Alarm priority \\
- "Class": Alarm class \\
- "State": Alarm state \\
- "Latch Variable <n>": Value of the selected latch variables
\end{tabular} \\
\hline "Text alignment" & \begin{tabular}{l}
Alignment of the contents in the column \\
- "Left" \\
- "Centered" \\
- "Right"
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline "X" & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (品) to other positions in the editor.

Specified in pixels. \\
Used for achieving the exact positioning relative to the background image.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Colors'
\begin{tabular}{|c|c|}
\hline "Graph color" & Color of the bar \\
\hline "Bar background" & The background of the bar is black.
The background of the bar is white. \\
\hline "Frame color" & Color that the frames are drawn. \\
\hline "Switch whole color" & The total color of the bar is switched to the color of the color area of the current value. \\
\hline "Use gradient color for bar" & - Bar is displayed with a gradient. \\
\hline "Color range markers" & \begin{tabular}{l}
The color areas can be separated from each other inside the bar with a vertical mark. \\
- "No markers": No display. \\
- "Marker forwards": The color of the vertical mark corresponds to the color of the previous color area. \\
- "Marker backwards": The color of the vertical mark corresponds to the color of the next color area.
\end{tabular} \\
\hline \multicolumn{2}{|l|}{"Color areas"} \\
\hline "Create new" & A new color area is added. \\
\hline "Delete" & The color area is removed from the list. \\
\hline "Begin of area" & Start value of the color area \\
\hline "End of area" & End value of the color area \\
\hline "Color" & Color that is used for displaying the area. \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" & \multicolumn{1}{l|}{\begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular}} \\
\hline " \(Y\) " & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.i Pos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\boldsymbol{\rightarrow}\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2. \\
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"Position \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular} \\
\hline
\end{tabular}

You can link the variables to a unit conversion.

The "X", " \(Y\) ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\hline \begin{tabular}{l} 
"Positioning" \\
Requirement: "User-defined settings" is selected as "Usage of". \\
The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on \\
whether a custom background image is selected. The following settings are used for achieving the exact position \\
relative to the background image.
\end{tabular} \\
\hline "Needle movement" & Length of the needle (in pixels) \\
\hline "Scale movement" & \begin{tabular}{l} 
Distance from the tick marks to the center (in pixels) \\
Requirement: A customer image is selected as "Background".
\end{tabular} \\
\hline "Scale length" & \begin{tabular}{l} 
Length of the tick marks (in pixels) \\
Requirement: A customer image is selected as "Background".
\end{tabular} \\
\hline "Label offset": & Distance from the labels to the tick marks (in pixels) \\
\hline "Unit offset": & Distance of the unit text "Label \(\mathbf{\rightarrow}\) Unit" from the upper scale edge (in pixels) \\
\hline "Origin offset" & \begin{tabular}{l} 
Offset of the element (in pixels) \\
Requirement: For the elements "Meter 180"" and "Meter 90"", this property is \\
displayed only if a custom image is selected as "Background".
\end{tabular} \\
\hline
\end{tabular}

\section*{Element prop-}
erty 'Colors'
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{"Color areas"} \\
\hline "Durable color areas" & \begin{tabular}{l}
: All color areas are visible, regardless of the current value. \\
Only the color area is visible that includes the current value.
\end{tabular} \\
\hline "Use colors for scale" & \: Colors in the color area are used only for the scale and frame. \\
\hline "Color areas" & \\
\hline "Create new" & A new color area is added to the "Elements" view. \\
\hline "Delete" & The color area is removed from the list and the list is refreshed. \\
\hline "Begin of area" & \begin{tabular}{l}
Start value of the color area \\
Example: 20 \\
p: The property "Variable" is shown below.
\end{tabular} \\
\hline "Variable" & \begin{tabular}{l}
Variable (integer data type). Contains the start value. \\
Example: PLC_PRG.iColorAreaStarto \\
Declaration:
```

PROGRAM PLC_PRG
VAR
iColorAreaStart0 : INT := 80;
END_VAR

```
\end{tabular} \\
\hline "End of area" & \begin{tabular}{l}
End value of the color area \\
Example: 120 \\
: The property "Variable" is shown below.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Variable" & \begin{tabular}{l} 
Variable (integer data type). Contains the end value. \\
Example: iColorAreaEndo \\
Declaration: \\
\\
\\
\\
\\
\hline PROGRAM PLC_PRG \\
VAR iColorAreaEndo : INT \(:=100 ;\) \\
END_VAR \(\quad\) Color that is used for displaying the area. \\
\hline
\end{tabular} \\
\hline
\end{tabular}

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'
\begin{tabular}{|l|l|}
\hline "Invisible" & \begin{tabular}{l} 
Variable (BOOL). Toggles the visibility of the element. \\
\\
\\
\\
TRUE: The element is not visible at runtime. \\
Example: bIsVisible with VAR bIsVisible : BOOL : \(=\) FALSE; \\
END_VAR
\end{tabular} \\
\hline "Deactivate inputs" & \begin{tabular}{l} 
Variable (BOOL). Toggles the operability of the element. \\
TRUE: User inputs do not have any effect in runtime more. The element is shown \\
as deactivated.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
\begin{tabular}{|l|l|}
\hline "Movement" \\
\hline "X" & \begin{tabular}{l} 
Variable (numeric data type). Defines the X position (in pixels). \\
Example: PLC_PRG.iPos_X. \\
Increasing this value in runtime mode moves the element to the right.
\end{tabular} \\
\hline "Y" & \begin{tabular}{l} 
Variable (numeric data type). Defines the Y position (in pixels). \\
Example: PLC_PRG.iPos_Y. \\
Increasing this value in runtime mode moves the element downwards.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle1. \\
The midpoint of the element rotates at the "Center" \\
point. This rotation point is shown as the \(\oplus\) \\
symbol. \\
In runtime mode, the alignment of the element \\
remains the same with respect to the coordinate \\
system of the visualization. Increasing the value \\
rotates the element to the right.
\end{tabular} \\
\hline "Interior rotation" & \begin{tabular}{l} 
Variable (numeric data type). Defines the angle of \\
rotation (in degrees). \\
Example: PLC_PRG. iAngle2.
\end{tabular} \\
\begin{tabular}{l} 
In runtime mode, the element rotates about the \\
point of rotation specified in "Center" according to \\
the value of the variable. In addition, the alignment \\
of the element rotates according to the coordinate \\
system of the visualization. Increasing the value in \\
the code rotates clockwise. \\
The rotation point is shown as the \(\boldsymbol{\oplus}\) symbol.
\end{tabular} \\
\begin{tabular}{l} 
Note: If a static angle of rotation is specified in the \\
"opsition \(\rightarrow\) Angle" property, then the static angle \\
of rotation is added to the variable angle of rotation \\
(offset) when the visualization is executed.
\end{tabular}
\end{tabular}

You can link the variables to a unit conversion.

The " \(X\) ", " "", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

\section*{Element property 'Access rights'}
\begin{tabular}{|l|l|}
\hline "Access rights" & \begin{tabular}{l} 
Opens the "Access rights" dialog. There you can edit the access privileges for \\
the element. \\
Status messages: \\
- "Not set. Full rights.": Access rights for all user groups : "operable" \\
- "Rights are set: Limited rights": Access is restricted for at least one group.
\end{tabular} \\
\(\qquad\)\begin{tabular}{l}

\end{tabular}
\end{tabular}

\section*{Visualization Element 'Histogram'}

Symbol:

\section*{Category: "Measurement Controls"}

The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.

See also
- ⓨ Chapter 6.4.5.2.4 "Displaying Array Data in a Histogram" on page 2862

\section*{Element proper- \\ ties}
\begin{tabular}{|l|l|}
\hline "Element name" & Example: GenElemInst_35 \\
\hline "Type of element" & "Histogram" \\
\hline "Data array" & \begin{tabular}{l} 
One-dimensional array with data displayed in this histogram. \\
Example: PLC_PRG.arr1
\end{tabular} \\
\hline
\end{tabular}

\section*{Element property 'Subrange of array'}
\begin{tabular}{|l|l|}
\hline "Use subrange" & : Only part of the array is displayed in the histogram. \\
\hline "Start index" & \begin{tabular}{l} 
First array index with a displayed value. \\
Requirement: "Use subrange" is activated.
\end{tabular} \\
\hline "End index" & \begin{tabular}{l} 
Last array index with a displayed value. \\
Requirement: "Use subrange" is activated.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Display type" & \begin{tabular}{l} 
- "Bars": Data is displayed as bars. \\
- "Lines": Data is displayed as lines. \\
- "Curve": Interpolation of data into a curve.
\end{tabular} \\
\hline "Line width" & \begin{tabular}{l} 
Specified in pixels \\
Requirement: "Curve" is selected as the "Display type".
\end{tabular} \\
\hline "Show horizontal lines" & \begin{tabular}{l} 
: : Horizontal lines are drawn on the main scale. \\
Note: Not all visualization styles have this property. This element property is not \\
available for visualization styles that have striped backgrounds (example: "Flat \\
style").
\end{tabular} \\
\hline "Relative bar width" & \begin{tabular}{l} 
Integer value between 1 and 100 \\
- 1: The bars are drawn as lines. \\
- 100: The entire width of the histogram is filled with the bars.
\end{tabular} \\
\hline
\end{tabular}

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal \(x\)-axis runs to the right. The positive vertical \(y\)-axis runs downwards.
\begin{tabular}{|l|l|}
\hline " \(X "\) & \begin{tabular}{l} 
X coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline " \(\mathrm{Y} "\) & \begin{tabular}{l} 
Y coordinate of the upper left corner of the element \\
Specified in pixels. \\
Example: 10.
\end{tabular} \\
\hline "Width" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 150
\end{tabular} \\
\hline "Height" & \begin{tabular}{l} 
Specified in pixels. \\
Example: 30
\end{tabular} \\
\hline
\end{tabular}

You can also change the values by dragging the box symbols (■-) to other positions in the editor.

See also
- Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element prop- The properties contain fixed values for the coordinates of the point of rotation. This point of erty 'Center'
\begin{tabular}{|l|l|}
\hline " \(X\) " & X-coordinate of the point of rotation \\
\hline " \(Y\) " & \(Y\)-coordinate of the point of rotation \\
\hline

Element property 'Colors'

| "Graph color" | Color of the bar in normal state. <br> Note: The normal state is in effect when the current value of the array compo- <br> nent does not fulfill the alarm condition. |
| :--- | :--- |
| "Alarm value" | Threshold for the alarm |
| "Alarm condition" | If the current value of the array component fulfills the alarm condition, then the <br> alarm condition is set. <br> - "Less": The current value is less than the "Alarm value" <br> - "More": The current value is greater than the "Alarm value" |
| "Alarm color" | Color of the bar in alarm state. |
| "Use color areas" | "目 The color areas defined in this element are used. |
| "Color areas" | A new color area is added. |
| "Create new" | The color area is removed from the list. |
| "Delete" | The start value on the "Scale" of the Histogram where the color area begins. |
| "Begin of area" | The end value on the "Scale" of the Histogram where the color area ends. |
| "End of area" | Color that is used for displaying the area. |
| "Color" |  |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" | Variable (numeric data type). Defines the $X$ position (in pixels). <br> Example: PLC_PRG.iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |
| :--- | :--- |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG.iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |
| "Rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle1. <br> The midpoint of the element rotates at the "Center" <br> point. This rotation point is shown as the $₫$ <br> symbol. <br> In runtime mode, the alignment of the element <br> remains the same with respect to the coordinate <br> system of the visualization. Increasing the value <br> rotates the element to the right. |

| "Interior rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle2. <br> In runtime mode, the element rotates about the <br> point of rotation specified in "Center" according to <br> the value of the variabbe. In addition, the alignment <br> of the element rotates according to the coordinate <br> system of the visualization. Increasing the value in <br> the code rotates clockwise. <br> The rotation point is shown as the $\oplus$ symbol. |
| :--- | :--- |
| Note: If a static angle of rotation is specified in the <br> "Position $\rightarrow$ Angle" property, then the static angle <br> of rotation is added to the variable angle of rotation <br> (offset) when the visualization is executed. |  |

> You can link the variables to a unit conversion.

The " $X$ ", " $Y$ ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also
-

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", " $X$ ", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground <br> Variable (BOOL) <br> Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

Element prop- Requirement: User management is set up for the visualization. erty 'Access
rights'

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for <br> the element. <br> Status messages: |
| :--- | :--- |
|  | - "Not set. Full rights.": Access rights for all user groups : "operable" <br> $\bullet \quad$ "Rights are set: Limited rights": Access is restricted for at least one group. |

See also

- ※y Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

## Visualization Element 'Image Switcher'

Symbol:

## Category: "Lamps/Switches/Bitmaps"

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the "Image settings" element properties. The effects of mouse clicks are defined in the "Element behavior" property.

## Element proper- <br> ties

| "Element name" | Optional <br> Hint: Assign individual names for elements so that they are found faster in the <br> element list. <br> Example: ImageSwitcher_1 |
| :--- | :--- |
| "Type of element" | "Image Switcher" |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| " $X$ " | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

You can also change the values by dragging the box symbols (ए़-) to other positions in the editor.

See also

- "y Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

| "Variable" | Variable (BOOL). <br> The value of the variable changes according to user input and it is independent <br> of the "Element behavior" element property. |
| :--- | :--- |

Image settings

| "Image "on"" | Image ID from an image pool. The image can be selected using the input assis- <br> tant. <br> The image is used if the variable of the "Variable" property has the value TRUE. |
| :--- | :--- |
| "Image "off"" | Image ID from an image pool. The image can be selected using the input assis- <br> tant. <br> The image is used if the variable of the "Variable" property has the value FALSE. |
| "Image "clicked""" | Image ID from an image pool. The image is selected using the input assistant. <br> In runtime mode, the visualization displays the referenced image when the ele- <br> ment is clicked (and the mouse button is held down). <br> Requirement: The "Element behavior" is "Image toggler". |

| "Transparency" | 冋: The "Transparent color" is selected. |
| :---: | :---: |
| "Transparent color" | The image pixels that have the transparent color are displayed as transparent. <br> Requirement: "Transparency" is activated. <br> - ...The "Color" dialog box opens. <br> - $\quad$ : A drop-down list with color names opens. |
| "Scaling type" | Defines how an image fits in the element frame. <br> - "Fixed": The original size of the image is retained, regardless of the dimensions of the element. <br> - "Isotropic": The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. <br> - "Anisotropic": The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained. |
| "Horizontal alignment" | Horizontal alignment of the image within the element frame or element <br> - Left <br> - Centered <br> - Right <br> Requirement: "Scaling type" is "lsotropic". |
| "Vertical alignment" | Vertical alignment of the image within the element frame or element <br> - Top <br> - Centered <br> - Bottom <br> Requirement: "Scaling type" is "Isotropic". |

| "Element behavior" | - "Image toggler": Every mouse click switches the image. <br> - "Image tapper"" While a visualization user holds down the mouse button, the <br> image of the "Image on" property is displayed. At the same time, the value <br> TRUE is assigned to the "Variable" property. |
| :--- | :--- |
| "Tap FALSE" | V: While the mouse button is pressed, the image of the "Image" property is <br> displayed and the "Variable" property gets the value FALSE instead of the value <br> TRUE, and back. <br> Requirement: "Image tapper" is selected in the "Element behavior" property. |

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| " $Y$ " | $Y$-coordinate of the point of rotation |

You can also change the values by dragging the symbols ( $\boldsymbol{\oplus}$ ) to other positions in the editor.

## Element property 'Texts'

| "Tooltip" | String display as tooltip for the element <br> Example: Valid access. |
| :--- | :--- |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" | Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG. iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |
| :--- | :--- |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG. iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |
| "Rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle1. <br> The midpoint of the element rotates at the "Center" <br> point. This rotation point is shown as the $\oplus$ <br> symbol. <br> In runtime mode, the alignment of the element <br> remains the same with respect to the coordinate <br> system of the visualization. Increasing the value <br> rotates the element to the right. |
| "Interior rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle2. <br> In runtime mode, the element rotates about the <br> point of rotation specified in "Center" according to <br> the value of the variable. In addition, the alignment <br> of the element rotates according to the coordinate <br> system of the visualization. Increasing the value in <br> the code rotates clockwise. <br> The rotation point is shown as the $\oplus$ symbol. <br> Note: If a static angle of rotation is specified in the <br> "Position $\rightarrow$ Angle" property, then the static angle <br> of rotation is added to the variable angle of rotation <br> (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| " $X$ " | The x-coordinate of the upper left corner of the element Specified in pixels <br> Example: 10 |
| :---: | :---: |
| "Y" | The y-coordinate of the upper left corner of the element Specified in pixels <br> Example: 10 |
| "Width" | Specified in pixels <br> Example: 150 |
| "Height" | Specified in pixels <br> Example: 30 |
|  | Tip: You can change the values in " $X$ ", " $Y$ ", "Width", and "Height" by dragging the corresponding symbols |
| "Angle" | Static angle of rotation (in degrees) <br> Example: 35 <br> The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. <br> Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow $\mathcal{A}$, you can rotate the element about its center as a handle. <br> (1): Handle <br> Note: If a dynamic angle of rotation is also configured in the property "Absolute movement $\rightarrow$ Internal rotation", then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset. |

| "Show cursor" | V: A cursor (vertical line) is displayed at the mouse position. The trigger and <br> variable values where the cursor points are displayed as a tooltip. |
| :--- | :--- |
| "Overwrite existing trace on | V: If a trace with the same name is on the PLC, then it is overwritten at down- <br> PLC" |
| "Number format" | Number format of values in the tooltip in printf syntax (example: \%d, \%5.2f). |

Element prop- $\quad$ The control variables are assigned automatically when you click "Insert elements for controlling erty 'Control Trace". variables'

| "Reset Trigger" | Variable (BOOL). <br> Standard control variable: bResetTrigger <br> TRUE: Resets the triggering. After the action is executed, the variable is set automatically to FALSE. |
| :---: | :---: |
| "Start Trace" | Variable (BOOL). <br> Standard control variable: bStart <br> TRUE: Starts the Trace. After the action is executed, the variable is set automatically to FALSE. |
| "Stop Trace" | Variable (BOOL). <br> Standard control variable: bStop <br> TRUE: Stops the Trace. After the action is executed, the variable is set automatically to FALSE. |
| "Save Trace to a file" |  |
| "Save Trace" | Variable (BOOL). <br> Standard control variable: bStore <br> TRUE: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to FALSE. |
| "File name" | Variable (STRING) that contains the file name of the file to be saved. Standard control variable: sStoreFilename |
| "Load trace from file" |  |
| "Load Trace" | Variable (BOOL). <br> Standard control variable: bRestore <br> TRUE: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to FALSE. <br> Note: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y ), then the file cannot be loaded. |
| "File name" | Variable (STRING) that contains the file name of the file to be read. Standard variable: sRestoreFilename |

Element prop-
erty 'Center'
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| $Y "$ | $Y$-coordinate of the point of rotation |

Element property 'Absolute movement'

You can also change the values by dragging the symbols ( $\boldsymbol{\oplus}$ ) to other positions in the editor.

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" |  |  |
| :---: | :---: | :---: |
| "X" | Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG.iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |  |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG.iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |  |
| "Rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle1. <br> The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. <br> In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |  |
| "Interior rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle2. <br> In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. <br> The rotation point is shown as the $\boldsymbol{\oplus}$ symbol. <br> Note: If a static angle of rotation is specified in the "Position $\rightarrow$ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |  |

## You can link the variables to a unit conversion.

The " $X$ ", " $Y$ ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

## Visualization Element 'Trend'

Symbol:

## Category: "Special Controls"

The element displays the curve of variable values as a trend diagram. The trend diagram is suitable for representing a long-term data curve because the data is read from a trend recording and hence from a database. Moreover, you can run the "Trend" element together with the "Date Range Picker", "Legend", and "Time Range Picker" operating elements so that the user can navigate conveniently in the diagram.

You can programmatically delete the recorded trend curve at runtime. The recording starts again from the time of deletion. See the help page for "Programming a Trend Visualization".

## Element proper-

ties

| "Element name" | Example: Velocity |
| :---: | :---: |
| "Data source" | Data source for the connection via the device and the application to the "Trend Recording" object where the trend data that you want to show was saved. <br> If the "Trend Recording" object is on the local device, then it is sufficient when you specify the respective application. If the trend recording is on a remote device, then you need to specify the data source connection to this device. <br> - 0" <local application>" <br> The "Trend Recording" object is located on the local device in the local application. <br> - <device name> . <application name> <br> Example: Device_A.App_A <br> The "Trend Recording" object is located on the local device Device_A below the application App_A. <br> - $\mathrm{F}^{(\mathrm{m}}$ <data source name> <br> Example: DataSource_B <br> The "Trend Recording" object is located on a remote device that is connected via the data source DataSource_B. Below the (now visible) "Application" property, the remote application is displayed as configured in the data source. <br> Example: App_B <br> Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder. |
| "Type of element" | "Trend" |
| "Trend recording" | : Trend recording whose data is displayed as a diagram <br> The trend recording is located on the device specified in the "Data source" property. |
| "Display Mode" | L: Opens the "Display Settings" dialog. |

| "Show cursor" | A cursor (black triangle with vertical line) is shown in the trend diagram. Behavior at runtime: As soon as the graph is drawn, the user can move the cursor along the time axis in order to mark a specific time. Then the variable value belonging to the cursor position is displayed in the legend above the graph. |
| :---: | :---: |
|  |  |
|  |  |
| "Show tooltip" | Requirement: "Show cursor" is activated. A tooltip opens at the cursor. <br> Behavior at runtime: The variable value belonging to the cursor position is displayed as a tooltip. |
| "Show frame" | - The trend diagram is drawn with a frame. |
| "Number format" | Format specification in printf syntax, which determines how the values are displayed in the tooltip and in the legend <br> Example: \%d (integer variable) or $\% 5.2 \mathrm{f}$ (floating-point number) |

## Element property 'Tick mark labels'

The time stored in the trend recording are in the UTC time zone. If the time is displayed in the trend of the visualization element, then the time stamps are converted to the local time zone of the operating system of the PLC.

Change the time zone in the operating system if the times in the trend diagram are not in the zone that you need.

| "Time stamps" | X-value of the trend diagram <br> - "Absolute time stamps" <br> The absolute time with date and time is displayed at each tick mark on the time axis. <br> Example: 03/18/2016 12h30m50s <br> - "Relative time stamps" <br> The time period from the start of the recording (=0) is displayed at each tick mark. <br> Example: 5m30s |
| :---: | :---: |
| "Draw labels on two lines" | The time stamps are displayed on two lines (for example, the date is displayed on the first line and the time on the second line). The time stamp is displayed on one line. Example: 2019-11-01-12:30:50. |
| " Omit irrelevant information in timestamps" | The time stamps are displayed in a truncated form (without insignificant information). For example, the date is displayed at the first tick mark, and only the time is displayed at the following tick marks. The "Internationalization (format strings)" property is not visible and is ignored. $\square$ The time stamps are displayed with all information. This takes into consideration the "Internationalization (format strings)" property which contains the format specification for the date and time display. |
| "Internationalization (format strings)" | Format specification for the date and time display of the time stamp (when it is displayed in full) <br> Note: The property is visible only if the "Omit irrelevant information in timestamps" option is not selected. |

| "Date" | Format string that returns the date display according to the defined format. The operating system locale is used as the default setting. <br> Defined format strings for the date: <br> - Year: yyyy, yy, y <br> - Month: mM, m <br> - Day: dd, d <br> - Recommended separator: - . / <br> Example: <br> YYYy-MM-d displays 2019-10-25 <br> yyyy-MM-dd displays 2019-10-25 <br> dd.MM. yyyy displays 25 .10. 2019 <br> dd/MM/yyyy displays 25/10/2019 |
| :---: | :---: |
| "Time" | Format string that returns the time (or time of day) display according to the defined format. The operating system locale is used as the default setting. Defined format strings for the time: <br> - 24-hour time definition: $\mathrm{HH}, \mathrm{H}$ <br> - 12-hour time definition: hh, h <br> - AM/PM for 12-hour time definition: $t$ t <br> - Minutes: mm, m <br> - Seconds: ss, s <br> - Milliseconds: ms <br> - Microseconds: us <br> - Recommended separator: : or space character <br> Example: <br> HH:mm:ss:ms displays $15: 30: 59: 123$ <br> $\mathrm{h}: \mathrm{mm}$ :ss tt displays 3:30:59 PM |

## Visualization Element 'ActiveX'

Symbol:

## Category: "Special Controls"

The element is used to link an existing ActiveX control in the visualization. You can configure the method calls and their parameters in the element properties of the "ActiveX" element.

## Element proper- <br> ties

| "Element name" | Example: GenElemInst_1 |
| :--- | :--- |
| "Type of element" | "ActiveX" |
| "Element" | Installed ActiveX component that is linked to the visualization. <br> Hint: To avoid typing errors, select the required ActiveX component by means of <br> the Input Assistant. |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

You can also change the values by dragging the box symbols (吊) to other positions in the editor.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| " $Y$ " | Y-coordinate of the point of rotation |

$\square$

[^43]| "Movement" |  |  |
| :---: | :---: | :---: |
| " $\times$ " | Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG.iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |  |
| " $Y$ " | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG.iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |  |
| "Rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle1. <br> The midpoint of the element rotates at the "Center" point. This rotation point is shown as the symbol. <br> In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |  |
| "Scaling" | Variable (integer data type). Causes centric stretching. <br> Example: PLC_PRG.iScaling. <br> The reference point is the "Center" property. <br> The value 1 shrinks the element by a factor of 0.001 . The value 1000 returns the element to its original size. |  |
| "Interior rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle2. <br> In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. <br> The rotation point is shown as the $\boldsymbol{\oplus}$ symbol. <br> Note: If a static angle of rotation is specified in the property "Position $\rightarrow$ Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |  |

You can link the variables to a unit conversion.

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. |
| :--- | :--- |
|  | TRUE: The element is not visible at runtime. |

The "Invisible" property is supported by the "Client Animation" functionality.

variables'
Table 720: Element property "Control variables --> File"

| "Variable" | Variable (STRING). Contains the file names and optionally the location of the file. <br> It is located in the file system of the controller. <br> Example: PLC_PRG. strFile: STRING : $=\quad$ / Documentation/ <br> Info.txt'; |
| :--- | :--- |
| "Open" | Variable (BOOL). Controls opening the file which is defined in the "Variable" <br> property <br> Example: bOpen: BOOL; <br> TRUE: The file is opened. |
| "Close" | Variable (BOOL). Controls closing the file which is defined in the "Variable" prop- <br> erty <br> Example: bClose : BOOL; <br> TRUE: The file is closed. |
| "Save" | Variable (BOOL). Controls saving the file which is defined in the "Variable" prop- <br> erty <br> Example: bStore : BOOL; <br> TRUE: The file is saved. |
| "New" | Variable (BOOL). Controls creating a new file. The name is defined in the <br> "Variable" property. <br> Example: bCreate: BOOL; <br> TRUE: A file is created and opened. |

Table 721: Element property "Control variables --> Edit"

| "Variable" | Variable (STRING). Contains the string to search for in the file <br> Example: strFind: STRING : $=~ ' a b c ' ; ~$ |
| :--- | :--- |
| "Find" | Variable (BOOL). Controls executing the search for the string in the "Variable" <br> property <br> Example: bFind: BOOL; <br> TRUE: The search is performed. The variable is automatically reset to FALSE. |
| "Find next" | Variable (BOOL). Controls the location to begin the search in the file <br> Example: bFindNext: BOOL; <br> TRUE: The search begins at the last search result location. |
|  | FALSE: The search begins at the beginning of the file. |

Table 722: Element property "Control variables --> Cursor position"

| "Line" | Variable (integer data type). Contains the line of the cursor <br> Example: iRowCursor: INT; |
| :--- | :--- |
| "Column" | Variable (integer data type). Contains the column of the cursor <br> Example: iColumnCursor: INT; |
| "Position" | Output variable (integer data type). Shows the absolute cursor position in the <br> text. <br> Example: iPosCursor: INT; |
| "Set cursor" | Variable (BOOL). Controls the setting of the cursor at a specific location <br> Example: iSetCursor: INT; <br> TRUE: The cursor is moved. The new position is defined in the "Line" and <br> "Column" properties. <br> FALSE: The "Line", "Column", and "Position" properties contain the actual <br> values. <br> Note: The variable is used as the control variable for an input event triggered <br> by a visualization user. |

Table 723: Element property "Control variables --> Selection"

| "Start position" | Output variable (integer data type). Shows the absolute position for starting the <br> text selection <br> Example: iPosSelection: INT; |
| :--- | :--- |
| "End position" | Output variable (integer data type). Shows the absolute position for ending the <br> text selection. <br> Example: iPosEndSelection: INT; |
| "Start line number" | Output variable (integer data type). Shows the line where the text selection <br> begins <br> Example: iRowSelection: INT; |
| "Start column index" | Output variable (integer data type). Shows the column where the text selection <br> begins <br> Example: iColumnSelection: INT; |
| "End line number" | Output variable (integer data type). Shows the line where the text selection ends <br> Example: iRowEndSelection: INT; |

| "End column index" | Output variable (integer data type). Shows the column where the text selection <br> ends <br> Example: iColumnEndSelection: INT; |
| :--- | :--- |
| "Line to select" | Variable (integer data type). Contains the line number that is selected <br> Note: The selection is controlled by the variables in the "Trigger selection" prop- <br> erty. |
| "Set selection" | Variable (BOOL). Controls the selection of a line. <br> Example: bSetSelection: BooL; |
| TRUE: The line from the "Line to select" property is selected and highlighted in <br> the Text Editor. <br> if the line is not in the current text segment of the Text Editor, then the text <br> segment is moved to this line. <br> Note: The variable is used as the control variable for an input event triggered <br> by a visualization user. The control variable is not reset automatically. You are <br> responsible for this to occur in the visualization. |  |

Table 724: Element property "Control variables --> Error handling"

| "Variable for error code" | Variable (integer data type). Contains the error code when an error occurs |
| :--- | :--- |
|  | Example: iError: INT; |
|  | The error codes are declared in GVL_ErrorCodes in the |
|  | VisuElemTextEditor library. To display the error text, the |
|  | VisuFctTextEditorGetErrorText () function of the library must be called. |

| "Variable for content changed" | Variable (BOOL). Shows whether the contents have changed <br> Example: bIsContentEdited: BOOL; <br> TRUE: The contents of the Text Editor have changed. |
| :--- | :--- |
| "Variable for access mode" | Variable (BOOL). Controls the access privileges to the file <br> Example: bIsReadOnly: BOOL; <br>  <br>  <br>  <br> TRUE: A visualization user has read-only permission. At runtime, the file contents <br> are highlighted in gray in the Text Editor. <br> FALSE: A visualization user has read/write permission. <br> Note: The variable overwrites the setting in the "Editor mode" property. |

| "Maximum line length" | Maximum number of characters per line |
| :--- | :--- |
| "Editor mode" | - "Read-only": A visualization user has read-only permissions to the file. At <br> runtime, the file contents are highlighted in gray in the text editor. |

## Element prop- <br> erty 'New files'

| "Encoding" | Character encoding of the new file: <br> - "ASCII" <br> - "Unicode (Little endian)" <br> - "Unicode (Big endian)" |
| :--- | :--- |
| "New line character sequence" | End of line character of the new file: <br> - "CR/LF": Normal for Windows systems <br> - "LF": Normal for UNIX systems <br> Please note: When a visualization user opens an existing file, the end-of-line <br> character of the file is detected and used automatically. |

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", " $X$ ", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground <br> Variable (BOOL) <br> Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

Element prop- Requirement: User management is set up for the visualization. erty 'Access
rights'

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for <br> the element. <br> Status messages: <br>  <br>  <br>  <br> - "Not set. Full rights.": Access rights for all user groups : "operable" <br> - "Rights are set: Limited rights": Access is restricted for at least one group. |
| :--- | :--- |

## Visualization Element 'Path3D'

Symbol:

## Category: "Special Controls"

The "Path3D" visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application 3D Path Generator, which is available in CODESYS Forge, shows how these data can be generated.
If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC_Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.

- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker

A description of the function blocks can be found in the Library Manager in the library SM3_CNC_Visu.

The element does not work with the CODESYS HMI display variant.

## Element proper-

ties

| "Element name" | Example: GenElemInst_1 |
| :--- | :--- |
| "Type of element" | "Path3D" |

[^45]| "X" | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

See also

- ${ }^{*}$ Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

## Path description

| "Path data |  |
| :--- | :--- |
| (VisuStruct3DTrack)" | Variable of the type VisuSt ruct 3DTrack, which is declared in the IEC code. <br> Example: PLC_PRG.pc. vs 3dt. A description of the structure can be found in <br> the library manager in the library VisuElem3DPath. Iibrary. <br> The data structure describes a path or track through a certain number of points. <br> The points are determined and buffered by the application. The track typically <br> displays the last n positions, so that only a certain part of them is ever displayed <br> at any one time. VisuStruct 3DTrack. pProjection is a variable that is <br> set by the visualization element and contains information about the path/track <br> projection. It can be read (only) by the application. In addition, the methods <br> Projection. Apply or .Appl yV can be used in order to see whether the <br> transformed position lies inside or outside the visualization display area, which is <br> defined by Project ion. ElementRect. |
| Color of the path drawn |  |
| "Path color" | Path line width in pixels, e.g.: "2" |
| "Style of boundary points" | Display of the points between two successive objects in the path <br> - End points are not displayed |

Track descrip- The track data are structured in exactly the same way as the path data: VisuStruct3DTrack tion

| "Track data |  |
| :--- | :--- |
| (VisuStruct3DTrack)" | Variable of the type VisuSt ruct3DTrack, which is declared in the IEC code. <br> Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in <br> the library manager in the library VisuElem3DPath. library. |
| "Track color" | Color of the track drawn |
| "Track line width" | Track line width in pixels, e.g.: "2" |

Camera control The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the $X / Y / Z$ axis
- Resetting of the view at $X / Y, Y / Z$ or $Z / X$ level, so that the path and the track are completely visible.

| "Control data |  |
| :--- | :--- |
| (VisuStruct3DControl)" | Variable of the type VisuStruct3DControl, which is declared in the IEC <br> code. Example: PLC_PRG.pc.vs3dc. <br> A description of the structure can be found in the library manager in the library <br> VisuElem3DPath. |
|  | The values can be set via the application itself or via the visualization element <br> "ControlPanel". The library VisuElem3DPath contains ready-to-use visualiza- <br> tion frames that provide a possible user interface for these data. |

## Additional

aspects

| "Coordinate system" | $\boxed{ }:$ : The coordinate system is displayed |
| :--- | :--- |
| "Grid" | $\boxed{\square}:$ Grid lines are displayed |
| "Grid color" | Color of the grid lines |

Highlighting Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

| Highlight mode | Select one of the following highlight modes: <br> $\bullet \quad$ Only the element whose ID corresponds to the value of the variable is high- <br> lighted. <br> All elements whose ID (linked with the object ID in the case of a CNC editor) <br> is smaller than or equal to the value in Variable are highlighted. |
| :--- | :--- |
| Variable | Project variable that specifies the ID of an element. Example: <br> PLC_PRG. iVarElement ID. This "highlight ID" is taken into account for the <br> setting of the highlight mode. The variable must be set in the IEC application. |
| Highlight color |  |

## Element look

| "Frame line width" | Width of the frame around the element, in pixels, for example: "1" |
| :---: | :---: |
| "Frame line style" | Select one of these style types for the frame line: <br> - Solid <br> - Dashes <br> - Dots <br> - Dash Dot <br> - Dash Dot Dot <br> - Hollow |

| "Transparent background" | 鸟: The background of the element is displayed transparently. <br> $\square$ <br> $\square$ : The background of the element is displayed in the defined background color. |
| :--- | :--- |
| "Background color" |  |

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", "X", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground <br> Variable (BOOL) <br> Example:bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

Element prop- Requirement: User management is set up for the visualization.
erty 'Access
rights'

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for <br> the element. <br> Status messages: |
| :--- | :--- |
|  | - "Not set. Full rights.": Access rights for all user groups : "operable"" |
| - "Rights are set: Limited rights": Access is restricted for at least one group. |  |

See also

- \& Chapter 6.4.5.21.3.1 "Dialog 'Access Rights"' on page 3366

## Visualization Element 'Control Panel'

Symbol:

## Category: "Special Controls"

This visualization element is used in connection with the "Path3D" visualization element. It is used for changing the position and orientation to the CNC path shown with "Path3D".

See also

- *y Chapter 6.4.5.21.5.42 "Visualization Element 'Path3D'" on page 3704

## Element proper- <br> ties

| "Element name" | Optional. <br> Hint: Assign individual names for elements so that they are found faster in the element list. <br> Example: Camera_Path_1 |
| :---: | :---: |
| "Type of element" | "Frame" |
| "Clipping" | If you have set the "Scaling type" to "Fixed", then only that part of the visualization is displayed that fits in the frame. |
| "Show frame" | Displays the frame <br> - "No frame": The displayed area of the frame does not have borders. <br> - "Frame": The displayed area of the frame has borders. <br> - "No frame with offset": The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. <br> The resulting gap prevents the referenced visualization from touching any adjacent elements. |
| "Scaling type" | Describes how the frame reacts when the visualization is resized: <br> - "Isotropic": The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately. <br> - "Anisotropic": The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately. <br> - "Fixed": The original size of the frame is retained, regardless of the visualization size. If you have also selected the "Clipping" option, then only the fitting part is displayed. <br> - "Fixed and scrollable": The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the "Scroll position variable horizontal" or "Scroll position variable vertical" property. |
| "Deactivation of the background drawing" | : To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order. <br> Deactivation of the background drawing. This can prevent the behavior described above. |

[^46]| "References" | Clicking "Configure" opens the "Frame Configuration" dialog. This is used to <br> manage the referenced visualizations. <br> Caution: Visualizations can be nested at any depth by means of Frame ele- <br> ments. In order to use the "Switch to any visualization" Frame selection type <br> without any problems, a Frame must not contain more than 21 referenced <br> visualizations. For more information, see also the description for the "Input <br> configuration" of an element: Action "Switch Frame visualization". |
| :--- | :--- |
| List of the currently referenced <br> visualizations | Visualizations that have a button also have this displayed as a subnode. Each <br> interface variable is listed with the currently assigned transfer parameters. <br> Example: <br> vis_FormA |
| - iDataToDisplay_1 : PLC_PRG.iVar1 |  |
| $\bullet \quad$ iDataToDisplay_2 : PLC_PRG.iVar2 |  |
| Hint: You can change the assignment of the variables to an interface variable |  |
| here and edit the value field. Or click the "Configure" button instead. |  |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| " $X$ " | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

You can also change the values by dragging the box symbols (古) to other
positions in the editor.

## See also

- ${ }^{4}$ Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| " $Y$ " | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (ఉ) to other positions in the editor.

Element prop- The properties contain fixed values for setting colors. erty 'Colors'

| "Color" | Color for the element in its normal state. <br> Please note that the normal state is in effect if the expression in the <br> "Color variables $\rightarrow$ Toggle color" property is not defined or it has the value <br> FALSE. |
| :--- | :--- |
| "Alarm color" | Color for the element in alarm state. <br> Please note that the alarm state is in effect if the expression in the <br> "Color variables $\rightarrow$ Toggle color" property has the value TRUE. |
| "Transparency" | Value (0 to 255) for defining the transparency of the selected color. <br> Example 255: The color is opaque. 0: The color is completely transparent. |
| "Use gradient color" | $\boxed{\checkmark}:$ The element is displayed with a color gradient. |
| "Gradient setting" | The "Color gradient editor" dialog box opens. |
| "Frame color" | Example: "Black" |
| "Fill color" | Example: "Light gray" |

See also

- ${ }^{\text {® }}$ Chapter 6.4.5.21.3.5 "Dialog 'Gradient Editor'" on page 3369

Element prop- The properties contain fixed values for setting the look of the element. erty 'Appearance'

| "Line width" | Value in pixels |
| :--- | :--- |
|  | Example: 2 |
|  | Note: The values 0 and 1 both result in a line weight of one pixel. If no line <br> should be displayed, then the "Line style" property must be set to the option <br> "Invisible". |
| "Line style" | Type of line representation <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> - "Solid" "Dashes" "Dots" <br> - "Dash Dot" <br> - "Dash Dot Dot" <br> - "not visible" |

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- « "Element property 'Appearance variables'" on page 3717

Element prop- The properties contains character strings for labeling the element. The character string can also erty 'Texts' contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.
CODESYS accepts the specified texts automatically into the "GlobalTextList" text list. Therefore, these texts can be localized.

| "Text" | Character string (without single straight quotation marks) for the labeling the <br> element. Add a line break by pressing the keyboard shortcut [CtrI] + [Enter]. <br> Example: Accesses: \%i <br> The variable that contains the current value for the placeholder is specified in the <br> property "Text variable $\rightarrow$ Text". |
| :--- | :--- |
| "Tooltip" | Character string (without single straight quotation marks) that is displayed as the <br> tooltip of an element. <br> Example: Number of valid accesses. <br> The variable that contains the current value for the placeholder is specified in the <br> property "Text variable $\rightarrow$ Tooltip". |

Element prop- The properties contain fixed values for the text properties. erty 'Text properties'

| "Horizontal alignment" | Horizontal alignment of the text within the element. |
| :---: | :---: |
| "Vertical alignment" | Vertical alignment of the text within the element. |
| "Text format" | Definition for displaying texts that are too long <br> - "Default": The long text is truncated. <br> - "Line break": The text is split into parts. <br> - "Ellipsis": The visible text ends with "..." indicating that it is not complete. |
| "Font" | Example: "Default" : The "Font" dialog box opens. Drop-down list with style fonts. |

| "Font color" | Example: "Black" <br>  <br>  <br> ... : The "Color" dialog box opens. <br> マ: Drop-down list with style colors. |
| :--- | :--- |
|  | Whole number (value range from 0 to 255 ). This determines the transparency of <br> the respective color. <br> Example: $255:$ The color is opaque. <br> $0:$ The color is completely transparent. <br> Please note: If the color is a style color and already has a transparency value, <br> then this property is write-protected. |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" | $X "$ Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG. iPos_X. <br> Increasing this value in runtime mode moves the element to the right. <br> " $Y$ " Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG. iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. <br> "Rotation" Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle1. <br> The midpoint of the element rotates at the "Center" <br> point. This rotation point is shown as the $\oplus$ <br> symbol. <br> In runtime mode, the alignment of the element <br> remains the same with respect to the coordinate <br> system of the visualization. Increasing the value <br> rotates the element to the right. <br> "Scaling" Variable (integer data type). Causes centric stretching. <br> Example: PLC_PRG. iScaling. <br> The reference point is the "Center" property. <br> The value 1 shrinks the element by a factor of 0.001. <br> to its original size.$\quad$The value 1000 returns the element |
| :--- | :--- |

| "Interior rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle2. <br> In runtime mode, the element rotates about the <br> point of rotation specified in "Center" according to <br> the value of the variable. In addition, the alignment <br> of the element rotates according to the coordinate <br> system of the visualization. Increasing the value in <br> the code rotates clockwise. <br> The rotation point is shown as the $\oplus$ symbol. <br> Note: If a static angle of rotation is specified in the <br> property "Position $\rightarrow$ Angle", then the static angle <br> of rotation is added to the variable angle of rotation <br> (offset) when the visualization is executed. |
| :--- | :--- |

The properties " $X$ ", " $Y$ ", "Rotation", and "Interior rotation" are supported by the

## Element prop- These properties are variables with contents that replace a format definition. erty 'Text variables'

| "Text variable" | Variable (data type compliant with the format definition). It contains what is <br> printed instead of the format definition. <br> Example: PLC_PRG. iAccesses |
| :--- | :--- |
|  | Note: The format definition is part of the text in the property "Texts $\rightarrow$ Text". <br> Note: If you specify a variable of type enumeration with text list support, then <br> the name of the enumeration data type is added automatically in angle brackets <br> after the variable name. Example: PLC_PRG.enVar <enumeration name>. <br> Then the symbolic value of the enumeration component is printed instead of the <br> numeric value when text is printed. Refer to the help page for the enumerations. |
| "Tooltip variable" | Variable (data type compliant with the format definition). It contains what is <br> printed instead of the format definition. <br> Example: PLC_PRG. iAccesses InTooltip <br> Note: The format definition is part of the text in the property "Texts $\rightarrow$ Tooltip". |

See also

- ${ }^{4}$ Chapter 6.4.5.20.2 "Placeholders with Format Definition in the Output Text" on page 3329
- そy "Element property 'Texts'" on page 3711
- $\xi^{4}$ Chapter 6.4.1.20.5.18 "Enumerations" on page 2263

Element prop- Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is erty 'Dynamic texts' currently indexed in the variable.

| "Text list" | Variable (string) or name of the text list as a fixed string in single straight quotation marks. <br> Example: 'Errorlist' <br> : Drop-down list with the dialogs available in the text lists. |
| :---: | :---: |
| "Text index" | Text list ID. This refers to the desired output text. <br> - As fixed string with the ID in single straight quotation marks. Example: '1' <br> - As a variable (STRING) for dynamically controlling the text output. <br> Example: strTextID <br> Sample assignment: PLC_PRG.strTextID := '1'; |
| "Tooltip index" | Text list ID. This refers to the desired output text. <br> - As fixed string with the ID in single straight quotation marks. <br> Example: '2' <br> - As a variable (STRING) for dynamically controlling the text output. <br> Example: strToolTipID <br> Sample assignment: PLC_PRG.strToolTipID := '2'; |
| See also <br> - $\boldsymbol{y y}^{4}$ Chapter 6.4.1.21.2.28 "Object 'Text List"" on page 2532 |  |
| Element property 'Font variables' | allow for dynamic control of the text display. |

| "Font name" | Variable (STRING). Includes the font of the text. <br> Example: PLC_PRG.stFontVar := 'Arial'; <br> The selection of fonts corresponds to the default "Font" dialog. |
| :---: | :---: |
| "Size" | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. <br> - <pt>: Points (default) <br> Example: PLC_PRG.iFontHeight <pt> <br> Code: iFontHeight : INT := 12; <br> - <px>: Pixels <br> Example: PLC_PRG.iFontHeight <px> <br> Code: iFontHeight : INT := 19; <br> If you click in the value field, a drop-down list opens on the right for setting the unit. <br> Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property "Text property $\rightarrow$ Font". |
| "Flags" | Variable (DWORD). Contains the flags for displaying fonts. <br> Flags: <br> - 1: Italics <br> - 2: Bold <br> - 4: Underline <br> - 8: Strikethrough <br> Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType :=6; |
| "Character set" | Variable (DWORD). Contains a character set number for the font. <br> The selection of character set numbers corresponds to the "Script" setting of the standard "Font" dialog. |
| "Color" | Variable (DWORD). Includes the color of the text. <br> Example: PLC_PRG.dwColorFont:= 16\#FF000000; |
| "Flags for text alignment" | Variable (integer data type). Contains the coding for text alignment. <br> Example: PLC_PRG.dwTextAlignment. <br> Coding: <br> - 0 : Top left <br> - 1: Horizontal center <br> - 2: Right <br> - 4: Vertical center <br> - 8: Bottom <br> Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5; |

Fixed values for displaying texts are set in "Text properties".

- «\& "Element property 'Text properties"' on page 3711

Element prop- The Element property is used as an interface for project variables to dynamically control colors erty 'Color varia- at runtime. bles'

| "Toggle color" | The property controls the toggled color at runtime. <br> Value assignment: <br> - FALSE: The element is displayed with the color specified in the "Color" property. <br> - TRUE: The element is displayed with the color specified in the "Alarm color" property. <br> Assignment options: <br> - Placeholder for the user input variable <br> - "<toggle/tap variable>" <br> - "<NOT toggle/tap variable>" <br> The color change is not controlled by its own variable, but by a user input variable. <br> Note: Specify a variable for the mouse events "Tap" or "Toggle" in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both "Toggle" and "Tap", then the variable specified in "Tap" is used. <br> Hint: Click the symbol to insert the placeholder "<toggle/tap variable>". When you activate the "Inputconfiguration", "Tap FALSE" property, then the "<NOT toggle/tap variable>" placeholder is displayed. <br> - Instance path of a project variable (BOOL) <br> Example: PLC_PRG.xColorIsToggeled <br> Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes. |
| :---: | :---: |
| "Normal state" <br> "Alarm state" | The properties listed below control the color depending on the state. The normal state is in effect if the variable in "Color variables", "Toggle colo"" is not defined or it has the value FALSE. The alarm state is in effect if the variable in "Colorvariables", "Toggle color" has the value TRUE. |
| "Frame color" | Assignment options: <br> - Variable (DWORD) for the frame color Example: PLC_PRG.dwBorderColor <br> - Color literal Example of green and opaque: $16 \#$ FFO OFF00 |
| "Filling color" | Assignment options: <br> - Variable (DWORD) for the fill color <br> Example: PLC_PRG.dwFillColor <br> - Color literal <br> Example of gray and opaque: 16\#FF888888 |

The transparency part of the color value is evaluated only if the "Activate semitransparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element prop- The variables control the element behavior dynamically. erty 'State varia-
bles'

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. <br>  <br>  <br>  <br>  <br> TRUE: The element is not visible at runtime. <br> Example: bIsVisible with VAR bIsVisible : BOOL : $=$ FALSE; <br> END_VAR |
| :--- | :--- |
| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element. <br> TRUE: User inputs do not have any effect in runtime more. The element is shown <br> as deactivated. |

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", "X", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground Variable (BOOL) <br> Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

Element prop- The properties contain the configurations for the user input when using the mouse or keyboard. erty 'Input con- A user input defines an event and one or more actions that are executed when an event occurs. figuration'

| The "Configure" button opens the "Input Configuration" dialog. There you can create or edit user inputs. <br> Configured user inputs are listed below the events. They each include the action that is triggered and the setting <br> in short form. <br> Example: "Execute ST Code": |  |
| :--- | :--- |
| "Onc__PRG.i_x $:=0 ;$ |  |
| "OnDialogClosed" | Input event: The user closes the dialog. |
| "OnMouseDown" | Input event: The user clicks the mouse button completely in the element area. <br> The mouse button is clicked and released. |
| "OnMouseEnter" | Input event: The user clicks down on the mouse button. |
| "OnMouseLeave" | Input event: The user drags the mouse pointer to the element. |

$\left.\begin{array}{|l|l|}\hline \text { "OnMouseMove" } & \text { Input event: The user moves the mouse pointer over the element area. } \\ \hline \text { "OnMouseUp" } & \begin{array}{l}\text { Input events: } \\ \text { - } \\ \text { The user releases the mouse button within the element area. It is irrelevant } \\ \text { whether the user has previously pressed the mouse button inside or outside } \\ \text { the element area. }\end{array} \\ \text { - The user presses the mouse button within the element area, leaves the } \\ \text { element area, and then releases the mouse button. } \\ \text { Note: This CODESYS-specific triggering behavior guarantees that actions for } \\ \text { key elements are completed. A key element starts an action for "OnMouseDown" } \\ \text { and ends the action for "OnMouseUp". } \\ \text { Example: A visualization user presses the mouse button within the element area } \\ \text { of the key element and then moves the cursor position so that it lies outside the } \\ \text { element area. The action is ended anyway because "OnMouseUp" is triggered. }\end{array}\right\}$

| "Tap" | When a mouse click event occurs, the variable defined in "Variable" is described <br> in the application. The coding depends on the "Tap FALSE" and "Tap on enter if <br> captured" options. |
| :--- | :--- |
| "Variable" | Variable (BOOL) that is set on mouse click event. <br> Example: PLC_PRG . bI sTapped <br> TRUE: A mouse click event exists. It lasts as long as the user presses the mouse <br> button over the element. It ends when the button is released. |
|  | FALSE: A mouse click event does not exist. <br> Requirement: The "Tap FALSE" option is not activated. |
| "Tap FALSE" | V: The mouse click event leads to a complementary value in "Variable". <br> TRUE: A mouse click event does not exist. |
| "Tap on enter if captured" | FALSE: While the mouse click event exists. |
| pointer is dragged within the element area or not while the mouse button is <br> pressed. <br> TRUE: While the mouse click event exists and the mouse pointer is moved over <br> the element area. <br> FALSE: A mouse click event does not exist. Or the user moves the mouse <br> pointer outside of the element area while the mouse button is pressed. <br> The value is TRUE again as soon as the user moves the pointer back to the <br> element area. The mouse is then captured. |  |

| "Toggle" | With the onset of a mouse click event, the variable is set; when the mouse click <br> event is completed, the variable is reset. |
| :--- | :--- |
| "Variable" | Variable (BOOL). Its value toggled when the mouse click event is ended. This is <br> when the user releases the mouse button while the mouse pointer is over the <br> element area. <br> If the user releases the mouse button while the mouse pointer is outside of the <br> element area, then the mouse click event is not ended and the value is not <br> toggled. <br> Hint: The user can cancel a started toggle input by dragging the mouse pointer <br> out of the element area. |
| "Toggle on up if captured" | V: The value toggles regardless of where the mouse pointer is when the mouse <br> button is released. The mouse is then captured. |

| "Hotkey" | Keyboard shortcut on the element for triggering specific input actions. <br> When the keyboard shortcut event occurs, the input actions in the "Events" property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action. |
| :---: | :---: |
| "Key" | Key pressed for input action. <br> Example: [T] <br> Note: The following properties appear when a key is selected. |
| "Events" | - "None" <br> - "Mouse down": Pressing the key triggers the input actions that are configured in the "OnMouseDown" property. <br> - "Mouse up": Releasing the key triggers the input actions that are configured in the "OnMouseUp" property. <br> - "Mouse down/up": Pressing and releasing the key triggers the input actions that are configured in the "OnMouseDown" property and the "OnMouseUp" property. |
| "Shift" | $\checkmark$ : Combination with the Shift key Example: [Shift]+[T]. |
| "Control" | $\boxed{\square}$ : Combination with the Ctrl key Example: [Ctrl]+[T]. |
| "Alt" | - Combination with the Alt key Example: $[A t t]+[T]$. |

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

## Visualization Element 'Date Range Picker'

Symbol:

## Category: "Date/Time Controls"

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the "Trend" visualization element.

## Element proper- <br> ties

| "Element name"" | Example: DateTrend1 <br> Optional <br> Hint: Assign individual names for elements so that they are found faster in the <br> element list. |
| :--- | :--- |
| "Type of element" | Date Range Picker" |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| " $X "$ | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

You can also change the values by dragging the box symbols (ए़-) to other positions in the editor.

See also

- 乡 Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| " $Y$ " | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols ( $\boldsymbol{\oplus}$ ) to other positions in the editor.

| "Show frame" | $\boxed{\square}$ : The visualization element is drawn with a frame. |
| :--- | :--- |
| "Resolution" | Resolution saved for the time stamp: "Millisecond" or "Microsecond" |
| "Attached element instance" | The element can be assigned to a "Trend" visualization element. As a result, the <br> time range of the trend element can be changed. The available visual elements <br> are selected with the help of the Input Assistant ( $\ldots$ ). |

## Element property 'Tick mark labels'

| "Two-line labelling" | The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line. $\square$ : Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting. |
| :---: | :---: |
| " Omit irrelevant information in time stamp" | The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in "Internationalization (format strings)" are ignored for this setting. $\square$ : All information is displayed for all time stamps. |
| "Internationalization (format strings)" | Only active when the parameter "Omit irrelevant information in timestamps" is deactivated. |
| "Date" | Definition of the date format. The default setting is taken from the Windows control panel. |
| "Time" | Definition of the time format. The default setting is taken from the Windows control panel. |

Element prop- The properties contain fixed values for the text properties.
erty 'Text prop-
erties'

| "Horizontal alignment" | Horizontal alignment of the text within the element. |
| :---: | :---: |
| "Vertical alignment" | Vertical alignment of the text within the element. |
| "Font" | Example: "Default" The "Font" dialog box opens. <br> - Drop-down list with style fonts. |
| "Font color" | Example: "Black" The "Color" dialog box opens. <br> *: Drop-down list with style colors. |
| "Transparency" | Whole number (value range from 0 to 255). This determines the transparency of the respective color. <br> Example: 255: The color is opaque. <br> 0 : The color is completely transparent. <br> Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |

## Element property 'Additional buttons'

| "Jump to the largest possible time stamp" | $\checkmark$ : An additional button ( $\quad$ ) is displayed for jumping to the last time stamp. |
| :---: | :---: |
| "Jump to the smallest possible time stamp" | $\checkmark$ : An additional button (14) is displayed for jumping to the first time stamp. |
| "Zoom out" | An additional button (o) is displayed for setting the current min./max. range to the maximum range. The selected range is left. |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" | Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG. iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |
| :--- | :--- |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG. iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |
| "Rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle1. <br> The midpoint of the element rotates at the "Center" <br> point. This rotation point is shown as the $\oplus$ <br> symbol. <br> In runtime mode, the alignment of the element <br> remains the same with respect to the coordinate <br> system of the visualization. Increasing the value <br> rotates the element to the right. |
| "Interior rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle2. <br> In runtime mode, the element rotates about the <br> point of rotation specified in "Center" according to <br> the value of the variable. In addition, the alignment <br> of the element rotates according to the coordinate <br> system of the visualization. Increasing the value in <br> the code rotates clockwise. <br> The rotation point is shown as the $\oplus$ symbol. <br> Note: If a static angle of rotation is specified in the <br> "Position $\rightarrow$ Angle" property, then the static angle <br> of rotation is added to the variable angle of rotation <br> (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The " $X$ ", " $Y$ ", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

Element prop- The variables control the element behavior dynamically. erty 'State variables'

| "Invisible" | Variable (BOOL). Toggles the visibility of the element. |
| :--- | :--- |

TRUE: The element is not visible at runtime.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", "X", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground <br> Variable (BOOL) <br> Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

[^47]| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for <br> the element. <br> Status messages: |
| :--- | :--- |
|  | - "Not set. Full rights.": Access rights for all user groups : "operable" |
|  | - "Rights are set: Limited rights": Access is restricted for at least one group. |

- $y^{y}$ Chapter 6.4.5.21.3.1 "Dialog 'Access Rights'" on page 3366

## Visualization Element 'Time Range Picker'

Symbol:

## Category: "Date/Time Controls"

The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.

Element proper-
ties

| "Element name" | Optional <br> Hint: Assign individual names for elements so that they are found faster in the <br> element list. <br> Example: TimeRangeTemperature |
| :--- | :--- |
| "Type of element" | "Time range picker" |

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| :--- | :--- |
| "Y" | Y coordinate of the upper left corner of the element <br> Specified in pixels. <br> Example: 10. |
| "Width" | Specified in pixels. <br> Example: 150 |
| "Height" | Specified in pixels. <br> Example: 30 |

You can also change the values by dragging the box symbols ( ( $^{-}$) to other positions in the editor.

See also

- © Chapter 6.4.5.5.3 "Positioning the Element, Adapting Size and Layer" on page 2874

| "Orientation" | Specifies whether the time picker element is aligned horizontally or vertically in <br> the editor. <br> Hint: Change the width to height ratio of the element in the editor. |
| :--- | :--- |
| "Show frame" | $\boxed{\square}$ : The visualization element is drawn with a frame. |
| "Resolution" | Resolution saved for the time stamp: "Millisecond" or "Microsecond" |
| "Attached element instance" | Assignment to the element that processes the time picker <br> The element can be assigned for example to a "Trend" visualization element. <br> Then the time range of the trend element can be changed. The available visual <br> elements are selected with the help of the input assistance (...). <br> Example: GenElemInst_1 |

## Element prop-

erty 'Texts'

| "Text" | String label for the element. <br> Example: Zoom |
| :--- | :--- |

Element prop- The properties contain fixed values for the text properties.
erty 'Text properties'

| "Font" | Example: "Default" <br> ...: The "Font" dialog box opens. <br> v: Drop-down list with style fonts. |
| :--- | :--- |
| "Font color" | Example: "Black" <br> ...: The "Color" dialog box opens. <br> v: Drop-down list with style colors. |
| "Transparency" | Whole number (value range from 0 to 255). This determines the transparency of <br> the respective color. <br> Example: $255:$ The color is opaque. <br> $0:$ The color is completely transparent. <br> Please note: If the color is a style color and already has a transparency value, <br> then this property is write-protected. |

Property 'Times' In "Times", the buttons that the element provides at runtime are defined and configured in an array.

| "Provide "All" selection" | :Time Range Picker bar extended by "All" button. The diagram represents a time interval that covers all time stamps. |
| :---: | :---: |
| "Times" | Adds another button to the Time Range Picker bar and increases the array by one entry. An additional index is present in the property "Times $\rightarrow$ Times $\rightarrow$ Times $\rightarrow$ [<new $>$ ]". "Time" is located under this index. The configuration of the button is to be entered there. |
| "Times" <br> - " [Index]" <br> with index $\in\{0,1,2, \ldots\}$ | Array of all buttons in the time selection bar. Index corresponds to the number of buttons. <br> $x$ : The associated button is removed from the Time Range Picker bar. The configuration entry is deleted from the "Times" property list. |
| " [Index]" <br> - "Time" | (ㄴ): Time interval in standardized notation. Example: 3M for 3 months; 30 m for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty. |

Element property 'Control variables'

| "Time" | Displays which time is currently selected. <br> Variable (STRING) <br> Example: PLC_PRG.strSelcetedTime |
| :--- | :--- |
| ""All" selected" | Displays the state of the "All" button <br> Variable (BOOL) <br> Example: PLC_PRG.AllTimesAreSelected |

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" |  |
| :--- | :--- |
| " $X "$ | Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG.iPos_X. <br> Increasing this value in runtime mode moves the element to the right. |
| $Y "$ | Variable (numeric data type). Defines the Y position (in pixels). <br> Example: PLC_PRG.iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |

| "Rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PRG. iAngle1. <br> The midpoint of the element rotates at the "Center" <br> point. This rotation point is shown as the $\oplus$ <br> symbol. <br> In runtime mode, the alignment of the element <br> remains the same with respect to the coordinate <br> system of the visualization. Increasing the value <br> rotates the element to the right. |
| :--- | :--- |
| "Interior rotation" | Variable (numeric data type). Defines the angle of <br> rotation (in degrees). <br> Example: PLC_PPRG. iAngle2. <br> In runtime mode, the element rotates about the <br> point of rotation specified in "Center" according to <br> the value of the variable. In addition, the alignment <br> of the element rotates according to the coordinate <br> system of the visualization. Increasing the value in <br> the code rotates clockwise. <br> The rotation point is shown as the $\boldsymbol{\oplus}$ symbol. |
| Note: If a static angle of rotation is specified in the <br> "Position $\rightarrow$ Angle" property, then the static angle <br> of rotation is added to the variable angle of rotation <br> (offset) when the visualization is executed. |  |

You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

## Visualization Element 'Date Picker'

Symbol:

## Category: "Date/Time Controls"

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Language- The element contains language-dependent texts that are managed in the System text list. dependent texts This deals with the names of the month and the days of the week written out completely or of the element abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

```
Example System text list
```

| ID | Default |
| :--- | :--- |
| Apr | Apr |
| April | April |

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the $\boldsymbol{\oplus}$ symbol. The point is used as the center for rotating and scaling.

| " $X$ " | X-coordinate of the point of rotation |
| :--- | :--- |
| $Y "$ | $Y$-coordinate of the point of rotation |

You can also change the values by dragging the symbols ( $\boldsymbol{\oplus})$ to other positions in the editor.

| "Variable" | Variable (DATE, DT, TIME, LTIME, TOD) <br> The value of the value of the variable is displayed and modified by means of the element. <br> The data type automatically determines the displayed value units: <br> - TIME: Day, hour, minute, and second (by default, milliseconds are not displayed) <br> - DATE: Year, month, and day <br> - DT: Year, month, day, hour, minute, and second <br> - TOD: Hour, minute, and second (by default, milliseconds are not displayed) <br> - LTIME: Day, hour, minute, and second (by default, milliseconds, microseconds, and nanoseconds are not displayed) |
| :---: | :---: |
| "Format string" | The format can restrict the output to individual values. <br> Example for LTIME: Format: HH:mm:ss.ms.us.ns --> displayed: 08:15:12.780.150.360 LTIME restricted: format: $\mathrm{HH}: \mathrm{mm}$--> displayed: 08:15 <br> Example for DATE: Format: yyyy/MM/dd --> displayed: 2015/12/17 . <br> Basically, all usual formats available for \%t are also supported. |
| "Design date time picker" | - "From style": All settings are preconfigured according to the style. <br> - "Explicit": The "Design settings" property is available. You can customize the calendar here. |
| "Design date picker" | - "From style": All settings are preconfigured according to the style. <br> - "Explicit": The "Design settings" property is available. You can customize the calendar here. |
| "Positioning date picker" | - "Dynamic": The calendar is adapted and positioned automatically. <br> - "Manual": The "Position settings" property is available. You can customize the calendar here. |

## Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| "Movement" | $X "$ Variable (numeric data type). Defines the X position (in pixels). <br> Example: PLC_PRG.iPos_X. <br> Increasing this value in runtime mode moves the element to the right. <br> " $Y$ " Variable (numeric data type). Defines the $Y$ position (in pixels). <br> Example: PLC_PRG.iPos_Y. <br> Increasing this value in runtime mode moves the element downwards. |
| :--- | :--- |

| "Rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle1. <br> The midpoint of the element rotates at the "Center" point. This rotation point is shown as the $\boldsymbol{\oplus}$ symbol. <br> In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |  |
| :---: | :---: | :---: |
| "Scaling" | Variable (integer data type). Causes centric stretchi <br> Example: PLC_PRG.iScaling. <br> The reference point is the "Center" property. <br> The value 1 shrinks the element by a factor of 0.00 to its original size. | The value 1000 returns the element |
| "Interior rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees). <br> Example: PLC_PRG.iAngle2. <br> In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. <br> The rotation point is shown as the $\boldsymbol{\oplus}$ symbol. <br> Note: If a static angle of rotation is specified in the property "Position $\rightarrow$ Angle", then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |  |

The properties " $X$ ", " $Y$ ", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

[^49]| "Invisible" | Variable (BOOL). Toggles the visibility of the element. |
| :--- | :--- |
|  | TRUE: The element is not visible at runtime. <br> Example: bIsVisible with VAR bIsVisible : BOOL : $=$ FALSE; <br> END_VAR |
| "Deactivate inputs" | Variable (BOOL). Toggles the operability of the element. <br>  <br>  <br> TRUE: User inputs do not have any effect in runtime more. The element is shown <br> as deactivated. |

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the "Support client animations and overlay of native elements" option in the Visualization Manager.

| "Animation duration" | Defines the duration (in milliseconds) in which the element runs an animation <br> - Variable (integer value) <br> Example: Menu.tContent with VAR tContent : INT := 500; END_VAR <br> - Integer literal <br> Example: 500 <br> Animatable properties <br> - "Absolute movement", "Movement", " $X$ ", " $Y$ " <br> - "Absolute movement", "Rotation" <br> - "Absolute movement", "Interior rotation" <br> - "Absolute movement", "Exterior rotation" <br> The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth. |
| :---: | :---: |
| "Move to foreground" | Moves the visualization element to the foreground <br> Variable (BOOL) <br> Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR <br> TRUE: At runtime, the visualization element is displayed in the foreground. <br> FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor. |

Element prop- Requirement: User management is set up for the visualization. erty 'Access rights'

| "Access rights" | Opens the "Access rights" dialog. There you can edit the access privileges for <br> the element. <br>  <br> Status messages: <br>  <br>  <br> - "Not set. Full rights.": Access rights for all user groups : "operable" <br> $\bullet \quad$ "Rights are set: Limited rights": Access is restricted for at least one group. |
| :--- | :--- |

### 6.4.5.22.1 Dialog 'Create a New Visualization Style'

Symbol:
Function: The dialog prompts you to specify data for a new created style file.
Call:

- In CODESYS:

In the "Visualization Manager" object (tab "Settings", group "Style Settings"):
Clicking 3 opens a drop-down list. Click "Create and Edit Derived Style".

- In the visualization style editor:

Menu bar: "File $\rightarrow$ New Style"

| "Name" | Name of the new style. <br> Example: Style_CI |
| :--- | :--- |
| "Storage location" | Working directory for style editing |
| "Base style" | Style to base the new style on The drop-down list includes all styles that are <br> installed in the repository. <br> "<none>": The new style does not derive itself from an existing style. |
| "Visualization profile" | The profile is intended for informational purposes. For example, you find ele- <br> ments that are not preconfigured with special style entries, and information from <br> the profile. In addition, CODESYS checks in the profile whether a required style <br> is missing. <br> Example: CODESYS V3.5 SP9 |
| Click "OK" | The new style is created and opened for editing in the visualization style editor. <br> It already includes all required style entries and the localization in German (lan- <br> guage column de). |

- $\Leftrightarrow$ Chapter 6.4.5.19 "Applying Visualization Styles" on page 2979

### 6.4.5.22.2 Dialog 'Open Existing Style as a Copy'

Function: This dialog prompts you to specify data for copying a style file.
Call:

- In CODESYS:

In the editor of the "Visualization Manager" object (tab "Settings", group "Style Settings", click 3 for a drop-down list). Click "Copy and Edit Style".

- In the visualization style editor:

Menu bar: "File $\rightarrow$ Open as Copy"

| ＂Style＂ | Style to be copied． <br> Example：Basic Style，3．5．9．0 <br> Note：You can also select a style from the repository． |
| :--- | :--- |
| ＂Destination＂ | Working directory for style editing |
| ＂OK＂ | A copy of the style is created and opened for editing in the visualization style <br> editor． |

Menu＇Styles＇The commands affect the contents of the＂Style Properties＂tab．

| " "New Entry (as Child)" | Creates another style entry as a child of the selected style property. |
| :---: | :---: |
| \& $\downarrow$ "New Entry (Afterwards)" | Creates a new style entry in the list after the selected style property. |
| Ғ "Move Down" | Moves the selected style entry down. Requirement: Sort order is flat. |
| $\pm$ "Move Up" | Moves the selected style entry up. <br> Requirement: Sort order is flat. |
| Pb, "Sort Order" | Toggles between three sort orders: <br> - Flat structure and alphabetical order <br> - Flat structure and order according to the position of the entry in the XML style file <br> This position also determines the position of the property in CODESYS. The property appears, for example, in the "Properties" view below the "Values" column in the drop-down list for style properties. <br> - Hierarchical structure of entries <br> Requirement: The names of the style properties contain at least one dash. |
| $\checkmark$ "Check" | The settings of the style properties are checked for consistency errors. This check is also performed when saving the style. |

Menu 'Localiza- The commands affect the contents of the "Localization" tab.
tion'

| V4 "Add Language" | The dialog box "Add New Language" opens. The dialog prompts you to specify <br> data for creating a new language column. |
| :--- | :--- |
| Rang "Remove Selected | Removes the columns of the selected cell. |
| "Rename Selected Language"" | The "Rename Language" dialog box opens. The dialog is used for renaming the <br> column that defines the selected cell and removes all previous translations. |

Table 733: Dialog box "Add New Language"

| "Name" | Name of the new language as a language code according to ISO 639-1. <br> Examples: de, en, es, it, fr, ja |
| :--- | :--- |
| "Copy from existing" | All existing language columns are available for selection. The selected language <br> is copied with all entered translations. <br> "<do not copy text>": The new language receives a blank translation column. |

Tab 'General' This tab contains the general metadata of the open style file and allows it to be edited.

Table 734: "Identification"

| "Company" | Example: $\mathrm{xy}-\mathrm{z}$ GmbH <br> Tip: In the installed styles, CODESYS can filter by the company names specified <br> here. |
| :--- | :--- |
| "Name" | Example: Style_A |
| "Version" | User-defined version number <br> Example: 1.1 .1 .1 |

Table 735: "General Settings"

| "Base style" | Name and version of the style that the open style is based on. <br> Tip: The derived style properties from the base style are highlighted in yellow in <br> the "Style Properties" tab. |
| :--- | :--- |
| "Partial style (usable only as <br> base for other visualization <br> styles)" | 局: The style is identified as incomplete. Therefore, it can be used for other <br> styles as a base style only. <br> Example: Style only with color definitions that derive this to many other styles. <br> Note: CODESYS does not check for consistency errors of an incomplete style for <br> itself. <br> $\square:$ The style is identified as complete. |
| "From" | The "Select Base Style" dialog box opens. This dialog prompts you to select a <br> style file that is saved to the file system (and not does not have to be installed). <br> The file is used as a base style. |

Table 736: "Informational"

| "Visualization profile" | The profile is intended for informational purposes. For example, you find ele- <br> ments that are not preconfigured with special style entries, and information from <br> the profile. In addition, CODESYS checks in the profile whether a required style <br> is missing. |
| :--- | :--- |

Tab 'Style Prop- This tab lists the names of the style properties with the associated values and makes it possible erties' to edit it, even by means of the commands in the "Styles" menu.

The style properties can be defined for colors, fonts, images, and any values.
The style properties defined in a base style are derived and highlighted in yellow.

| "Name" | Name of the style property. <br> If the name contains a dash, then the Visualization Style Editor can sort the style <br> properties by the prefixed terms before the dash and display them in a hierarchy. <br> A name can contain more than one dash. |
| :--- | :--- |
| "Value" | Value that is assigned to the style property. |
| "Type" | Data type of the style property; selected from a drop-down list. <br> Note: This is possible and necessary only for specific style properties with a data <br> type that is not implicitly defined. |
| "Attribute" | "hide": The associated style property is not listed in the drop-down lists in <br> CODESYS. |
| "Used by" | Visualization element that can be configured with this style property. Can be <br> edited. |
| Comment | Example: Special setting for Bar Display. Optional. |
| Double-click a cell. | An input field opens for editing. |
| [Del] | Removes the selected row. |

Tab 'Localiza- This tab makes it possible to translate the names of the style properties into other languages. tion'

| "Name" | Lists the name of the style properties as they are defined in the "Style <br> Properties" tab. |
| :--- | :--- |
| "<language>" | Identification of the language name (as language code according to ISO 639-1) <br> in which the style property name should be translated. |
| Double-click a cell. | An input field opens for editing. |

### 6.4.6 CODESYS Visualization Support

With CODESYS Visualization Support, you get the functionality to collect and manage images in image pools and texts in text lists. For image pools, the focus is on the most optimal storage of image files. For text lists, the focus is on the localization of the texts.

### 6.4.6.1 Using an Image Pool

An image pool is a table of image files where an entry for each image is listed with the image ID, file name, thumbnail, and link type. At this central location, you add an image to your project or application and can further edit the image entry. At the location in the code where an image is accessed, the image ID can then be briefly specified instead of the file name of the image. The centrally stored images are accessed primarily in visualizations.

We recommend that you reduce the size of image files as much as possible before integrating them. This will optimize the loading time of the visualization in every visualization type: TargetVisu, WebVisu, and development system.

You can create any number of image pools in the project in order to sort and categorize the images thematically.
You can create image pools in the POU pool so that they are available globally in all applications. If necessary, it is located there next to the GlobalImagePool image pool, which is created automatically.
In a library project, you can use the object properties of an image pool to convert it into a symbol library for the visualization.

### 6.4.6.1.1 Creating an image pool

1. In the device tree, select the "Application" object.

Click "Project $\rightarrow$ Add Object $\rightarrow$ Image Pool".
$\Rightarrow$ The "Add Image Pool" dialog opens.
2. Type a name for the image pool (for example, "Images1") and click "Add".
$\Rightarrow$ The ${ }^{\leftrightarrows}$ image poolis added to the device tree.
3. Select the "ImagePool" object and click "Project $\rightarrow$ Edit Object" to open it.
4. Double-click the field in the "ID" column and assign an appropriate ID (for example, "Icon1").

Alternatively, you could also click ${ }^{\wedge} \Rightarrow$ Add Image File to add new images to the list.
5. Double-click the field in the "File Name" column. Click the ... button.
$\Rightarrow$ The "Select Image" dialog opens.
6. Click the ... button and then select the image file.
$\Rightarrow$ A thumbnail of the image file is displayed in the field of the column "Image". The name of the file is displayed in the "File name" field.

The image file can be references only by the name Images1. Icon1.

### 6.4.6.1.2 Implementing access to an image

At locations in the application where an image should to be accessed, the image ID can be briefly specified. This is especially the case with visualizations. There you can configure elements which can display images with the image ID (qualified with <name of image pool>.<image ID>).
Elements with static image display:

- *Image visualization element: "Static ID" property
- *sutton visualization element: "Static ID" property
- \& Chapter 6.4.5.21.5.30 "Visualization Element 'Image Switcher"' on page 3646 visualization element: "Image on", "Image off", and "Image clicked" properties
- Cartesian XY Chart visualization element: Configuration of the background in the Dialog: XY Chart Configuration dialog
If an element should dynamically display multiple images one after the other, then a string variable is specified for it, not the image ID itself. The variable is set programmatically (in IEC code) to change the image IDs. In this way, a dynamic image display in the visualization element is achieved.

Elements with dynamic image display:

- "Image" visualization element: "Image ID variable" property
- "Button" visualization element: "Image ID variable" property

### 6.4.6.1.3 Tab: Build

The tab contains options for compiling the object.

### 6.4.6.1.4 Running the HMI application

1. Click the | 4 |
| :--- |
| symbol. | $\Rightarrow$ The application is compiled.
2. Click the $\sigma_{\text {symbol }}$.
$\Rightarrow$ The application is downloaded to HMI device.
3. Click the start symbol.
$\Rightarrow$ The HMI application is executed. The visualization starts. The actual value from the controller is output.

Output: -24714
You can operate the visualization using the keyboard, mouse, or gestures.

### 6.4.6.1.5 For experts

When accepting the remote adapter by means of the "Copy to Project" command, the I/O dimensions with which the adapter responded are set for the first "exclusive owner" connection. In order to log all of the detected assembly instances after scanning, the definition IODRVETHERNETIP_PRINT_SCAN_RESULT must be set. By default, it is scanned by the instance ID 100-199. This can be adapted by means of the library parameters ParamScanStartOfInstanceAssem and ParamScanLastOfInstanceAssem from the library IoDrvEtherNetIP Library. This might be necessary, for example to scan in another manufacturer-specific range (assembly instance ID ranges).

### 6.4.6.1.6 Configuring a visualization background with an image

You can set an image in the background definition of a visualization. You can define the image by the name of the image pool plus the file name, as described above for a visualization element.

For more information, see: Command: ${ }^{*} \Rightarrow$ Background

### 6.4.6.1.7 Labeling an Image Element with Static Text

Requirement: A project with a visualization is open. You have an image file for a stop symbol.

1. Below the application, insert an "ImagePool" object named ImagePool_A.
2. Add an image with the Stop ID to ImagePool_A.

## STOP

3. Open the visualization and drag an "Image" element to the editor. $\Rightarrow$ The Input Assistant opens. ImagePool_A is listed on the Category tab.
4. Select the Stop image and click "OK" to close the dialog.
5. Configure its "Text" property: ImagePool_A, Stop
6. Configure the "Text properties $\rightarrow$ Horizontal alignment" property: Links.
7. Configure the "Text properties $\rightarrow$ Vertical alignment" property: Bottom.

## STOP

ImagePool_A, Stop

### 6.4.6.2 Using a Text List

A text list is a table of text entries which lists an entry with a text ID, the default text, and its translations into other languages for each text used in the project. At this central location, you can add a new text or further edit an existing text entry.
The centrally stored texts are accessed primarily by visualizations. The text list is the basis for localization, selecting a language, and changes languages in visualizations.

|  | ServiceMenue $\mathbf{x}$ |  |  |
| :--- | :--- | :--- | :--- |
| ID | Default | de | en |
| 0 | Service - Usermanagement | Service - Benutzerverwaltung | Service - Usermanagement |
| 1 | Servie - Service parameter | Service - Service Einstellung... | Servie - Service parameter |
| 2 | Service - System settings | Service - Systemeinstellungen | Service - System settings |

You can specify the texts in Unicode format so that all languages and characters are possible.
You can translate the default texts and add more languages when needed.
Moreover, you can export text lists and then translate the texts outside of the current project.
For more information, see:

- Esporting a text list
- ${ }^{4}$ Importing files with text list entries

### 6.4.6.2.1 Output of dynamic text by a variable

Besides the automatically created global text list, there are also custom text lists.
If an element should dynamically display multiple texts one after the other, then a string variable is specified for it, not the text ID itself. The variable is then set programmatically (in IEC code) to change the text IDs. In this way, a dynamic text display in the visualization element is achieved.
In custom text lists, you can translate the default texts and add more languages when needed. If language switching is implemented for visualizations, then the translation is displayed at runtime for the configured text.
Elements which can dynamically display the text referenced under the "Dynamic texts" property:

- Ey Image visualization element
- ${ }^{\text {- }}$ Frame visualization element
- $y^{4}$ Pie visualization element
- $\Leftrightarrow$ Polygon, Polyline, and Bézier Curve visualization elements
- Rectangle visualization element
- $\Leftrightarrow$ Button visualization element
- $\Leftrightarrow$ Scroll Bar visualization element
- $\Leftrightarrow$ Table visualization element
- $\Leftrightarrow$ Text Field visualization element

## Example

1. All texts about a topic (such as error handling) are listed in a text list. $\Rightarrow$

| ErrorHandling $\mathbf{x}$ |  |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
| ID | Default |  |  |  |
| ID_1 | OK |  |  |  |
| ID_2 | Execute service 2 |  |  |  |
| ID_3 | Execute service 3 |  |  |  |
| ID_4 | Switch off the device |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

2. The "Text Field" visualization element is configured for dynamic display:
3. A case distinction is implemented in the application code where the text for error handling is displayed depending on the error.
$\Rightarrow$ For this purpose, a text ID from the ErrorHandling text list is assigned to the strHandlingID variable depending on the iError error.
// Text list name
strErrorHandling := 'ErrorHandling';
//Assigning text ID
CASE iError OF
2: strHandlingID := 'ID_2'; 3: strHandlingID := 'ID_3'; 4: strHandlingID := 'ID_3';
ELSE strHandlingID := 'ID_1';
END_CASE;

### 6.4.6.2.2 Managing Languages and Translations

## Adding a language and translating text

Requirement: A project is open with a text list or global text.

1. In the device tree or POU view, double-click an object of type "TextList" or "GlobalTextList".
$\Rightarrow$ The "Text List" menu is shown in the menu bar and the text list opens in the editor.
2. Click "Text List $\rightarrow$ Add Language".
3. Specify a name for the language (example: en-US). Click "OK" to exit the dialog.
$\Rightarrow$ A column is displayed with the heading en-US.
4. Type in the translation of the source text into the column.

You can use the "Rename Language" command in the context menu of the text list to correct the name of a language in the table.

## Exporting a text list

$\checkmark \quad$ Requirement: A project is open with a text list or global text.

1. Double-click the "GlobalTextList" object or a "TextList" object type.
$\Rightarrow$ The object opens.
2. Click "Text List $\rightarrow$ Import/Export Text Lists".
$\Rightarrow$ The "Import/Export" dialog opens.
3. At "Choose export file", click ... and select the directory and file name.

Example: Text_lists_exported
4. Select the "Export" option.
5. Click "OK" to close the "Import/Export" dialog.
$\Rightarrow$ CODESYS exports to a file the text list entries of all text lists of the project. The table contains a column with the text list names.

| Example | Contents of the Text_lists_exportedfile |  |  |
| :--- | :--- | :--- | :--- |
|  | TextList | Id | Default en_US |

## Preparing the Exported File for the Input Assistant

$\square$ Requirement: A file is created (example: Text_lists exported) by means of the "Import/Export Text Lists" command. It contains the texts of the text lists of the project.

1. Click "Tools $\rightarrow$ Options", "Visualization" category, "File Options" tab.
2. In "Text file for textual "List components"", click ... and select a file (example: Text_lists_exported). Click "OK" to exit the dialog.
$\Rightarrow$ When you specify a static text in the "Texts" property for an element in a visualization, CODESYS offers the source text of the file as input assistance when typing in the first letter.

## Importing files with text list entries

A file to be imported has the .csv format. The first line is a header (example: TextList Id Default en US). The other lines contain text list entries. You get this kind of file by exporting the text lists of the project to a file. There you can edit the text list entries and then import the file outside of CODESYS. When importing, CODESYS handles the text list entries differently for the GlobalTextList and for dynamic text lists.

GlobalTextList

- CODESYS does not create new text list entries for an unknown ID.
- CODESYS ignores changes that affect the ID or the source text.
- CODESYS accepts changes in the translations.

Text List

- For a new ID, CODESYS supplements the corresponding text list with a text list entry.
- For an existing ID which does not match in the source text, the source text of the text list is overwritten with the source text of the file.
- CODESYS accepts changes in the translations.

Importing a file $\quad \checkmark$ Requirement: A project is open with a text list or global text.

1. Double-click the "GlobalTextList" object or a "TextList" object type.
$\Rightarrow$ The object opens.
2. Click "Text List $\rightarrow$ Import/Export Text Lists".
$\Rightarrow$ The "Import/Export" dialog opens.
3. In the "Choose file to compare or to import" input field, click... and select the directory and file.

Example: Text_lists_corrected.csv
4. Select the "Import" option.
5. Click "OK" to exit the dialog.
$\Rightarrow$ CODESYS imports the text list entries of the file into the respective text lists.

| Example | Contents of the file Text_lists_corrected.csv |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | TextList | Id | Default en US |  |
|  | Text_list_A | A | Information A | Information A2_en |
|  | Text_list_A | B | Information B: | OK Information B_en: OK |
|  | Text_list_A | C | Information C | Information C_en |
|  | Text_list_A | D | Information D | Information D_en |
|  | Text_list_A | E | Information E | Information E_en |
|  | Text_list_A | F | Information F | Information $\mathrm{F}_{-}^{-}$en |
|  | Text_list_A | G | Information G | Information G_en |
|  | Alarmgroup | 2 | Warnung 2 |  |
|  | AlarmGroup | 1 | Warnung 1 |  |
|  | GlobalTextList |  | Information B | Information B_en |
|  | GlobalTextList |  | Information A | Information A_en |
|  | GlobalTextList |  | Umschalten | Switch |
|  | GlobalTextList |  | Zähler: \%i | Counter : \%i |

These contents are applied to the text lists with the same name in the project.
For more information, see: ${ }^{\$ y}$ Import/Export Text Lists

## Comparing text lists with a file and exporting differences

$\checkmark$ Requirement: A project is open with a text list or global text.

1. Double-click the "GlobalTextList" object or a "TextList" object type.
$\Rightarrow$ The object opens.
2. In the context menu, click "Text List $\rightarrow$ Import/Export Text Lists". $\Rightarrow$ The "Import/Export" dialog opens.
3. In the "Choose file to compare or to import" input field, click ... and select the directory and file name of the comparison file (example: Text_lists_corrected.csv).
4. For "Choose export file", click ... and select the directory and file which contains the comparison result.
5. Select the "Export only text differences" option.
6. Click "OK" to exit the dialog.
$\Rightarrow$ CODESYS reads the import file and compares the text list entries that have the same ID. If they do not match, then CODESYS writes the text list entries of the text list to the export file.

For the global text list, CODESYS compares the translations of the same source texts. If they do not match, then CODESYS writes the text list entries to the export file.

### 6.4.6.2.3 Using static text in GlobalTextList

The global text list is the central location for texts that are displayed in the visualization.
When you configure a text for the first time in visualization element, CODESYS creates the global text list. CODESYS fills in the table as you create more texts. Therefore, the table includes all texts automatically that you create in the project visualizations. CODESYS assigns incremental IDs as integers, beginning at 0.

You can check, update, and align the global text list with the static texts of the visualization. You cannot edit the source text or the ID directly in the table. However, you can replace a source text with another source text by creating and importing a replacement file. Menu commands are provided for this purpose.

## Configuring visualization elements with static text

A text in a "GlobalTextList" can contain a format definition.
$\checkmark$ Requirement: A project with a visualization is open. The "GlobalTextList" object contains the texts that are defined in the project visualizations.

1. Double-click the visualization.
$\Rightarrow$ The editor opens.
2. Select an element with the "Text" property (example: "Text Field").
3. Type in some text in the "Text" property (example: Static Information A).
$\Rightarrow$ CODESYS adds the text to the global text list in the POU view.

## Checking GlobalTextList

$\checkmark$ Requirement: A project with a visualization is open. The "GlobalTextList" object contains the texts that are defined in the project visualizations.

1. Double-click the "GlobalTextList" object in the POUs tree.
$\Rightarrow$ The table opens with the static texts.
2. Click "Text List $\rightarrow$ Visualization Text IDs".
$\Rightarrow$ CODESYS reports when a source text of the text list does not match the static text that is identified by the ID. The source text in the global text list and the text in the visualization with the same ID do not match.

## Updating IDs in GlobalTextList

$\checkmark$ Requirement: A project with a visualization is open. The "GlobalTextList" object contains the texts that are defined in the project visualizations.

1. In the POU tree, double-click the "GlobalTextList" object.
$\Rightarrow$ The list opens with the text list entries.
2. Click "Text List $\rightarrow$ Update Visualization Text IDs".
$\Rightarrow$ CODESYS adds text to the global text list when a text in the "Static Text" property does not match the source text in the project visualizations.

## Removing GlobalTextList and creating current IDs again

Requirement: A project with a visualization is open. The "GlobalTextList" object contains the texts that are defined in the project visualizations.

1. Right-click the "GlobalTextList" object in the POUs tree and select the "Delete" command. $\Rightarrow$ The object is removed.
2. Open a visualization.
3. Click "Visualization $\rightarrow$ Create Global Text List".
$\Rightarrow$ In the POU view, a new "GlobalTextList" object is created. The global text list contains the static text from the existing project visualizations.

## Removing IDs from GlobalTextList

$\checkmark$ Requirement: A project with a visualization is open. The "GlobalTextList" object contains the texts that were defined in the project visualizations.

1. Double-click the "GlobalTextList" object in the POUs tree.
$\Rightarrow$ The table opens with the texts.
2. Click "Text List $\rightarrow$ Remove Unused Text List Entries".
$\Rightarrow$ CODESYS removes the text list entries with IDs not referenced in the project visualizations.

## Editing GlobalTextList with a replacement file

A replacement file has the CSV format. The first row is a header: defaultold defaultnew REPLACE. The following rows contain the old source texts, the new source texts, and then the REPLACE command. Tabs, commas, and semicolons are permitted separators. A combination of separator characters in a file is not permitted.

Example (tab as separator character)

```
defaultalt defaultneu REPLACE
Information A Information A1 REPLACE
```

When you import a replacement file, CODESYS processes the replacement file row by row and performs the specified replacements in the "GlobalTextList". In addition, CODESYS replaces the previous text with the replacement text in the visualizations. If the replacement text already exists as static text, then CODESYS recognizes this and harmonizes the static text and leaves only one text list entry.

Requirement: A project is open with a text list or global text.

1. Double-click the "GlobalTextList" object.
$\Rightarrow$ The object opens.
2. Click "Text List $\rightarrow$ Import/Export Text Lists".
$\Rightarrow$ The "Import/Export" dialog opens.
3. At the "Choose file to compare or to import" input field, click ... and select the directory and file (example: ReplaceGlobalTextList.csv).
4. Select the "Import replacement file" option.
5. Click "OK" to exit the dialog.
$\Rightarrow$ The texts in the text lists and the visualizations are replaced.

### 6.4.6.2.4 Creating Text in Text Lists and Displaying Dynamically

You can create and translate texts in a text list for dynamic texts in order to display them dynamically in a visualization or in the alarm management. The object of type "Text list" can be located globally in the POU view or below an application in the device tree. It contains a table with text list entries that you can edit and extend. A text list entry consists of an ID for identification, the output text, and its translation. You can add new text list entries to a text list. Menu commands are provided for this purpose.

## Creating text lists for dynamic text display

Requirement: A project with a visualization is open.

1. Select an application in the POU view or device tree and click "Project $\rightarrow$ Add Object".
2. Select "Text List".
3. Type a name (example: Text_List_A). Click "Add" to exit the dialog.
$\Rightarrow$ A $\Leftrightarrow$ Text List type object is created.
4. Click below the "Default" column and open the input field. Type a text (example:

Information).
$\Rightarrow$ The source text is created. It is used as a key in the table and as a source text for translations.
5. Type any string in the "ID" column (example: A).
$\Rightarrow$ A text list entry is defined with source text and ID. When you configure the "Dynamic texts" property of an element in a visualization, you can select the text list Text_List_A and assign the ID A.
6. Double-click in the blank line at the end of the table below "Default" and type in more text list entries.
$\Rightarrow$

|  |  |  |  |
| :--- | :--- | :--- | :--- |
|  | Textliste_A $\times$. |  | en |
| ID | Standard |  |  |
| A | Information A |  |  |
| B | Information B |  |  |
| C | Information: OK |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |

## Dynamically Displaying a Text

In a visualization, you can configure the dynamic output of texts which were created in a text list by configuring the "Dynamic texts" property of an element. You can directly assign a text list and an ID, as well as IEC variables, where you set the values programmatically.
$\checkmark$ Requirement: A project with visualization is open and a text list is in the device tree.

1. Open the text list (example: Text_List_A).
2. Double-click the visualization.
$\Rightarrow$ The editor opens.
3. Drag an element (example: "Rectangle") to the visualization.
4. Configure its "Dynamic texts" property by selecting one in the "Text list" property (example:
'Text_List_A') and add an ID from the text list into the "Text index" (example: 'A').
Pay attention to the single straight quotation marks. You can also assign an IEC variable of type STRING for the text list name and ID.
$\Rightarrow$ The IEC variables allow for programmatic access to the texts of the text lists.
5. Build the application, download it to the controller, and start it.
$\Rightarrow$ The visualization shows the text from the text list in the text field: Information A.

### 6.4.6.2.5 Displaying a text dynamically

You can define a text in "Texts $\rightarrow$ Text" in order to display it statically. A text in "Texts $\rightarrow$ Tooltip" is shown as a tooltip. You can configure the text in such a way that the contents of a variable are displayed with it.

You can expand a static text by exactly one placeholder with a formatting specification in order to display the contents of a variable at this location at runtime. The variable which you have assigned in the "Text variable" property is displayed. When the variable changes in the application code, its display in the visualization changes at the same time.
$\square$ Requirement: A project with a visualization is open.

1. Open the visualization and add a "Text Field" element.
$\Rightarrow$ The "Properties" view shows the configuration of the element.
2. Configure the "Texts $\rightarrow$ Text" property with File name: \%s.
$\Rightarrow$ The text contains the $\% s$ placeholder.
3. In the application in the PLC_PRG POU, declare a type-compliant variable strFileName : STRING : = 'File_A';
4. Configure the "Text variable" property of the button with PLC_PRG.strFileName.
$\Rightarrow$ The contents of the variable will be displayed instead of the placeholder at runtime.
5. Compile, download, and start the application.
$\Rightarrow$ The application runs. The visualization opens. The element displays the text: File name: File_A

A text entered in the "Texts $\rightarrow$ Text" or "Texts $\rightarrow$ Tooltip" visualization property is automatically entered in GlobalTextList under POUs. There you can translate the text into other languages.
For more information see: ${ }^{\mu}$ Using static text in GlobalTextList

### 6.4.6.3 Reference

### 6.4.6.3.1 Objects

Object: ImagePool
The "ImagePool" object contains a table with image ID assignments.
For more information, see: $y_{y}$ Using an Image Pool

| "ID" | ID of the image <br> You reference this ID, for example in the visualization of the image. |
| :--- | :--- |
| "File name" | File path of the image file <br> When you click the ... button for more settings, the "Select Image" dialog opens. |
| "Image" | Show a thumbnail of the image |
| "Link Type" | Opens the "Select Image" dialog <br> In the dialog, you define the type of link. |

## Dialog: Select Image

"Image $\quad$ Name and directory of the image file (example: "C:\Program Fileslimages\logo.bmp") PNG, SVG, and TIFF. Note that a controller might not support all formats.
Whether or not you can use images formatted as scalable vector graphics (*.svg) depends on the operating system. Any necessary information is located in the device description of the hardware vendor.
Hint: It is recommended to use only images in SVG format where the aspect ratio of width to height corresponds to the aspect ratio of the view box value. Otherwise an unexpected display might result.

Table 737: File Handling

| "Remember the |
| :--- | :--- |
| link" | | Only the link is saved. This automatically updates a change to the image file |
| :--- |
| in the image pool. |
| You need to make sure that the path of the image file does not change. |
| When saving the project as a project archive, the image file is embedded |
| into the project archive. | \left\lvert\, | "Remember the |
| :--- | :--- |
| link and embed |
| into project" |$\quad$| The image in the image pool is copied, but the link information is retained. |
| :--- |
| This makes it possible to detect changes to the image file so that, if neces- |
| sary, an update of the image can be made in the image pool. |
| The behavior is controlled with the options in the next table. |
| Note: Embedded image files increase the memory requirement of the |
| project. |\right.

Table 738: Change Tracking

| These options are available only if you have <br> selected the "Remember the link and embed <br> into project" option as described above. |  |
| :--- | :--- |
| "Reload the file automatically" | The image file is automatically updated in the <br> project without any prompts. |
| "Prompt whether to reload the file" | If the image file has changed, then you may be <br> prompted whether or not the image file should <br> be updated. |
| "Do nothing" | The image file in the image pool is not updated. |

## Object: GlobalTextList

## Symbol: 国

The object is used to manage and translate texts which are composed as static text in visualizations in the project. The object contains a table with these texts. When you compose a text in a visualization in an element in the "Texts" property, CODESYS automatically adds a line in the table. You can only edit existing text here, not compose any new text.

For more information, see: $\left.{ }^{\Downarrow}\right\rangle$ Using a Text List, $\Leftrightarrow$ Text List

Moreover, CODESYS provides the following commands in order to consolidate the "GlobalTextList":

- "Check Visualization Text IDs"
- "Update Visualization Text IDs"
- "Remove Unused Text List Entries"

The object is located in the POU view and exists at most one time.

| "ID" | Unique identifier of the text |
| :--- | :--- |
| "Default" | Source text as string with one formatting specification at the most <br> (example: Information A: \%i options) <br> If a translation is not provided below a language column, then the <br> default text is used. <br> Double-click in the field to edit the text. |
| You can add as many lan- <br> guage columns to the table <br> as you want. A language <br> column is named with <br> a language code which <br> you already specified when <br> creating the column with <br> the "Insert Language" com- <br> mand. |  |
| "<language code>" | Name of the language as a language code (example: en-US) <br> This column contains the translation of the text that is made in <br> "Default". <br> When the language code is selected as a language in the Visuali- <br> zation Manager, a visualization displays the translation when it is <br> run. A running visualization can toggle between languages at the <br> request of a user. <br> Double-click in the field to edit the text. |

## Object: Text List

Symbol:
The object is used to create, manage, and translate texts. It contains a table with texts where you can add new texts. You can select a text which you have composed here can be selected in a visualization in the "Dynamic texts" property of an element. In runtime mode, the visualization displays this text dynamically in the selected language.

For more information, see: $乡 \nu$ Using a Text List
When the object is assigned to an alarm group and is located below the "Alarm Configuration" object, CODESYS adds the texts of the alarm group to the table. You can also add texts.

| "ID" | Unique identifier of the text |
| :--- | :--- |
| "Default" | Source text as string (example: Information A: \%i <br> options). Use the [Ctrl] + [Enter] shortcut to add a line break. <br> Double-click in the field to edit the text. |

| You can add as many <br> language columns to the <br> table as you want. A lan- <br> guage column is named <br> with a language code which <br> you already specified when <br> creating the column with <br> the "nsert Language" com- <br> mand. |  |
| :--- | :--- |
| "<language code>" | Name of the language as a language code. Example: en-US. <br> This column contains the translation of the text which is com- <br> posed in "Default". Under the condition that the language code <br> is selected as the language in the Visualization Manager, a visu- <br> alization displays the transslated text in runtime mode. If a transla- <br> tion has not been composed, then CODESYS uses the text in <br> "Default". A visualization in runtime mode can also change the <br> language if requested by a user. |
|  | Edit the line to add your own text. |
| Blank line |  |

### 6.4.6.3.2 Menu Commands

## Image Pool

Command: Insert Image
Symbol: 图
Function: The command inserts a new line into an image pool.
Call: "Image Pool" menu; context menu
Requirements: An image pool is active and a line is selected in the image pool.
For more information, see: $\Rightarrow$ Using an Image Pool

## Text List

## Command: Add Language

Symbol: 国
Function: Another language column is added to the text list.
Call: "Text List" menu; context menu
Requirement: A text list or global text list is open and active.
In the "Choose Language" dialog, specify a language abbreviation for the new language (example: "en-US"). This language code is then inserted as a column heading.

## Command: Create Global Text List

Symbol:
Function: The GlobalTextList global text list is created in the "POUs" view.
Call: "Visualization" menu; context menu
Requirement: A visualization is open.
For more information, see: ${ }^{y} \boldsymbol{y}$ GlobalTextList

## Command: Export All Unicode .txt Text List Files

Symbol: 图
Function: All text lists of the project are exported.
Call: "Text List" menu; context menu

## Requirements:

- A text list or global text list is open and active.
- The visualization encodes the characters of the texts into Unicode.
- The "Use unicode strings" option is selected in the Visualization Manager.
- The VISU_USEWSTRING compiler statement of the application is set. To check this, select the "Properties" command in the context menu. Then click the "Build" tab. VISU_USEWSTRING is specified in the input field for "Compiler definitions".
At this time, a simple text file (.txt format) is created for each text list. The name of the text list is used as the file name. The directory where the files are exported is defined in "Project $\rightarrow$ Project Settings $\rightarrow$ Visualization", on the "General" tab, in "Text list files".
A controller can read and use this format. You can copy the file to a controller, for example, and configure a setting in the Visualization Manager so that the text lists are not transferred again when the application is downloaded.
For more information, see: Using a Text List

## Command: Insert Text

Symbol: ㅍ]
Function: A new line is inserted above the selected line in the text list. Below "Default", an input field opens where you specify the output text.

Call: "Text List" menu; context menu
Requirement: A text list (not a "GlobalTextList") is open and active. A field is selected in the table.

## Command: Import/Export Text Lists

Symbol:
Function: The command exports an active text list, imports a file, or aligns a text list with a file. The file is in CSV format. The "Import/Export" dialog provides options for this.
Call: "Text List" menu; context menu
Requirement: A text list or global text list is open and active.

## Dialog: Import/Export

| "Choose file to <br> compare or to import" | File which is read <br>  <br> "...: Opens the "Choose Text List File" dialog for you to select a file |
| :--- | :--- |
| "Choose export file" | File to which is written <br>  <br>  <br> file and directory <br> fil Opens the "Choose Text List File" dialog where you can select a |

Table 739: "Import/Export Type"

| "Import" | Requirement: A file is selected in "Choose file to compare or to import". <br> The file can contain text list entries for both the global text list and text lists. <br> Global text list <br> - The file is read. Then the text list entries are compared for the same source text and the differences in the translations are accepted. If necessary, the translations are overwritten in the project. <br> Text lists <br> - The file is read. Then the text list entries are compared for the same IDs and the differences in the source text and translations are accepted into the project. If necessary, the text list entries in the project are overwritten. <br> - If the file contains a new ID, then the text list entry is imported into the text list of the project and the text list is added. |
| :---: | :---: |
| "Import replacement file" | Requirement: A replacement file is selected in "Choose file to compare or to import". <br> The replacement file contains replacements for the global text list. <br> The replacement file is processed row by row and the specified replacements are performed in the global text list. <br> The structure of the replacement file is described in the " $\Leftrightarrow$ Using static text in GlobalText- List" chapter. |
| "Export" | Requirement: The file which will be written to is selected in "Select export file". <br> All texts from all text lists of the current project are exported. All languages available in the project are inserted as columns in the export file. The file can be used for the external translation of the language-dependent texts. |
| "Export only text differences" | Requirement: An import file is selected for the comparison in "Choose file to compare or to import", and an export file to be written to is selected in "Select export file". <br> The import file is read and the lines of the active text list are compared with it. When lines match, they are ignored. <br> When lines differ, the line is written to the export file. Translations from the text list are accepted if necessary. The translations from the import file are accepted and overwritten if necessary. |
| "Use qualified path" | Text lists are exported and imported with full and qualified path name. <br> Example: Device.Application.TextList <br> As a result, text lists are found uniquely, even if they occur multiple times in the project with the same name. |

For more information, see: ${ }^{y} y$ Using a Text List

## Command: Remove Language

Symbol: 国
Function: The selected language column is removed from the text list.
Call: "Text List" menu; context menu
Requirement: A text list or global text list is open and active. A field is selected in the language column which you want to remove.
For more information, see: ${ }^{4} y$ Using a Text List

## Command：Rename Language

Symbol：国
Function：A dialog opens for specifying a new name for a language which is displayed in the text list as a column heading．

Call：＂Text List＂menu；context menu
Requirement：A text list or global text list is open and active．A field is selected in the language column which you want to rename．
For more information，see：$\Longleftrightarrow$ Using a Text List

## Command：Remove Unused Text List Entries

Symbol：图
Function：The command checks whether or not a text list entry in the project is used as a static text．If this is the case，then the text list entry is removed from the text list．
Call：＂Text List＂menu；context menu
Requirement：The＂GlobalTextList＂is open and active．A field is selected in the table．
For more information，see：${ }^{\leftrightarrows}$ Using a Text List

## Command：Check Visualization Text IDs

Symbol：
Function：The command checks whether or not the ID of a text list entry in the project is correct and reports the result．

Call：＂Text List＂menu；context menu
Requirement：The＂GlobalTextList＂is open and active．A field is selected in the table．
If the check determines that the global text list and the static texts of the visualizations do not match，then the reason for this may be that the global text list is or was write－protected．The requirement for this is that you have configured a user management in the project．
For more information，see：${ }^{\aleph}$ Using a Text List

## Command：Update Visualization Text Ids

## Symbol：㨼

Function：The command updates all inconsistent IDs in a static text list．
Call：＂Text List＂menu；context menu
Requirement：The＂GlobalTextList＂is open and active．A field is selected in the table．The object is write－protected．
If the check determines that the global text list and the static texts of the visualizations do not match，then the reason for this may be that the global text list is or was write－protected．The requirement for this is that you have configured a user management in the project．

For more information，see：${ }^{\Downarrow}$ Using a Text List

## Command：Remove text list support

Symbol：䓍
Function：The text list support from the selected enumeration object is removed．

Call: Context menu of an object of an enumeration with text list support (祭)
Text list support allows for the localization of the enumeration component identifier and the display of the symbolic component value in a text display of a visualization.

## Command: Add text list support

Symbol:
Function: A text list support is added to the selected DUT object of type Enumeration.
Call: Context menu of a standard DUT object of type Enumeration (
Text list support allows for the localization of the enumeration component identifier and the display of the symbolic component value in a text display of a visualization.

### 6.4.6.3.3 Dialogs

## Dialog: Properties - Image Pool

Function: The basic properties of the selected image pool are set here.
Call: "View $\rightarrow$ Properties" command of an "ImagePool" object; context menu of an "ImagePool" object

| "Download only <br> used images" | $\boxed{\checkmark}:$ Instead of loading all images from the image pool, only the images <br> which are actually used in the application are downloaded to the con- <br> troller. |
| :--- | :--- |
| "Download by <br> visualization" | $\boxed{\checkmark}:$ The image pool is downloaded with the visualization to the controller. |
| "Internal" | $\checkmark:$ The image pool is not provided in the "ToolBox" view. You cannot <br> drag these images to the visualization. |

Table 740:"Symbol Library Settings"

| "Mark library as |  |
| :--- | :--- |
| symbol library" | Identifies the image pool as a symbol library for use in a visualization <br> The symbol library gets the VisuSymbolLibrary = TRUE key as a file <br> property in the project information. The VisuElements library is automat- <br> ically inserted as a placeholder library in the "POUs" pool of the Library <br> Manager. <br> Requirement: A library project is open. <br> The symbol libraries installed in the repository under "Project Settings", <br> "Visualization" category, "Symbol Libraries" tab are displayed. |
| "Text list for <br> symbol <br> translation" | Select the text list from the list box which contains the translated texts for the <br> image pool. |

For more information, see: ${ }^{4}$ Using an Image Pool and $\left.{ }^{4}\right\rangle$ Using a Text List

## Dialog: Properties - Text List

Function: The basic properties of the selected text list are set here.
Call: "View $\rightarrow$ Properties" command of a "Text List" object; context menu of a "Text List" object

| "Download by <br> visualization" | $\boxed{\square}:$ The text list is downloaded with the visualization to the controller. |
| :--- | :--- |
| "Internal" | $\boxed{\square}:$ The text list can be used only in a library. It is not available in an <br> ordinary CODESYS project. |

For more information, see: ${ }^{\Downarrow}$ Using a Text List

### 6.5 Libraries and solutions

### 6.5.1 Information on libraries

AC500 V3 library handling with CODESYS V3 is different from the library handling with CODESYS V2. In AC500 V3 a coexistence of library versions in the library manager is possible and users can change a version within the project. How to install a new library and how to choose a library version in the project is described in the application note Add New Library Version To an AC500 V3 Project.

System libraries When upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically. Older library versions will be removed as coexistence of a new library version and an older library version is not possible. Check the available library version in the Library Manager.

> Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.

> As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.

Chapter 6.3.7 "Converting an AC500 V2 project to an AC500 V3 project" on page 1799

Part of the system libraries are the group of CMP libraries, i.e. the App library, IEC task library and the log library. How to use CMP libraries is described in an application example.

## Customer libra- Target change from AC500 V2 to AC500 V3 ries <br> After a target change from AC500 V2 to AC500 V3 the customer libraries have to be converted manually using the Library Converter ${ }^{*}>$ Chapter 6.3.1.3 "Later change-over of a target system" on page 1414.

Some Standard CODESYS libraries are automatically converted during the target change.

## Documentation

for libraries

- Description for the use of and information about selected libraries
- Reference for function blocks, functions, structures etc.

』 Chapter 6.5.14 "Reference, function blocks" on page 4086

### 6.5.2 Reference to CODESYS (V3)

Note that CODESYS V3 libraries are used.
Chapter 6.4.1.17.3 "Information for Library Developers" on page 2035

### 6.5.3 Library Manager functionality

### 6.5.3.1 General

The Library Manager contains descriptions of libraries and function blocks. In the Automation Builder the Library Manager is located under the node "Application".
这 PLC_PRG (PRG)
$\pm$ Task Configuration
The Library Manager offers a wide array of functionality for the user.

Use cases and how to handle the function blocks of a certain library is described in sample projects. After the respective library has been installed the corresponding sample projects are available in the default path AutomationBuilder Examples. If the default path is inaccessible, click "Help $\rightarrow$ Project examples" in the Automation Builder menu.

StringUtils With the help of the StringUtils library, strings in the AC500 PLC application can be handled library and modified. How to use the available functions is demonstrated in the application example StringUtils library.

### 6.5.3.2 Search for libraries and add libraries

In the Library Manager the search function allows you to quickly find any library, user defined library or function.

1. Select "Add Library".

| $\dagger$ Add Library | $\times$ Delete Library |  | fifl Library Repository (0) Icon legend... |  |
| :---: | :---: | :---: | :---: | :---: |
| Name |  |  | Namespace | Effective version |
| $\pm$ 3SLicens | e $=$ 3SLicense, 3.5 .1 | 4.0 (3S - Smart Software Solutions GmbH) | _3S_LICENSE | 3.5.14.0 |
| $\pm$ A AC500_ | DiagCpu = DiagCpu, | 1.2.0.4 (ABB) | AC500_DiagCpu | 1.2.0.4 |

$\Rightarrow$ The Add Library Window opens and a list of all available libararies is displayed.
Libraries in folder "ABB - AC500" are created by ABB and tested in combination with Automation Builder.

We recommend to use libraries of subfolder "Use Cases" for your project.
Libaries in subfolder "Intern" are necessary for internal procedures.
All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libaries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.

2. Enter the name of the library or function you are searching for.
3. Choose the library you want to add

### 6.5.3.3 View embedded documentation of all libraries

In the Library Manager you can view embedded documentation of any ABB and 3S libraries.
Precondition: Library must be available in Library Manager.
ⓨ Chapter 6.5.3.2 "Search for libraries and add libraries" on page 3774

1. Select a library.
$\Rightarrow$ The contents of the library are shown.

2. From the contents select an object.
$\Rightarrow$ The corresponding documentation is opened.

|  | DiagTypes, 1.2.4.1 (ABB) | - |
| :---: | :---: | :---: |

### 6.5.3.4 Access version history

The Library Manager allows you to access the version history of ABB libraries. The version history is not available for non ABB libraries.

1. Select a library.
$\Rightarrow$ The contents of the library are shown.

2. Select "history".
$\Rightarrow$ The version history is shown.

Inputs/Outputs Documentation
history (STRUCT)
TYPE history : STRUCT
Change history

### 6.5.3.5 Download missing libraries

The Library Manager allows you to automatically download missing 3 libraries from the project that are not available from the library repository.

1. Select "Download missing libraries".
$\Rightarrow$ The 'Download missing libraries' window is opened.
2. Select which libraries you want to download.

### 6.5.4 ACS/DCS drives libraries

### 6.5.4.1 Introduction

### 6.5.4.1.1 Scope of the document

The purpose of system technology document is to give an overview and explain the overall concepts of the Drives library in V3. The library contains function blocks to establish communication, to control the ABB ACS / DCS drives from AC500 V3 PLCs.

### 6.5.4.1.2 Safety instructions and preconditions to use drives library

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the devices you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 in the online help in Automation Builder.
- Read the user information of the devices and functions you are using, see online help in Automation Builder.
- Installation and commissioning of the drive(s) is not part of this document nor the online help of Automation Builder. Installation and commissioning of the drive(s) must be done according to the related drives manuals and safety instructions.
The library package has been released for the software and firmware versions listed in the readme file of the package only.

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the Drives V3 Library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.
The user must follow all applicable safety instructions and the guidelines mentioned in the user documents of the ABB products.
Read the complete safety instructions for the AC500 before installation and commissioning.

## CAUTION!

Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

### 6.5.4.1.3 Comparison of V2 and V3 drives library

The below table compares the FBs in the V2 library package and corresponding adapted FBs in the V3 library package.

The V2 package (PS553-Drives) has different library files for each protocol and the same is replaced with a single library in V3 (ABB_Drives_AC500).

| PS553-Drives Library package (V2) |  | PS5605-Drives Library package (V3) |  |

### 6.5.4.1.4 PLCs and drives: communication and control

## General

This document will briefly explain about communication settings between PLCs with drives, how to control the drives from PLC using the control function blocks.
Each input and output of the function blocks are explained in the integrated documentation in the library.

This library is released for the following products:

- AC500 V3 CPU
- ABB Drives:
- ACS380, ACS480, ACS580, ACH580, ACQ580, ACSM1, ACS880, DCS550, DCS800, DCS880. Other drives may still work, but are not tested.
- To use the control blocks the Communication Profile must be "ABB Drives Profile" or "ABB Drives Profile enhanced"
- Fieldbus Adapters: FENA-01, FENA-11, FENA-21, FSCA-01, FCAN-01, FECA-01, RETA-01, RETA-02, RCAN-01, FPNO-21, FMBT-21.
Fieldbus adapter support is dependent on the drive and for more details refer the corresponding drive manual.

Drives Library in V3 will support following protocols for the communication:

- Modbus TCP (onboard ETH1 and ETH2 ports)
- Modbus RTU (onboard COM1 port)
- PROFINET (using communication module CM579-PNIO)
- EtherCAT (using communication module CM579-ETHCAT)
- CANopen (onboard CAN port)

## Modbus TCP

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC with ETH option. Configure onboard ETH1 or ETH2 for Modbus TCP.
- Drive with fieldbus adapter module
- ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21 or FMBT-21
- DCS550 and DCS800: RETA-01
- RJ45 Ethernet cable

## ACS drives

Fig. 274: FB - Overview of Modbus TCP connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:

Use function block 'DrvModbusTcp'. \&y Chapter 6.5.4.4.1.8 "DrvModbusTcp" on page 3805

- DrvModbusTcp
- Control function block in AC500 program:

Use function block 'DrvControlModbusACS'. « Chapter 6.5.4.4.1.4 "DrvControIModbusACS" on page 3801

- Scaling of the speed or torque (optional):

Use function block ‘DrvScaling'. ${ }^{\text {B }}>\mathrm{C}$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:

Use the function block 'DrvModbusTcp' with input EnhancedProfile = TRUE. $\Longleftrightarrow$ Chapter 6.5.4.4.1.8 "DrvModbusTcp" on page 3805

- DrvModbusTcp
- Control function block in AC500 program:

Use function block 'DrvControlModbusACS'. \& Chapter 6.5.4.4.1.4 "DrvControIModbusACS" on page 3801

- Scaling of the speed or torque (optional): Use function block 'DrvScaling'. $y^{\star y}$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
 on page 3804
- Write the values:

Use the function block 'DrvModbusWrite’. \& Chapter 6.5.4.4.1.7 "DrvModbusWrite" on page 3805

- Read Write the values:

Use the function block ‘DrvModbusReadWrite23'. « Chapter 6.5.4.4.1.11 "DrvModbusReadWrite23" on page 3825

DCS drives

Fig. 275: FB - Overview of Modbus TCP connection with DCS drives

DCS550 and DCS800 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:

Use function block "DrvModbusTcp". « Chapter 6.5.4.4.1.8 "DrvModbusTcp" on page 3805

- Control function block in AC500 program:

Use function block "DrvControlModbusDCS". « Chapter 6.5.4.4.1.5 "DrvControlModbusDCS" on page 3803

- Scaling of the speed or torque (optional):

Use function block "DrvScaling". ${ }^{\wedge}>$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:

Use the function block "DrvModbusRead". $\Rightarrow$ Chapter 6.5.4.4.1.6 "DrvModbusRead" on page 3804

- Write the values:

Use the function block "DrvModbusWrite". «̌ Chapter 6.5.4.4.1.7 "DrvModbusWrite" on page 3805

- Read write the values:

Use the function block "DrvModbusReadWrite23". « Chapter 6.5.4.4.1.11 "DrvModbusReadWrite23" on page 3825

DCS880 drives To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:

Use function block "DrvModbusTcp". $\Longleftrightarrow$ Chapter 6.5.4.4.1.8 "DrvModbusTcp" on page 3805

- "DrvModbusTcp"
- Control function block in AC500 program:

Use function block "DrvControlModbusDCS". « Chapter 6.5.4.4.1.5 "DrvControlModbusDCS" on page 3803

- Scaling of the speed or torque (optional):

Use function block "DrvScaling". « ${ }^{\Downarrow}$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB drives enhanced
- Communication function block in AC500 program:

Use the function block "DrvModbusTcp" with input EnhancedProfile = TRUE. ${ }^{\#}$ chapter 6.5.4.4.1.8 "DrvModbusTcp" on page 3805

- "DrvModbusTcp"
- Control function block in AC500 program:

Use function block "DrvControlModbusDCS". \& Chapter 6.5.4.4.1.5 "DrvControlModbusDCS" on page 3803

- Scaling of the speed or torque (optional): Use function block "DrvScaling". $\Leftrightarrow$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:

Use the function block "DrvModbusRead". $\triangleq$ Chapter 6.5.4.4.1.6 "DrvModbusRead" on page 3804

- Write the values:

Use the function block "DrvModbusWrite". „ Chapter 6.5.4.4.1.7 "DrvModbusWrite" on page 3805

- Read Write the values:

Use the function block "DrvModbusReadWrite23". \& Chapter 6.5.4.4.1.11 "DrvModbusReadWrite23" on page 3825

## Modbus RTU

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard COM1 for the Modbus RTU communication.
- Drive with
- ACS Drives and DCS880: Embedded fieldbus or FSCA-01
- DCS550 and DCS800: Embedded fieldbus or RMBA-01
- Twisted pair serial cable

## ACS drives

Fig. 276: FB - Overview of Modbus RTU connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:

Use function block "DrvModbusRtu". ${ }^{\leftrightarrows}$ Chapter 6.5.4.4.1.9 "DrvModbusRtu" on page 3812

- DrvModbusRtu
- Control function block in AC500 program:

## PROFINET

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC with CM579-PNIO (PROFINET Master communication module)
- Drive with fieldbus adapter module
- ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
- DCS550 and DCS800: RETA-02
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive $\rightarrow$ AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 $\rightarrow$ Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
- ACS Drives: Use function block ‘DrvControIACS’. \& Chapter 6.5.4.4.1.2 "DrvControIACS" on page 3797.
- DCS Drives: Use function block ‘DrvControIDCS’. \& Chapter 6.5.4.4.1.3 "DrvControIDCS" on page 3799.
- Scaling of the speed or torque (optional): Use function block 'DrvScaling'. $y^{*}$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796.
- PROFINET read function block. $\#$ Chapter 6.5.4.4.1.14 "DrvPNRead" on page 3829
- PROFINET write function block. 出 Chapter 6.5.4.4.1.15 "DrvPnWrite" on page 3830

## ACS drives

Fig. 278: FB - Overview of PROFINET connection with ACS drives

## DCS drives

Fig. 279: FB - Overview of PROFINET connection with DCS drives

## EtherCAT

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC with CM579-ETHCAT (EtherCAT Master communication module)
- Drive with fieldbus adapter module
- ACS Drives and DCS880: FECA-01
- DCS550 and DCS800: RECA-01
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive $\rightarrow$ AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 $\rightarrow$ Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

#### Abstract

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
- ACS Drives: Use function block "DrvControlACS". 出 Chapter 6.5.4.4.1.2 "DrvControIACS" on page 3797
- DCS Drives: Use function block "DrvControIDCS". « Chapter 6.5.4.4.1.3 "DrvControIDCS" on page 3799
- Scaling of the speed or torque (optional): Use function block "DrvScaling". $\Leftrightarrow$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

## ACS drives

Fig. 280: FB - Overview of EtherCAT connection with ACS drives

## DCS drives

Fig. 281: FB - Overview of EtherCAT connection with DCS drives

## CANopen

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Drive with fieldbus adapter module
- ACS Drives and DCS880: FCAN-01
- DCS550 and DCS800: RCAN-01
- CANopen communication cable with $120 \Omega$ resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive $\rightarrow$ AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 $\rightarrow$ Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
- ACS Drives: Use function block "DrvControIACS". « Chapter 6.5.4.4.1.2 "DrvControIACS" on page 3797
- DCS Drives: Use function block "DrvControIDCS". \& Chapter 6.5.4.4.1.3 "DrvControlDCS" on page 3799
- Scaling of the speed or torque (optional): Use function block "DrvScaling". $\triangleq$ Chapter 6.5.4.4.1.1 "DrvScaling" on page 3796

## ACS drives

Fig. 282: FB - Overview of CANopen connection with ACS drives

## DCS drives

Fig. 283: FB - Overview of CANopen connection with DCS drives

## CANopen with CAN CiA402 Profile for generic Drives

## Preconditions

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Any drive with CAN fieldbus adapter module and CAN CiA402 profile.
- CANopen communication cable with $120 \Omega$ resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive $\rightarrow$ AC500: Status word and actual speed.
- AC500 $\rightarrow$ Drive: Control word and reference speed.

The following function blocks can be configured in the AC500 program.

- Communication profile: CANopen device profile CiA402
- Control block: Use function block "DrvControICANCiA402". \#y Chapter 6.5.4.4.1.13 "DrvControICANCiA402" on page 3828

## General drives with CAN CiA402 interface

Fig. 284: FB - Overview of CANopen CiA402 with any drives

### 6.5.4.1.5 Compatibility

To check the compatibility of the drives and their communication modules please refer to the following table, it shows the tested combinations.

| Communication | PLC communication modules |  | Drive fieldbus adapter module |  |  | Drive |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PLC com-munication module | Firmware version | FBA | FBA comm sw ver | FBA appl sw ver | Drive | Firmware version | Drive rating ID |
| Modbus RTU <br> Classic | Onboard |  | FSCA-01 |  | 1.63 | ACS580 | $\begin{aligned} & \hline 1.70 .4 .0 \\ & (\mathrm{CCON}-11) \end{aligned}$ | $\begin{aligned} & \text { ACS580-0 } \\ & 1-12 A 6-4 \end{aligned}$ |

Before adding a drive to the device tree, the correct device description file has to be installed into Automation Builder's device repository. For ABB drives the corresponding device descriptions are available for download from our webside. For ABB drives connected via CANopen or EtherCAT there is also the option to generate the device descriptions via Drive Composer Pro ("Tools $\rightarrow$ EDS Export").

Drive configuration tool and fieldbus adapter module support is dependent on the drive used, for the compatible tool details refer to the drive manual.

### 6.5.4.4 Description of the library

### 6.5.4.4.1 Function blocks

## DrvScaling

| DrvScaling |  |
| :---: | :---: |
| Enable $B O O L$ | BOOL Busy |
| SpeedScaleMax UINVT | B001 Error |
| SpeedRefMax USMT | ERROR_D ErrorID |
| SpeedRef REAL | BOOL WarnAct |
| ActSpeedFb INT | WARNUMG_ID WarnIDLast |
| TorqueScaleMax UINT | INT SpeedRefFb |
| TorqueRefMax UINVT | REAL ActSpeed |
| TorqueRef REAL | SVT TorqueRefFb |
| ActTorquefb $\mathrm{INT}^{\text {I }}$ | REAL ActTorque |

Fig. 285: DrvScaling

DrvScaling function block is used to scale the speed or torque reference to the drive based on the maximum values defined.

Function block "DrvScaling" can be used to scale the variables from fieldbus equivalent values to values used in the program. Fieldbus variables are given in fieldbus equivalent values as INT values. With the scaling a conversion from INT (fieldbus) to REAL (program) and vice versa is performed. Reference1 and Actual Value1 (speed) are mostly given in the range of $-20000 \ldots+20000$. Reference2 and Actual Value2 (torque) are mostly given in the range of $0 \ldots+10000$.

## DrvControIACS

| Enable $B O O L$ | DrvControlACS |
| :--- | ---: |
| - |  |
| SwitchOn BOOL | BOOL Busy |
| Run $B O O L$ | $B O O L$ Error | -

This function block can be used to control ACS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW has to be send to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

| Drive Parameter | ACS380/ ACS480/ <br> ACS580/ ACH580/ <br> ACQ580/ ACS880 | ACSM1 | Comment |
| :--- | :--- | :--- | :--- |

## DrvControIModbusACS

|  | DrvControlModbusACS |
| :--- | ---: |
| Enable $B O O L$ |  |
| - SwitchOn $B O O L$ | $B O O L$ Busy | -

This function block can be used to control ACS drives with ABB Drives profile or ABB Drives enhanced profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.
Status Word (SW) is read from drive through Modbus communication block using "DriveData" interface. © Chapter 6.5.4.4.3 "Structure: DrvDataType" on page 3831

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for ACS drives using ABB drive (Classic/ Enhanced) profile for Modbus protocol only. The data transfer to the ACS drive is realized via the "IN_OUT" variable DriveData, which must be connected to "DrvModbusTcp" or "DrvModbusRtu" function block.

## DrvControIModbusDCS

| DrvControlModbusDCS |  |
| :---: | :---: |
| Enable BOOL | BOOL Busy |
| Switchon BOOL | BOOL Error |
| Run BOOL | ERROR_ID Errorid |
| StopEmcyCoast BOOL | BOOL WarnAct |
| -StopEmcyRamp BOOL | WARNING_ID WarnIDLast |
| Reset BOOL | BOOL NoConToDrive |
| Autostart BOOL | BOOL Ready |
| ControlWordB11 BOOL | BOOL Operating |
| ControlWordB12 BOOL | BOOL OnInhibited |
| ControlWordB13 BOOL | BOOL AtSetpoint |
| ControlWordB14 BOOL | BOOL Tripped |
| ControlWordB15 BOOL | BOOL Alarm |
| SpeedRef INT | BOOL LocalCtri |
| RefValue2 INT | INT ActSpeed |
| DriveData DrvDataType | INT ActValue2 |
|  | WORD ActStatusWord |
|  | WORD UsedControlWord |
|  | STRING(65) Message |

This function block can be used to control DCS drives with ABB Drives profile using Modbus communication block like "DrvModbusTcp" or "DrvModbusRtu".
Status Word (SW) is read from drive through Modbus communication block using DriveData interface. ${ }^{*}$ ) Chapter 6.5.4.4.3 "Structure: DrvDataType" on page 3831

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

## The function block should be used for DCS drives using ABB drive profile for Modbus protocol only. The data transfer to the DCS drive is realized via the "IN_OUT" variable DriveData, which must be connected to "DrvModbusTcp" or "Dr̄ModbusRtu" function block.

## DrvModbusRead

The function block 'DrvModbusRead' reads one or more parameters / values of the drive. The number of data to be read is specified at the input 'Nvar'. The first parameter number is specified at the input 'PrmNum'. All parameters must be accessible from consecutive Modbus registers in the drive. The values of the parameters are stored in the PLC memory area, defined at the input 'Data'.
The values in the PLC memory area are updated when the read job was performed without error. This is indicated by JobDone $=$ TRUE and ModMastErrorAct $=$ FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Enable is set from TRUE to FALSE.
As long as the Enable = TRUE a new read job is requested automatically one cycle after the further read job was terminated. The Modbus job is started from the Communication Block which is connected to the same 'DriveData' variable. It uses the Modbus function code 03 (read n words). The drive (Modbus device) from which the parameter is read is specified at this Communication Block. The Communication Blocks are available from the library e.g. DrvModbusTcp or DrvModbusRtu.
The function block is activated (Enable = TRUE) or deactivated (Enable = FALSE) via input Enable. If the block is active, the current values are available at the outputs. To start a new read job the input Enable must be set to TRUE. If the input values are valid, a request to perform a Modbus job is send to the Communication Block via the 'DriveData' variable. If at least 1 input is invalid, no job is generated, and the error is displayed at the outputs Error and ErrorID instead.

## DrvModbusWrite

Function block 'DrvModbusWrite' writes ' $n$ ' parameters to the drive. The number of parameters to be written must be available in the PLC memory area, defined at the input Data. The write job has been performed without error if JobDone $=$ TRUE and ModMastErrorAct $=$ FALSE .

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

To start a new write job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the Communication Block which is connected to the same DriveData variable. It uses the Modbus function code 16 (write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

## DrvModbusTcp

## Introduction

| DrvModbusTcp |  |
| :---: | :---: |
| Enable BOOL | BOOL Busy |
| Eth BYTE | BOOL Error |
| IPAdrServer STRING(15) | ERROR_ID Errorid |
| EnhancedProfile BOOL | BOOL ModMastErrorAct |
| NvarRead BYTE | WORD ModMastErrorIDLast |
| NvarWrite BYTE | BOOL WarnAct |
| WriteValues ARRAY [1..12] OF INT | WARNING_ID WarnIDLast |
| EnableWrite BOOL | BOOL JobDone |
| SteadyWrite BOOL | BOOL JobBusy |
| DriveData DrvDataType | ARRAY[1..12] OF INT Readvalues |

Function block DrvModbusTcp controls the Modbus TCP communication to ACS/DCS drives and provides the basic values (CW, Ref1, Ref2, SW, Act1, Act2) which are used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

## ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Reading status The function block continuously reads data from the drive starting at Modbus register 400004. information from drives
(Actual Value 2) are continuously read from the drive and written to the DriveData variable.
These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written in AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880, ACSM1 | $\begin{array}{\|l} \text { DCS550, } \\ \text { DCS800 } \end{array}$ | DCS880 |  |  |
| Communication module | FENA-01/ 11/21 FMBT-21 | RETA-01 | FENA-01/11/21 FMBT-21 |  |  |
| 400004 | Status Word (SW) | Status Word (SW) | Status Word (SW) | DriveData.wStatusWord | Enable = TRUE |
| 400005 | Actual Value 1 | Actual Value 1 | Actual Value 1 | DriveData.iActValue1 | Enable = TRUE |
| 400006 | Actual Value 2 | Actual Value 2 | Actual Value 2 | DriveData.iActValue2 | Enable = TRUE |

Writing control To write the Control Word (CW), Reference Value 1 (Speed Reference) or
word and reference value to drives

Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite $=$ TRUE (default $=$ FALSE) these values are written steadily.
If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.
The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 | $\begin{aligned} & \text { DCS550, } \\ & \text { DCS800 } \end{aligned}$ | DCS880 |  |  |
| Communication module | $\begin{aligned} & \text { FENA-01/ 11/21 } \\ & \text { FMBT-21 } \end{aligned}$ | RETA-01 | FENA-01/11/21 FMBT-21 |  |  |
| 400001 | Control Word (CW) | Control Word (CW) | Control Word (CW) | DriveData.wControlWord | Enable = TRUE |
| 400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 | DriveData.iRefValue1 | Enable = TRUE |
| 400003 | Reference Value 2 | Reference Value 2 | Reference Value 2 | DriveData.iRefValue2 | Enable = TRUE |

## ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters.
Using the input NvarRead the function block can be configured to read between 0 and 12 parameters from the drive. All read data is then written to the array at the ReadValue output array. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written in AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880, ACSM1 | $\begin{array}{\|l\|} \hline \text { DCS550, } \\ \text { DCS800 } \end{array}$ | DCS880 |  |  |
| Communication module | FENA-01/ 11/21 FMBT-21 | RETA-01 | FENA-01/11/21 <br> FMBT-21 |  |  |
| 400051 | Status Word (SW) | Status Word (SW) | Status Word (SW) | DriveData.wStatusWord | Enable = TRUE |
| 400052 | Actual Value 1 | Actual Value 1 | Actual Value 1 | DriveData.iActValue1 | Enable = TRUE |
| 400053 | Actual Value 2 | Actual Value 2 | Actual Value 2 | DriveData.iActValue2 | Enable = TRUE |
| 400054 | FBA Data IN 1 | FBA Data IN 1 | FBA Data IN 1 | ReadValues[1] | Enable = TRUE NVarRead >= 1 |
| 400055 | FBA Data IN 2 | FBA Data IN 2 | FBA Data IN 2 | ReadValues[2] | Enable = TRUE NVarRead >= 2 |
| ... | ... | ... | ... | ... | ... |
| 400064 | FBA Data IN 11 | FBA Data IN 11 | FBA Data IN 11 | ReadValues[11] | Enable = TRUE NVarRead >= 11 |
| 400065 | FBA Data IN 12 | FBA Data IN 12 | FBA Data IN 12 | ReadValues[12] | Enable = TRUE NVarRead >= 12 |

## If 32-bit parameters are mapped to DATA IN,

- The following field in DATA IN must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive. (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from ReadValues fields must be recombined in the program.

Function block DATA IN has to be configured in drive in the following groups see also FENA-x1 manual.

| Drive | Parameter Group |
| :--- | :--- |
| ACS355 | $54.01 \ldots 54.10$ |
| ACS380, ACS480, ACS580, ACH580, | $52.01 \ldots 52.1252 .01 \ldots 52.12$ if installed as <br> ACQ580, ACS880, ACSM1 |

Writing control word and reference value to drives

To write the Control Word (CW), Reference Value 1 (Speed Reference) or
Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.
If the input SteadyWrite $=$ FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.
Apart from these three there parameters there is also an option to write 12 additional drive parameters.
Using the input NvarWrite the function block can be configured to write between 0 and 12 parameters to the drive. The necessary values must be present in the array connected to WriteValues input. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 | $\begin{array}{\|l\|l} \hline \text { DCS550, } \\ \text { DCS800 } \end{array}$ | DCS880 |  |  |
| Communication module | FENA-01/ 11/21 FMBT-21 | RETA-01 | FENA-01/11/21 <br> FMBT-21 |  |  |
| 400001 | Control Word (CW) | Control Word (CW) | Control Word (CW) | DriveData.wControlWord | Enable = TRUE |
| 400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 | DriveData.iRefValue1 | Enable = TRUE |
| 400003 | Reference Value 2 | Reference Value 2 | Reference Value 2 | DriveData.iRefValue2 | Enable = TRUE |
| 400004 | FBA Data OUT 1 | FBA Data OUT 1 | FBA Data OUT 1 | WriteValues[1] | Enable = TRUE <br> NVarWrite >= 1 |
| 400005 | FBA Data OUT 2 | FBA Data OUT 2 | FBA Data OUT 2 | WriteValues[2] | Enable = TRUE NVarWrite >= 2 |
| ... | ... | ... | ... | ... | $\ldots$ |
| 400014 | FBA Data OUT 11 | FBA Data OUT 11 | FBA Data OUT 11 | WriteValues[11] | Enable = TRUE <br> NVarWrite >= 11 |
| 400015 | FBA Data OUT 12 | FBA Data OUT 12 | FBA Data OUT 12 | WriteValues[12] | Enable = TRUE <br> NVarWrite >= 12 |

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information then job is aborted with an error.
Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used 'NvarRead' and 'NvarWrite' input number respectively.

## If 32-bit parameters are mapped to DATA OUT,

- The next/following field in DATA OUT must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive. (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from WriteValues fields must be recombined in the program.

ACS drive parameters are only saved temporarily, if changed via fieldbus.
To make these changes permanent in the drive the special parameter
"PARAMETER SAVE" must be set.
Please see also drive manuals which parameter must be set.
For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 Par $96.07=1$

For ACSM1, DCS800 and DCS550 - Par 16.06 = 1

## Diagnosis

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information the job is aborted with an error.
The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModTcpMast job. The ModMastErrorIDLast will keep this Error ID until a new rising edge of the Enable is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusTcp".

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

| If input "SteadyWrite" is <br> true can also be set to <br> "Control RW" |  |  | 51.27 |
| Refresh settings in drive | 51.27 |  |  |

- Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.
- For RETA-01/-02 IP address could also be set via hardware Dip-Switches. If any switch is set (192.168.0.xxx) with $x x x=$ Dip-Switches setting
- ACS drive parameters are only saved temporarily, if changed via fieldbus.

To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.
Please see also drive manuals which parameter must be set. For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880

- Par $96.07=1$

For ACSM1, DCS800 and DCS550 - Par 16.06 = 1

## DrvModbusRtu

## Introduction

Function block DrvModbusRtu controls the Modbus RTU communication to ACS/DCS drives and is used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

## ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

With input NvarRead the function block can be configured to read in the same job between 0 ... 24 data more from the drive. These additional data are written to the array at the 'ReadValues' output. These data must be configured in the drive and are only accessible if the embedded Modbus is used.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written in AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 | $\begin{array}{\|l\|} \hline \text { DCS550, } \\ \text { DCS800 } \end{array}$ | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880,DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | Embedded fieldbus |  |  |
| 400004 | Status Word (SW) | Status Word (SW) | Status Word (SW) <br> $58.104=4$ | DriveData.wStatusWord | Enable = TRUE |
| 400005 | Actual Value 1 | Actual Value 1 | Actual Value 1 $58.105=5$ | DriveData.iActValue1 | Enable $=$ TRUE |
| 400006 | Actual Value 2 | Actual Value 2 | Actual Value 2 <br> $58.106=6$ | DriveData.iActValue2 | Enable = TRUE |
| 400007 | - | - | 58.107 DATA I/O 7 | ReadValues[1] | Enable = TRUE |
| 400008 | - | - | 58.108 DATA I/O 8 | ReadValues[2] | Enable = TRUE |
| ... | ... | ... | ... | ... | ... |
| 400014 | - | - | $\begin{aligned} & \text { 58.114 DATA I/O } \\ & 14 \end{aligned}$ | ReadValues[8] | Enable = TRUE |
| ... | ... | ... | ... | $\ldots$ | ... |
| 400024 | - | - | 58.124 DATA I/O 24 | ReadValues[18] | Enable = TRUE |

More details on the limits for the data read and write is explained in Chapter
6.5.4.5 "Limits for the data read and write between AC500 and drives"
on page 3832. The value is dependent on the Drive used.

Writing control word and reference value to drives

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.
The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880, <br> ACSM1DCS880 <br> DCS880 | $\begin{array}{\|l\|} \hline \text { DCS550, } \\ \text { DCS800 } \end{array}$ | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | Embedded fieldbus |  |  |
| 400004 | Control Word (CW) | Control Word (CW) | Control Word (CW) $58.101=1$ | DriveData.wControlWord | Enable = TRUE |
| 400005 | Reference Value 1 | Reference Value 1 | $\begin{aligned} & \hline \begin{array}{l} \text { Reference Value } \\ 1 \\ 58.102=2 \end{array} \\ & \hline \end{aligned}$ | DriveData.iRefValue1 | Enable = TRUE |
| 400006 | Reference Value 2 | Reference Value 2 | Reference Value 2 $58.103=3$ | DriveData.iRefValue2 | Enable = TRUE |

> More details on the limits for the data read and write is explained in 4 Chapter 6.5.4.5 "Limits for the data read and write between AC500 and drives" on page 3832. The value is dependent on the Drive used.

## ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

The ABB Drives Profile Enhanced communication profile provides register mapped access to the Control, Status, Reference and Actual Values of the ABB Drives Profile Enhanced. The mapping of the registers has been enhanced to allow additional writing of up to 12 control and reading of up to 12 additional status parameters in a single Modbus job.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051 So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData. iActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters in the same job.
Using the input NvarRead the function block can be configured to read between 1 and 12 more parameters from the drive. All read data is then written to the array at the ReadValues output. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.
The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written in AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 | $\begin{array}{\|l} \text { DCS550, } \\ \text { DCS800 } \end{array}$ | DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | FSCA-01 |  |  |
| 400051 | Status Word (SW) | Status Word (SW) | Status Word (SW) | DriveData.wStatusWord | Enable = TRUE |
| 400052 | Actual Value 1 | Actual Value 1 | Actual Value 1 | DriveData.iActValue1 | Enable = TRUE |
| 400053 | Actual Value 2 | Actual Value 2 | Actual Value 2 | DriveData.iActValue2 | Enable = TRUE |
| 400054 | FBA Data IN 1 | FBA Data IN 1 | FBA Data IN 1 | ReadValues[1] | Enable = TRUE NVarRead >= 1 |
| 400055 | FBA Data IN 2 | FBA Data IN 2 | FBA Data IN 2 | ReadValues[2] | Enable = TRUE NVarRead >= 2 |
| $\ldots$ | ... | ... | ... | $\ldots$ | $\ldots$ |
| 400064 | FBA Data IN 11 | FBA Data IN 11 | FBA Data IN 11 | ReadValues[11] | Enable = TRUE NVarRead >= 11 |
| 400065 | FBA Data IN 12 | FBA Data IN 12 | FBA Data IN 12 | ReadValues[12] | Enable = TRUE NVarRead >= 12 |

Writing control word and reference value to drives

The function block checks if there are changes in any of the following values since last write job:

- Control Word (wControlWord),
- Reference Value 1 (iRefValue1),
- Reference Value 2 (iRefValue2) on the DriveData variable,
- values in the input array WriteValues - WriteValues[1..NvarWrite].

If there is a change a write job is requested to send the 3 control values and the values in WriteValues array (WriteValues[1..NvarWrite]) to the ACS/DCS drive starting at Modbus register 400001. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.
The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880, ACSM1 <br> DCS880 | $\begin{aligned} & \text { DCS550, } \\ & \text { DCS800 } \end{aligned}$ | DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | FSCA-01 |  |  |
| 400001 | Control Word (CW) | Control Word (CW) | Control Word (CW) | DriveData.wControlWord | Enable = TRUE |
| 400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 | DriveData.iRefValue1 | Enable = TRUE |
| 400003 | Reference Value $2$ | Reference Value 2 | Reference Value 2 | DriveData.iRef Value2 | Enable = TRUE |
| 400004 | FBA Data OUT 1 | FBA Data OUT 1 | FBA Data OUT 1 | WriteValues[1] | Enable = TRUE NVarWrite >= 1 |
| 400005 | FBA Data OUT 2 | FBA Data OUT 2 | FBA Data OUT 2 | WriteValues[2] | Enable = TRUE NVarWrite >= 2 |
| ... | ... | ... | ... | ... | ... |
| 400014 | FBA Data OUT 11 | FBA Data OUT 11 | FBA Data OUT 11 | WriteValues[11] | Enable = TRUE NVarWrite >= 11 |
| 400015 | FBA Data OUT 12 | FBA Data OUT 12 | FBA Data OUT 12 | WriteValues[12] | Enable = TRUE NVarWrite >= 12 |

## Reconnection pause

When one or more drives in the Modbus RTU lines are offline, all the other drives have to wait for the TimeOut to elapse until a line token is assigned to next drive. Reconnection pause input helps in skipping the drives which are offline from the next Modbus job and execute Modbus job operations only for the drives which are online.
"ReconnectPause" is time in seconds before next retry to connect after a timeout was detected. Timeout is detected with ModMastErrorIDLast = 16\#120 (ERR_TIMEOUT).

This feature can be used with the DrvModbusRtu function block in both ABB Drives Profile and ABB Drives Enhanced Profile. User must configure the reconnect pause input value using the input variable "ReconnectPause".

For the generic RTU block ModRtuToken (part of AC500_ModbusRtu library), also the value for the reconnect pause must be configured at input variable "ReconnectPause".

## Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusRTU".

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If several drives are used, for each drive a communication function block such as DrvModbusRtu must be programmed. Also, every other generic Modbus server device on the same Modbus RTU line must be programmed with its own ModRtuToken function block. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive/device, so only one drive/device at a time is communicating with the PLC.
ModRtuToken function block and ModRtuTokenType structure are part of AC500_ModbusRtu library. Kindly refer the same.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

If a Modbus RTU job tries to access a register in the drive which has no valid mapping information then the job is aborted with an error.
Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used 'NvarRead' and 'NvarWrite' input number respectively.

## Modbus RTU using Embedded Fieldbus:

When embedded fieldbus is used for the Modbus RTU communication, user can read maximum of 24 parameters (based on the limitation in drive) from the DATA I/O parameters in the embedded fieldbus parameter group. These parameters can only be used for reading operation and cannot be configured to write data.

## Drive parameter settings

| Settings in the drive <br> according to AC500 <br> configuration | ACS380, ACS480, <br> ACS580, ACH580, <br> ACQ580, ACS880, <br> ACSM1, DCS880 | DCS550, <br> DCS800 | ACS380, ACS480, <br> ACS580, ACH580, |

| FSCA-01 |

- Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.
- ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.
Please see also drive manuals which parameter must be set.
For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880
- Par 96.07 = 1

For ACSM1, DCS800 and DCS550 - Par $16.06=1$

## DrvModbusRtuBroadcast

## Introduction

Function block DrvModbusRtuBroadcast is a communication block which sends the broadcast messages via the Modbus RTU communication to all ACS/DCS drives and other Modbus devices connected to the same Modbus RTU line (physical line). The function block can be used with all drives with either ABB Drives Profile or ABB Drives Enhanced Profile but not a mix of both profiles.
As the broadcast job will be received by all devices on the same physical Modbus line it's highly recommended to use this block only in case there are no other Modbus devices connected to this line and all drives use the same profile.
This function block does not perform any Modbus read operation, hence it does not read any values such as status word, actual value 1 and actual value 2 etc., from any of the drive.

This function block should not be used along with 'DrvModbusRead' and 'DrvModbusReadWrite23' function blocks. They will be ignored showing an error. This function block should be only used independently or in combination with 'DrvModbusWrite' function block for broadcasting write operation.
A successful broadcast message for writing control word, reference values and additional mapped parameters (only in case of Enhanced Profile) is indicated by JobDone = TRUE and ModMastErrorAct = FALSE. A next broadcast job for writing these values can once again started with a fresh rising edge at 'SendCtrIValues' input.

Apart from sending control values and up to 12 additional values from WriteValues array (only in case of ABB Drives Enhanced Profile) a normal Modbus write function block "DrvModbusWrite" can be used to send broadcast write messages to specific address on all drives connected to the Modbus RTU line. The requests to process broadcast write Modbus jobs is transferred via the DriveData structure at the InOut variable DriveData which can be connected to multiple instances of write function block 'DrvModbusWrite'.

After each successful broadcast write job a fixed pause of 250 ms is implemented before any other Modbus job within the same line will be started.

## ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Writing control word and reference value to drives

A rising edge from FALSE to TRUE at input 'SendCtrIValues' starts sending broadcast message with Control Word and Reference Values to all the drives starting at Modbus register 400001.
Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) are taken from DriveData variable for sending broadcast message.
The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block and input SendCtrlvalues |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1DCS880 DCS880 | $\begin{aligned} & \text { DCS550, } \\ & \text { DCS800 } \end{aligned}$ | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880DCS880 <br> DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | Embedded fieldbus |  |  |
| 400001 | Control Word (CW) | Control Word (CW) | Control Word (CW) $58.101=1$ | DriveData.wControlWord | ```Enable = TRUE and Rising Edge at SendCtrlvalues``` |
| 400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 $58.102=2$ | DriveData.iRefValue1 | ```Enable = TRUE and Rising Edge at SendCtrlvalues``` |
| 400003 | Reference Value 2 | Reference Value 2 | Reference Value 2 $58.103=3$ | DriveData.iRefValue2 | ```Enable = TRUE and Rising Edge at SendCtrlvalues``` |

## ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

With the ABB Drives Profile Enhanced profile, along with 3 control values Control Word, Reference Value 1, Reference Value 2, up to 12 additional values can be sent as broadcast message in a single Modbus job.

Writing control word and reference values to drives

A rising edge from FALSE to TRUE at input 'SendCtrIValues' starts sending broadcast message with Control Word and reference values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) from DriveData along with values in the input array WriteValues - WriteValues[1..NvarWrite] are taken for sending broadcast message.

For the additional 12 values the configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus broadcast write job and the needed mapping in the drive as well as the area where the data is taken from the AC500.

| Modbus register address in drive | Mapping configuration in drive |  |  | Written from AC500 | Condition at function block |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | ACS380, <br> ACS480, <br> ACS580, <br> ACH580, <br> ACQ580, <br> ACS880, ACSM1 <br> DCS880 | $\begin{aligned} & \text { DCS550, } \\ & \text { DCS800 } \end{aligned}$ | DCS880 |  |  |
| Communication module | FSCA-01 | RMBA-01 | FSCA-01 |  |  |
| 400001 | Control Word (CW) | Control Word (CW) | Control Word (CW) | DriveData.wControlWord | Enable = TRUE |
| 400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 | DriveData.iRefValue1 | Enable = TRUE |
| 400003 | Reference Value $2$ | Reference Value 2 | Reference Value 2 | DriveData.iRef Value2 | Enable = TRUE |
| 400004 | FBA Data OUT 1 | FBA Data OUT 1 | FBA Data OUT 1 | WriteValues[1] | Enable = TRUE NVarWrite >= 1 |
| 400005 | FBA Data OUT 2 | FBA Data OUT 2 | FBA Data OUT 2 | WriteValues[2] | Enable = TRUE NVarWrite >= 2 |
| ... | ... | ... | ... | ... | ... |
| 400014 | FBA Data OUT 11 | FBA Data OUT 11 | FBA Data OUT 11 | WriteValues[11] | Enable = TRUE NVarWrite >= 11 |
| 400015 | FBA Data OUT 12 | FBA Data OUT 12 | FBA Data OUT 12 | WriteValues[12] | Enable = TRUE NVarWrite >= 12 |

## Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects an actual error occurred in Modbus job. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusRTUBroadcast"

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.

For all drives, which are connected to same Modbus RTU line, one instance of broadcast block DrvModbusRtuBroadcast is enough and it must be connected to same LineToken of DrvModbusRtu function blocks which are used for communication between PLC and each drive on Modbus RTU line. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive / device, so only one drive / device at a time is communicating with the PLC.

All the drives should be configured either in Classic Profile or Enhanced Profile and accordingly the function block DrvModbusRtuBroadcast should be parameterized. Mix of profile with few drives in Classic and few drives in Enhanced should not be used when using DrvModbusRtuBroadcast block, if using such configuration along with DrvModbusRtuBroadcast may lead to incorrect operation.
If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

The Modbus RTU broadcast job is sent to all devices on the same physical Modbus RTU line.
Therefore, if other Modbus devices than ACS / DCS drives are connected to the same line using the ModRtuToken communication block it's highly recommended not to use the DrvModbusRtuBroadcast function block.
This might only be used, if the user is aware about the behavior of the connected devices if they receive the Modbus broadcast job.

If a Modbus RTU broadcast job is sent to access a register in the drive which has no valid mapping information then Modbus broadcast job is not aborted but will just send out the broadcast message without any error in the function block. This broadcast message is ignored by drives which have no valid mapping information.

Therefore, the drive parameters in FBA DATA OUT have to be configured according to the used 'NvarWrite' input number respectively.

## DrvModbusReadWrite23

| DrvModbusReadWrite23 |  |
| :---: | :---: |
| Execute BOOL | BOOL Done |
| Prio BOOL | BOOL Busy |
| NvarRead UINT | BOOL Error |
| PrmNumRead UINT | ERROR_ID Errorid |
| DataRead DWORD | BOOL ModMastErrorAct |
| NvarWrite UINT | WORD ModMastErrorIDLast |
| PrmNumWrite UINT | BOOL WarnAct |
| DataWrite DWORD | WARNING_ID WarnIDLast |
| DriveData DrvDataType | BOOL JobDone |
|  | BOOL JobBusy |

The function block 'DrvModbusReadWrite23' reads and writes one or more parameters of the drive via DriveData connected to Modbus TCP / Modbus RTU communication blocks with Modbus function code FCT $=23$. This function block internally calls DrvModbusWrite to execute ReadWrite job with FCT $=23$, used along with the internal structure for Fct23, DrvModFct23Type.

The number of parameters to be read is specified at the input 'NvarRead'. The first address for read operation is specified at the input 'PrmNumRead'. The values of the data are stored in the PLC memory area, defined at the input 'DataRead'.

The number of parameters to be written is specified at the input 'NvarWrite'. The first address for write operation is specified at the input 'PrmNumWrite'. The values of the data that should be written must be stored in the PLC memory area, defined at the input 'DataWrite'.
To start a new ReadWrite job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the communication block DrvModbusTcp or DrvModbusRtu which is connected to the same DriveData variable. It uses the Modbus function code 23 (Read and write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

The values in the PLC memory area are updated when the ReadWrite job was performed without error. The ReadWrite job has been performed without error if JobDone = TRUE and ModMastErrorAct $=$ FALSE .

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

After termination of this job, even if it was not successful, a next ReadWrite job can once again only be started with a rising edge at 'Execute' input.

Drive parameters are only saved temporarily, if changed via fieldbus.
To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.
Please see drive manuals for the parameter details.
For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 -
Par $96.07=1$
For ACSM1, DCS800 and DCS550 - Par 16.06 = 1

## DrvControIModbusEng

| DrvControlModbusEng |  |
| :---: | :---: |
| Enable BOOL | BOOL Busy |
| Off1 BOOL | BOOL Error |
| Off2 BOOL | BOOL NoConToDrive |
| Off3 BOOL | BOOL ReadyOn |
| -InhibitOp BOOL | BOOL ReadyRun |
| RampOutZero BOOL | BOOL ReadyRef |
| RampHold BOOL | BOOL Tripped |
| RampInZero BOOL | BOOL Off2state |
| Reset BOOL | BOOL Off3State |
| ControlWordB8 BOOL | BOOL SwitchOnInhibit |
| ControlWordB9 BOOL | BOOL Alarm |
| RemoteCmd BOOL | BOOL AtSetpoint |
| ExtCtriloc BOOL | BOOL Remote |
| ControlWordB12 BOOL | BOOL AboveLimit |
| ControlWordB13 BOOL | BOOL ExtCtrilocact |
| ControlWordB14 BOOL | BOOL ExtRunEnable |
| ControlWordB15 BOOL | BOOL StatusWordB13 |

| ControlWord WORD | BOOL StatusWordB15 |
| RefValue1 INT | WORD ActStatusWord |
| RefValue2 INT | INT ActValue1 |
| DriveData DrvDataType | INT ActValue2 |
|  | WORD UsedControlWord |

The function block "DrvControlModbusEng" is designed for user specific control of the drive by setting the control word (CW) by the user itself in the program.
Therefore, the user should have a detailed knowledge of the ABB drives profile handling.
The reference and actual values must be given in fieldbus equivalent, e.g. range -20000 ... +20000.

Inputs "RefValue1", "RefValue2" and the generated control word are written to the "DriveData" variable which transfers these values to a communication function block, e.g. "DrvModbusRtu", "DrvModbusTcp" or "DrvModbusRtuBroadcast" communication function block writes to the drive. In the same way "ActValue1", "ActValue2" and the status word are transferred from the communication function block to the "DrvControlModbusEng" block, where they are written to the outputs.
The control word can be generated in 2 ways.
First way is to set the single bits of the control word separately at the inputs "Off1", "Off2" ... "ControlWordB15" while the input "UseControlWord" = FALSE.
Second way is to set the input "UseControlWord" = TRUE and write the control word as a whole word directly to the input control word. The generated control word is written to the "DriveData" variable and for diagnosis purpose also available at output "UsedControlWord".
The input and output names of the bits in control word and status word reflect the functions used with ABB Drive Profile. So the block should be used with ABB Drives Profil setting in the drive.

The function block does not execute any functionality expect data transfer to and from the "DriveData" variable. There is no special drive parameter setting necessary to use this block.
The programmer using this block should have a detailed understanding of how to set the control word according to the status word and the description of the used drive.
For standard speed and torque control application it is recommended to use the "DrvControlModbusACS" instead.

## DrvControlCANCiA402

| DrvControlCANCiA402 |  |
| :---: | :---: |
| Enable BOOL | BOOL Busy |
| -SwitchOn BOOL | BOOL Error |

|  | BOOL StatusWordBit13 |
|  | BOOL StatusWordBit14 |
|  | BOOL StatusWordBit15 |
|  | WORD ControlWord |
|  | STRING(80) Message |

The function block "DrvControlCANCiA402" is used for the control of ABB ACS Drive or nonABB drives from AC500 using CANCiA402 Profile. The CANopen CiA402 function block and visualization from the library can also be used for the 3rd party drives which comply to the CANopen CiA402 Profile.

## DrvPNRead

Function block "DrvPnRead" reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be read is specified at the input Nvar.
Parameters to read from the drive are specified at the Data input. "DrvPbPnPrmDpv1DataType" structure must be declared to a variable and connected to Data input using ADR. This structure contains the group, index, which must be given to the variable. Read parameter type and values are stored in the same variable.
"DrvPdPrmDpv1DataType" structure has the following array elements:

## ⓨ Chapter 6.5.4.4.4 "Structure: DrvPdPrmDpv1DataType" on page 3832

- "abyPrmGroup": Array of 37 WORD for specifying parameter group.
- "abyPrmIndex": Array of 37 WORD for specifying parameter index.
- "abyPrmType": Array of 37 DRV_PDRIVE_PRM_TYPE. READ parameter data type will be available here. For details refer to DRV_PDRIVE_PRM_TYPE. If a type is set here at the start, it can be compared with the type read from the drive if the compare input is TRUE.
- "adwPrmValue": Array of 37 DWORD. Read parameter value will be available here. If a value is set at the start, it can be compared with the value read from the drive if the compare input is TRUE.

## Read errors:

If the drive rejects to read a specific parameter, it returns the error code DRV_ERROR_PRM (16\#44) in the corresponding abyPrmType element and a more specific error value in the corresponding adwPrmValue element.

The number of elements with errors from the drive are given at the output "NumPrmErrors". The output "PrmErrCmpValues" gives an array, which contains the more specific error values in the elements (index). This can be used to quickly identify the erroneous elements.

## Compare input:

As the "DrvPnWrite" function block does not return an error in case a parameter in the drive could not be written correctly it is recommended to verify the writing.
This can be done with the call of this function block "DrvPnRead" if the same parameters, types and values are connected to the DATA input (use the same struct as for the writing), and the input "Compare" is set to TRUE.

Then the types and values of the connected struct are copied at the rising edge of execute inputs and compared with the returned types and values from the drive.

In case of a difference this is set into the corresponding element of the output array "PrmErrCmpValues" with the possible three error codes DRV_CMP_DIFF_TYPE, DRV_CMP_DIFF_VALUE or DRV_CMP_DIFF_TYPE_AND_VALUE

## Mode input:

- Mode $=16 \# 00=>$ Read direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the "Data.awPrmGroup" and "Data.awPrmIndex" array. (Number of Elements in the PN Data block is set to 16\#01)
- Mode $=16 \# 01 \Rightarrow>$ Read direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the "Data.awPrmGroup" and "Data.awPrmIndex" array. (Number of Elements in the PN Data block is set to 16\#01)
- Mode $=16 \# 1 \mathrm{x}=>$ to be used to access "PROFIDrive" parameters with Attribute $=16 \# 10$ (Value) and Number of Elements $=x$.
- Mode $=16 \# 2 x=>$ to be used to access "PROFIDrive" parameters with Attribute $=16 \# 20$ (Description) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
- Mode $=16 \# 3 x=>$ to be used to access PROFIDrive parameters with Attribute $=16 \# 30$ (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
For "PROFIDrive" parameters using Mode $=16 \# 1 \mathrm{x}, 16 \# 2 \mathrm{x}$ or $16 \# 3 \mathrm{x}$ the Number of Elements $=$ $x$ is used for all the parameters in the Data array.

## DrvPnWrite

| DrvPnWrite |  |
| :---: | :---: |
| [Execute BOOL := FALSE] | BOOL Done |
| CmDevice AC500_IoDrvCM579Profinet.IDeviceCM579Profinet | BOOL Busy |
| DevName STRING(INT\#240) | BOOL Error |
| [DevSlot UIVTT : $=1$ ] | ERROR_ID ErrorID |
| [DevSubSlot UIVT := 1] | AC500_CM579Profinet.ERROR_ID AddErrorID1 |
| [Mode BYTE :=0] | UDINT AddErrorID2 |
| [MaxRetries BYTE :=4] | DWORD Status |
| [WaitTimeRetry WORD $:=200$ ] | WORD AddVal1 |
| Nvar BYTE | WORD AddVal2 |
| Data DWORD | UINT PackageSize |

Function block "DrvPnRead" reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be written is specified at the input Nvar.
Another limit while using the "DrvPnWrite" function block is, it can process only up to 240-byte data in one request or 37 drive parameters whichever is lower. If the write data length is more than 240 bytes, the function block generates an error code WRITE_PACKAGE_SIZE_TOO_LONG 16\#0004. At the output "PackageSize" the precalculated size of the request is shown.
Parameters to write to the drive are specified at the data input. "DrvPdPrmDpv1DataType" structure must be declared to a variable and connected to data input using ADR.
"DrvPdPrmDpv1DataType" structure has the following array elements:
② Chapter 6.5.4.4.4 "Structure: DrvPdPrmDpv1DataType" on page 3832

- "abyPrmGroup": Array of 37 WORD for specifying parameter group.
- "abyPrmIndex": Array of 37 WORD for specifying parameter index.
- "abyPrmType": Array of 37 DRV_PDRIVE_PRM_TYPE for specifying parameter type, refer the respective drives manual for parameter data type and enter the respective enumeration. For details about enumeration refer DRV_PDRIVE_PRM_TYPE in the library.
- "adwPrmValue": Array of 37 DWORD for specifying parameter value that should be written.

The values in the structure area are updated when the write job was performed without error. This is indicated by Done=TRUE.

## Mode input:

- Mode $=16 \# 00=>$ Write direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the "Data.awPrmGroup" and "Data.awPrmIndex" array. (Number of Elements in the PN Data block is set to 16\#01)
- Mode $=16 \# 01=>$ Write direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the "Data.awPrmGroup" and "Data.awPrmIndex" array. (Number of Elements in the PN Data block is set to 16\#01)
- Mode $=16 \# 1 \mathrm{x}=>$ to be used to access "PROFIDrive" parameters with Attribute $=16 \# 10$ (Value) and Number of Elements $=x$.
- Mode $=16 \# 2 x=>$ to be used to access "PROFIDrive" parameters with Attribute $=16 \# 20$ (Description) and Number of Elements $=x$. (Not supported with Fxxx or Rxxx modules)
- Mode $=16 \# 3 x=>$ to be used to access PROFIDrive parameters with Attribute $=16 \# 30$ (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)

For "PROFIDrive" parameters using Mode $=16 \# 1 \mathrm{x}, 16 \# 2 \mathrm{x}$ or $16 \# 3 \mathrm{x}$ the Number of Elements $=$ x is used for ALL the parameters in the Data array.

### 6.5.4.4.2 Function: DrvModPara32Bit

Creates the Modbus address for 32-bit parameters of the ACSxxx drives.
To access 32-bit parameters in ACSxxx drives using Modbus a special address calculation must be performed.
This block calculates the 6-digit address out of the 5-digit address used for 16-bit parameters.
Input is the 5-digit address: GGii, where GG = parameter group and $\mathrm{ii}=$ the index.
E.g. Par $12.02 \Rightarrow$ address $=1202$.

Output is the calculated address for 32-bit parameters according to the following rule:
DrvModPara32Bit $=20000+(200$ * GG $)+(2$ * ii $)$ e.g. Par. $14.54 \Rightarrow$ output $=22908$
This output can be connected directly to the input "PrmNum" of one of the blocks DrvModbusRead or DrvModbusWrite or inputs "PrmNumRead" and "PrmNumWrite" of the block DrvModbusReadWrite23.

### 6.5.4.4.3 Structure: DrvDataType

Structure DrvDataType is used for the DriveData variable to exchange the data for one drive.
Structure DrvDataType is used for the DriveData variable which must be connected to all function blocks related to the same drive.

Besides the element "sName" all variables should not be written by the user directly. They are read and written within the function blocks. The DrvDataType contains some more internal, invisible variables which are used for internal functionality and not meant for user access.

The following table shows the visible variables of DrvDataType.

| Variable | Data Type | Default value | Description |
| :--- | :--- | :--- | :--- |
| wStatusWord | WORD | 0 | Actual status word from drive |
| iActValue1 | INT | 0 | Actual value1 from drive - mostly equal speed |
| iActValue2 | INT | 0 | Actual value2 from drive - mapping is made in drive <br> configuration |
| wControlWord | WORD | 0 | Control word to drive |
| iRefValue1 | INT | 0 | Reference value1 to drive - mostly speed reference |
| iRefValue2 | INT | 0 | Reference value2 to drive - mapping is made in drive <br> configuration |
| xOnline | BOOL | FALSE | Connection established - set in Modbus communication <br> function block after successful reading and writing one <br> Modbus job |
| xCtrlBlockUsedf | BOOL | FALSE | A control block is used to generate the control word, <br> ref1 and ref2 values |
| sName | STRING | 'Default <br> Drive Name' | Name for drive, which can be set by user directly to <br> DriveData variable |

### 6.5.4.4.4 Structure: DrvPdPrmDpv1DataType

Structure "DrvPdPrmDpv1DataType" is required to exchange the data between AC500 and drives using the PROFINET communication. "DrvPdPrmDpv1DataType" structure must be declared to a variable and connected to data input using ADR in the "DrvPnRead" or "DrvPnWrite" function blocks.

| Variable | Data Type | Default value | Description |
| :--- | :--- | :--- | :--- |
| awPrmGroup | ARRAY [1..37] <br> OF WORD | $[37(0)]$ | ABB drive Group number from where the parameter to <br> read or write - Profidrive Parameter Index. |
| awPrmIndex | ARRAY [1..37] <br> OF WORD | $[37(0)]$ | ABB drive index number from where the parameter to <br> read or write - Profidrive Parameter Subindex. |
| abyPrmType | ARRAY [1..37] <br> OFDRV_PDRI <br> VE_PRM_TYP <br> E | $[37($ DRV_EMP <br> TYPRM) $]$ | Parameter Type in array. While using read block it will <br> act as an output (and input ar start of block with Com- <br> pareTRUE). While using write block it will act as an <br> input. |
| adwPrmValue | ARRAY [1..37] <br> OR DWORD | $[37(0)]$ | Parameter Value in array. While using read block it will <br> act as an output (and input at start of block with Com- <br> pare=TRUE). While using write block it will act as an <br> input. |

### 6.5.4.5 Limits for the data read and write between AC500 and drives

The below table defines the limits for the reading of data from the drive and limits for writing data to drives from AC500 with cyclic data exchange.
If fieldbus adapter Plug (FBA) is used, then parameter group FBA DATA IN (e.g. 52) and group FBA DATA OUT (e.g. 53) is accessed in the drive. For the embedded fieldbus (EFB) parameters are used in EFB group (e.g. 58).
According to the table below, limits are defined for the variables 'NVarRead', 'NVarWrite' in DrvModbusRtu and DrvModbusTcp blocks.

| Drive | Fieldbus Adapter (FBA) |  | Embedded Fieldbus <br> (EFB) |
| :--- | :--- | :--- | :--- |
|  | Data In (Group 52) | Data Out (Group 53) | Data I/O (group 58) <br> Configurable as input <br> or output. |
| ACS380 | 12 | 12 | 14 |
| ACS480 | 12 | 12 | 14 |
| ACS580 | 12 | 12 | 14 |
| ACQ580 | 12 | 12 | 14 |
| ACH580 | 12 | 12 | 14 |
| ACS880 | 12 | 12 | 24 |
| ACSM1 | 12 | 12 | Not supported |
| DCS550 |  |  |  |
| DCS800 |  |  |  |
| DCS880 | 12 | 12 | 24 |

### 6.5.5 Application libraries

Application libraries can be used in AC500 V3 PLCs. The requirements for the use of the function blocks of the application libraries and information and prerequisites for the general handling of application libraries are described in the application examples:

HTTP library In order to be able to use the PLC as a client for web services, the HTTP function block library can be used. Setup and use of the HTTP library are described in the application example AC500 Webservices - HTTP Function Block Library.

MySQL library With the help of the MySQL function block library, MySQL databases can be used to store and access AC500 V3 data. Setup and use are described in an application example.

MSSQL library With the help of the MSSQL function block library, MSSQL databases can be used to store and access AC500 V3 data. Setup and use are described in an application example.

### 6.5.6 BACnet-BC

### 6.5.6.1 Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.
The BACnet protocol defines services to allow communication between devices. Examples include 'Who is', 'I am', 'Who has' and 'I have' for device and object search and identification, "Read Property" and "Write Property" for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.
More background information and introduction can be found here:
http://www.bacnet.org
http://www.bacnet.org/Bibliography

### 6.5.6.2 AC500 and BACnet

A BACnet device can be described by its "BACnet Interoperability Building Blocks" (BIBB)s, which are needed to establish services. They are grouped in different areas:

- "Data Sharing" (DS)
- "Alarm and Event Management"(AE)
- "Scheduling" (SCHED)
- "Trending" (T)
- "Device and Network Management" (DM)
"Data Sharing" for example contains two BIBBs which are needed for the "Service Read Property":
- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. "BACnet Simple Sensor" (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

|  |  | CP600 | AC500 V3 |  | AC500 V2 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | DM-BR-A | 11  <br> 1 1 <br> 1  | DM-BR-B |  |  |  |  |

The AC500 V2 supports BIBBs qualifying it as "BACnet Application Specific Controller" (BASC), by installing the BACnet B-ASC library.
AC500 V3 supports many more BIBBs qualifying it as "BACnet Building Controller" (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

| DS-COV-A, -B | (Change of Value-A, -B) |
| :--- | :--- |
| DS-COVP-A, -B | (Change of Value of Properties-A, -B) |
| AE-N-E-B | (Alarm and Event-Notification External-B) |
| AE-ASUM-B | (Alarm and Event-Alarm Summary-B) |
| SCHED-I-B | (Scheduling-Internal-B) |
| T-VMT-E-B | (Viewing and Modifying Trends External-B) |
| DM-TS-B | (Time Synchronization-B) |
| DM-UTC-B | (UTC Time Synchronization-B) |
| DM-MTS-A | (Manual Time Synchronization-A) |
| DM-LM-B | (List Manipulation-B) |
| DM-OCD-B | (Object Creation and Deletion-B) |
| NM-BBMDC-B | (BBMD Configuration-B) |

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICSAC500_V3.pdf. Direction: Help/Project examples/Examples.
The figure below shows a typical application for an AC500 V3, acting as B-BC.

A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as "Analog Input" (AI) object on the MS/TP network.
\& Chapter 6.5.6.3.2 "Supported BACnet networks" on page 3835
AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as "Analog Value" (AV) object and as "Trend" object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects "Analog Value" and "Trend" for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.

### 6.5.6.3 AC500 V3 as BACnet Building Controller (B-BC)

### 6.5.6.3.1 General

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

### 6.5.6.3.2 Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS-485
- BACnet IP, based on Ethernet / UDP / IP

Different networks can be combined to one common "BACnet internetwork". The figure above shows an example of some BACnet devices in one "BACnet internetwork". Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example "BACnet internetwork" consists of different BACnet networks:

- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2,3 in the example). ${ }_{y}{ }^{\circ}$ Chapter 6.5.6.3.5.5 "Configuration of datalinks" on page 3844
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.
\# ${ }^{\sharp}$ Chapter 6.5.6.3.5.5 "Configuration of datalinks" on page 3844
To form a common "BACnet internetwork" the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).
Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.

|  |  |  |  | BACnet network \#2 (IP) |  |  |  | BACnet network \#3 (IP) |  |

The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by "Broadcast Management Devices" (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.
An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in ${ }^{\mu} \Rightarrow$ Chapter 6.5.6.3.5.5 "Configuration of datalinks " on page 3844.

### 6.5.6.3.3 Supported objects and properties

Communication with BACnet is done through objects and properties.
The AC500 B-BC server of the figure below is represented as a BACnet device object with "ID 12". The device contains more objects like the Analog Input object, representing the input of a temperature measurement device. An object contains several properties, like "ID, Description, Present Value, Unit" etc.

Further possible objects of an AC500 B-BC are:

- "Binary Input" for example from connected to a switch
- "Analog / Binary Output" for actuators
- "Analog / Binary Values" for local variables
- "Calender"
- "Schedule"
- "Trend Log"
- ...
- A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICSAC500_V3.pdf. Help/Project examples/.

Fig. 286: BACnet objects, properties, services and BIBBs

### 6.5.6.3.4 Supported BIBBs and services

While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 286 BACnet objects, properties, services and BIBBs shows a simple "Service Read Property" which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request "Read Property", asking for the present value of the "Analog Input" of object with "ID 1010".
2. The server answers with an acknowledge, sending the present value which is $21,89^{\circ} \mathrm{C}$ in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

## 6．5．6．3．5 BACnet configuration in Automation Builder

## General

To act as a BACnet server or client，the AC500 must be configured accordingly．The figure below shows the basic configuration of a BACnet server（left）and a BACnet server with client functionality（right）．It is also possible to have server and client functionality in parallel．

```
-17) Device_12 (PMS650-2ETH - TB5620-2ETH)
    * 副 PLClogic
        道 Io_8us
    - 目っ Interfaces
```

 Following objects need to be created：
1 ＂BACnet Server＂root object．This is the root object for the server functionality，as well as for the client functionality．It is mandatory，even if only client functionality is required．$\Leftrightarrow$ Chapter 6．5．6．3．5．2＂Configuration of BACnet server root object＂on page 3838
2 BACnet server objects，for example＂BACnet Analog Input＂Temperature．The properties of the objects must be controlled（written or read）by the PLC logic．${ }^{\wedge} \Rightarrow$ Chapter 6．5．6．3．5．3 ＂Adding BACnet server objects＂on page 3840
3 BACnet client objects，represented by a different symbol．For example，＂BACnet Client Read Property＂．The functionality of the client objects must be programmed in the PLC logic． Inserting the client objects below the server is optional．It is also possible to instantiate the objects only in a PLC logic．${ }^{*}>$ Chapter 6．5．6．3．5．4＂Adding BACnet client functionality＂ on page 3841
4 Datalink for the physical layer．This object links the physical interface（Ethernet IP or serial MS／TP）to the＂BACnet Server＂object．In the example above the IP address of ETH1 is automatically retrieved by inserting the＂BACnet IP datalink＂below the ETH1 port．\＆＂Con－ figuration of an IP datalink＂on page 3845．For MS／TP refer to ${ }^{*}$＂Configuration of an MS／TP datalink＂on page 3844.

## Configuration of BACnet server root object

1．Create an empty project with an AC500 V3 CPU type and call it fpr example＂Device＿12＂．
2．Insert a＂BACnet Server＂object below the interfaces object in the device tree．

| Devices | Add object below ：Interfaces |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |
|  | Object path： |  |  |  |  |  |
|  | Device＿12IInterfaces |  |  |  |  |  |
|  | Object name：BACnet＿Server |  |  |  |  |  |
|  | Categories | $\checkmark$ | Search object name |  |  |  |
|  | $\begin{aligned} & \text { Scripting } \\ & \text { Uncategorized } \end{aligned}$ |  | Name | Short Description | Version | Order Number |
|  |  |  | BACnet Server |  | 1．5．2．1 |  |

3. Set the device InstanceNumber in the "BACnet Parameters" of the "BACnet Server", e.g. to 12 and the InstanceName to Device_12 (according to Fig. 286 BACnet objects, properties, services and BIBBs).

| Devices $\quad$ - $\quad \mathrm{x}$ | BACnet_Server $\times$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | BACnet Parameters | Parameter UsedBACnetStringType |  |  |
|  |  |  | Type | Value |
|  | BACnet IEC Obje |  | Enumeration of DINT | BACNET_STRING_U... |
|  | BACnet IEC Objects | - SupportUnsolicitedCOV | BoOL | FALSE |
|  | Status | - HideToOutside | BOOL | FALSE |
|  |  | - AutoStart | BOOL | true |
|  | Information | AutoGenerateBACstackConfig | BOOL | true |
|  |  | -- Device Properties |  |  |
|  |  | $\pm$ propertyAttributes |  |  |
|  |  | - InstanceNumber | DWORD | 12 |
|  |  | - InstanceName | WSTRING(255) | 'Device_12" |
|  |  | - SystemStatus | Enumeration of DINT | DEV_OPERATIONAL |
|  |  | - VendorName | WSTRING(255) | "ABB" |
|  |  | - Vendoridentifier | UDINT | 808 |
|  |  | - ModelName | WSTRING(255) | 'PM5650-2ETH" |
|  |  | - FirmwareRevision | WSTRING(255) | ${ }^{*}{ }^{*}$ |
|  |  | - ApplicationSoftwareversion | WSTRING(255) | "1.14.1.1.5.2.1" |

4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below ETH1. Default parameters are sufficient if only one datalink is used.
« "Configuration of an IP datalink" on page 3845
Devices
5. Build the project, download to the PLC and set it to [RUN]. The status of the "BACnet Server" should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select [Show license information] from the runtime licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.
«y Chapter 6.3.2.2.2 "PLC runtime licensing" on page 1446

6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

## Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 286 BACnet objects, properties, services and BIBBs, left part containing a temperature value.

1. Configure a "BACnet Server" root object according to ${ }^{\wedge}>$ Chapter 6.5.6.3.5.2 "Configuration of BACnet server root object " on page 3838.
2. Add a "BACnet Analog Input" object below the "BACnet Server".

3. Rename it to Temperature, adjust the parameters: InstanceNumber: 1010, Description: Temperature, Units: UNIT_DEGREES_C.

4. The present value of the objects Temperature needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.

5. Download the program and observe the temperature value in the BACnet client.

| S Inneasoft BACnet Explorer (Free Edition) |  |  |  |
| :---: | :---: | :---: | :---: |
| File View ? |  |  |  |
|  |  |  |  |
| Favorites <br> Local network <br> Device_12 <br> © Alarms <br> - COV subscriptions <br> Analog Input <br> Temperature <br> Device | Id | Name | Value |
|  | 85 | Present Value | 25,36049 |

|  | 103 | Reliability | no-fault-detected (0) |
|  | 357 | Reliability Evaluation Inhibit | False |
|  | 106 | Resolution | 0,1 |
|  | 111 | Status Flags | $\{0 ; 0 ; 0 ; 0\}$ |
|  | 113 | Time Delay | 0 |
|  | 356 | Time Delay Normal | 0 |
|  | 117 | Units | ${ }^{\circ} \mathrm{C}(62)$ |
|  | 118 | Update Interval | 0 |
| Number of properties : 33 |  |  |  |

## Adding BACnet client functionality

Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 286 BACnet objects, properties, services and BIBBs, right part.

1. Add a new controller and configure a "BACnet Server" root object according to ${ }_{\xi}{ }^{\circ}$ Chapter 6.5.6.3.5.2 "Configuration of BACnet server root object " on page 3838.
2. Set InstanceNumber to 14 and InstanceName to Device 14.

3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a "BACnet Server". Add a "BACnet Client Read Property" below the "BACnet Server" node.

4. The created object "BACnet Client Read Property" generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.
In line 1-5 of the code part the function block is called with the following parameter:

- Device ID of the server to read from (12) $\stackrel{y}{y}$ Chapter 6.5.6.3.3 "Supported objects and properties " on page 3837
- Object ID of the object to read from (1010 for the "Analog Input")
- Object type ("Analog Input")
- Property to read ("present value")
- triggerRead to start the read operation

When the user (or another program part) sets the variable triggerRead from FALSE to TRUE the edge triggered function block BACnet_Client_Read_Property starts operation and sends the read request to the server device. After receiving the reply from the Server, the output . xDone gets TRUE (line 8) and the temperature value can be read from the output. result (line 14).

5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting triggerRead to TRUE. In online mode the read temperature value can be observed in line 14.

Alternative con- Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a figuration client function block can be used without creating a BACnet client as device.

There is no BACnet_Client_Read_Property object created below the "BACnet Server". Instead a function blōck BACnēt clīent Read Property must be declared in the PRG (line 6 in the declaration) and initially "connected" to its "BACnet Server" in IEC-code via RegisterToServer (), and thus get activated (line 2 in the code) $\left.{ }^{\circ}\right\rangle$ Chapter 6.5.14 "Reference, function blocks" on page 4086.

## Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.
${ }^{\wedge}$ Chapter 6.5.6.3.2 "Supported BACnet networks" on page 3835
For a non-routing device one MS/TP or IP datalink must be configured.
If more than one datalink is configured, routing between the datalinks is automatically enabled.

Configuration of • Add the "BACnet MS/TP COM" object below the COM port. an MS/TP datalink

In fact the empty COM port is replaced by the "BACnet MS/TP COM". By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

- Below the "BACnet MS/TP COM" port object an "BACnet MS/TP datalink" is inserted automatically which can be configured according to the requirements.

| Devices $\quad \square \mathbf{~}$ | BACnet_MS_TP_datalink $\times$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
|  | BACnet MS/TP Parameters | Parameter | Type | Value |
|  |  | - DeviceName | STRING | '/dev/tty 00 ' |
|  | BACnet MS/IP IEC Objects | - NetworkNumber | WORD | 1 |
|  | Status | - ConnectionType | Enumeration of USINT | Master |
|  |  | - Baudrate | Enumeration of UDINT | 19200 |
|  | Information | - ReplyTimeout | UDINT | 250 |
|  |  | - TokenTimeout | UDINT | 20 |
|  |  | - DatalayerAdress | UDINT | 1 |
|  |  | - MessageQueuelength | WORD | 50 |

- NetworkNumber: Use the default value 1 if no routing is required. For routing, use a unique network number in one controller.
- ConnectionType: Use the default value Master if no routing is required. For routing, use "Master - answering always postponed".
- Baudrate can be set according to requirements in the range of from 9600 to $38400 \mathrm{bits} / \mathrm{s}$, higher values ( 57600 and 115200 bits/s) are not recommended.
- DatalayerAddress: This is the MAC address as described in $\Leftrightarrow$ Chapter 6.5.6.3.2 "Supported BACnet networks " on page 3835. The MAC address must be unique in the MS/TP network.
- For all other parameters the default values are recommended for typical applications.

Configuration of - Add a "BACnet_IP_datalink" object below the Ethernet port ETH1 or ETH2. an IP datalink

- NetworkNumber: Use the default value if no routing is required. For routing, use a unique network number in one controller.
- UPDport: Use the default value (47808 decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in ${ }^{7}$ Chapter 6.5.6.3.2 "Supported BACnet networks " on page 3835. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (ETH1 or ETH2); its IP address is set in the communication settings of the CPU node, "Device_14" in the example.
- ForeignDevice and BBMD: Special configuration is only needed if an internet router is located between two BACnet devices.
«4 Chapter 6.5.6.3.2 "Supported BACnet networks" on page 3835
AC500 can be configured as ForeignDevice or BBMD, but not the combination of both. An example for BBDM can be found in the example folder.

Configuration of Routing enables the combination of different BACnet networks to one common "BACnet Routing internetwork".
ⓨ Chapter 6.5.6.3.2 "Supported BACnet networks" on page 3835
BACnet devices from different BACnet networks can communicate with each other.
If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

* Chapter 6.5.6.3.2 "Supported BACnet networks" on page 3835

For MS/TP the ConnectionType must be set to "Master - answering always postponed". An example for routing can be found in the example folder.

## Time syncronisation

The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0 . This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.

Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab "PLC Shell":

Set the time by the command "time hh:mm:ss"

- Read the local time from the Automation Builder Tab "Statistics":
"Current PLC Date and time" shows the PLC time as local time without conversion, if the tab "Show PLC time in UTC" is enabled.

For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab "Statistics"), since this is always converting from local time to UTC time.

- BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0 .
- If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.
Please contact the PLC support for more information.

### 6.5.6.3.6 Package content

## General

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
- BACnet plug-in component
- Device descriptions for "BACnet Server", BACnet objects, BACnet client and datalinks
- Libraries: BACnet, BACnetDefaultImpl and CmpBACnet.乡 Chapter 6.5.6.3.6.2 "BACnet libraries" on page 3847

Example folder - Example folder

- Examples and example documentation \# ${ }^{\text { }}$ Chapter 6.5.6.3.6.3 "Application examples" on page 3848
- Datasheet and FAQ BACnet Protocol Implementation Conformance Statement (PICS), acting as a datasheet, describing all BACnet objects, services and communication capabilities. BACnet Conformance Certificate FAQ - Frequently Asked Questions, including AC500 specific information, performance and limit

## BACnet libraries

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods. The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application
Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefault Impl library.

The BACnetDefault Impl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
- Update of the date/time information of the device object

The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have "facade" functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- Starting and stopping the BACnet stack

Always use BACnetServer. StartBACnetStack and
BACnetServer.StopBACnetStack or AutoStart. Never directly use the corresponding
functions of the CmpBACnet library, such as CmpBACnet. BACnetServerInit.

- Using BACnet server objects and their properties

Always use the specified function blocks in IEC-lib-BACnet, such as BACnetAnalogValue. Never directly use the corresponding functions of the BACnet library, such as CmpBACnet. BACnetStorePropertyInstance.

- Triggering of asynchronous requests Always use the specified client function blocks of the BACnet library, such as BACnetClientReadProperty. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet. BACnetReadProperty. All functions of the CmpBACnet library that require a BACnetAsyncTransactionToken belong to this category and should never be used directly.
- Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application
Always use IBACnetEventConsumer and BACnetServer. RegisterHook/ UnregisterHook/RegisterCallback/UnregisterCallback. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet. BACnetSetHook or CmpBACnet. BACnetSetCallback.
When is it appropriate and safe to directly call the functions of the CmpBACnet library?
Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as BACnet*CbCompletion, BACnetIam(Ex), or BACnetIHave(Ex), BACnetUnconf*.

Most often, you will use BACnet*CbCompletion to implement your specific
IBACnetEventConsumer. BACnetEventCallbacks. But first check whether or not the BACnetDefaultImpl library already contains an appropriate standard implementation.

## Application examples

- AC500_V3_BACnet_B-BC_Example_ABxxx.project including simple read and write

- Use case 1: AC500 as BACnet client, read and write (with priority)
- Use case 2: AC500 as "BACnet Server", publish the analog value
- AC500_V3_BACnet_B-BC_Example_Routing_ABxxx.project
- Examples from 3S, including
- Read and write operations with more options, notification class, calendar, scheduler, etc.
- Device discovery
- BBMD
- Persistence
- Logging
- Routing

### 6.5.7 CAA library guidelines

With the help of the CAA library, different use cases for dealing with AC500 PLCs can be programmed. Function block descriptions for the CAA library can be found in the Library Manager.
The guidelines for the CAA libraries correspond to the general guidelines for library development. For a detailed description see help chapter Guidelines for Library Development.

By using the CSV read function, information from CSV or other formatted DAT files can be read into Structured Text. This use case is described in an application example.

Procedures how to handle files with the CAA library in order to write, read and append files are given in an application example.

### 6.5.8 Data Logger Library

### 6.5.8.1 Overview

The AC500 "Data Logger Library" package (PS5609-Log) contains the:

- "DataLogger" and "DataLoggerEco"library (licensed)
- "Multilogger" library (technology preview, documentation in the examples folder)

The data logging function block library ("DataLogger" and "DataLoggerEco") contains 5 function blocks for the purpose of advanced time-stamped data logging for different use cases.
In the most challenging use case, it also can be called buffering:
The AC500 application program generates or receives data which are normally transmitted to a telecontrol system for storage (historian databases) and further processing or displaying to the end user (SCADA, reporting). Typically, these may be remote applications like wateror oil-pumping or electrification stations or solar power plants. The connection between these remote stations with an AC500 and a central SCADA/telecontrol station is not always stable (mobile or wired internet) or only sporadically connected. Sporadically connected can be by intention, e.g. to save communication costs or open ports/connections to be used with a control station only in a limited way. Still owners or even authorities often require gapless data for compliance/prove of correct operation, billing or other purposes.

- Then the data logging function blocks buffer or store data in case of a broken or intentionally interrupted connection between AC500 and the telecontrol system and automatically retrieves and resends the data once online again and/or requested, while already newer data has to be buffered in parallel.

Fig. 287: Overview
1 AC500 application (remote substation)
2 Telecontrol (control station)

- The "Data Logger Library" can be also used as an event recorder. In this special mode data is continuously recorded in a ring buffer which can be read out after a certain event $x$ (e.g. outage) in order to analyze the values especially before but also after the event $x$.
OR
- Data can be logged only (and on command transferred to the FTP area to be analyzed offline or taken out via the memory card).

The following figure gives an overview of the described interaction of the data logging function blocks. There is always an input function block ("Logxx_Input") needed which transfers the input data into data sets with timestamp for use by the data logger ("LogHandling"). An output function block (Logxx_Output) receives the current or retrieved data from the data logger in case of communication or further processing. The input function blocks "Logxx_Input", the function block "LogHandling" and the output function blocks "Logxx_Output" communicate via SRAM FIFOin and FIFOout areas in the memory. The SRAM FIFOin is power-fail-safe intermediate buffer and help in decoupling time wise and speeding up the necessary write/read operations on the logging file structures significantly. These read/write operations on the files are done in blocks of data sets, enabling a comparably fast interaction with the otherwise slow file system.

Fig. 288: Overview function blocks
Each data logger application requires the main function block "LogHandling", one of the input function blocks to provide data to be logged and one output function block to retrieve the data and send the data to telecontrol (SCADA).
As input and output function blocks 2 different types exist:

- For data logging of an interrupted IEC 60870 communication, the function blocks "Loglec60870_Input" and "Loglec60870_Output" are provided. The IEC 60870 data logging function blocks support the IEC data types and work internally with the standard AC500 IEC 60870 library. The IEC data logging output function block does not need special handling or control/inputs.
- For other types of general data "LogGeneric_Input" and "LogGeneric_Output" are provided. The generic data logging function blocks support an even larger variety of data types. The generic output function block needs to be handshake with for each data set, in order to retrieve the data from the data logging files. Therefore the generic function blocks can also be used to integrate the data logging into any other protocol, e.g. Modbus.
The function block "LogHandling" ensures that also several consecutive and fast interruptions can be handled without losing data. While the log file is replayed, arriving new data is stored in the SRAM FIFOin and added to the data logging files in parallel (File FIFO) if the SRAM FIFOin becomes full (during that short time the log file replay is paused). Nevertheless any data send to a control station via a communication is always with the oldest data first (FIFO = "First In First Out").

As for normal Ethernet default setting it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols the following has to be done):

- The data rate at which data might have to be buffered in case of a communication break has to be estimated and possibly minimized, especially the threshold option has to be checked carefully if used. A worst case test is advised with the application if in doubt.
- Ping mechanism should be used in the substation. This is done in the example program for the IEC logger. With this ping the interruption is detected much faster e.g. here after 1-2 seconds (can be configured in the example program - the configurable "SecureReadTime" must be considered in this context. This ensures that the time delay - before a loss of connection is detected and is compensated).

As the SRAM FIFO has to store data during this time its size limits the data rate. The SRAM FIFO size is 160 data sets (or 60 data sets on AC500-eCo). If data rate is too high, FIFO will overflow. The maximum data rate is depending on the CPU type, storage media (memory card/flash disk) and cycle time configured, and must be determined by trial and error if high.

The data rates for storing only without this detection can be much higher and depends on the CPU and memory type chosen. The data is always logged in directly readable csv format.

② Chapter 6.5.8.6 "CSV file formats" on page 3856
Depending on the input function block and data type, the log file contains only one or up to 32 data variables per timestamped data set. The data logging files can be configured (up to 65 k data sets per file, up to 999 consecutive log files, file name extension).

### 6.5.8.2 Operating modes

This chapter describes the different operating modes of the data logging and their behavior.

- Mode 0/1: Buffer and disposal in chronologic order.
- Mode 0: Limited storage (keeps oldest, but stops if full).
- Mode 1: Endless (ring buffer) operation modes (deletes oldest).
- Mode 2: Buffer and disposal via FTP, Log file(s) copied to FTP server area for further use.
- Mode 3: Events recorder, logs data before and after an event.

Mode 0/1: Buffer and disposal in chronologic order

Fig. 289: Overview Mode 0/1
Mode $0 / 1$ is for buffering the values from the AC500 application in case of a broken or intentionally interrupted connection between AC500 and telecontrol. In the normal state 1 the values are directly sent from the FIFOin (input values from application) to FIFOout (telecontrol connection). As soon as the connection is interrupted, the data logging changes to working state 2 . The values are sent to the file FIFO instead. When the file FIFO is full, the data logging is stopped (Mode 0) or the oldest data will be overwritten (Mode 1 = ringbuffer). When the connection is established again and the "ReleaseHistory" pin is triggered, the data logging changes to working state 3. It cares for disposal of the values in chronological order. The buffered values
are written to FIFOout (working state 3a). This may take some time during which new values are coming from the application and stored into FIFOin. Before the FIFOin overflows the data logging switches to working state 3b and buffers the new values. After that it can continue with working state 3a. Only if the File FIFO is empty (all files deleted) the data logging changes back to normal state 1.
The advantage of Mode $0 / 1$ is that all values (directly and buffered) are sent to telecontrol in strictly chronological order which is expected by most control stations (SCADA systems/historians).
If a historical value is sent to the SCADA after a current value has already been sent, the historical value is normally rejected by the SCADA.

As it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols by the AC500 hardware/firmware), the data rate at which data should be logged in case of a communication break has to be calculated and limited. It therefore makes sense to use PING to detect a possible interruption in the connection. This enables an earlier detection of the connectionless state.

Mode 2: Buffer and disposal via FTP

Fig. 290: Overview Mode 2
Mode 2 is also used for buffering the values from AC500 application in case of a broken connection between AC500 and telecontrol. State 1 and state 2 are similar to Mode 0/1. The difference is the disposal. When the connection is established again the data logging changes directly back to state 1 and the input values in FIFOin are directly sent to FIFOout (telecontrol connection). The buffered values in File FIFO are internally moved from disk 1 to disk 2 which can then be accessed or used by FTP (client or server). This move action can also be triggered by the command "MoveFile", or when file 1 is full. The advantage of Mode 2 is the immediate availability of the latest and all current values after an outage.

## Use data logging for permanent logging

To use data logging for normal, permanent logging, set Mode $=2$ and make input "BreakConnect" = "TRUE" or "Connected" = "FALSE".

Mode 3: Events recorder

Fig. 291: Overview Mode 3
Mode 3 is used to record data values around an event, before and after the event $X$, e.g. outage of a part of the plant. The values are continuously recorded into the File FIFO file system independent of the connection status to telecontrol. If the File FIFO is full the oldest values are overwritten (ring buffer). Thus the file FIFO always contains the values from the past period $n$, which is depending on the number of values per second and on the size of the File FIFO. When a certain event $x$ occurs, the command "MoveFile" can be given directly or after the period $m$. With the command "MoveFile" the values in File FIFO are internally moved from disk1 to disk 2 and can be read out by an FTP action (client or server) when required.

Fig. 292: The buffered values represent the time before the event ( $n-m$ ) and after the event ( $m$ ).
The advantage of Mode 3 is that the values from the time period before the event ( $n-m$ ) and after the event ( m ) are recorded and can help to reconstruct the cause and effect of the event.

### 6.5.8.3 Technical details

| Parameter | Value |
| :--- | :--- |
| IEC 60870-5-104 protocol inte- <br> grated in data logging, IEC data <br> types | SinglePoint SP1/16, DoublePoint DP, IntegratedTotal <br> IT1/16, MeasurementValue ME1/16 |
| Generic logging to file(s); AC500 <br> data types | BIN, BYTE, INT, UINT, DINT, UDINT, REAL |
| Trigger | Cyclic, event, tolerance |

| Parameter | Value |
| :---: | :---: |
| File format | CSV, including local timestamp. Generic logging with separate ID (max. 8 characters), IEC logging with IEC addresses. <br> Timestamped data sets contain 1-16 values (IEC) depending on type logged. Generic contain different number of values, depending on type logged. <br> BINARY: max. 58 <br> BYTE: max. 88 <br> INT: max. 50 <br> UINT: max. 58 <br> DINT: max. 29 <br> UDINT: max. 31 <br> REAL: max. 27 |
| Data logging target | Flash disk, userdisk or memory card, power fail input for memory card (from UPS) |
| Data logging file sizes and storage depth | FIFO storage in file system, data logging depth only limited by memory size |
| Configurable file FIFO | Number of files (max. 999); number of data sets per file (max. 65535) |
| Internal SRAM FIFO size | 160 data sets (Standard AC500 PLC) <br> Maximum 60 data sets (AC500-eCo PLC) |
| Block write mode into files | Up to 50 data sets/second per max. 88 values |
| Operation modes | Mode 0: Buffer and disposal in chronologic order limited storage (keeps oldest, but stops if full) <br> Mode 1: Buffer and disposal in chronologic order endless (ring buffer) operation modes (deletes oldest) <br> Mode 2: Buffer and disposal via FTP, log file(s) copied to FTP server area for further use <br> Mode 3: Events recorder, logs data before and after an event. |
| Supported software/firmware | V3.4 or higher |
| Current restrictions | One data logger per PLC <br> One IEC 60870 connection only: While log file is replayed, no other current information via IEC available Usable solutions: <br> - Delay replay of log file after connection returned to allow a "general inquiry" <br> - Use of Mode 2 |

## Logging capacity:

- Data set: One data set always has 400 bytes.
- FIFOin: Has a maximum capacity of 161 data sets (a 400 bytes $=64400$ bytes).
- FIFOout: Has a maximum capacity of 161 data sets (a 400 bytes $=64400$ bytes).
- File: One file store up to 65535 data records, which are copied block by block from the FIFOin in case of a communication lost.
- A maximum of 999 files can be saved.

In purely mathematical terms, that would be 999 files * 65535 data sets * 400 bytes/data set $=$ $26,187,786,000$ bytes $=26 \mathrm{~GB}$.

Since neither the flash disk nor the usable memory card have such a capacity, the user has to find a sensible compromise. The flash disk as a storage medium is fail-safe, i.e. in the event of a sudden power failure, data in the possibly currently open file is reconstructed when the power is restored. This is not the case with a memory card. There the file is destroyed. It is therefore advantageous if such a variant is operated with a power supply that keeps the PLC alive for at least a few seconds after the supply voltage failure ("Input ExternalPower" on the "LogHandling" function block).

## Time synchronization:

Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0 . This will be improved in near future. In the meantime, it is recommended to store the local time in the AC500 as a workaround.
\#y Chapter 6.5.6.3.5.6 "Time syncronisation" on page 3845

### 6.5.8.4 File names

File names are renamed according to storing time with an accuracy of 100 ms . The files are renamed from "filename.csv" to a file name with timestamp and with or without file extension, according to input "Disk2Extension" is applicable only in Mode 2.

```
File name with 02281448.593 = February 28th, 2:48pm (14:48),59s, 300ms
timestamp
```

File name with $\quad 02281448 . c s v=$ February 28th, 2:48pm (14:48) timestamp and file extension

### 6.5.8.5 Preconditions

## CAUTION!

To avoid failure in processing of the function blocks.

- The function blocks LOGxxxxxx_Input, LogHandling and LOGxxxxxx_Output must be executed in the same task.

The "Data Logger Library" is supported in standard AC500 V3 PLCs, use the library "ABB_Datalogger_AC500".
The "Data Logger Library" can be used with AC500-eCo V3 - PM50x2-T-2ETH using the library "ABB_DataloggerEco_AC500".

- CPU firmware must be V 3.4 .0 or higher.
- Use memory card from ABB with sufficient free space, at least $1.5 \times$ file size as configured (file size is depending on input "MaxNumDatasetFile" from "LogHandling" function block).
- Maximum number of files (input of "LogHandling") is limited to 999. ABB memory card is formatted with FAT by default.
\& Chapter 5.2.9 "Storage devices" on page 1332

## Runtime License:

- To use the "Data Logger Library", runtime license must be activated in the PLC. Runtime license is separate for standard AC500 and AC500-eCo V3 PLC.
If using the:
- "ABB_Datalogger_AC500" library with standard PLC, use the PS5609-Log runtime license.
- "ABB_DataloggerEco_AC500" library with AC500-eCo V3 (PM50x2-T-2ETH), use the PS5609-Log-e runtime license (AC500-eCo library will not run on AC500 Standard), but PS5609-log license can also be used on AC500-eCo library).

### 6.5.8.7 Comparison V2 and V3 Data Logger Library package

List of differences between V2 and V3 "Data Logger Library".

| Feature | V2 data logger | V3 data logger |
| :--- | :--- | :--- |
| Package | Part of PS563-Water | PS5609-Log |
| Supported in AC500-eCo <br> PLCs | No | Yes (PM50x2-T-2ETH) |
| Buffer size | 160 data sets | AC500 - 160 data sets <br> AC500-eCo - Maximum 60 <br> data sets (default 50) |
| Storage area | Memory card, flash disk | Memory card, flash disk, user- <br> disk |

While updating the library from V2 to V3 platform some of the inputs and output names are adapted in the function blocks. List of adapted names as below, not mentioned variables remains unchanged.

| Function block | Variable type | V2 name | V3 name |
| :---: | :---: | :---: | :---: |
| LogGeneric_Input | Output | RDY | InExecution |
|  | Output | OV | Overflow |
|  | Output | DONE | Busy |
|  | Output | NUMBER_OV | NumberOverflow |
| LogGeneric_Output | Input | SENT | PickedUp |
|  | Output | WORD_ARRAY | UintArray |
|  | Output | DWORD_ARRAY | UdintArray |
|  | Output | - | Busy |
| LogHandling | Input | RESET | CleanAll |
|  | Input | QUIT |  |
|  | Input | DISK1 | NameDisk1 |
|  | Input | DISK2 | NameDisk2 |
|  | Input | DISK2_EXTENTION | Disk2Extension |
|  | Input | MAX_DS_IN_FILE | MaxNumDatasetFile |
|  | Output | DONE | Busy |
|  | Output | RDY | - |
|  | Output | OV | Overflow |
|  | Output | ENUM_ERROR | FileError |
|  | Output | FILE_NEXTWRITE | FileNextWritePosition |
|  | Output | FILE_NEXTREAD | FileNextReadPosition |
|  | Output | USED_FILES | NumberUsedFiles |
|  | Output | NUMBER_DIRECT_S ENDS | NumberDirectSendDatasets |
|  | Output | WRITETIME_DB_IN_FILE | WriteTimeDatablocksInFile |
|  | Output | $\begin{aligned} & \text { READ- } \\ & \text { TIME_DB_FROM_FIL } \\ & \text { E } \end{aligned}$ | ReadTimeDatablocksFromFile |

| Function block | Variable type | V2 name | V3 name |
| :--- | :--- | :--- | :--- |
|  | Output | MAXWRITE- <br> TIME_DB_IN_FILE | MaxWriteTimeData- <br> blocksInFile |

In all 5 function blocks, all the "INOUT" variables in V2 are changed as
"VAR_INPUT" variable in V3.

### 6.5.8.8 Examples

Example projects for the libraries can be found in the example folder: "Help
$\rightarrow$ Project examples" in the Automation Builder menu.
Prerequisite: Install the related library package with "Automation Builder
$\rightarrow$ Tools $\rightarrow$ Installation Manager" - [Modify].

### 6.5.9 High Availability Modbus TCP

### 6.5.9.1 HA-Modbus TCP - System technology

### 6.5.9.1.1 The AC500 High Availability system

The AC500 High Availability system is designed for the demand of automation systems that require a higher availability, which is realized by redundant devices and communications. The redundancy concept reduces the risk of losing production due to failure of parts of the automation system and thereby minimizes scheduled idle times.
For instance, control can be taken over by the secondary station automatically if the primary station fails.
AC500 High Availability system implements redundancy based on standard AC500 PLCs:

- PLC
- Field communication
- SCADA communication

General differences in high availability / redundancy systems are in which way and how fast the switchover between redundancies happens.

- Cold standby: A replacement system is there but not up and running - Process has (to allow) to completely stop for switchover - e.g. outputs may go to zero.
- Warm standby: Both CPU may be running (= warm) but e.g. communication need to be started/stopped for switch-over - Process needs to tolerate longer freeze times e.g. on outputs - e.g. several seconds.
- AC500 High Availability systems are "hot-standby":
- Redundant CPUs and all communications are always up and running (hot)
- Continuous failure detection in both CPU's and mutual exchange of status
- Continuous synchronization of critical/historical data from primary to secondary
- Automatic switch-over in very short time in case of any failure in primary CPU

Fig. 297: Principle AC500 HA-Modbus TCP architecture example based on Ethernet redundancy

Details of AC500 HA operation along the figure above:

- PLC redundancy: The two PLCs ( A and B ) are running in parallel and calculating and reading.
One is "primary" = active, which means also writing data to field devices.
The other one is "secondary" (= stand-by), also calculating but only reading data from field and receiving synchronization (or short = sync) data from the primary.
- Synchronisation data are critical internal variables with e.g. historical content, which will be transmitted from primary to secondary CPU over the sync connection, so that secondary always has the latest data and can take over immediately. Automatically synced are the historic data of the special HA library function blocks (like counters, timers, integral controllers, ...), additional Data e.g. of events and diagnosis can be synced by the user with sync blocks. The sync connection also transmits a "lifecom1" signal (back and forth) containing diagnosis data of each CPU, so that both CPU know the status of the other CPU. If secondary CPU receives no "lifecom1" anymore it assumes that primary CPU has a failure and takes over primary status. If the sync connection is broken both CPUs would try to adopt primary status, therefore, a parallel separate connection "lifecom2" is used to differential a "sync link" failure from an "other PLC" failure. The "lifecom2" should be routed via a different physical communication path than the data sync/lifecom1, e.g. the Field or SCADA network.
- The field I/O connection is performed via the Ethernet protocol ModbusTCP - connecting the CI 52 x devices (CI521 or CI522) * $乡$ Chapter 5.2.6.5.1 "CI521-MODTCP" on page 1070 \# ${ }^{4}$ Chapter 5.2.6.5.2 "CI522-MODTCP" on page 1111.

For high availability/redundancy of the field or SCADA network, proven Ethernet network redundancy mechanisms are used. (In AC500 this is assumed to be realized by at least 2 (to avoid a single point of failure) external, managed switches), which has the advantage to be able to use AC500 HA with any faster redundancy mechanism / protocol.

- For the I/O communication with CI52x modules two variants exist (see online help: PLC Automation with V2 CPUs $\rightarrow$ PLC integration $\rightarrow$ Device specifications $\rightarrow$ Communication interface modules (S500) $\rightarrow$ Modbus XY)
For smaller systems, the CI 52 x modules can be directly daisy chained (as in previous figure above) if MRP (Media Redundancy Protocol) or DLR (Device Level Ring) is used. Ci52x are not actively participating in ring recovery however, a special FW allows fast ring detection and very short freeze times. Larger systems with e.g. many IO and clusters typically anyway connect to the network via a dedicated managed switch.
- SCADA connection is redundant by nature of the two Ethernet ports and can be extended with further redundancy level as well by managed switches. SCADA itself can also switch the primary PLC to ensure communication to the active PLC in case of a simple connection and a connection failure. If the redundancy mechanism of the OPC DA server is not used, SCADA level itself must be able to handle and differentiate primary and secondary PLC and IP addresses based on the HA-status bits. For CP600 a script exists to do the same for Modbus or AC500 communication protocol.

In most PLC applications the critical components to fail are, beneath PLC, typically the power supply or communication components such as wires or switches. Therefore a SPOF (Single Point Of Failure) has to be avoided by adding redundant devices or redundancy functions wherever a failure likelihood is high and failures are not tolerable.
HA core functionality typically can tolerate only a single failure in the different levels. Then, a repair of the failed part is highly advised to achieve and ensure redundancy again. As shown in the above figure, the I/O-network cabling already provides a second independent redundancy layer e.g. for cable failure by its redundancy mechanism (e.g. ring), which can keep up communication without switching the PLCs: There a second failure in the PLC level could be tolerated as long as both connecting, managed switched still work, but it is highly advised to repair immediately anyway.

The AC500 High Availability system itself only takes care of the first fault. For example, in case of a second fault the primary PLC remains primary PLC until the second fault occurs. This results in no further switchovers (manual switchovers included).

Due to the efficient data sync mechanism, which allows data sync over normal and shared ethernet networks, with a well-planned communication network, the PLCs can operate geographically separated (by many $10^{\text {th }}$ of kilometers). So even in catastrophic events with full mechanical destruction still one PLC will be available to control the process or infrastructure.

The secondary PLC or single CI52x modules can be exchanged in a running system without interruption of the primary PLC or the process. (Check document in "Examples" directory of Automation Builder if HA package was installed.)

Libraries In order to achieve high availability, the CODESYS application must be enhanced with HA function blocks, from the HA-Modbus TCP library and the CI52x library. If the bulk data manager tool (BDM) is used for configuring the System and I/O modules - this is done automatically for the basic initial configuration step by code creation resulting in a prepared user specific "template" application (see below).

- HA-Modbus TCP library contains HA control and HA utility function blocks
- HA control function blocks manage the core HA functionality by collecting diagnosis and switching if necessary.
- HA utility function blocks provide standard functions in the application program with internal sync for integral data e.g. timers, counters, PI control.
- CI52x library contains a function block to configure and communicate to the communication interface modules and ensures that only the primary PLC writes to the outputs. The inputs are read by both PLCs.
- For both PLCs the same application must be used/downloaded.

Bulk data man-
For configuration of the CI52x Modbus TCPs, a separate Bulk Data Manager tool (BDM) is ager tool (BDM)
provided. Especially in larger systems usage of BDM is recommended to comfortably engineer HA and create CI 52 x related configuration and variable data in one place:

- Configuration and parameters of the used I/O modules
- Program code creation for variable naming, configuration, communication and all basic HA functionality
The BDM tool can serve SCADA programming and documentation as well in an efficient manner.

### 6.5.9.1.2 Hardware, requirements and options overview

## Introduction

Two same type AC500 PLCs are required as central hardware components. Each PLC is equipped with at least two Ethernet ports at a processor module or at a communication module. The two PLCs, called PLC A and PLC B, are linked by Ethernet to exchange and synchronize information (Sync). Connections to the AC500 peripheral field devices (I/O) are performed via Ethernet as well.
を) Further information on which CPU type and library to be used.
The following table gives an overview of the different High Availability variants possible with AC500.

The figures are indicative, depend on chosen architectures, system size, network and CPU/ communication modules used.

Table 742: Overview of AC500 HA systems and options

|  |  | HA-CS31 | HA-Modbus TCP |  |  |  |  |  |

${ }^{1)}$ Number of CI52x recommendation based on performance or max. number of sockets.
For more details of Modbus clients supported in AC500 V3 PLCs refer to 'Ethernet protocols and ports for AC500 V3' $ڭ^{*}$ Chapter 6.8.2.6.1.2.4 "Limitation of connections per protocol" on page 4484.
${ }^{2)}$ Limited by CPU performance, number of CM574 modules number of CS31 clients and process data limits.
${ }^{3)}$ Depends on system size and CPU type.

## 4) For details on certain S500-eCo modules not supported, see the Automation Builder release notes, Appendix 1.

${ }^{5)} 2 \mathrm{ETH}$ onboard ports - port extensions via CM5640-2ETH: 2 separate ETH ports/communication module for separate networks (no additional sockets or coprocessing, not switched, all ports in different subnets).
${ }^{6}$ ) Based on HA bits switchover, depending on failure case.
 configuration recommendations for HA system" on page 3884
${ }^{7}$ ) Field network: If CI 52 x are used with their 2 ports as part of a ring: In the moment of a network switchover single telegrams may be destroyed: - for V2 ETH onboard: Standard TCP delays repeats by 500 ms - for V3 CPUs onboard/CM5640 or V2 CPU using CM597: A special HA-FW ensures fast repeats of typ. $\sim 50 \mathrm{~ms}$ (settable).

## CPU choice, system size and performance indications

The diagrams below indicate the example choices of AC500 CPU's (horizontal axes) based on the number of communication interface CI-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).
Further details can be found in 'Task configuration recommendations for HA system' ${ }^{\leftrightarrows}$ Chapter 6.5.9.1.5.3 "Task configuration recommendations for HA system" on page 3884. The values in below graphs base on the assumption to use max. $50-60 \%$ as CPU loading by the bare fast IO communication and HA functionality. So the application load would come on top and cycle times (especially HA, Modbus) need to be relaxed (made higher) compared to below indication.

Fig. 298: Indication of AC500 CPU's performance (horizontal axes) based on the number of communication interface Cl-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).

Example: If you need a system supporting min. 25 Cl at application cycle time around 120 ms , suitable options based on above graph would be V2 PLCs - PM592 or PM595 and V3 PLCs PM5650 or PM5670. The main parameter in the application cycle determination is the amount of overall Sync data, which is assumed 160 bytes per CI for the smaller systems, up to 250 bytes per Cl for the larger ones. Sync data of the project of in total more than $\sim 1200$ byte necessitates several HA cycles to transfer within one application cycle.
If CM5640-2ETH port extender is used for the CI network, slightly lower performance/longer cycle time needs has to be expected.
The V2 or V3 PLCs types, also differ in available interfaces, protocols supported and memory size.

CI521-MODTCP or CI522-MODTCP can be used as peripheral devices which communicate via the Modbus TCP protocol with the PLCs. The HA-Modbus TCP library supports currently up to 120 CI 52 x , depending on the CPU type as listed in table 'Overview of AC500 HA systems and options' $\Rightarrow$ Further information on page 3863. Each CI52x supports up to a maximum of 10 S500-I/O modules. Nevertheless the standard Modbus TCP communication of the HA library transfers only 120 words per cycle: Therefore please check if for your module configuration matches: In case of many analog IO modules with high-density - like 16 channel AI523/AO523 or modules with fast counters - this limit might be surpassed by roughly 5-6 such modules (to help calculate exactly, there is an Excel sheet provided in the HA "Examples" subfolder of Automation Builder once installed).

For more details of Modbus clients supported in AC500 V3 PLCs refer to 'Ethernet protocols and ports for AC500 V3' ${ }^{\mu}$ Chapter 6.8.2.6.1.2.4 "Limitation of connections per protocol" on page 4484.

> Local I/O on a CPU can only signal/interact for diagnosis or service with/from this CPU. This local I/O is connected only to this CPU - cannot work with other CPU in case of this CPU failure.

## Hardware connections

Fig. 299: AC500 HA and SCADA connection
SCADA/ Engineering connection is done using ETH ports of both PLCs (or their communication module ETH modules) and one or several managed Ethernet switches depending on the redundancy requirements in the SCADA levels.

- HA communication between PLC A and PLC B must be done via two physical connections between PLC A and PLC B in order to distinguish a "sync link" failure from another PLC failure:
- Sync (including "lifecom1") over Ethernet
- "Lifecom2"
over Ethernet (Modbus TCP): Can also be combined with Field or SCADA network over CAN (only possible with AC500 V3 CPU)
(For V3 CPUs: - "Lifecom2" and sync should be directly on the CPU onboard ports, - while for Cl and SCADA network the use of CM5640 is possible to be in separate networks).
- Field devices (CI52x modules) will be connected via Ethernet switches, forming a redundant network (if requested) $\Longleftrightarrow$ Chapter 6.5.9.1.5.4 "Field I/O network topologies" on page 3886.

The following table shows possible combinations of connections for different CPU types. There must be at least two physical connections. The availability can be increased with a third physical connection, e.g. CM597 for AC500 V2 CPUs, CAN or CM5640-ETH for AC500 V3 CPUs.

|  | V2 CPU with 1 ETH onboard + CM597 |  | V2 CPU with 2 ETH onboard (+CM597) |  |  | V3 CPU | with 2 ETH onboard (+CAN) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Scada/ Engineering | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Sync/ lifecom1 | 1 | 11 | 1 | 2 | 2 | 1 | 2 | 1 | 2 |
| lifecom2 | 11 | 1 | 2 | 1 | 11 | 2 | 1 | 3 | 3 |
| Field (Modbus TCP) | 11 | 11 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| \# of physical connections | 2 | 2 | 2 | 2 | 3 | 2 | 2 | 3 | 3 |

|  | V2 CPU with 1 ETH onboard + CM597 ETH |  | V2 CPU with 2 ETH onboard (+CM597-ETH) |  |  | V3 CPU with 2 ETH onboard (+ CAN) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Scada / Engineering | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Sync / lifecom1 | 1 | 11 | 1 | 2 | 2 | 1 | 2 | 1 | 2 |
| lifecom2 | 11 | 1 | 2 | 1 | 11 | 2 | 1 | 3 | 3 |
| Field (Modbus TCP) | 11 | 11 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| \# of physical connectiol | 2 | 2 | 2 | 2 | 3 | 2 | 2 | 3 | 3 |

For V3 CPU's with CM5640-2ETH, following as of Automation Builder 2.6.1 new port options are available for SCADA and field connection.

1 ETH1 (orange)
2 ETH2 (green)
3 CAN (light blue, applicable only in V3)
11 CM597 communication module at slot1 (grey)
X (Dark Blue), Y (Yellow): For CM5640-2ETH: Any one of the both ETH ports can be used.
V3 ETH interface internal numbering for each port of CPU and CM5640-2ETH communication module (ETH1, ETH2).

| Port print of <br> device | CPU onboard | Communica- <br> tion module <br> $\mathbf{1}$ | Communica- <br> tion module <br> $\mathbf{2}$ | Communica- <br> tion module <br> $\mathbf{3}$ | Communica- <br> tion module <br> $\mathbf{4}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| ETH1 | 1 | 3 | 5 | 7 | 9 |
| ETH2 | 2 | 4 | 6 | 8 | 10 |

The dotted box above indicates the example which is used in the next chapters.
"Lifecom2" connection ="3": when selected as 3-> means using CAN. It has no relation with communication module 1 ETH1 : 3 port.
At present all the CI modules in the ring must be connected either on onboard ETH or only one port of the CM5640.

The numbers in the figure above define the slot on which the connection is made. Last line \# of physical connections define how many physical interfaces are used or connected between the PLCs.

It is also possible to realize an HA system without a communication interface Cl module ${ }^{\star}$, Chapter 6.5.9.1.6.1.2 "Configuration without communication interface modules to establish redundancy" on page 3890.

## Hardware Example

HA hardware example using CM5640 for field and SCADA connection: Both ports of the CPU available for the two sync connections.

Fig. 300: Physical connection example: 2 ETH CPUs combining sync data / "lifefcom2" with SCADA / Field I/O network

Support of I/O modules (S500/S500-eCo) depends on the version of the library package. See the version details of the library in the Automation Builder release notes.

### 6.5.9.1.3 Functionality

Failures and use cases
The AC500 High Availability system performs a switch-over whenever the primary PLC is powered off, crashed or stopped or if the primary PLC loses fieldbus communication (cut of ETH or defect MRP switch) while the secondary PLC still has connection.
In the following figure the different use cases and reaction times are outlined.

Fig. 301: HA use cases - failures, assuming PLC A is primary and "lifecom2" over field network
The below use case table with reaction and diagnosis messages are based on the setup where Sync is via SCADA network, "lifecom2" over field network and PLC A is primary.

| Case | Use case | Reaction | Diagnosis message <br> on <br> *) |
| :--- | :--- | :--- | :--- |
| 1 | Primary PLC is powered off, <br> crashed or stopped. | Switchover to secondary <br> PLC. CI52x outputs are <br> frozen during switchover <br> period. | Secondary |
| 2 | Secondary PLC is powered <br> off, crashed or stopped. | No switchover, process con- <br> tinues. | Primary |
| 3 | Primary PLC loses con- <br> nection to fieldbus CI52x <br> modules while secondary <br> PLC still has a connection. | Switchover to the secon- <br> dary PLC. CI52x outputs <br> are frozen during switchover <br> period. | Primary |
| 4 | Secondary PLC loses con- <br> nection to one or more CI52x <br> modules. | No switchover, process con- <br> tinues. | Secondary |

| Case | Use case | Reaction | Diagnosis message <br> on <br> *) |
| :--- | :--- | :--- | :--- |
| 5 | Cl52x module is stopped/ <br> powered off. | No switchover, process con- <br> tinues. | Primary and secon- <br> dary |
| 6 | Connection lost in Field <br> Ethernet network. | Depending on Ethernet net- <br> work structure, and redun- <br> dancy mechanisms used a <br> reconfiguration time exists. | Lifecom2 lost and CI <br> module lost errors will <br> be generated in pri- <br> mary and secondary. |
| 7 | Sync and/ or "lifecom2" are <br> broken. | No switchover, process con- <br> tinues. | Primary and secon- <br> dary |

## Use case descriptions

The below cases explain the behavior of the system during different use cases.
Basic diagnosis information is provided for each case ${ }_{y}{ }^{\circ}$ Chapter 6.5.9.1.8 "Diagnosis" on page 3895.

Case 1 a): Primary PLC is powered off or crashes

| Reaction | Switchover to secondary PLC. The communi- <br> cation interface modules are updated by the <br> new primary PLC. |
| :--- | :--- |
| Comment | Cl52x outputs are frozen during switchover <br> period. |
| Diagnosis message on function block | Primary PLC is powered off. <br> Secondary PLC: control block output Runtime <br> Error = 16\#001E and xHaModPrimary = TRUE |

## Case 1 b): Primary PLC is stopped

| Reaction | Switchover to secondary PLC. The communi- <br> cation interface modules are updated by the <br> new primary PLC. |
| :--- | :--- |
| Comment | Cl52x outputs are frozen during switchover <br> period. |
| Diagnosis message on function block | Primary PLC is stopped. <br> Secondary PLC: control block output Runtime <br> Error = 16\#0016 and xHaModPrimary = TRUE |

If "lifecom2" is lost and the PLC is in STOP mode RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

Case 2 a): Secondary PLC is powered off or crashes

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error $=16 \# 001 E$ and $x H a M o d P r i m a r y ~$$=$ TRUE |
| Secondary PLC is stopped. |  |

Case 2 b): Secondary PLC stop

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0016 and xHaModPrimary = TRUE <br> Secondary PLC is stopped. |

> If "lifecom2" is lost and the PLC is in STOP mode RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

Case 3: Primary PLC loses connection to fieldbus CI52x modules

| Reaction | Switchover to secondary PLC. The communi- <br> cation interface modules are updated by the <br> new primary. |
| :--- | :--- |
| Comment | CI52x outputs are frozen during the switch- <br> over period. |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0094 and xHaModPrimary $=$ <br> FALSE <br> Secondary PLC: control block output Runtime |
|  | Error = 16\#0015 and xHaModPrimary = TRUE |

## Case 4: Secondary PLC loses connection to fieldbus CI52x modules

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0015 and xHaModPrimary = TRUE <br> Secondary PLC: control block output Run- <br> time Error = 16\#0094 and xHaModPrimary $=$ <br> FALSE |

Case 5: Cl 52 x is powered off or stopped

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0081 and xHaModPrimary $=$ TRUE <br> Secondary PLC: control block output Run- <br> time Error = 16\#0081 and xHaModPrimary $=$ <br> FALSE |

If any $\mathrm{CI} 52 x-M O D T C P$ module is powered off and on, there is no need to power restart the complete system. The module will be recognized once the communication is reestablished.

Case 7 a): Sync connection is broken between the PLCs

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime |
|  | Error = 16\#0014 / 16\#0094 and xHaModPri- |
| mary = TRUE |  |
|  | Secondary PLC: control block output Runtime |
|  | Error = 16\#0014 / 16\#0094 and xHaModPri- |
| mary = FALSE |  |

Case 7 b):
Lifecom2 connection is lost between the PLCs

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0008 and xHaModPrimary = TRUE <br> Secondary PLC: control block output Run- <br> time Error = 16\#0008 and xHaModPrimary $=$ <br> FALSE |

Case 8: Primary PLC loses SCADA connection

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues, SCADA is responsible to <br> detect and switchover |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0000 and xHaModPrimary = TRUE |
| Secondary PLC: control block output Run- <br> time Error = 16\#0000 and xHaModPrimary $=$ <br> FALSE |  |

## Case 9: Secondary PLC loses SCADA connection

| Reaction | No switchover |
| :--- | :--- |
| Comment | Process continues, SCADA is responsible to <br> detect and switchover |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error $=16 \# 0000$ and $x H a M o d P r i m a r y ~=~ T R U E ~$ <br> Secondary PLC: control block output Run- |
| Sech |  |
| time Error = 16\#0000 and xHaModPrimary $=$ |  |
| FALSE |  |

SCADA link may be combined with sync connection or "lifecom2" connection. In that case runtime error and system behavior will be as described in the cases above (Sync connection lost / "lifecom2" connection broken).

## Case 11: Manual changeover by user

| Reaction | Changeover from primary PLC to secondary <br> PLC. |
| :--- | :--- |
| Comment | CI52x outputs will be frozen during switchover |
| Diagnosis message on function block | Primary PLC: control block output Runtime <br> Error = 16\#0000 and xHaModPrimary $=$ <br> FALSE <br> Secondary PLC: control block output Runtime |
|  | Error = 16\#0000 and xHaModPrimary = TRUE |

A manual switchover can be triggered from both PLCs. For each trigger a switchover from primary PLC to secondary PLC will take place.
6.5.9.1.4 How to get and install the AC500 High Availability system package

The PS5601- High Availability Modbus library package can be installed from the Automation Builder Installation Manager by selecting the component.

Fig. 302: Automation Builder Installation Manager
The following components are installed:

- Libraries
- AC500 V2 libraries: C:IProgram Files (x86)\Common FilesICAA-Tar-gets\ABB_AC500\AC500_V12\ibrary\PS5601-HA-MTCP CI52x_AC500_Vxx.lib, HAModbus_AC500_Vxx.lib.
- AC500 V3 libraries available in library repository: ABB_CI52x_AC500.compiled-library, ABB_HaModbus_AC500.compiled-library
- Online help: HA-CS31, HA Modbus V2 function block description
- Automation Builder Example folder: \%ALLUSERSPROFILE\%IDocuments\Automation Builder Examples\PS5601-HA-MTCP
- AC500_V2: Examples for AC500 V2 including documentation
- AC500_V3: Examples for AC500 V3 including documentation
- BulkDataManager: Bulk Data Manager (BDM) tool which helps efficient engineering in larger projects. This requires a separate installation. Further information can be found in the document: \%ALLUSERSPROFILE\%\Documents\Automation Builder Examples $1 P S 5601-H A-M T C P \backslash B u l k D a t a M a n a g e r I D o c u m e n t a t i o n . ~$

### 6.5.9.1.5 System structure

## Introduction

This chapter explains the detailed structure of the HA system in CODESYS. A HA-Modbus TCP system is characterized by two AC500 PLCs with the following features:

- Identical programs (application with additional HA and Modbus function blocks) that are loaded to both PLCs.
- Communication interface modules CI52x-MODTCP that are connected via Modbus TCP.
- Synchronization of both PLCs (sync/lifecom1 and lifecom2 logical connections).

## Programming

Each PLC contains at least three main tasks/ programs:

- HA program
- Application program
- Modbus program

The programs in one PLC communicate via internal structures of the libraries and dedicated internal memory areas for HA-Sync array and the Modbus CI52x memory(ies) CiModDataxx.

Fig. 303: Principle structure of the HA system and recommended tasks: HA, Modbus, Application

Table 743: Image description

| Layout element | Meaning |
| :--- | :--- |
| Dotted outline box | Indicates optional function block or programs. |
| Solid outline box | Indicates the mandatory function blocks or <br> programs. All mandatory blocks are called <br> when an export is created from Bulk data <br> manager. |
| Italic font | Indicates the program or functions user should <br> call in his project and not created by Bulk data <br> manager. |
| Light yellow background block / blue arrow | Indicates the operations which are handled <br> internally in the library. |
| Green solid box | Indicates the three different tasks which user <br> has to configure. |

Modbus pro- The function block CIModCI52x (V3) / CI_MOD_CI52x (V2) reads the input values from the gram CI52x modules and stores them in the structure CiModDataxx. If the CPU is primary it also writes the outputs to the CI 52 x modules. The Function block also parametrizes the Cl Module as configured in e.g. Bulk data manager tool during the first startup or when a Cl module is exchanged.
Normally the HA-Modbus TCP library takes care of communication monitoring. Nevertheless if com- munication is cut completely, the CI52x communication interfaces and its I/O modules have to react on their own to achieve a bumpless or desired behavior: The following parameters for the CI52x com- munication interfaces and I/O modules need to be considered:

-     - CI52x: parameter "Timeout" for Bus supervision: ${ }^{2)}$
Allows to detect errors from communication interface side as well and take action to ensure a fail- safe behavior if communication is cut. It can be set in 10 ms steps. If set to 0 no bus supervision is active. Proposed value: $50=$ $500 \mathrm{~ms}=$ default in Bulk data manager; this value should be increased, e.g. to value 65 if AC500 V2 CPU ports are used for field communication to take care of the larger TCP retransmit time.
- "Behaviour Outputs" at "Timeout for Bus supervision" 1), 2). This fail-safe parameter has to be con- sciously set: separate settings are possible for each module (and communication interface): "off"; "last" or "substitute": 5 s , $10 \mathrm{~s}, \infty \mathrm{~s}^{11}$.

## Remarks:

1) The parameters "Behaviour Outputs at comm. Error" is only analyzed if the Failsafe-mode is [ON].
${ }^{2)}$ Both are CI52x parameters set e.g. via Bulk data manager tool in the program.

## Application program

Example of a utility function block (with integrated sync data)

Consider the on-delay timer HA_MOD_TON (V2)/ HaModTon (V3).

Fig. 304: HaModTon utility function block with internal synchronization
Both PLCs require the same function block called in the program. Under normal operating conditions the elapsed time ET and output Q of the timer is synchronized internally from primary to the secondary CPU. ET and Q data are available and can be attached to local or global variables in the program as per application requirements. If PLC A shuts down due to a fault, the primary status switches over to PLC B.

In the event of a switchover, the moment PLC B becomes the primary, the timer on this PLC will keep running. Until the time of PLC A failure, the timer on PLC B was synchronized. This is most important in cases when one CPU was not in run or off and needs to "catch up" such integral or historic system values (timers, counters, operator settings, ...). The actual process remains then unaffected by the switchover.

## HA program <br> HA_MOD_CONTROL has two functions:

- Exchange status data (lifecom1 and lifecom2) and switch from secondary to primary PLC (or vice versa) based on the status according to the use cases described in 'Failures and use cases' ${ }^{\aleph}$ Chapter 6.5.9.1.3.1 "Failures and use cases" on page 3869.
- Send sync "HA SYNC" array from primary to secondary PLC to ensure that the secondary PLC is always in hot-stand-by and can take over immediately. UDP protocol is used for data synchronization between the CPUs.

Data synchroni- This chapter explains how the data synchronization happens between primary and secondary zation via UDP PLC via UDP.

All prepared sync data is synchronized with the secondary PLC. Typically only integral values (timers, counters, PID , ...) or settings which might have been received have to be synchronized. For example for fast start-up cases when a secondary CPU was restarted, as both PLCs are running and calculating closely in parallel and based on the same input values, synchronization will make the secondary start with current value instead of default value. For details on how to configure or use the data sync function block refer example projects.

Following steps are performed:

- HA SYNC array is transferred via UDP to the secondary CPU. This includes the exchange of lifecom1 status between primary and secondary CPU.
- In the HA program the HA_MOD_CONTROL function block collects all diagnosis, sync and lifecom2 data from the field and/ or the other PLC. Whether a switchover is necessary is decided based on a simple decision matrix.
- Lifecom2 is exchanged between CPUs over Modbus TCP every cycle.
- One task per program, see figure above.
- Status of the inputs connected to CI 52 x decentralized I/O stations is transferred to both PLCs simultaneously in every PLC cycle. They are received by the CI52x function block.
- At the end of the program, the generated output values are sent, by transferring from the primary PLC respective buffers to the $\mathrm{CI} 52 \mathrm{x}-\mathrm{MODTCP}$ module(s) via Cl 52 x function block and Modbus TCP. The secondary PLC is prepared to send but stays "silent" (not sending output values).

One ETH frame copies approx. 1412 data bytes. The number of ETH frames needed to synchronize HA Sync Array completely depends on the number of data sync bytes. Global variable iNoOfEthFrames gives the user this information, which should be used to calculate the cycle time for the application task.
y Chapter 6.5.9.1.5.3 "Task configuration recommendations for HA system" on page 3884
Up to max. 60 kB of Sync data can be synchronized.
Synchronization between the primary and the secondary PLC happens over a few cycles of HA task time depending on the total sync data bytes configured in the system. Lifecom1 is also exchanged between the primary and the secondary PLC. The primary PLC sends lifecom1 to the secondary PLC along with sync data. Backwards the secondary PLC sends lifecom1 to the primary PLC every cycle.
The following figures shows an example for V2 PLC. When in the project the sync data is equal to 4 iNoOfEthFrames then it takes 4 HA cycles to synchronize the data between the PLCs.

Here, it is assumed that 4 HA cycles are needed to transfer sync data from Primary to secondary, meaning global variable iNoOfEthFrames $=4$. Therefore system need 4 HA cycles, 2 Modbus and 1 Application cycle for one round of sync.

When sync data in the project is equal to 6 iNoOfEthFrames then it takes 6 HA cycles to synchronize the data between the PLCs.

Here, it is assumed that 6 HA cycles are needed to transfer sync data from Primary to secondary, meaning global variable iNoOfEthFrames $=6$. Therefore system need 6 HA cycles, 3 Modbus and 2 Application cycle for one round of sync.

## Task configuration recommendations for HA system

For a balanced performance of the HA system consider the following recommendations in your project task configuration:
General

- Use the real time priorities for all HA related tasks. The HA program/ task should be called at highest priority as it is responsible for the core HA functionality and should be the fastest task.
- The Modbus task contains the Modbus communication function blocks at lower priority and (depending on CPU performance) also a faster cycle time to ensure sufficient update rates on Modbus without over- loading the CPU with communication.
- The application program parts should be called in the application task with even lower priority and a larger cycle time than above tasks.
- Configuration to improve standard Modbus TCP for a fast switch over between PLCs.
- AC500 V2
- CM597ETH_SET_TCP_RTO function block from CM597_ETH_AC500_V28.lib needs to be called inside HA task. User needs to call this function block for each CM597 module connected. For recommended values see example description.
- AC500 V3
- RTO retransmission time function block "EthSetRtoMin" for the ETH port where fieldbus communication is configured. By default, minimum retransmission time configured is 15 ms .

| Task | Priority | PM57x, PM58x, PM59x | PM595-4ETH | V3 PLCs |
| :---: | :---: | :---: | :---: | :---: |
| HA | 10 (high) | 4 ms or higher | 2 ms or higher | 4 ms or higher |
| Modbus | 11 (medium) | Maximum of (HA cycle time *2), (3 ms + roundup (\#Cl/2)) | Maximum of (HA cycle time *2), (3 ms + roundup (\#CI/2)) | Onboard ETH: Max ((HA cycle time *2), (3 + roundup (\#CI modules/2))) |
|  |  |  |  | CM5640-2ETH: Max ((HA cycle time * 2 ), (\#CI modules)) |
| Application | 12 (low) | Maximum of (Modbus cycle time *2), (iNoOfEthFrames * HA cycle time) | (iNoOfEthFrames <br> * HA cycle time) | Maximum of (Modbus cycle time *2), (iNoOfEthFrames * HA cycle time *2) |

## Procedure for task configuration

1. Choose suitable CPU type according to chapter CPU choice, system size, performance indications
2. Configure task priorities according to the table
3. Set HA task to minimum according to above table
4. Calculate Modbus cycle time according formulas in the table, based on HA cycle and number of Cl modules "\#Cl"
5. Calculate Application cycle time according to formulas in the table, based on Modbus cycle time and variable iNoOfEthFrames, which is defined in the global variables of HAModbus TCP library.
6. Measure PLC and CPU load during trial operation.

V3: PLC Utilisation $\leadsto$ Chapter 6.8.2.2.1.7 "PLC utilization" on page 4428
If the PLC load is higher than $40 \%$ or CPU load higher than $60 \%$ then increase HA cycle time (e.g. to $8 \mathrm{~ms} / 12 \mathrm{~ms} / 24 \mathrm{~ms}, \ldots$ ) and go to step 4, repeat the steps until loading is within defined range.

## A new V3 CPU configuration option is introduced from Automation

 Builder 2.4.1 and onwards which allows to change the priority for Ethernet communication in PLCs.Set this configuration in the device tree of the CPU in Automation Builder double click on PLC "CPU Parameters $\rightarrow$ Communication Schema $\rightarrow$ Select "Onboard Ethernet"".

The above parameter should be set to "Onboard" Ethernet for HA systems and it will consequently increase the loading due to the higher priority. PLC Load $<50 \%$ and CPU load $<70 \%$ should be considered as guidelines here instead, while setting the task times while setting the task times.
7. Following timeout values has to be defined in the user project according to the relation defined.

| Timeout variables <br> (see defini- <br> tions in box below table) | HA in V2 | HA in V3 |
| :--- | :--- | :--- |
| timCl52xTimeOut | $1^{*}$ Modbus Task time | 50 ms or 2 * Modbus Task <br> time, whichever is higher |
| timHaModSyncTimeOut | $1^{*}$ HA Task time | $2^{*}$ HA Task time |
| timResponseTimeout | Not applicable | 50 ms or (3 * "Modbus Task <br> time"), whichever is higher |
| timCanTimeOut | Not applicable | 100 ms or increase in mul- <br> tiple of 100 |
| timeLifecom2TimeOut | 50 ms | 50 ms |

8. Add additional applications and SCADA communication: Check PLC and CPU load again vs. your requirements.

In the HA Modbus system different timeouts must be configured for the fine operation of the system as described above in the task configuration for V2 and V3 PLCs. These different timeouts meaning, and relation is explained below:

## timHaModSyncTimeOut:

Time limit to check if the new sync data is received or not in the secondary PLC. If this timeout is not defined properly, Sync lost error/ "lifecom1" lost error will be generated.

## timCanTimeOut:

Time used for the check whether "lifecom2" is received when configured via CAN. This value is applicable only in AC500 V3. Lifecom2 via CAN won't be stable between the PLCs and runtime error "lifecom2 lost" will be flickering if not the right value is configured.

## timCl52xTimeOut:

Time limit to check whether new data is received in the Modbus field modules. It is also used to check whether "lifecom2" is received when configured via Modbus TCP. If "timCI52xTimeOut" is not defined as described, "lifecom2" error / communication interface diagnosis error will not be generated as expected.

## timResponseTimeOut:

Timeout value to check whether CPU has lost the communication interface modules connected in the network. If this value is not defined as described, communication interface module lost detection will not be indicated properly.

## timeLifecom2TimeOut

Time limit to check whether "lifecom2" is received when configured via Modbus TCP. Set "timlifecom2TimeOut" value to default 50 ms , if the value is not defined correctly, runtime error "Lifecom2 lost" diagnosis error will not be generated as expected.

Field I/O network topologies

## General

Modbus TCP communication between PLC and communication interface modules CI 521 MODTCP or CI522-MODTCP can be done using different network topologies. In the following subchapters different simple combinations with their pros and cons are explained.

If a CI52x module of a daisy chain is powered off, next following modules will lose connection/ data provided there is no redundancy in the Ethernet network (e.g. ring and managed switch).

## Simple ring topology (smaller systems)

In a simple configuration, CI52x modules can be part of a ring if MRP (or DLR) protocol is used in the managed switches. Then the Cl 52 x are connected from one to another device ("daisy chained") through e.g. two network switches. The redundancy protocol detects a closed ring and opens one port of a managed switch to avoid the ring. The user has to configure the necessary ring configurations and enable the ring manager for the used ring ports in one switch.

Fig. 305: Redundant ring topology with 2 MRP switches (avoids a SPOF (Single Point Of Failure))

## Standard network topology (large systems)

In the standard redundant network, which is often done by third party dedicated telecommunication companies, managed switches are used for every connection point to this network. It's the network's (and operator's) responsibility to repair any failure fast enough so that no influence on the HA system or its outputs occur.

The network can use other fast redundancy algorithms, also having other than ring structures, if redundancy links are activated fast enough.

Fig. 306: Redundant ring topology with independent network (using any fast redundancy mechanism internally in a ring or meshed network)

## Parallel network topology (using PRP)

Each CI52x module and PLCs as single ended devices are connected by PRP switches to both networks. Here the failure of the switch which connects the primary CPU will also lead to a switchover.

Fig. 307: Parallel-redundant network, PRP switches to connect each device, CPU and communication inter- face modules

Redundancy switchover timing should match the settings in the program and communication interface modules for time-out and freeze periods. The networks for larger systems are often seen as a separate entity and done by a separate company. Make sure to have the redundancy status information of the network at least in SCADA, to repair in time. If the I/O field network responsibility is with the automation/ PLC part, the redundancy status should be also monitored by the PLC. A warning to initiate repair may be created from the managed switches in the I/O field network.

Examples - Alarm output(s) wired (e.g. to a CI52x input and related settings of the switch(es)).

- Settings of the switch(es) to send (e.g. SNMP traps, which can be received in PLC (AC500 SNMP library)).
- Use of "automation switches" which can also communicate their status directly via Modbus.

> It is also possible to connect switches in ring combination with CI modules connected to them in daisy chain. User needs to do the relevant setting based on type of switch and protocol (Ex: MRP, RSTP).
> If RSTP ring configuration is used in the system, ring reconfiguration time is slower than other ring protocols. During this reconfiguration, connection to the CI modules will be lost.

## HA Modbus system without communication interface modules in the network

It is also possible to have a HA Modbus system without connecting any field devices, CI521MODTCP / CI522-MODTCP in the network. This system can be used for establishing a redundant PLC system with data synchronization between two AC500 controllers, either without field IO or with user integration of other protocols to field-IO or "intelligent" IO: CPUs as field devices.

Secondary will be on hot standby with primary PLC, during a power off/ stop of the primary PLC. Secondary will take over the control and continue the process. Any user integrated field-IO or CPUs can establish communication mapped with the primary bit: parallel reading but prevent parallel writing.
HA without Cl modules can be also used during commissioning to check the data sync, OPC and SCADA related communications without any field devices configured. The user has to set the global variable 'xNoCiBus' to TRUE defined in the HA_GLOBAL_VARIABLES. This variable has to be set to TRUE in both PLCs. Note: It is not advised to update this variable during run time.

Fig. 308: Simple SCADA connection

### 6.5.9.1.6 Getting started

Quick start list and guidelines

## Workflow

## Engineering

Fig. 309: Engineering workflow using Automation Builder
Simple steps to engineer the HA Modbus system is explained in the following chapters.

## Configuration without communication interface modules to establish redundancy

Configuration of the HA system without communication interface modules to establish redundancy is done by the following steps (for details see the example documentations):

1．Install the hardware $\stackrel{\mu}{\leftrightarrows}$ Chapter 6．5．9．1．2＂Hardware，requirements and options overview＂ on page 3862.

2．Select the CPUs based on the requirements ${ }^{\Perp}$ Chapter 6．5．9．1．2．2＂CPU choice，system size and performance indications＂on page 3864.

3．Install Automation Builder including the latest libraries $\left.{ }^{4}\right\rangle$ Chapter 6．5．9．1．4＂How to get and install the AC500 High Availability system package＂on page 3878.

4．Create a new project in Automation Builder for the chosen CPUs．
5．Configure the required Modbus and UDP configuration in the Automation Builder device tree of the CPU．

```
= -I] HA_Without_CIModules (PM591ETH - TB521ETH)
```

```
        App
    |T0_Bus
        0.0}
    -Q Interfaces
        目且 COM1_Online_Access (COM1 - Online Access)
    10
    目[ FBP_Online_Access (FBP - Online Access)
    ETM Ethernet
        [] ETH1 (ETH1)
        -1] Protocols (Protocols)
```

            Modbus_TCP_IP_Server (Modbus TCP/IP Server)
            - in UDP_no_AC31_header (UDP (no AC31 header))
                if Connection (Connection)
    Extension_Bus
    樶迫 CM597_ETH (CM597-ETH)
            (1) IP_Settings (IP Settings)
            - Modbus_TCP_IP_Server_1 (Modbus TCP/IP Server)
    (1) Slot_2 (TA524)
    6．For UDP in AC500 V2 PLC，configure＂UDP＿no＿AC31＿header＂and set the port number to value＇3000＇．

| ［4］Connection x |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Parameter | Type | Value | Default Value | Unit | Description |
| －Port | WORD（0．65535） | 3000 | 0 |  | Port |
| －Size of receive buffer | WORD（1464．65535） | 4096 | 4096 |  | Set the size of receve buffer |
| －Size of transmit buffer | WORD（0．65535） | 4096 | 4096 |  | Set the sze of transmit buffer |
| －Receive broadcast | Enumeraton of BYTE | Dsable | Dsable |  | Disable／enable broadkast reception（data padage to al stations） |
| －Behaviour on receive buffer overfiow | Enumeration of ETTE | Overwite | Overvite |  | Behoviour on receve buffer overfiow Overurite $=$ the oldest data padages stored in the receive buffer |

7．Assign the IP addresses in $\geq 2$ different Ethernet networks：
－SCADA network：SCADA，connected PLC A and PLC B
－Field network：connected CI52x module（s）
8．Configure the mandatory HA＿MOD＿CONTROL function block for the HA task «＂HA program＂on page 3882.
9．Add Callback stop function HA＿MOD＿CALLBACK＿STOP and call it in the system event ＂stop＂．
10．Add optional HA utility function blocks or function block HA＿MOD＿DATASYNC．

11．Make the global variable $\mathrm{xNoCiBus}=$ TRUE to run the system without communication interface module configured in the system $\Leftrightarrow$ Chapter 6．5．9．1．5．4．5＂HA Modbus system without communication interface modules in the network＂on page 3889.

```
- -I] HA_Without_CIModules (PM5650-2ETH - TB5620-2ETH)
    - 瞁 PLC Logic
        = Application
        +Q Diagnosis
        -D GVL_Variables
            * GV_CP600
            * GV_OPC
            APP_GV__Variables
        -D HA_Config
                d HA_Constants_conf
                目 HA_Program_pro (PRG)
            - Programs
                鱼 APP_PRG (PRG)
                - DataSync (PRG)
                -1 HA_Utilities (PRG)
                - PRG_CALL (PRG)
                if) Library Manager
            D] CALLBACK_STOP (FUN)
            - Symbol Configuration
                Task Configuration
                # Application_Task
                #1 PRG_CALL
            - %) HA_Task
                #] HA_Program_pro
                4) VISU_TASK
            * E1 Visualization Manager
            #HAV3_Visualization
```

12．Add the task configuration $\stackrel{\text { M Chapter 6．5．9．1．5．3＂Task configuration recommendations for }}{ }$ HA system＂on page 3884.

13．Activate the runtime license if it is a V3 PLC to enable HA system $\Leftrightarrow$ Chapter 6．3．2．2．2 ＂PLC runtime licensing＂on page 1446.
14．Compile and download to both PLCs（simplified in V3 via integrated download manager）．
15．Create a boot project，restart the complete system and RUN．
16．Operation：Test use cases（e．g．by putting the primary PLC to STOP mode and observe the switchover）．For different use cases and behavior refer to ．

17．Runtime error and diagnosis function block can be used to monitor the system $\Leftrightarrow$ Chapter 6．5．9．1．8＂Diagnosis＂on page 3895.

## Configuration with communication interface modules and redundancy

For medium or large HA systems the configuration with communication interface modules and redundancy is done by the following steps．For details see the example documentations：
1．Install the hardware $\xi^{\xi}$ Chapter 6．5．9．1．2＂Hardware，requirements and options overview＂ on page 3862.
2．Select the CPUs based on the requirements ${ }^{\wedge} \Rightarrow$ Chapter 6．5．9．1．2．2＂CPU choice，system size and performance indications＂on page 3864.
3．Install Automation Builder including the latest libraries $\Leftrightarrow$ Chapter 6．5．9．1．2＂Hardware， requirements and options overview＂on page 3862.

4．Install the Bulk Data Manager tool（BDM）$\stackrel{y}{\wedge}$ Chapter 6．5．9．1．4＂How to get and install the AC500 High Availability system package＂on page 3878.
5．Create a new project in Automation Builder for the chosen CPUs．
6. Configure the required Modbus and UDP configuration in the Automation Builder device tree of the CPU. UDP settings are only required in AC500 V2 PLCs.

```
= IJ PLC_AC500_V2 (PM591ETH - TB521ETH)
    = [1] Application
        App
=-0
    IO_Bus
        0. DA501 (DA501)
-0 Interfaces
    [1] COM1_Online_Access (COM1 - Online Access)
    14] COM2_Online_Access (COM2 - Online Access)
    |! FBP_Online_Access (FBP - Online Access)
    - ETH Ethernet
        7] ETH1 (ETH1)
        =0) Protocols (Protocols)
            Modbus_TCP_IP_Server (Modbus TCP/IP Server)
        - 有 UDP_no_AC31_header (UDP (no AC31 header))
                    [i] Connection (Connection)
    Extension_Pus
    14! CM597_ETH (CM597-ETH)
        7] IP_Settings (IP Settings)
        - Modbus_TCP_IP_Server_1 (Modbus TCP/IP Server)
    | Slot_2(TA524)
```

7. For UDP in AC500 V2 PLC, configure "UDP_no_AC31_header" and define the port number as '3000'

| 53 Connection $\times$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Parameter | Type | Value | Defaut Value | Unit | Description |
| - Port | WORD(0..65535) | 3000 | 0 |  | Pert |
| - Size of receive buffer | WORD(1464.65535) | 4096 | 4096 |  | Set the size of receve buffer |
| - Size of traramt buffer | WORD(0..65535) | 4096 | 4096 |  | Set the size of tranmit buffer |
| - Receive broadcast | Enumeration of BYTE | Disable | Dsable |  | Disable/ensble broadcast reception (data padage to al stations) |
| - Behaviour on recelve buffer overfiow | Enumeration of BrTE | Overwite | Oververite |  | Behoviour on receve buffer overfiow Overunite $=$ the oldest data padages stored in the receive buffer |

8. In AC500 V2 PLCs for each CM597-ETH communication module added the "Send timeout" value has to be changed to 600 ms for the Modbus TCP server.

9. Assign the IP addresses in $\geq 2$ different Ethernet networks:

- SCADA network: SCADA, connected PLC A and PLC B.
- Field network: connected CI52x module(s).

10. Configure a network switch in the field network (if managed/redundant) based on network redundancy required $\xi$ Chapter 6.5.9.1.5.4 "Field I/O network topologies" on page 3886.
11. Run BDM tool to configure CI52x network.
12. Export the files. Refer for details in the document: \%ALLUSERSPROFILE\%IDocuments\Automation Builder Examples\PS5601-HA-MTCP\BulkDataManager\Documentation.
13. Import the Bulk data export files to the Automation Builder project.
14. Add Modbus TCP configuration for the ETH ports.
15. For the system with V3 PLCs, set the Communication Schema to "Onboard Ethernet" "CPU Parameters" for better performance.

16. Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event "stop".
17. Add optional HA utility function blocks or function block HA_MOD_DATASYNC.

18. Add the task configuration $\stackrel{\Downarrow}{\Perp}$ Chapter 6.5.9.1.5.3 "Task configuration recommendations for HA system" on page 3884.
19. Activate the runtime license if it is a V3 PLC to enable HA system ${ }^{4}$ Chapter 6.3.2.2.2 "PLC runtime licensing" on page 1446.
20. Compile and download to both PLCs (simplified in V3 via integrated download manager).
21. Create a boot project, restart the complete system and RUN.
22. Operation: Test use cases (e.g. by putting the primary PLC to STOP mode and observe the switchover).
23. For different use cases and behavior refer to 'Failures and use cases' * Chapter 6.5.9.1.3.1 "Failures and use cases" on page 3869.
24. Runtime error and diagnosis function block can be used to monitor the system ${ }^{\mu}$ Chapter 6.5.9.1.8 "Diagnosis" on page 3895.

### 6.5.9.1.7 HA-Modbus TCP Limits

HA-Modbus TCP is supported as of Automation Builder 2.0 or higher and the corresponding AC500 CPUs mentioned previously. AC500 V3 PLC is currently not supporting external ETH communication modules. Therefore, onboard ETH1, ETH2 (and eventually CAN) ports are to be used for communication.

3000 sync instances can be used: Either 3000 HA_MOD_DATA_SYNC function block instances alone or together 3000 instances of HA_MOD_DATA_SYNC inclouding + HA utility function block can be used. If more than 3000 instances are configured user can see the error at

The maximum length of sync data at an instance of HA_MOD_DATA_SYNC function block would be 1412 bytes. The maximum size of sync data which can be synced between PLCA and PLCB in total can be max. 60000 bytes.
The HA-Modbus TCP system takes care of the first fault only. This fault must be visualized by the programmer and overall system (e.g. HMI, SCADA) to the operator, to plan and repair as soon as possible as redundancy might be lost. If more than one error occurs, system may not react to second or following faults.
SCADA/ HMI has to be configured/programmed to:

- Only read data from the primary PLC.
- Parameters and control data should be always written to both PLCs or has to be synchronized via the function block.
This is given automatically when using OPC DA, where the CODESYS OPC Server does this switching for the connected clients according to the primary status. For CP600 HMI a script is available to switch likewise (connected via the internal AC500 protocol or Modbus). Zenon as a SCADA also uses the AC500 protocol to automatically switchover.

### 6.5.9.1.8 Diagnosis

## General

This chapter explains the diagnosis information available to the user in the HA Modbus library and CI52x library. Diagnosis information is available at the outputs of HA control function block, HA Diagnosis function block and at the CI 52 x function block.

Depending on the use case different diagnosis information can be accessed.
\& Chapter 6.5.9.1.3 "Functionality" on page 3869
Primary CPU currently can read-out the diagnosis information (CI52x function
block outputs) from communication interface module only once, hence secon-
dary PLC will not be able to read the diagnosis information from the CI52x
module.
So if any change happens in CI52x diagnosis it is not reflected in the secondary
CPU.
This can lead to different diagnosis information of CI52x module in the primary
and the secondary CPU. Hence it is recommended to customers that diagnosis
information should be handled in the application (e.g. SCADA).

## Diagnosis in HA-Modbus TCP library

In the HA Modbus library diagnosis information is available at the control block and diagnosis block.

## Output System Configuration

This output at the HA control block gives the information of system configuration. Each bit of the word represents a different configuration.

| Bit | Description |
| :--- | :--- |
| 0 | Sync is configured via CAN |
| 1 | Sync is configured via UDP |
| 2 | Lifecom2 is configured via CAN |
| 3 | Lifecom2 is configured via UDP |
| 4 | Lifecom2 is configured via Modbus TCP |
| 5 | Initialization for Ethernet configuration |

| Output System |
| :--- |
| Configuration |
| error |

| Bit | This output at the HA control block gives the details of error in the configuration. Each bit of the <br> word represents different configuration errors. It is valid only when Error $=$ TRUE. |
| :--- | :--- |
| 0 | Description |
| 1 | Communication interface module is not configured properly |
| 2 | $1<$ SyncSlot >3. Invalid value at input sync slot |
| 3 | $1<$ SecSlot>3. Invalid value at input second slot |
| 4 | Value at IpAdrCpuASync is invalid |
| 5 | Value at IpAdrCpuBSync is invalid |
| 6 | Value at IpAdrCpuALifecom2 is invalid |
| 7 | Value at IpAdrCpuBLifecom2 is invalid |

Output Runtime This output at the HA control block gives the details of the error during run time of the system. error

| Bit | Description |
| :--- | :--- |
| 0 | Communication interface modules are lost |
| 1 | Other CPU is not active |
| 2 | Lifecom1 is lost (part of sync) |
| 3 | Lifecom2 is lost. This error will not be TRUE if the PLC is in STOP status. This is <br> because Modbus is still responding even when PLC is in STOP |
| 4 | Synchronization is lost |
| 5 | Error in synchronization |
| 6 | Ethernet status error |
| 7 | Other PLC lost communication to CI52x modules |
| 8 | CAN_HEADER function block has error |
| 9 | CAN_DATA function block has error |
| 10 | fbGetOwnIP function block has error |

Diagnosis func- Outputs at the HA Diagnosis function block, HaModDiag (V3) / HA_MOD_DIAG (V2) provides tion block the following diagnosis information of the HA system.

| Output | Description |
| :--- | :--- |
| CpuAPrimary / CPUA_PRIMARY | TRUE indicates CPU A is primary |
| CpuBPrimary / CPUB_PRIMARY | TRUE indicates CPU B is primary |
| CpuARun / CPUA_RUN | TRUE means CPU A is in RUN mode |
| CpuBRun / CPUB_RUN | TRUE means CPU B is in RUN mode |
| CpuACI52xBusActive / <br> CPUA_CI52x_BUS_ACTIVE | Modbus TCP CI52x bus active on CPU A |
| CpuBCI52xBusActive / <br> CPUB_CI52x_BUS_ACTIVE | Modbus TCP CI52x bus active on CPU B |
| CpuACi52xCfg / CPUA_CI52x_CFG | Total number of CI52x configured on CPU A |
| CpuBCi52xCfg / CPUB_CI52x_CFG | Total number of CI52x configured on CPU B |
| CpuACi52xAct / CPUA_CI52x_ACT | Total number of CI52x active on CPU A line |
| CpuBCi52xAct / CPUB_CI52x_ACT | Total number of CI2x active on CPU B line |
| SyncInstances / SYNC_INSTANCES | Number of data sync and utility blocks initial- <br> ized in the system |
| SyncDataCheckSum / SYNC_DATA_SUM | Checksum of all address pointer blocks in <br> bytes, indicates total number of bytes getting <br> synchronized. |

| Output | Description |
| :---: | :---: |
| StHACpuStatus / stHA_CPU_STATUS | HA own CPU status. It will show the status details of logged in CPU for the following parameters: <br> - HA1: CPU A is primary <br> - HA2: CPU B is primary <br> - bit_CI52x_BUS_active: $\mathrm{CI} 52 x$ bus with one or more communication interface modules active <br> - bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost <br> - RUN: Run status of Cl 52 x <br> - cnt: Count of data sync communication, indicates data sync between CPUs is okay. |
| StHAotherCpuStatus / stHA_OTHER_CPU_STATUS | HA other CPU status. It will show the status details of other CPU for the following parameters: <br> - HA1: CPU $A$ is primary <br> - HA2: CPU B is primary <br> - bit_CI52x_BUS_active: $\mathrm{Cl} 52 x$ bus with one or more communication interface modules active <br> - bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost <br> - RUN: Run status of Cl 52 x <br> - byETH_ACT_CI52x_Count: CI52x alive identification count. |

Other diagnosis Apart from the errors / diagnosis information available in the control and diagnosis block, few variables other variables can be monitored too.

| Variable | Value | Description |
| :--- | :--- | :--- |
| wHA_ER_NO_SYNC_LINK | 16\#7487 | No sync link between the <br> PLCs |
| HA_MOD_INVALID_LENGTH | 16\#2017 | Invalid length at the input of <br> the data sync block |
| HA_MOD_ERNO_TBL_OVER <br> FLOWW | $16 \# 2022$ | HA data reference table is full |
| xHaModDataErr | TRUE | IF TRUE - HA data sync is in <br> error state |
| wHaModDataErNo |  | HA data sync error code |
| xHaModErr | TRUE | HA system is in error state |
| dwHaModServerAlive |  | Life counter incremented by <br> OPC DA server |

## Diagnosis in CI52x library

In addition to the diagnosis information in the HA Modbus library, additional diagnosis information for each communication interface module can be obtained from the CI52x library.

System Config- This output at the CI52x function block gives the details of the configuration error in the Cl 52 x uration error module. Each bit of the byte represents different configuration errors:

| Bit | Description |
| :--- | :--- |
| 0 | Reserved |
| 1 | Wrong ETH port is configured at input Config ETH |
| 2 | Wrong IP address is configured for communication interface module |

$\begin{array}{ll}\text { Runtime error } & \begin{array}{l}\text { RuntimeError (v3) / RUNTIME_ERROR (v2) of the function block CiModCi52x (v3) / } \\ \text { CI_MOD_CI52x (v2). Runtime error is a combination of error bits that are described in the }\end{array} \\ & \text { following: }\end{array}$

| Runtime Error | Description |
| :--- | :--- |
| Bit 0 | Indicates communication error i.e., when CPU is not able to <br> get any response from CI52x module. This error will get reset <br> when communication is reestablished. |
| Bit 1 | Indicates parameter state is not equal to 2 <br> (PARA_STATE_PARA_DONE). If not true, then system gives <br> I/O bus error. System resets this error when parameter state is <br> equal to 2. |
| Bit 2 | Indicates the cluster error ${ }^{1}$ ) in the system, if there is an error <br> in the diagnosis buffer. ACK input is needed to reset this error. |
| Bit 3 | Indicates the hardware configuration error, mismatch between <br> configuration and actual hardware detected. System automati- <br> cally resets this error when the hardware matches. |
| S-ERR (LED on communica- <br> tion interface module) | Indicates that there is some issue with channel configuration in <br> the cluster 1 ). It is not linked with Runtime Error. User can read <br> DiagBuffer (v3) / DIAG_BUFFER (v2) from CiModDiag (v3)/ <br> CI_MOD_DIAG (v2) function block to get more information. <br> This error does not get reset using ACK. It will only reset when <br> all channel errors are removed. |
| 1) "Cluster" means a combination of one communication interface module and several I/O <br> modules attached to it. |  |

Runtime error in different scenarios:

| Error | Runtime error | PLC A: Primary |  |  |  | PLC B: Secondary |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Bit0 comm error | Bit1 I/O bus error | Bit2 cluste $r$ error | Bit3 HW config error | Bit0 comm error | Bit1 I/O bus error | Bit2 cluster error | Bit3 HW config error |
| Wrong IP address configured | 16\#1 | TRUE | FALSE | FALSE | FALSE | TRUE | FALSE | FALSE | FALSE |
| Wrong slot address configured ${ }^{1}$ ) | 16\#0 | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE |
| Communication cable disconnected | 16\#2 | TRUE | TRUE | FALSE | FALSE | TRUE | TRUE | FALSE | FALSE |
| Wrong I/O module plugged in the CI module | 16\#B | BLINK | TRUE | FALSE | TRUE | BLINK | TRUE | FALSE | TRUE |
| Wrong hotswap I/O module plugged at the start | 16\#B | BLINK | TRUE | FALSE | TRUE | BLINK | TRUE | FALSE | TRUE |
| Wrong hotswap I/O module swapped online | 16\#4 | FALSE | FALSE | TRUE | FALSE | FALSE | FALSE | FALSE | FALSE |
| Configured I/O module not connected at start ${ }^{2}$ ) | 16\#B | BLINK | TRUE | FALSE | TRUE | BLINK | TRUE | FALSE | TRUE |
| Configured hotswap I/O module not connected at start ${ }^{2}$ ) | 16\#B | BLINK | TRUE | FALSE | TRUE | BLINK | TRUE | FALSE | TRUE |
| I/O module powered off in Cl module ${ }^{2}$ ) | 16\#4 | FALSE | FALSE | TRUE | FALSE | FALSE | FALSE | FALSE | FALSE |
| Hotswap I/O module powered off in Cl module ${ }^{2}$ ) | 16\#4 | FALSE | FALSE | TRUE | FALSE | FALSE | FALSE | FALSE | FALSE |
| Remove hotswap I/O module when online ${ }^{2}$ ) | 16\#4 | FALSE | FALSE | TRUE | FALSE | FALSE | FALSE | FALSE | FALSE |

| Error | Runtime error | PLC A: Primary |  |  |  | PLC B: Secondary |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Bit0 comm error | Bit1 I/O bus error | Bit2 cluste r error | Bit3 HW config error | Bit0 comm error | Bit1 I/O bus error | Bit2 cluster error | Bit3 HW config error |
| Cl module is powered off | 16\#2 | TRUE | TRUE | FALSE | FALSE | TRUE | TRUE | FALSE | FALSE |
| Mismatch in Channel configuration and wiring ${ }^{3}$ ) | 16\#0 | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE |
| Regular I/O module mounted on hotswap terminal unit ${ }^{4}$ ) | 16\#0 | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE |
| During an error stage if HA system changeover is initiated 5) | 16\#0 | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE | FALSE |

[^50]Communication interface diagnosis

Table 744: Function block CiModDiag (V3) and CI_MOD_DIAG (V2)

| Output | Description |
| :---: | :---: |
| DevState / DEV_STATE | CI521 or CI522 device current status is displayed. <br> - STATE_PREOP: Device is booting <br> - STATE_OPERATION: Device is operational, no bus supervision is active <br> - STATE_ERROR: Device detected a bus error, bus supervision is active <br> - STATE_IP_ERROR: Device has an IP address error <br> - STATE_CYLIC_OPERATION: Device is operational, bus supervision is active <br> - STATE_NA: Not available |
| ParaState / PARA_STATE | CI521 or CI522 device parameter status. <br> - PARA_STATE_NO_PARA: Device has no parameters <br> - PARA_STATE_PARA_ACTIVE: Parameterization process is running <br> - PARA_STATE_PARA_DONE: Device used valid parameters and parameterization is done <br> - PARA_STATE_ERROR: Device has invalid parameters <br> - PARA_STATE_NA: Not available |
| Devicelnfo / DEVICE_INFO | CI521 or Cl522 type and extended module types. This will give the details of the module configured in the communication interface module including the I/O modules. <br> If module is with suffix $F$, then fast counter is enabled for that module. |
| DiagBuffer / DIAG_BUFFER | CI521 or CI522 module diagnosis buffer $\Rightarrow$ Chapter 6.8.4.1.2.3.3 "Diagnosis data" on page 4576. |

### 6.5.10 Motion Control

### 6.5.10.1 Motion wizard

This section is an introduction to the key features and tools, which will be used during the motion solution project.

### 6.5.10.1.1 Introduction to the project

Understanding the "Motion Solution Project"
The project type "Motion Solution Project" is an AC500 project with an inbuilt "Motion Solution Wizard" which helps guide the user intuitively though a step-by-step process to add and configure the motion axis in a few simple steps.

## Understanding the "Motion Solution Wizard"

The "Motion Solution Wizard" is a tool which helps the user to efficiently configure the motion axis. The motion wizard helps the user to configure the axis based on PTO or EtherCAT using 2.7.0.

The time saving functions this includes are; code writing, adding hardware and intuitively setting up PDO mapping. Afterwards the user can proceed by adding further PLCopen function blocks based on their application needs.

## Understanding the "Motion Specific Device" objects

When using the motion solution to commission the user will come across motion specific objects. These are devices which allow the user to represent:

- Real EtherCAT axes
- Real PTO axes
- Encoders (used for following or closing the position loop)
- Virtual axes (used for following)

Each of these elements contain a motion axis object for configuration.

## Understanding the motion axis objects

When using the "Motion Solution Project", motion axis objects are used to configure the axis behavior. These are device tree elements which allow the user to:

- define the motor position system type,
- mechanical units, gearing, and scaling
- control settings (PID)
- PLC Limits (Speed, acceleration etc.)
- PDO mapped data (Only for EtherCAT axis)
- "Drive Control Mode" (Only for EtherCAT axis)

### 6.5.10.1.2 Installing the latest "Motion Control Wizard" and libraries

As described earlier, during the Automation Builder installation process, or later when opening the Installation Manager the "Motion Control (PS5611)" option can be selected and installed. After this step is carried out, the latest version of libraries and motion control tools (such as the "Motion Control Wizard", Cam editor etc) are available to be used.

### 6.5.10.1.3 Introduction to the PLC capabilities

Selection of the correct AC500 PLC type
AC500-eCo CPU (type dependent)

- Supports up to 4 PTO channels - (1ms> Profiling time)
- Support onboard EtherCAT - (1ms> Profiling time)

AC500 CPU (e.g.PM56xx-2ETH)

- Supports only motion via EtherCAT using the CM579-ECAT communication module $(0.5 \mathrm{~ms}$ $>)$
Each variant has a different limitation which are explained in the following chapters.

## PTO operations

Due to differences in the performance of CPU types, there are different limits.

PTO profiling cycle time limits
On the minimum cycle times configurable in each PLC type. These are detailed below:

| PLC Type | PM5032 | PM5052 | PM5072 | PM 5082 |
| :--- | :--- | :--- | :--- | :--- |
| Min. cycle time | 5 ms | 2 ms | 1 ms | 1 ms |

## PTO hardware limits

Withing the AC500-eCo range there are different revisions hardwares available. The revision 0 hardware can only support 2 * 200 kHz or 4 * 100 kHz PTO, where in revision 1 or higher can support 4 * 200 kHz PTO channels. To know if you have a revision 1 AC500-eCo PLC, please refer to the SAP number on the side of the PLC.

- "Revision 1 CPU" has order number 1SAPxxxxxxR017x
- "Revision 0 CPU" has order number 1SAPxxxxxxR007x

## Selection of different revision CPU's

Within the wizard page there is a checkbox for selecting of hardware is revision 1 or higher (default) or older revision 0 hardware. The tick box should be made matching your revison.

| Motion axes cycle time | 5 |  | ms |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Axis name | Axis type | HW Type | HW Info | Channel/Node | Status | Simulate | Generate |
| PTO_Axis | Finite | PTO | Onboard | PTO 0 (DO00-D004) | Not generated |  | $\square$ |
| PTO_Axis_1 | Finite | PTO | Onboard | PTO 1 (D001-D005) | Not generated | $\square$ | $\checkmark$ |
| PTO_Axis_2 | Finite | PTO | Onboard | PTO 2 (D002-D006) | Not generated | $\square$ | - |
| - Hide generated code |  |  |  |  |  | $\checkmark \mathrm{V}$ | Revision 1 |

## Revision 1 or higher CPU

## Up to 4 * 200 kHz (default) PTO axis

When the axis is configured in revision 1 CPU, output channels 0 to 3 are available for 200 kHz outputs. This means "Output 0" to "Output 3" for direction (PTOx Dir) and "Output 4" to "Output 7 " for pulse/step (PTOx HS Pulse) and users need to connect the PTI drive cables accordingly.
Wiring example:

The below table shows the user an overview of the hardware channels configured based on the number of axes configured, this can be used as a reference for the pulse and direction wiring to PTI drive.

Revision 0 AC500-eCo CPU

Number of PTO axis per PLC (Below are the maximum PTO axes combinations possible based on the PTO frequency configured).

- Max 4 PTO axis -100 kHz
- Max 3 PTO axis - two 100 kHz and one 200 kHz ( 200 kHz axis must not be configured between to 100 kHz axis)
- Max 2 PTO axis - 200 kHz

Up to 4 * 100 kHz (default) PTO axis with "Revision 0 CPU"

When the axis is configured as 100 kHz , output channel "Output 0 " to "Output 3 " are configured as direction output (Value = PTOx Dir) and "Output 4" to "Output 7" are configured as pulse (Value = PTOx LS Pulse) and users need to connect the PTI drive cables accordingly.
The below table shows the user an overview of the hardware channels configured based on the number of axes configured, this can be used as a reference for the pulse and direction wiring to PTI drive.

PTO axes 100 When two PTO axes are configured as 100 kHz , the "Motion Solution Wizard" set the onboard kHz output configuration. For the first axis, direction as "Output 0 " and pulse as "Output 4" and for the second axis direction as "Output 1 " and pulse as "Output 5".

Up to 2*200 kHz PTO axis with "Revision 0 CPU"

When the axis is configured as 200 kHz , output channel "Output 4" (Value = PTOx HS Pulse) and "Output 5" (Value = PTOx HS Dir) are configured as pulse and direction output for the first axis and "Output 6" and "Output 7" is configured as pulse and direction output for the second axis.

Below table shows the user an overview of the hardware channels configured based on the number of axes configured, this can be used as a reference for the pulse and direction wiring to PTI drive.

|  |  |  | Axis frequency in $\mathbf{k H z}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | DO5 | PWM/PTO1 LS Pulse <br> PTOO HS Dir/Cw <br> PTOO HS Single 1 | PTO0 HS Dir/Cw | PTO0 HS Dir/Cw |
|  | DO6 | PWM/PTO2 LS <br> Pulse <br> PTO1 HS <br> Pulse/Cw <br> PTOO HS Single <br> 2 |  | PTO1 HS <br> Pulse/Cw |
|  | DO7 | PWM/PTO3 LS <br> Pulse <br> PTO1 HS Dir/Cw <br> PTOO HS Single 3 |  | PTO1 HS Dir/Cw |

PTO axes 200 When two PTO axes are configured as 200 kHz , the "Motion Solution Wizard" set the onboard kHz output configuration. For the first axis, Pulse as "Output 4" and direction as "Output 5" and for the second axis pulse as "Output 6" and direction as "Output 7".

| \% PTO_Axis_2_Direction | Digital output D07 |

Up to 2* 100 kHz and 1 * 200 kHz PTO axis with "Revision 0 CPU"

When some axes are configured as 100 kHz and some are configured as 200 kHz frequency, user must take care following points:

- Make sure the 200 kHz axis is configured as first or last axis and not in between 100 kHz axis.
- When the first axis is 200 kHz , Automation Builder will configure the "Output 4" and "Output 5 " channels and for 100 kHz "Output 6" and "Output 7" is configured as pulse and "Output 2" and "Output 3" are configured as direction.

Below table shows the user an overview of the hardware channels configured based on the number of axes configured.

|  |  | Axis frequency in kHz |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Axis1 | 100 | 200 | 100 | 200 | 100 |
|  |  | Axis2 | 200 | 100 | 100 | 100 | 200 |
|  |  | Axis3 |  |  | 200 | 100 | 100 |
|  |  | Axis4 |  |  |  |  |  |

## EtherCAT operation limits

Due to differences in the performance of CPU types, there are different limits for EtherCAT which are detailed below.

## Configuration minimum EtherCAT cycle time in each PLC type

| PLC Type | PM5072 | PM5082 | PM5630 | PM5650 | PM5670/ <br> PM5675 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Min. <br> EtherCAT <br> master cycle <br> time configu- <br> rable (ms) | 2 ms | 1 ms | 2 ms | 1 ms | 0.5 ms |

Maximum number of synchronized axes in each PLC type

There are limit on the minimum cycle time for each PLC type and limit on the number of servo drives can be connected for each PLC type based on the cycle time configured. Refer the help file for more details ("PLC Automation with V3 CPUs $\rightarrow$ Libraries and solutions $\rightarrow$ Motion control library $\rightarrow$ Preconditions for the use of the libraries") and adapt the cycle time or PLC Type accordingly to avoid error messages during program download.

| PLC Type | PM5072 | PM5082 | PM5630 | PM5650 | PM5670/ <br> PM5675 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Number of <br> synchr. axis in <br> 1 ms | - | 4 | - | 8 | 16 |
| Number of <br> synchr. axis in <br> 2 ms | 4 | 8 | 4 | 16 | 32 |
| Number of <br> synchr. axis in <br> 4 ms | 8 | 16 | 8 | 32 | 64 |

These limits are based on the EtherCAT master cycle time configured in the EtherCAT master.
The "Number of axes" is counted in Automation Builder are based on the axis configured, therefore PTO axis also counted in case if configured in the AC500-eCo Pro PLC.

Mor axis can be used by:

- Increasing the EtherCAT cycle time to accommodate a higher "Number of axes" in the same PLC type.
- Choosing a higher PLC type.

The "Motion Solution" window can be used to see how many axes are supported and how many are already used for the particular PLC type for the EtherCAT master cycle time configured by checking the slider at the bottom of the "Motion Solution Wizard" overview page:

### 6.5.10.1.4 Creation a new "Motion Solution Project"

Once the installation process is completed and the elements that will be needed in the configuration are known then the "Motion Solution Project" can be used to allow the user to create a matching configuration.

## Creation a "New Project"

1. Start Automation Builder and select "New Project".
2. Select the "Motion Solution Project" icon.

3. Click the [OK] button and a new project will be created in the specified location with the specified name.

## Addition of a PLC

1. Automation Builder will now pop up a "Select PLC" window and from here user can select one of the V3 PLC's.

$\Rightarrow$
The PLC type can be changed at any time using the steps outlined earlier.
2. Click the [Add PLC] button to get it added to Automation Builder hardware tree.
3. After selecting the PLC type, "Motion Solution Wizard" will guide the user to the "Motion Solution Wizard" page.
4. After creating the hardware tree, Automation Builder will launch the "Motion Solution Wizard" overview page. From here user can add the axis to the application.
Depending on the PLC type selected some of the axis types are not possible for the user to add to the project.

## Addition of the PTO axes

All AC500-eCo PLC's are supported with a maximum of 4 PTO axis via onboard I/O channels.
After creating the hardware tree, Automation Builder will launch the "Motion Solution Wizard" overview page. From here user can add the PTO axis to the application by clicking on the [Add PTO axis] button from the "Motion Solution Wizard" overview page.

Nested underneath the "OnBoard_IO" object is the PTO axis object. From here users can configure each axis they have added separately as per the application requirement by opening the motion axis object which is added under the "OnBoard_IO".

To do this double click on the object to open "Settings" tab.

Here user can update settings as per the application requirement. Later when downloading the application, the wizard will use these settings to define the operation and scaling of this axis object.

## PTO axis settings

All settings related to the application and axis specific will be done here and need to be carefully updated for each axis. Based on the inputs provided here, wizard will compile and generate the code.
"Axis type" The user can select the type of axis to be configured based on the application requirement.

| Axis type <br> - Modulo (rotary)$\quad$ Finite (rotary) | Linear (rotary screw) | O Linear (linear motor) | $\square$ Axis simulation mode |
| :--- | :--- | :--- | :--- | :--- |

Below is the list of settings which user can configure from the "Motion Control Wizard" along with their meanings:

| Axis type | Detail | Max Limit (Counts) |
| :--- | :--- | :--- |
| Modulo (rotary) | Default setting in the wizard. <br> By selecting the "Modulo" <br> (rotary) your axis will be con- <br> figured as a roll-over axis and <br> the desired modulo range can <br> be configured later. | 16\#7FFFFFFF[RB1] |
| Finite (rotary) | Your axis will be configured <br> as a roll-over axis where <br> in modulo range is non <br> editable by the user and <br> calculated based on the <br> "Unit" selection, Inc_Per_R, <br> U_Per_Rev_Nominator and <br> U_Per_Rev_Denominator set- <br> ting. | 16\#40000000 |
| Linear | This needs to be configured <br> when the user having a rotary <br> motor with linear movements <br> (linear axis). | 16\#7FFFFFFFF+/- |
| (rotary screw) | This needs to be configured <br> when the user axis is a linear <br> motor. | 16\#7FFFFFFFF+/- |
| Linear <br> (linear motor) | This option is read only from <br> here and needed when the <br> user configured the axis but <br> not have the real hardware <br> yet. This can be selected from <br> the "Motion Solution Wizard" <br> overview page. <br> Virtual axis configuration. <br> a Chapter 6.5.10.1.4.6 "Addi- <br> tion of a virtual axis" <br> on page 3932 | 16\#7FFFFFFFF |
| Axis simulation mode |  |  |

"PTO " (Hard- With "Revision 1 CPU" or higher, by default 4 * 200 kHz PTO axis is supported, there is no ware settings) special settings needed in the axis configuration page.

| PTO |  |
| :--- | :--- |
| PTO frequency | 200 kHz |

If a "Revision 0 CPU" is used, user can set the PTO axis frequency to 100 kHz or 200 kHz using the drop down as shown below. Based on the PTO axis frequency selection, the onboard I/O configuration will be updated.

| PTO |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PTO frequency | 200 kHz マ | $\checkmark$ Closed loop | Attention: Non-Revision 1 CPU is selected |  |  |
| Unit | 100 kHz |  |  |  |  |
| pulse | 200 kHz | nm | $\bigcirc$ degree | inch | Orevolution |

"Closed loop" By default, the PTO axis is open loop and however user can also configure a maximum of two PTO axis as closed loop.
To configure the axis as closed loop, user need to configure an encoder axis -> encoder source -> encoder channel -> encoder purpose as the PTO axis which needs to be a closed loop axis.
"Unit" Based on the application requirement user can select the desired unit in the wizard and the wizard will update the subsequent parameters to the selected user unit.
From the below picture user can find the currently supported unit formats.

| Unit | $\bigcirc \mathrm{mm}$ | $\bigcirc \mu \mathrm{m}$ | $\bigcirc \mathrm{nm}$ | $\odot$ degree | $\bigcirc$ inch | $\bigcirc$ revolution |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

As an example, when the user selects the axis type as "Modulo (rotary)" and unit as degree, the wizard will update the subsequent parameters to the selected user unit and fill with default values, ex: modulo range = 360 degree (default). However make sure the user updates the subsequent parameters as per the actual application requirement.

"Pulses per revolution scaling"

When the axis is open loop, user can update the "Pulses per revolution scaling" with the steps per revolution.

When the PTO axis is open loop, it is important that the user set the steps per revolution and maximum rpm by keeping the PTO frequency limits into consideration.
For example, for a 100 kHz PTO axis if the steps per revolution is 2000, the maximum rpm the axis can support is $3000 \mathrm{rpm}(=2000 * 3000 / 60=100 \mathrm{kHz})$

## "Application gearing"

Based on the actual application requirement, here user can check/uncheck the "Application has gearing" check box. Here the user can also update the required tool travel distance per motor revolution.
When the user unchecks the "Application has gearing", user can update the "Tool travel distance per motor revolution" as per the application requirement as shown in the below picture.
Application gearing
$\square$ Application has gearing
Units per revolution scaling (without gearbox)
Tool travel distance per motor revolution (2)
Reference: Unit conversion formula
Number of pulses (pulse) $=\frac{\text { Encoder increments per revolution (1) }}{\text { Tool travel distance per motor revolution (2) }}$ * Travel distance (in user defined units)

When the user checks the "Application has gearing", user will be prompted to provide the gear box details additionally as shown in the below figure and during the generate application, the wizard will update the same accordingly.

"Modulo range" The user can provide the "Modulo range" here. This is the value at which the axis position will wrap back to zero. This window will be active only when the user selects the axis type as any of the rotary axis.

"Software The user can configure some of the common "Software limits" from the wizard itself. Below is limits" the list of software limits which user can configure from the wizard in the selected application units.

By default, software limits in wizard are not enabled and user need to enable the same by enabling the check box "Enable limits".

| Software limits |  |  |
| :--- | :--- | :--- |
| $\square$ Enable limits |  |  |
| Forward limit (axis stop) | 1000 | degree |
| Reverse limit (axis stop) | 0 | degree |
| Forward limit (warning) | 990 | degree |
| Reverse limit (warning) | 10 | degree |

"Direction
correction"
In some of the application we need to change the relationship between its real direction and that within the PLC program. By default, the check box will be unchecked, and the direction will be normal. By selecting the check box "Invert direction" both actual and reference position will be inverted, and the axis will move in opposite direction.

## Direction correction

| "Position | Here the user can configure the parameters related to position control and supervision. Details <br> control (cyclic <br> of each parameter is explained in our system technology chapter. |
| :--- | :--- |
| sync mode)" | « Chapter 6.5.10.3.5.6.3 "Position control loop" on page 4028 |
|  | " Chapter 6.5.10.3.5.6.2 "Supervision" on page 4027 |

| Position control (cyclic sync mode) |  |
| :--- | :--- |
| Control time | 100 |
| Feed forward percentage $(0-100 \%)$ | 25 |
| Following error percentage $(0-300 \%)$ | 200 |
| Delay time velocity check | 10000 |
| Position lag supervision | Deactivated $\sim$ |

"Dynamic limits"

Users can update the maximum limits here. Some parameters depend on the drive settings and needs to be set correctly to get the desired result.
The user can set the "Maximum application velocity" to a desired value to limit the maximum application speed.

| Dynamic limits |  |
| :--- | :--- |
| Maximum application velocity  <br>   <br> Maximum acceleration degree $/ \mathrm{sec}$ <br> Maximum deceleration 10000 <br> Maximum jerk 10000 <br>  degree $/ \mathrm{sec}^{2}$ | 100000 |

## "Drive based limits"

Maximum reference value is the maximum frequency of the drive in which it reaches the maximum rpm. In some drives, the calculated maximum reference value may need to be modified, and user can select "Modify" box and change the value. Note, we have the hardware limitation as 100 kHz or 200 kHz based on the configuration and user must make sure this limitation is not crossed.

Maximum speed is recommended to keep the same maximum speed at the drive and at the PLC parameter.

| Drive based limits |  |  |
| :--- | :--- | :--- | :--- |
| Maximum reference value | 200000 | $\square$ Modify |
| Maximum speed (user defined) | 6000 | rpm Maximum speed allowed with this configuration is: 6000 |

Currently the applications torque limits in the wizard are not valid for PTO axis and this is ignored.

When the PTO axis is open loop, it is important that the user set the steps per revolution and maximum rpm by keeping the PTO frequency limits into consideration.

For example, for a 100 kHz PTO axis if the steps per revolution is 2000, the maximum rpm the axis can support is $3000 \mathrm{rpm}(=2000 * 3000 / 60=100 \mathrm{kHz})$

When in closed loop, set the maximum rpm for the axis to reach when the maximum PTO axis frequency is provided.

For example, if the axis is configured as 200 kHz and closed loop, set the maximum rpm for the axis to reach when the 200 kHz frequency is achieved.
"Results Based on the inputs provided, wizard will calculate the results and can be viewed immediately at (calculated)" the end of the configuration page.

| Results (calculated) |  |  |
| :--- | :--- | :--- |
| Position resolution | 364.0889 | pulses/ degree |
| Maximum possible velocity | 36000 | degree $/ \mathrm{sec}$ |
| Maximum allowed following error | 3600 | degree |

## Addition of an EtherCAT axes

From Automation Builder 2.7.0, users will have two options to realize an EtherCAT network; Using the AC500 and CM579-ETH solution (as we have supported before) and the new option of use AC500-eCo PM5072 and PM5082 PLC's (EtherCAT master using onboard ETH1 port.)

## Differences of the AC500 and AC500-eCo wizard views

After creating the hardware tree the user has selected the CPU. Automation Builder will launch the "Motion Solution Wizard" overview page. As we can see below the user will see a slightly different view based on their selection.

## AC500 CPU adding the EtherCAT master via CM579-ETHCAT

To start adding devices click the [Add CM579-ETHCAT axis] button.

AC500-eCo Pro CPU's adding the EtherCAT master onboard ETH1 port for AC500-eCo CPU's

1. To start adding devices click "Add onboard EtherCAT axis".

2. Adding EtherCAT devices to the master.

Here user find any of EtherCAT drives or devices needed for the application. The user can also add the axis by right clicking on the "EtherCAT_Master" object and select the "Add Object "option or by using the [Add axis] button from "Motion Solution Wizard" overview page.

If user wants to add multiple servo drives, please uncheck the "Close this dialog after each transaction" check box (in left bottom corner) and add multiple drives without closing. In AC500 CPU user can add the EtherCAT motion axis only on the coupler slot 1.

## Configuration of the EtherCAT master

As mentioned in the beginning of the chapter, user can now configure EtherCAT master in AC500 CPU via CM579-ETHCAT communication module or in AC500-eCo Pro PLC's via onboard ETH1 port.

In general, all EtherCAT settings are similar in both solutions but in CM579-ETHCAT user will have more settings tab than onboard EtherCAT. Based on which EtherCAT solution is used, user needs to also use the relevant libraries for diagnosis/SDO handling etc.
For CM579-ETHCAT use the library "AC500_EtherCAT" and for onboard EtherCAT use the library "ETCStack". Both solutions are not identical, and user need to manually adapt the applications incase if moving from CM579-ETHCAT to onboard EtherCAT or vice versa.

CM579-ETHCAT These are the settings specific to CM579-ETHCAT master and not valid for onboard EtherCAT. The label will normally CM579_ETHCAT this can be changed by the user but is normally left as default. If so, the name will be CM579_ETHCAT (CM579-ETHCAT).

In most cases these settings can be left at default but occasionally the user might need to change these to fit the application requirements.

- "Run on Config Fault " - As default it is set to "Yes" meaning the CM579-ETHCAT will not go into error and the PLC program will not go into stop if a slave is lost, this is beneficial as the PLC is then still available to handle other follow up actions. This can be changed if the user wants a configuration where a missing slave will prevent the PLC running.
- "Distributed clocks" - As default it is set to "Active" which is a must if you want to use syncronised motion over EtherCAT.
- "Optimize I/O update" - As default it is set to "On" meaning that, consecutive I/O's are merged in one block to optimize the performance.

ETHCAT_Master This second part of the EtherCAT master defines the specific settings that define the behavior (EtherCĀTMaster) of the EtherCAT operation and from here settings are similar in both CM579-ETHCAT and in onboard EtherCAT.

Onboard EtherCAT is only possible to configure it on PM5072 and PM5082 ETH1 port. It is recommended not to configure any other protocols on the EtherCAT configured ETH port.

The label will normally be in the format of '[name](ETHCAT-Master)' this can be changed by the user but is normally left as default. If so, the name will be ETHCAT_Master (ETHCAT-Master). The most important settings for this are mentioned below:

- "Auto-config master/slaves" - As Default this is activated, this means the parameters are set automatically here in accordance with the default settings. This setting is recommended unless the user is very familiar with the setup of EtherCAT networks.
- "Cycle time" - The default EtherCAT cycle time is $4000 \mu$ s but based on the application requirement, user can adapt the EtherCAT cycle time as as shown below.

EtherCAT cycle time will directly influence the PLC load. If your PLC load is higher than desired, please increase the cycle time or upgrade the PLC type.

## Configuration of the EtherCAT slave and axis

This section explains how to configure the behavior of the Comms slave module. From here we can define how the hardware will behave. It's important to understand the EtherCAT slave axis once added is split into two parts in the project tree. These two parts are described below.

## EtherCAT slave drive object settings

The label will normally be in the format of [Drive name](Drive Type) this can be changed by the user but is normally left as default. If so, the name could be "MicroFlex_e190" (MicroFlex-e190).

In most cases these settings can be left at default but occasionally the user might need to change these to fit the application requirements. Useful settings may be to enable "Expert Settings" to add additional PDO mappings, to check and set mappings or to check the status of the device once online.

## PDO mappings

## PDO and startup parameters (SDO)

Based on the selection under "Motion axis $\rightarrow$ Mapping", PDO and startup parameters are generated automatically as shown below.

Based on the control type and PDO mapping selected in the wizard, it will update the "Process Data" tab from the slave axis object and assign the autogenerated name to each object which is added.

(17) Microflex_e190 x

| General | $\vdots り$ ¢ $\times$ Clear mappings ${ }^{\text {¢ }} \mathbf{Y}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Object Name | Variable | Channel | Address | Type | Description |
| Process Data | MicroFlex_e 190 | MicroFlex_e190_ControlWord | AX0_ControlWord_U16 | \%QW2 | UINT | AX0_ControlWord_U16 |
| Startup Parameters | MicroFlex_e190 | Microflex_e190_TargetPosition | AX0_TargetPosition_I32 | \%QD2 | DINT | AX0_TargetPosition_I32 |
| Starup Paraters | Microflex_e190 | MicroFlex_e190_StatusWord | AX0_StatusWord_U16 | \%IW2 | UINT | AX0_StatusWord_U16 |
| EoE Settings | MicroFlex_e190 | MicroFlex_e190_ActualPosition | AXO_ActualPosition_132 | \%ID2 | DINT | AXO_ActualPosition_132 |
| Log |  |  |  |  |  |  |
| EtherCAT I/O Mapping |  |  |  |  |  |  |
| EtherCAT IEC Objects |  |  |  |  |  |  |
| I/O mapping list |  |  |  |  |  |  |

Like PDO mapping, SDO startup will be updated based on the control type and the mapping selected in the wizard.

Based on the application requirement, user can add more PDO/startup parameters manually.

## User defintion of PDO mappings

If the user wants to add additional PDO mapped objects first enable the "Expert settings", then the user will get an additional tab called "Expert Process Data" below the general tab and here user can add/edit/delete the mapping.

## EtherCAT axis settings

Nested underneath the EtherCAT slave drive object is the axis object, from here users can configure each axis as per the application requirement.

To open this double-click on the object to open the configuration page which then has two separate tabs, one for "Settings" and the other one for "Mapping".

The user can update both the pages as per the application requirement.

Later during the "Generate application" process, the wizard will use these settings to define the operation and scaling of this axis object.

EtherCAT axis object settings

All settings related to the application and axis specific will be done here and need to be carefully updated for each axis. Based on the inputs provided here, wizard will compile and generate the code.
"Axis type" The user can select the type of axis to be configured based on the application requirement.

| Axis type | Linear (rotary screw) $\quad$ Linear (linear motor) (rotary) $\quad \square$ Axis simulation mode |
| :---: | :---: | :---: |

Below is the list of settings which user can configure from the "Motion Control Wizard" along with their meanings:

| Axis type | Detail | Max Limit (Counts) |
| :---: | :---: | :---: |
| Modulo (rotary) | Default setting in the wizard. <br> By selecting the "Modulo" (rotary) your axis will be configured as a roll-over axis and the desired modulo range can be configured later. | 16\#7FFFFFFF[RB1] |
| Finite (rotary) | Your axis will be configured as a roll-over axis where in modulo range is non editable by the user and calculated based on the "Unit" selection, Inc_Per_R, U_Per_Rev_Nominator and U_Per_Rev_Denominator setting. | 16\#40000000 |
| Linear <br> (rotary screw) | This needs to be configured when the user having a rotary motor with linear movements (linear axis). | 16\#7FFFFFFF+/- |
| Linear <br> (linear motor) | This needs to be configured when the user axis is a linear motor. | 16\#7FFFFFFF+/- |
| Axis simulation mode | This option is read only from here and needed when the user configured the axis but not have the real hardware yet. This can be selected from the "Motion Solution Wizard" overview page. <br> Virtual axis configuration. <br> Chapter 6.5.10.1.4.6 "Addition of a virtual axis" on page 3932 | 16\#7FFFFFFF |

"Unit" Based on the application requirement user can select the desired unit in the wizard and the wizard will update the subsequent parameters to the selected user unit.
From the below picture user can find the currently supported unit formats.
$\square$
As an example, when the user selects the axis type as "Modulo (rotary)" and unit as degree, the wizard will update the subsequent parameters to the selected user unit and fill with default values, ex: modulo range = 360 degree (default). However make sure the user updates the subsequent parameters as per the actual application requirement.

For rotary axis the units $m m, \mu m, n m$, and inch might lead to inaccuracy due to rounding errors.
"Pulses per revolution scaling"

User can update the "Pulses per revolution scaling" with the actual encoder increments per motor revolution.

## Pulses per revolution scaling

Encoder increments per motor revolution (1) 131072 pulses/revolution

## "Application gearing/units per revolution"

Here the user can set the tool travel distance per motor revolution and define the gearing relationship with the mechanical system. As default the "Application has gearing" box is unchecked, this means the application has no gearing and the user can update the "Tool travel distance per motor revolution" as per the application requirement:
Application gearing
$\square$ Application has gearing
Units per revolution scaling (without gearbox)

| Tool travel distance per motor revolution (2) |
| :--- |
| Reference: Unit conversion formula |
| Number of pulses (pulse) $=\frac{\text { Encoder increments per revolution (1) }}{\text { Tool travel distance per motor revolution (2) }} *$ Travel distance (in user defined units) | 360

If the application has gearing the user can check the "Application has gearing" box and they will be prompted to provide the gearing details. During the generate application, the wizard will update the same accordingly.

"Modulo range" The user can provide the "Modulo range" here. This is the value at which the axis position will wrap back to zero. This window will be active only when the user selects the axis type as any of the rotary axis.

## "Software limits"

The user can configure some of the common "Software limits" from the wizard itself. Below is the list of software limits which user can configure from the wizard in the selected application units.

By default, software limits in wizard are not enabled and user need to enable the same by enabling the check box "Enable limits".

| Software limits |  |
| :--- | :--- |
| $\square$  <br> Enable limits 1000 <br> Forward limit (axis stop) 0 <br> Reverse limit (axis stop) 990 <br> Forward limit (warning) 10 <br> Reverse limit (warning) degree |  |

"Direction and Homing type"
" Invert direction" - This needs to be set for the application which needs to change the axis relationship between its real direction and that within the PLC program. By default, the check box will be unchecked, and the direction will be normal. By selecting the check box "Invert direction" both actual and reference position will be inverted, and the axis will move in opposite direction.

"Homing using DRIVE IO Touch Probe" - Selecting this will allow the axis to home to a drive based touch probe using EtherCAT.

Selecting this also by default make the PDO mapping preselected for the user, but this can be later changed based on the application need.

```
Additional PDO mapping
    Touch probe 1
    |ising Edge (Pos)
    Falling Edge (Neg)
    Touch probe 2
    \square \text { Rising Edge (Pos)}
    \square \text { Falling Edge (Neg)}
```

Here the user can configure the parameters related to position control and supervision. Details of each parameter is explained in our system technology chapter.
② Chapter 6.5.10.3.5.6.3 "Position control loop" on page 4028
« Chapter 6.5.10.3.5.6.2 "Supervision" on page 4027

| Position control (cyclic sync mode) |  |
| :--- | :--- |
| Control time | 100 |
| Feed forward percentage $(0-100 \%)$ | 25 |
| Following error percentage $(0-300 \%)$ | 200 |
| Delay time velocity check | 10000 |
| Position lag supervision | Deactivated $\sim$ |

[^51]| Dynamic limits |  |
| :--- | :--- |
| Maximum application velocity | 36000 |
| Maximum acceleration | 10000 |
| Maximum deceleration | 10000 |
| Maximum jerk | degree $/ \mathrm{sec}$ |

Servo drive Example, if user is using an ABB servo drive with, 131072 encoder increments per revolution and a maximum speed is 6000 rpm .
Maximum application velocity = Max application velocity in RPM * Tool travel distance per revolution $/ 60$ * Gearbox nominator / gearbox denominator $=6000$ * $360 / 60$ * $1 / 1$
$=36000$ degree $/$ sec
For easy calculation of parameters user can use the excel "AC500_V3_MotionControl_Startup guide for MC parameterization.xIsx" from example program folder PS5611-Motion.

> Use cases and how to handle the function blocks of a certain library is described in sample projects. After the respective library has been installed the corresponding sample projects are available in the default path AutomationBuilder Examples. If the default path is inaccessible, click "Help $\rightarrow$ Project examples" in the Automation Builder menu.
"Drive based limits"

Here the user can define the limits that will dictate the expected behavior of the drive.

| Drive based limits |  |  |
| :--- | :--- | :--- |
| Maximum speed (user defined) | 6000 | rpm |
| Maximum positive torque | 300 | $\%$ |
| Maximum negative torque | -300 |  |

It is recommended to keep the same "Maximum speed" at the drive and at the PLC parameter.
Currently users can define the applications torque limits in the wizard and they will be written to the SDO startup parameter only if the user selects "Torque limits" in the "Mapping" page. These parameters are not used in the program by default.

```
SDO startup parameter mapping
    Give EtherCAT control
    V Operating mode
    V Torque limits
```

"Results Based on the inputs provided, wizard will calculate the results and can be viewed immediately at (calculated)" the end of the configuration page.

| Results (calculated) |  |  |
| :--- | :--- | :--- |
| Position resolution | 364.0889 | pulses/ degree |
| Maximum possible velocity | 36000 | degree $/ \mathrm{sec}$ |
| Maximum allowed following error | 3600 | degree |

## Mapping (Axis control type and object mapping)

The "Mapping" and "Control Type" tab can be selected if the user wants to set a "Control type" other than CSP (default) and mappings other than default (Control Word, Set Position, Status Word, Actual Position). It can be found under the axis object here:

Control type By default, wizard is selected for "Cyclic synchronous position mode (CSP)". User can change the same based on the application requirement. The supported control modes are:
Cyclic synchronous position mode (CSP).
Cyclic synchronous velocity mode (CSV).
Cyclic synchronous velocity mode for load control (CSVL).

CSVL is an ABB specific mode to achieve load control/profiling. By using this mode, the user can use the "Motion Control Load library" which is implemented based on the "PLCopen Motion Part 6 - Fluid Power Extensions". For more details on load/torque control please refer to the library integrated documentation, system technology in online help file and the example program / description from example program folder.

Additional PDO
mapping

If the application needs "Additional PDO mapping" the wizard helps the user to add most used PDO mapping just by selecting them here.

Based on the control type selected, a few of the mandatory PDO mapping are generated automatically and from additional mapping area in wizard user can find the most common PDO mapping and user can add the same based on the application requirement.

The user can add additional PDO mapping which are not listed here manually by enabling the expert settings from the slave device general configuration page (as described earlier).

SDO start-up By default, two of the SDO startup parameters are selected and it is recommended not to parameter map- change these unless the user has expert level knowledge of DS 402 control modes or intends to ping

```
SDO startup parameter mapping
    \ Give EtherCAT control
    \ Operating mode
    \square \text { Torque limits}
```

The user can select the "Torque limits" and the torque values set from the "Settings" page will be written to the respective slave drives startup parameters list.

| Drive based limits |  |  |
| :--- | :--- | :--- |
| Maximum speed (user defined) | 6000 | rpm |
| Maximum positive torque | 300 | $\%$ |
| Maximum negative torque | -300 |  |

Once these settings are made and the generated code is executed you can see that these settings have change the drives EtherCAT slave configuration as shown in the picture below:

| General <br> Process Data |  | \% Add IEdt $X$ Delete \& Move Up \& Move Down |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Line | Index:Subindex | Name | Value |
|  |  | 1 | 16a5002:16a00 | Give EtherCAT Control | 1 |
| Sartup Parameters | POU_2 (PRG) | $-2$ | $16=6060: 16=00$ | ModesOfOperation = 8 (Cydic Synchronous Position Mode) | 8 |
|  |  | $-3$ | 16a5023:16=00 | Maximum Torque Limit | 3000 |
| EoE Settings |  | 4 | $16=5022: 16=00$ | Mrinum Torque Limit | -3000 |

## Addition of an encoder axis

For any application which needs an encoder, an encoder axis can be added and configured. This can be added either by opening the "Motion Solution Wizard" object and clicking on the [Add encoder axis] button on the bottom of the page as shown below or by right clicking on the "Motion Solution Wizard" and selecting "Add object".

Fig. 310: SC_2023_AB_Motion_wiring_appl_progr
After adding an encoder axis, the user can find it under the "Motion Solution Wizard" in the Automation Builder. Users can double click on the added encoder axis object to get the settings page and configure it as per the requirement. Settings here is like any other motion axis expect here user need to configure encoder source.
When an encoder axis is added, user must configure the encoder source channel and encoder source.

## Selection of the encoder source

For a user to use an encoder they must know where the data source that supports it comes from.

Below are the options for the encoder source:

- "Drive encoder" (EtherCAT) - When there is an EtherCAT axis, the user will have a chance to use the EtherCAT servo drives, master encoder (16\#400C:03) as a source for the encoder axis (which will be scanned at EtherCAT cyclic rate). This can only be used as a 'master encoder".
- PLC encoder (OBIO) - When an AC500-eCo PLC is used there is an option to use the onboard IO to take in a two channel Automation Builder encoder signal using the 24 V digital inputs. This can be used as a 'master encoder'* or to close the position loop to a PTO drive in a PTO axis is configured.
- "Data source" - here the user can select any data source from which the value of the encoder can be driven. This requires a data area or variable configured within the program.
* This can now be used to latch positions, or as a master for another axis to follow.

## Using an EtherCAT drive based encoder source

1. Go to the desired EtherCAT drives axis object.
2. Open the "Mapping" tab.
3. Tick the box for "Master encoder".

$\Rightarrow$ Now the configured "Master encoder" is ready to be selected. This selection will make the encoder object 16\#400C:03 available as a source for the encoder axis (which will be scanned at EtherCAT cyclic rate).
4. Add or select the desired encoder axis.
5. Select "Encoder source channel" as "Drive encoder" and the "Encoder source" via the name of the EtherCAT drive's name which the encoder will be selected.

## Using a PLC (OBIO) based encoder source (AC500-eCo only)

When there is a PTO axis, user will have an option to use the onboard encoder channels from AC500-eCo PLC as a source for the encoder axis.

User can add or select the desired encoder axis and select "Encoder source channel" as "PLC encoder OBIO" and the "Encoder source" via the channel (0 or 1). In addition, the purpose should be defined, either "Master encoder" (This can now be used to latch positions, or as a master for another axis to follow) or "Close pos loop" to close the position loop for a PTO axis:

Filtering is also available should the encoder data require it.

## Data source

Here the user can use a "Data source" to define a variable which will then create the variable in the mentioned name as data type "DINT".

Alternatively they can connect to an existing variable from the project to encoder axis. The variable must be of data type "DINT".

| Encoder |  |
| :--- | :--- |
| Encoder source channel |  |
| Encoder source | Data source $\quad$. |

Other encoder axis parameters are same as EtherCAT or PTO axis and for details please refer to the previous chapters.

## Addition of a virtual axis

If the applications require a virtual axis (one which has no associated hardware) then the user can add this.

Eeither by and .

1. Opening the "Motion Solution Wizard" object (by doubling clicking on it).
2. Clicking on the [Add virtual axis] button on the bottom of the page.

3. Open the"Motion Solution Wizard" object by doubling clicking on it.
4. Click on the [Add virtual axis] button on the bottom of the page.

5. Alternatively, right click on the "Motion Solution Wizard "object and by selecting "Add object" option to add the axis.
6. After adding a virtual axis, the user can find it object under the "Motion Solution Wizard ". Users can double click on the added virtual axis object to access the settings page and configure it.

$\Rightarrow$ Settings here are the same as the motion axis and details for how to configure the parameters, refer to the previous chapters.

## Important general PLC settings

Compared with a standard AC500 project, when the user is using motion solution wizard, some default settings are changed during code Generation. These settings are always overwritten as long as there is a change in axis configuration or added a new axis. Below are the settings which are updated by the "Motion Solution Wizard":

|  | Project type |  |
| :--- | :--- | :--- |
| Setting | EtherCAT | PTO Only |
| IO bus - Run on congif fault | Yes | Yes |
| PLC > PLC Settings > Always <br> update variables | "Disabled" | "Disabled" |
| PLC > PLC Settings > Bus <br> Cycle Options | e.g. "Task" - any real slow task must be selected and it <br> shouldn't be set as "unspecified" as this can lead to a negative <br> on cyclic operation. |  |
| CPU-Parameters > Check <br> battery | Off | NA |
| CM579-ETHERCAT > Run on <br> congif fault | Yes | NA |
| CM579-ETHERCAT > Bus <br> Behaviour | Sync Mode 1 | NA |

It is recommended that user change the above settings manually based on the actual application requirement. To update these setting manually, user need to change the setting after all the axis changes are done and then generate the code.

## Generation the motion configuration

Once all the configuration is completed, the user can generated the application (like compile) which will then update; its settings, the PDO and SDO mapping, and the motion task configuration automatically based on the settings and parameters provided in the wizard. To do this, go to "Build" menu and click on "Generate Code"

Automation Builder will generate the axis configuration. Once completed successfully, Automation Builder will show the message "Motion Solution Generation successful" in the message window. This can take some time based on the number of axes configured in the project and PDO mapping selection.

## Task configuration

## Tasks within the Motion Wizard

The wizard will automatically create a fast task and a slow task to help guide the user to correctly distribute their code. The kernel function block and the transfer of axis IO data with EtherCAT or other hardware should be processed in a faster task. This task should be as short and real time (if EtherCAT) or as fast possible (if PTO) to achieve the best motion control performance.
In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following figures show an example for EtherCAT.

The Cyclic task is show as below:

## MotionSolution_Task

The "Motion Solution Wizard" will automatically create a fast task called "MotionSolution_Task". This will call all the axis operation code, and will be configured dependently on the configuration.

## MotionSolution_Task in EtherCAT applications

In the case of EtherCAT applications synchronized the setting of "Cycle time" is defined in the EtherCAT master.

Once the solution is generated this will then define a task which has a type of external and a cycle time which matches that configured in the EtherCAT master and the Priority is set as " 0 ".

```
Confguraton
Prioity ( 0.16 ): 0
Type
#xtemal Extemal vent CoupleEvivent1
\squareEnable
```

## MotionSolution_Task in PTO only applications

In the case of PTO only applications, set the cycle time in the "Motion Solution Wizard".
Once the solution is generated this will then define a task which has a "Type" of "Cyclic" and a cycle time which matches that configured in the solution wizard and the priority is set as "10".

## Function blocks must be called in the Motion Solution Task

As mentioned previously the "MotionSolution_Task" is the fastest and highest priority task in the CPU and so of course the most draining on resources. It is possible for the user to call parts of the motion application in this "MotionSolution_Task" - however excessive amounts of code or that with a poor structure in this task can lead to overloading of the CPU.

Despite these limitations some function blocks must be called in the same task as the kernel function block ("MotionSolution_Task").

- MC_CombineAxes
- MCA_MoveByExternalReference
- MCA_MoveByExtRefRelative
- MCA_DigitalCamSwitch
- MCA_GetTappetValue
- ECAT_CiA402 Touchprobe_App
- ECAT_HomingOnTouchprobe
- ECAT_CiA402ParameterHoming

For onboard EtherCAT motion axis projects, it is recommended to call all the EtherCAT function blocks in one task, for coupler EtherCAT this is not relevant.

## Cyclic tasks and created task "Task"

As default the wizard will also create a 10 ms cyclic task called "Task" which the user can use for such code calling for noncritical motion function blocks:

## Guidance for code distribution within tasks

It is recommended for most non-real time motion PLCopen function blocks in the program to use a different cyclic task with a cycle time at least double of that used in the "MotionSolution_Task" and a lower priority (such as 'Task'). This will reserve more capacity for better performance on the EtherCAT by the PLC.
To save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real time task with the axis implementation as shown in the figure below.

## Motion solution libraries

Based on the control type selected, mandatory libraries are added to the Library Manager. The libraries added depend on the control type selected. See the table below for the libraries added based on the control type selected.
$\left.\begin{array}{|l|l|l|l|l|}\hline \text { Control Type } & \text { Library } & \begin{array}{l}\text { AC500_Ecat_CiA } \\ 402\end{array} & \begin{array}{l}\text { AC500_Motion- } \\ \text { Control }\end{array} & \begin{array}{l}\text { AC500_Motion- } \\ \text { ControILoad }\end{array}\end{array} \begin{array}{l}\text { AC500_Motion- } \\ \text { ControIEco }\end{array}\right]$.

For example, if the user selects control type as CSVL we can see the libraries indicated in the Library Manager.

## Axis program generated (Hidden by default)

The code which is generated for each axis is hidden by default (using the tick box in the "Motion Solution Wizard') but users can choose to make it visible if needed.

To view the generated axis program, the user must access the "Motion Solution Wizard" window.

Then navigate to the bottom and uncheck the [Hide generated code] button from the "Motion Solution Wizard"overview page.

Once the user has unchecked [Hide generated code], they can find the folder "MotionSolution_Generated", which has sub folders for each of the axis configured using the wizard. Each axes subfolder has a GVL and a PRG respectively. Name of the folder GVL/PRG/ Function Blocks/variable are generated based on the axis object name.

Below is the example from EtherCAT axis, for other axis it follows the similar structure.

It is not recommended to change the program manually without exert knowledge as any changes which will be made later the axis object will overwrite all the changes done by the user if the "Generate" check box is checked.

## Axis parameters generated (GVL)

The GVL generated by the wizard maps the parameters set by the wizard to the library variables in the Axis_Ref structure, and the Axis_IO declaration is initiated here.

```
VAR GLOBAL
    MicroFlex_e190_Kernel : ONC_Basic_Kernel; ('Axis reference for MicroFlex_e190_Ker
    MicroFlex_e190_Ecat : ECAT_Cla402_Control_App; ('Axis reference for MicroFlex_el90
    MicroFlex_e190_axis : AC500_MotionControl.Axis_Ref := (
        expert:=1
        ECAT := MicroFlex_e190_Ecat,
            OperatingMode := B,
            Kernel i= MicroFlex_e190_Kernel
            ).
            paramecer:=(
            paraReverseDirection i= 0, //0 = nomal direction, 1 = reverse imput f
            paraEnablePosLagMonitoring := TRUE, //Position Lag super vision
            paraMaxVelocityAppl I= 36000, //Naximum application velocity
            paraMaxAcceleracionSystem :m 10000, //Maximum acceleration
            paraMaxDeceleracionSystem i= 10000, //Naximum deceleration
            paraMaxJerk := 2000 //Maximu= Jerk
            |): ('Axis class for MicroFlex_e190_axis')
    MicroFlex_e190_axis_ReadPos : AC500_MotionControl.MC_ReadactualPosition;
    MicroFlex_e190_axis_ReadVel : MC500_MocionControl.MC_ReadActualVelocity;
END_VAR
```

It is recommended not to add/edit the program here manually since this will be lost next time when the user click on the [Generate Code].

## Generation a program (PRG)

Program which is generated by the wizard initiates the CMC_Axis_Control_Parameter, CMC_Basic_Kernel/CMC_Load_Motion_Kernel and ECAT_CiA402_Control_App func-

For CSP and CSV control type, CMC_Basic_Kernel function block will be called and for CSVL control type CMC_Load_Motion_Kernel function block will be called.

It is recommended not to add/edit the program here manually since this will be lost if there was any modification done on the particular axis reference.

### 6.5.10.1.5 Wiring application program

It is recommended to the user to write the application by creating new POU's and adding the POU's to a new task and setting a cycle time and task priority lower than "MotionSolution_Task". Dependent on the code writing guidelines mentioned earlier.

An exception to the above general guideline is for the function blocks which needs to be called in the same task where the axis is running and, in such cases, user need to call those function blocks in a separate POU add call the POU in "MotionSolution_Task". If a function block needs to be called inside the real time task ("MotionSolution_Task"), this is mentioned in the function block help file.

An example of a function blocks which needs to be called in the "MotionSolution_Task" is MCA_MoveByExternalReference. To use this in a program, a new POU with this (and any other real time function blocks) has been created called "MyMotion".

This POU can then be called from the "MotionSolution_Task" by adding it as shown below.

| Projects <br> PLC_AC500_V3 (PM5650-2ETH - TB5620-2ETH) <br> Moton Solution Wizard <br> - 3. 3 PLCLogic <br> - Application <br> $+\square$ Diagnosis <br> * MotionSolution_Generated <br> Lbrary Manager <br> 0) MyMotion (PRG) <br> - PLC_PRG (PRG) <br> = Task Configuration <br> - \& MotonSolution_Task <br> (1) PRG_Mcroflex_e 190_Axis [1] MyMoVion <br> Task <br> \#1) PLC_PRG |
| :---: |

### 6.5.10.2 Cams and Tappet tables

### 6.5.10.2.1 Definition of a "Cam table"

A "Cam table" is an object type containing a tool which allows the user to create and edit Cams and tappets either graphically or by means of tables. After the code is generated for the corresponding application, there elements or tables are transposed into global data structures or "Cam Data" which the IEC program can access.

## Definition of a Cam

An electronic Cam describes the functional dependency of the position one axis (slave) to another axis (master). The relationship is described by a continuous function (or curve) that maps a defined range of master actual position values to slave target position values.

A software Cam is created by breaking the motion into several segments. Each segment defines how far the slave axis will travel for a given move distance on the master axis. Once these segments have been defined, a path between them is produced, the interpolation method being set by the user. The user controls the size and accuracy of the segments. Using many small segments will produce smoother motion.

Motion across each segment and across segment boundaries will go through all specified points. The segment information for a Cam profile is defined in an array called a table. A table of positions must be defined together with an optional table of master increments.

## Definition of a Tappet

An electronic Tappet describes a function which allows the user to derive a digital state from an axis or cam position which can be user to trigger an event or indicate a state at which an action should occur. You may add tappets (binary switches) to the cam at any position. In this way, you can create cam tables which contain tappets.
6.5.10.2.2 Cam table

Cam table types
With Automation Builder 2.7.0 user has two different Cam objects available in add object option as shown below. From the context menu: "Cam table ABB" and "Cam table ABB basic".

## Differences in the objects

The difference between these objects is the code that is generated by them and the libraries they are compatible with. By hovering over them the user can see the guidance for when to use them:
"Cam table ABB"

- This allows the user to get additional data via Cam structure.
- In the project the user need to use "MCA_CamStructureSelect" (and not "MC_CamTableSelect").
- Compatible with Automation Builder 2.6.1 or higher.

"Cam table ABB basic"
- This gives the user only basic information from the Cam.
- In the project the user need to use "MC_CamTableSelect" as in the past.
- Compatible with Automation Builder 2.6.0 or lower.

## Differences in using the two "Cam tables" types in application code

To use the "Cam table" the user needs to call at least the "MCA_CamStructureSelect" (new) or "MC_CamTableSelect" (old/basic) depending on which version of the "Cam table" objects that are used. Also, in either case you will also need "CamIn" or "CamInDirect" function blocks from the AC500_MotionControl library.

If you use the wrong function block for the wrong type of Cam you can expect your "MC_CamIn/MC_CamInDirect" to never go into 'InSync' = TRUE.

### 6.5.10.2.3 Cam table object structure

The "Cam table" is split into individual editors, which allow the users to edit and add elements to the selected views.

The editor consists of the following tabs:

- [Cam]: Here, you can display and modify the Graphs showing slave position, slave velocity, slave accel-eration, and slave jerk. This view can show the user when you program a movement with high acceleration.
- [Cam table]: Here, you can display and modify the slave position, slave velocity, slave acceleration, and slave jerk in a tabular view.
- [Tappets]: Is an editor for programming tappets (switch points) in a diagram. This display provides a very good overview of the sequential order of the tappets.
- [Tappet table]: Is an editor which lists switch points in a table. Here, you can specify the switch points.

### 6.5.10.2.4 Cam tab

In the Cam graphical editor, the Cam graphs are shown and can be interacted with.
The editor window displays the curves of four graphs:

- Slave position (black)
- Slave velocity (blue)
- Slave acceleration (green)
- Slave jerk (yellow)

The horizontal axis of all four coordinate systems shows the range of the master values ([Minimum - Maximum]). The vertical axis in the position diagram shows the value range that is defined in the Cam properties. The vertical axis of velocity, acceleration, and jerk is scaled automatically.
It is possible to modify all curves, except the jerk curve. As velocity, acceleration, and jerk are derived curves, changes to one graph causes changes to the other graphs.

Switch between the graphical editor and the alternative tabular editor at any time ("Cam table" tab).

### 6.5.10.2.5 Cam table tab

The "Cam table" is an alternative to the graphical editor for defining the Cam graphs ("Cam" tab). The first line of the table always contains the start position of the master (and the related slave values) and the last line is always the end position. The lines in-between alternately define segments and points.
Below is a list of key elements and their descriptions:

| $\oplus$ | Inserts a new line. |
| :--- | :--- |
| 畐 | Deletes the selected segment |
| X | X-position of the slave axis |
| Y | Y-position of the slave axis |
| V | Velocity of the slave axis |
| A | Acceleration of the slave axis |
| J | Jerk of the slave axis |
| Segment type | $\bullet$ Poly5: 5th degree polynomial <br> $\bullet$ |

These elements are always shown in every "Cam" configuration:

The following values result from the values of the respective segment. They cannot be modified.

| $\min$ (Position) | Minimum value of the slave position |
| :--- | :--- |
| $\max$ (Position) | Maximum value of the slave position |
| $\max$ (Velocity) | Maximum value of the velocity of the slave, based on the master axis |
| $\max$ (Acceleration) | Maximum value of the acceleration of the slave, based on the master <br> axis |

Table 745: View "ToolBox"

| $\star$ Select | Select a line in the table by using this tool. <br> Selected points are deleted by pressing the [Del] key. |
| :--- | :--- |
| $\oplus$ Add point | Add new points with this tool. Click the insertion point in the diagram. <br> Te graph is then adapted automatically so that its curve runs through <br> the new inserted point. |

Switch between the table editor and the graphical editor at any time ("Cam" tab).

### 6.5.10.2.6 Tappets tab

The tappet behaviors are shown and can be defined in this graphical editor. A tappet path defines one or more tappets depending on the master position. At the upper edge of the editor window, a horizontal axis approaches the range of the master positions. The individual tappet paths are defined below.
You can switch between the graphical editor and the alternative tabular editor at any time ("Tappet table" tab).

| 1 형 | Track ID of the tappet path． <br> All tappets of a tappet path refer to the same tappet switch（a variable <br> of type BOOL）． |
| :--- | :--- |

Table 746：View＂ToolBox＂

| A Select | Select the tappets by means of this tool．You can drag the selected <br> tappets to another position． <br> You can modify the switch on／off attribute of a tappet by clicking the <br> relevant end of the crossed line $(\Sigma)$. <br> Delete the selected tappet by pressing the［Del］key． |
| :--- | :--- |
| $\mathbf{x}$ | Add new tappets with this tool．Click the insertion point in the path． |

Table 747：View＂Properties＂
The tappet is assigned to a result，if it is passed from the position of the master axis in the positive（increasing master values）or negative direction．

| X | Position of the tappet |
| :---: | :---: |
| Positive pass | Switch on／off attribute <br> －No action <br> －Switch to ON <br> －Switch to OFF <br> －Invert |
| Negative pass | Switch on／off attribute <br> －No action <br> －Switch to ON <br> －Switch to OFF <br> －Invert |

Table 748：Table of the possible combinations of tappet attributes

| Tappet symbol | Positive pass | Negative pass |
| :---: | :---: | :---: |
| Z | No action | No action |
| Z | Switch to ON | No action |
| $\triangle$ | Switch to OFF | No action |
| － | No action | Switch to ON |
| Z | No action | Switch to OFF |
| 区 | Switch to ON | Switch to OFF |
| Z | Switch to ON | Switch to OFF |
| $\triangle$ | Switch to OFF | Switch to ON |
| 又 | Switch to OFF | Switch to OFF |
| X | Invert | No action |
| 又 | No action | Invert |
| 区 | Switch to ON | Invert |
| 区 | Invert | Switch to ON |
| X | Invert | Switch to OFF |

| Tappet symbol | Positive pass | Negative pass |
| :--- | :--- | :--- |
| $Z$ | Switch to OFF | Invert |
| $区$ | Invert | Invert |

### 6.5.10.2.7 Tappet table tab

This tabular editor is an alternative to the graphical editor for configuring the tappet paths ("Tappets" tab). A tappet path defines one or more tappets depending on the master position. In the table, the lines with the definitions of the associated tappets follow below each line that defines a tappet path.

Switch between the graphical editor and the alternative tabular editor at any time ("Tappet table" tab).

| - | Inserts a new tappet. |
| :---: | :---: |
| - | Deletes the tappet. |
| Track ID | ID of the tappet path. <br> All tappets of a tappet path refer to the same tappet switch (a variable of type BOOL). |
| X | Position of the tappet. |
| Positive pass | Switch on/off attribute <br> - No action <br> - Switch to ON <br> - Switch to OFF <br> - Invert |
| Negative pass | Switch on/off attribute <br> - No action <br> - Switch to ON <br> - Switch to OFF <br> - Invert |

Table 749: View "ToolBox"

| $\star$ Select | Select the tappets by means of this tool. You can drag the selected <br> tappets to another position. |
| :--- | :--- | tappets to another position.

The tappet is assigned to a result, if it is passed from the position of the master axis in the positive (increasing master values) or negative direction.
X $\quad$ Position of the tappet

| Positive pass | Switch on/off attribute <br> - No action <br> - Switch to ON <br> - Switch to OFF <br> - Invert |
| :---: | :---: |
| Negative pass | Switch on/off attribute <br> - No action <br> - Switch to ON <br> - Switch to OFF <br> - Invert |

### 6.5.10.2.8 Cam additional settings

Once the user has the "Cam" view open (double-click on the "Cam" object in the device tree) the user will have access to several additional "Cam" settings and options:

## Cam ToolBox

This will allow the user to add and remove elements to the "Cam" and tappet editors. Typical options are:

Table 751: View "ToolBox"

| * Select | Select a line in the table by using this tool. <br> Selected points are deleted by pressing the [Del] key. |
| :--- | :--- |
| Add point | Add new points with this tool. Click the insertion point in the diagram. <br> Te graph is then adapted automatically so that its curve runs through <br> the new inserted point. |

This can be accessed by either "View $\rightarrow$ Properties" or by right clicking on the "Cam" object and selecting properties. It will allow the user to define the behavior and dimensions of the "Cam".

Here the user can change:

- Dimensions: The master and slave "Cam table" start and end positions.
- Slave period: Depending on these parameters, the slave start point is adjusted automatically when the end point is changed, as well as the other way around. This adjustment optimizes the period transition to be as smooth and jerk-free as possible.
- Continuity requirements: Activation of these options prompt a continuity check, which reports any violations to the message view (Cam). Clear these options, if the application requires it.
- Compile format: In the Automation Builder is only one option: "polynomial (XYVA)" - Polynomial description of the points, for master position, slave position, slave velocity, and slave acceleration.

### 6.5.10.2.9 Display generated Code

To view the code that is generated by the "Cam" object:

1. Close all Cam views.
2. Open the Cam which's code needs to be viewed.
3. Go to "Cam" tab from the main Automation Builder tab.
4. Select "the display generated code" option.

The code will be shown where user can find the Cam points that are created in an array. "Cam table" function block from motion library is already initialized with few inputs.

Below is an example of the code generated by the "Cam table $A B B$ " object (Automation Builder 2.6.1 and newer).

Here you can see more in depth information about the Cam is encoded in the structure.
Below is an example of the code generated by the "Cam table ABB basic" object (Automation Builder 2.6.0 and older).

```
S cenerded coce >
(fattribuce 'IInkalvays')
vaz olobal
Cam_21 גNNAY[0..3] or MC_PDrofile i= !
    master_position i= 0, interpolation_poiat i= 0, velocity_ratio i= 0, aoceleration_ratio i- 0)
    (master position i= 220, interpolation, poist i= 120, velootty_ratio i= 1, acceleration_ratio i= 0)
    (master position i= 360, interpolacion point i= 360, veloeve\ ratio i= 0, acceleration ratio i= 0) )
```

```
[0%_vas
```

Here you can see only basic Cam data is encoded in the structure.
Currently it can only show the code generated from one Cam which is open.

### 6.5.10.2.10 <br> Creating Cams

The steps to create a Cam can be explained using an example application. In this application, we can say that there is a rotary table with eight slots ( $360^{\circ} / 8=45^{\circ}$ division). Inside there is a component to be joined by ultrasonic welding. The welding tool is fed by a linear drive after the rotary table has rotated. After welding, the linear axis returns and the rotary table continues to rotate.

Work steps:

- Rotary table turns $45^{\circ}$ (duration: 400 ms ).
- The welding head is moved down by a vertical axis of 250 mm (duration: 200 ms ).
- Start welding (duration: 1200 ms ).
- The welding head is moved up by a vertical axis of 250 mm (duration: 200 ms ).

A cycle time of 2000 ms results from total times.
The application is implemented by means of a virtual master axis that runs continuously (modulo). The end value of the axis is projected according to the cycle time of 2000 ms . The rotary table is achieved as a Cam (modulo; end value: $45^{\circ}$ ). The vertical axis is also achieved as a Cam (restricted; end value: 300 mm ). The welding process is controlled by a tappet.

### 6.5.10.2.11 Setting up project

1. Select "Motion Solution" project.
2. Select the required AC500 controller.
3. Add two real drives and configure as below:
$\Rightarrow$ Name "RotaryAxis", Type: Modulo, units: Degrees, scale: Gearing 8/1, 1 Tool Rev = $360^{\circ}$, Modulo 0-45 ${ }^{\circ}$
$\Rightarrow$ Name "VerticalAxis" Type: Linear (Rotary Screw), units: mm, scale: 1 Motor Rev = 10 mm
4. Add a virtual axis (and don't rename it)
$\Rightarrow$ Name "MasterAxis" Type: Modulo, units: Pulse, Modulo range $=2000$

Adding a Cam to the device tree

1. Select the "Application" object in the device tree.
2. Click "Project $\rightarrow$ Add object $\rightarrow$ Cam table".
$\Rightarrow$ "Cam table $A B B$ " - This allows the user to get additional data via Cam structure and user need to use "MCA_CamStructureSelect" instead to "MC_CamTableSelect".
$\Rightarrow$ "Cam table ABB basic" - This allows the user to use the Cam object in the traditional ABB way together with "MC_CamTableSelect".
3. Specify the name "RotaryAxisCam" for the Cam and click [OK].
$\Rightarrow$ The object is inserted into the device tree.
4. Insert another Cam.
5. Rename it "VerticalAxisCam".

## Setting the properties of the Cam

1. Select the "Rotary table" Cam in the device tree.
2. Click "Properties" in the "View" menu or in the context menu.
3. Select the "Cam" tab.
4. Specify the following values:

- Master start position: 0
- Master end position: 2000
- Slave start position: 0
- Slave end position: 45
- Slave Period: 45 (NA)
- Smooth transition: (deactivated)

5. Click $[O K]$ to close the dialog. Confirm the dialog for changing the Cam object.
6. Change the values for the "Vertical axis" Cam in the same way:

- Master start position: 0
- Master end position: 2000
- Slave start position: 0
- Slave end position: 300
- Slave Period: 300
- Smooth transition: (activated)

7. Click $[O K]$ to close the dialog. Confirm the dialog for changing the ca, m object.

### 6.5.10.2.12 Changing the Cam path

These instructions use the example from the section \& Chapter 6.5.10.2.10 "Creating Cams" on page 3949 to demonstrate how to change a Cam.

## Changing the path with the graphical editor

1. Open the "Rotary table" Cam in the editor.
$\Rightarrow$ The "Cam" tab is visible.
2. Select the point at 120 and 240 and delete them by pressing the key [Del].
3. Select the "Add point" tool from the "ToolBox" view.
$\Rightarrow$ The mouse pointer turns into crosshairs when you move it into the editor.
4. Click near "Master position" 400 and "Slave position" 45 in the upper graphs (slave position).
$\Rightarrow$ The curve of the slave position is changed. The curves of velocity, acceleration, and jerk also change.
5. Select the new inserted point by clicking it.
6. Drag the point to another position.
$\Rightarrow$ The curve of the slave position is adjusted accordingly.
7. Select this point and open the properties view and change the " $X$ " value to 400 and the " $Y$ " value to 45 .
8. 9. Using the same method, change the end point to an " $X$ " value of 2000 and " $Y$ " value to 45.
1. Select the "Select" tool from the "ToolBox" view.
2. Select the second curve element (between 400 and 2000).
3. Change the "Segment type" property to "Line".
4. Check the curve in the graphical editor.

## Changing the Cam path with a "Cam table" editor

1. Open the "Vertical axis" Cam in the editor.
$\Rightarrow$ The "Cam" tab is visible.
2. Select the "Cam table" tab.
3. Delete the points at 120 and 240 by clicking the symbol.
4. Click the symbol.
$\Rightarrow$ A new point and a new segment are inserted at (1000/150).
5. Add two more points.
6. Change the values $X / Y$ of the following points:

- Point 1: $0 / 0$
- Point 2: 400 / 0
- Point 3: $600 / 250$
- Point 4: 1800 / 250
- Point 5: 2000 / 0
$\Rightarrow$ The curve of the slave position is changed. The curves of velocity, acceleration, and jerk also change.

7. In the "Cam table", change the "Segment type" of the first and third segments to "Line".
8. Check the curve in the graphical editor.

By clicking "Display generated Code," you can display the automatically created global variables.

## Application program using a generated Cam and Tappet table

Once the Cam and Tappet tables are created by the Cam editor, user can use the Cam function blocks to use the same in user application. These instructions use the same example as the previous example (from the section ${ }^{4} \Rightarrow$ Chapter 6.5.10.2.10 "Creating Cams" on page 3949) to demonstrate how to define the application program for Cam and tappet points.

Using Cam tables in application code

In the below example we have used an instance of "MC_CamStructureSelect" to connect to the Cam directly (no ADR is needed). Also this function has inputs to allow the user to directly define "Reverse" or "Periodic" settings so the use of "MCA_Cam_Extra" is no longer needed.

Note that in this instance the Cam; "Cam_1" is of the type "ABB Cam Table".

Using Tappet To use the Cam Tappets the user has two options: "MCA_CamDigitalSwitch" or tables in application code
"MCA_GetTappetValue".
"MCA_GetTappetValue" uses the output from the "MCA_CamStructureSelect" and will reflect the value based upon the "CAM SLAVE" position and "W$/ L L$ " take into account offsets or changes to scaling.

In the example, as the second Cam editor object name is "VerticalAxisCam". If the user has opted to use the new "ABB Cam Table" object and "MCA_CamStructureSelect" then they can use this function to set an output based on the Cam. An excerpt from the generated code can be seen below:

"MCA_CamDigitalSwitch" uses part of the "CAM STRUCTURE" and will reflect the value based upon the "AXIS" position and will NOT take into account offsets or changes to scaling. If using the this the "MCA_CAM" tappet array mut be accessed. This is generated automatically based on the configuration in tappet. The array name follows the format [Cam object name] $+[T]$.

In the example, as the second Cam editor object name is "VerticalAxisCam" then the "MCA_CAMTappet" array instance name is "VerticalAxisCam_T". An except from the generated code can be seen below:

VerticalAxisCam_T: ARRAY[0..1] OF MCA_CAMTappet := [
This can be directly passed to input pin name "Tappets" of function block
"MCA_DigitalCamSwitch".

More details on how to use the Cam curve can be found in Automation Builder online help and from the "AC500_MotionControl library" integrated documentation.

Importing a Cam from 3rd party CODESYS controller

## Exporting the Cam for the the 3rd party PLC

Using a Cam application that has been previously written using another 3rd party CODESYS based PLC it's possible to reuse these same data points in your new Automation Builder project to save the user time and effort. The steps to do this are below, in the example application we are using a inovance AM600 PLC program.

1. Open the 3rd party CODESYS environment and the project in question.
$\Rightarrow$ As when using ABB's solution, the Cam object must be selected from the project tree to allow the user to access the "Cam" item in the system menu at the top of the page which will be needed for some of the steps that follow.

The first thing you should consider is the master and slave settings such as start and end position, and slave period.
2. Check this, with a right click on the Cam object in the hardware tree and select $P$ "'roperties.
$\Rightarrow$ From here you will get a pop up where you can double check the settings that will define the Cam operation. Make a note of these.

3. Look at the "Cam table" just to get an idea about the general layout, here we can see this Cam has 6 points (beginning, end and 4 user selected items).

| Com | Cam table | Tappets Tappet table |  |  |  | Segm... |  |  |  | $\max (1)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | X | Y | V | A | J |  | $\min \left(P^{-}\right.$ | $\max (\ldots$ | $\max (1)$ |  |
|  | 0 | 0 | 0 | 0 | 0 |  |  |  |  |  |
| $\bigcirc$ |  |  |  |  |  | Line | 0 | 0 | 0 | 0 |
| - | 10 | 0 | 0 | 0 | 0 |  |  |  |  |  |
| - |  |  |  |  |  | Poly5 | -4.69... | 54.76... | 2.168... | 0.056... |
| 曾 | 103.6... | 54.76... | 2.168... | 0 | 0 |  |  |  |  |  |
| $\bigcirc$ |  |  |  |  |  | Line | 54.76... | 227.9... | 2.168... | 0 |
| - | 183.5... | 227.9... | 2.168... | 0 | 0 |  |  |  |  |  |
| - |  |  |  |  |  | Poly5 | -6.25... | 273.8... | 3.587... | 0.098... |
| - | 350 | 0 | 0 | 0 |  |  |  |  |  |  |
| $\bigcirc$ |  |  |  |  |  | Line | 0 | 0 | 0 | 0 |
|  | 360 | 0 | 0 | 0 | 0 |  |  |  |  |  |

4. Consider the method for getting the Cam data exported from the application.
5. Select the "Cam" object to access the Cam menu.
6. Select the option for "Write Cam Data into ASCII Table".
7. Export or "Write" the data to an ASCII file.

8. Select somewhere to save it.
$\Rightarrow$ Then you will see a pop up which will ask you how many Cam data points you want to export into the file, we can treat this like resolution. In the example below we select 128 data points.

If we select many of points when the Cam is exported, we can expect the larger number of data points will give the same profile even using the 3rd party Cam builder's interpolation types to ensure the Cam profile is immediately matched perfectly to the previous application.
If we select a lower number of points, one that matches the interpolation points (the smallest number possible) for example then you are relying on Automation builder to plot the interceding Cam points so the interpolation types selected within Automation Builder are more important and must be checked.
Now we are finished with the 3rd party environment.

Importing the
Cam data into
Automation
Builder

1. Switch to Automation Builder in which we need to have a project which has a Cam in it ready for us to write the data into.
2. Check the properties of the Cam to check that it has the same maximum and minimum values and other characteristics.
3. Select the Cam object to access the menu in the "Tool bar" from which we can select "Read Cam Data from ASCII table".

4. Select the ASCII file we created before.

You will then be asked how many data points you want to import into the project. Typically, this should always match the value that was exported.

In the figure below you can see the result with all 128 data points imported.

Edit the segments (interpolation types) used in each segment in this newly imported Cam via the "Cam table" view.

| , Cam | [1] Diag_10_Bus |  | $\Theta^{9}$ Trace | $\sqrt{7}$ | Microflex_e ${ }^{\text {1 }}$ | 90_axis | Microflex_e190_1_axis |  |  | © | Motion ! |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| cam | cam table |  |  |  |  |  |  |  |  |  |  |
|  | X | Y | V | A | J | Segme... | $\min \left(\mathrm{P}_{0} \ldots\right.$ | $\max (\mathrm{P} .$. | $\max \left(\mathrm{l} \mathrm{V}_{\text {... }}\right.$ | $\max (1)$ |  |
|  | 0 | 0 | 0 | 0 | 0 |  |  |  |  |  |  |
| © |  |  |  |  |  | Polys ${ }^{5}$ | 0 | 0 | 0 | 0 | 0 |
| \% | 2.8346... | 0 | 0 | 0 | 0 |  |  |  |  |  |  |
| ¢ |  |  |  |  |  | Poly5 | -3.2302... | 0 | 4.4703... | 2.3264... |  |
| \% | 5.6692... | 0 | 0 | -2.3264... | 0 |  |  |  |  |  |  |
| © |  |  |  |  |  | Poly5 | -2.6924... | 1.6136... | 0.0001... | 0.0006... |  |
| \% | 8.5039... | 0 | -0.0001... | -0.0006... | 0 |  |  |  |  |  |  |

Once all necessary adjustments have been made, now the Cam is ready to be used in the program.

### 6.5.10.3 Motion control library

```

Check the latest version of "Motion Library System Technology" in chapter 10.1 of the "AC500 V3 Motion Control Guide 3ADR 3ADR011239.pdf.
```

## ABB Library

```
Or via pdf document at: "C:|Users \(\mid\) Public \(\mid\) Documents 1 Automation Builder 2.x ExamplesIPS5611-Motion\Documentation
If the default path is inaccessible, click "Help \(\rightarrow\) Project examples" in the Automation Builder menu.
```

### 6.5.10.3.1 Safety instructions

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the drives you are using, before installation and commissioning.
- Read all safety instructions and important user information of the AC500 PLC.

²) Chapter 1.4 "Regulations" on page 9

### 6.5.10.3.2 Preconditions for the use of the libraries

The library package has been released for the software and firmware versions listed in the readme file of Automation Builder only ("Help $\rightarrow$ Automation Builder Release Notes") . In no event will $A B B$ or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the HA library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

The first version of Motion Control Library Package PS5611-Motion has been released with Automation Builder 2.4.0. There after the package is updated with several changes. For details on all changes please refer PS5611-Motion release note area from Automation Builder release notes.

The motion control package contains follows libraries:

| Library | Automation Builder | PLC firmware |
| :---: | :---: | :---: |
| ABB_MotionControl_AC500 | AB 2.4.0 or higher | AC500 V3 firmware version 3.3.1 or higher <br> AC500-eCo V3 firmware version 3.4.0 or higher |
| ABB_Ecat_CiA402_AC500 |  |  |
| ABB_MathFunctions_AC500 |  |  |
| ABB_MotionControlEco_AC500 (kernel blocks for eCo V3 PLCs) |  |  |
| ABB_MotionControlLoad_AC500 | AB 2.5.0 or higher | AC500 V3 firmware version 3.5.0 or higher |

The PS5611-Motion libraries have been tested with the following product/firmware/software versions:

- AC500 V3 PLC firmware 3.3.1 or higher
- AC500-eCo V3 (PTO \& PWM) firmware 3.4.0 or higher
- CM579-ETHCAT EtherCAT communication module firmware 4.4.3.21 or higher
- ABB e190 Drive
- CD522 module

In no event will $A B B$ or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product/software/firmware versions. The error-free operation of the PS5611-Motion with other devices/software/firmware versions should be possible but can not be guaranteed and may need adaptations e. g. of example programs.

## CAUTION!

Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

Limits on number of synchronized axis

There are limits on the minimum EtherCAT cycle time, user can configure in each PLC type.

Table 752: Details on the limits on the minimum EtherCAT cycle time

| PLC type | PM5630 | PM5650 | PM5670 |
| :--- | :--- | :--- | :--- |
| Min. EtherCAT master cycle <br> time | 2 ms | 1 ms | $0,5 \mathrm{~ms}$ |

Other than the above limits, there is also limits on configuring the number of synchronized axis in each PLC type. This limits is based on the EtherCAT master cycle time configured under EtherCAT master.

Table 753: Details on the limits for each PLC type

| PLC type | PM5630 | PM5650 | PM5670 |
| :--- | :--- | :--- | :--- |
| Number of synchronized <br> axis in 1 ms | - | 8 | 16 |
| Number of synchronized <br> axis in 2 ms | 4 | 16 | 32 |
| Number of synchronized <br> axis in 4 ms | 8 | 32 | 64 |

"Number of axis" is counted in Automation Builder is based on the number of Kernel function block instance declared in the IEC application. In this way, it is made sure all real and virtual axis are counted.

User can increase the EtherCAT cycle time to accommodate more "Number of axis" in the same PLC type.

User can use the [Statistics] tab from Automation Builder to see how many axis are supported for the particular PLC type and for the EtherCAT master cycle time configured. Once the axis is configured user need to update the [Statistics] tab by "Generate Code" to get the updated information.

Automation Builder allows an additional axis than what is mentioned in the above table to support one virtual axis additionally.

Please remove any Kernel function block instance which is declared but not used in the application to get the correct number of axis calculated by Automation Builder under the [Statistics] tab.

### 6.5.10.3.3 Overview

## Introduction

The PS5611-Motion is a motion control library for AC500 V3 CPUs, to create motion control applications based on function blocks according to the standard of PLCopen motion control. These function blocks can be used for PLC-based motion control and cover a wide range of possible motion control functionalities. Starting from single axis movements to master-follower axes to perform electronic gearing and CAM functions.

The detailed functionality of each function block is defined in the integrated documentation of the library.

## PLC-based motion control

With PS5611-Motion the application program and the profile generator are realized in the PLC. The implementation of the profile generator is based on a set of function blocks which are named central motion control (CMC).
The profile generator of many possible axes is centrally placed inside the AC500 PLC. Therefore multiaxis motion functionalities become easily available and can be accessed by PLCopen function blocks. As a result, motion control functionalities are almost drive independent.

The detailed functionality of each function block is defined in the integrated documentation of the library.

Available motion control functionalities:

- Simple axis Movements
- Electronic Gearin
- Electronic CAMs
- Position Profiles
- Velocity Profiles
- Acceleration Profiles
- Load control (Torque profilling)

Then the output is a position reference signal which the drive will follow. A new position reference value will be calculated with every cycle of the PLC and has to be transferred to the drive, which demands real time capabilities to the PLC and to the communication channel. A real time fieldbus like EtherCAT is needed. The feedback of the actual position can be used for supervision purposes during operation and is needed to adjust the value of the position reference before the drive will be enabled.

## AC500 as Motion Controller (Central Motion Control)

Servo Drive (Non Intolligent)

Fig. 311: System structure of PLC-based motion control with AC500 PLC and PS5611-Motion
With PLC-based motion control it is also possible to include the position control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory.

Fig. 312: PLC-based motion control with AC500 PLC and PS5611-Motion, closed position control loop

With PLC-based motion control it is also possible to include the load control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory and to close the load control loop, feedback of the actual load / torque is mandatory.

AC500 as Motion Controller (Central Motion Control)

Fig. 313: PLC-based motion control with AC500 PLC and PS5611-Motion, closed load control loop

Fig. 314: Central motion control with AC500 PLC and PS5611-Motion, different axis implementations at the same time

## Overview of PLCopen function blocks

The following tables give an overview of the defined function blocks, divided into administrative (not driving motion) and motion related sets. They give an overview which function block could be used for the different possible configurations.

These function blocks are part of the ABB_MotionControl_AC500 and ABB_MotionControlLoad_AC500 library.

If there are restrictions concerning a certain drive ("XXX") which lead to a different or limited behavior compared to the standard the respective chapter is supplemented with an additional paragraph "Notes for XXX".

The "KERNEL" function blocks are available in different variants.
The "CMC_Basic_Kernel" and "CMC_Load_Motion_Kernel" function block is designed to be used in standard $\bar{V} 3$ PLCs, and can either work with drives connected to a fieldbus or IOs.
The "OBIO_PTOMotionKernel" or "OBIO_PWMMotionKernel" function blocks (part of AC500_MotionControlEco) are solely to be used in AC500-eCo V3 CPUs and to make use of the integrated stepper-IO along with PLCopen function blocks. It connects automatically to the internal IOs.

For details of the limitations of PTO and PWM outputs in eCo V3 PLCs, refer to Automation Builder help file.

Table 754: Motion control administrative function blocks

## Overview of libraries

$\triangleright \quad$ Add the following libraries for the listed applications.
$\Rightarrow$ In some cases by adding a library, there will be other libraries added automatically.

| Application | Library to be added manually |
| :--- | :--- |
| PLC-based motion control | ABB_MotionControl_AC500.-compiled-library |
|  | ABB_MathFunctions_AC500.-compiled-library |
| PLC-based motion control, optional for <br> EtherCAT | ABB_Ecat_CiA402_AC500.-library |
| Motion control with eCo V3 (OBIO_PTOMo- <br> tionKernel \& OBIO_PWMMotionKernel) | ABB_MotionControlEco_AC500.compiled <br> ibrary |
| PLC-based motion control - Fluid Power <br> Extensions | ABB_MotionControlLoad_AC500.compiled <br> ibrary |

The features of the function blocks provided with PS5611-Motion can be used from the PLC program according to PLCopen standard. Different drives and different motion control realizations could be used and can be combined with each other as well as different fieldbuses. ABB_Ecat_CiA402_AC500.library is editable and can be adapted based on the drive configuration and drive type.

## Overview of data types

The following data types are used for the motion control library. The data types are defined in the library file ABB_MotionControl_AC500 compiled-library. The corresponding elements can be used for the function blocks inputs.

Table 760: Structures

| Data type | Elements | Element data type |

## Naming of function blocks and data structures

PLCopen All function blocks and data types named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation. They may have additional inputs but according to PLCopen rules.
All function blocks and data types named MCA_xxx are implemented corresponding to PLCopen rules with adaptations specific to AC500. They are AC500 specific extensions to the PLCopen library.

## PLC-based motion control

All function blocks named CMC_xxx belong to the implementation of PLC-based motion control. All data types named CMC_xxx belong to the implementation of PLC-based motion control.
All data types named AXIS_xxx exist according to PLCopen definition. The content is ABB specific and not documented.
All function blocks named zCMC_xxx belong to the implementation of PLC-based motion control. These are not documented and not intended for customer use.
All function blocks and data types named MC_xxx are implemented according PLCopen definition and follow the PLCopen documentation.
All function blocks and data types named OBIO_xxx in the ABB_MotionControlEco_AC500 library are intended for use with AC500-eCo V3-PLCs only.
All function blocks named xxx_APP are not write protected and may be modified for adaptations. Editable library is available in the example folder.

Editable library is available in the example folder.

### 6.5.10.3.4 PLCopen

Introduction
Based on application requirements and project specifications engineers are required to use or select a wide range of motion control hardware. In the past this required unique software to be created for each application even though the functions are the same. PLCopen motion standard provide a way to have standard application libraries that are reusable for multiple hardware platforms. This lowers development, maintenance and support costs while eliminating confusion. In addition, engineering becomes easier, training costs decrease, and the software
is reusable across platforms. Effectively, this standardization is done by defining libraries of reusable components. In this way the programming is less hardware dependent, the reusability of the application software increased, the cost involved in training and support reduced, and the application becomes scalable across different control solutions. Due to the data hiding and encapsulation, it is usable on different architectures, for instance ranging from centralized to distributed or integrated to networked control. It is not specifically designed for one application, but will serve as a basic layer for ongoing definitions in different areas. As such it is open to existing and future technologies.

ABB is a member of the PLCopen organization. More Information about PLCopen can be read on the PLCopen website.

Fig. 315: PLCopen motion control logo

Function blocks according to PLCopen are designed for controlling axes via the language elements consistent with those defined in the IEC 61131-3 standard. It was decided by the task force that it would not be practical to encapsulate all the aspects of one axis into only one function block. The retained solution is to provide a set of command-oriented function blocks that have a reference to the axis, e.g. the abstract data type Axis, which offers flexibility, ease of use and reusability.

Implementations based on IEC 61131-3 (for instance via function blocks and SFC) will be focused towards the interface (look-and-feel/proxy) of the function blocks. This specification does not define the internal operation of the function blocks.

PLCopen motion control function blocks can be used in any IEC 61131-3 programming language. The following figure shows an example of a function block used in Function Block Diagram (FBD) language.

Fig. 316: Command for absolute positioning according to PLCopen standard
Application programs which use the manufacturer independent function blocks according to PLCopen will lead to the following advantages:

- Reusable software structure for different platforms.
- Programming based on function blocks.
- Function blocks can be used in any IEC 61131-3 language.

All function blocks which are defined by PLCopen will have the following qualities independently to the manufacturer of the motion control system:

- Same inputs/outputs
- Same functional behavior
- Same name

The following parts of the PLCopen motion control definition are completely or partly included in this product:

- Part 1: Function blocks for motion control
- Part 2: Extensions
- Part 3: User Guidelines
- Part 4: Homing Procedures
- Part 6: Function blocks for motion control - Fluid Power Extensions

## Programming guidelines

This chapter explains some rules on the usage of the libraries and the structure Axis_Ref.

- In general, the kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.
- If Axis_Ref is used as input on a user defined function block or program or function, always use it as VAR_IN_OUT and never use it as VAR_INPUT or VAR_OUTPUT. The reason is that this would
- Break the consistency and destroy data.
- Consume a lot of computing power by copying data.
- Any instance of a function block should be called only once per cycle and in only one specific task.
If the instance is used in several tasks, it has to be checked that is not called several times.
Because this could corrupt the handshake from function block to Axis_Ref to
CMC_Basic_Kernel and vice versa.
- Some PLCopen function blocks are only allowed to be called within the same task as the CMC_Basic_Kernel function block. This is mentioned in the function block descriptions.
- If PLCopen function blocks are called from a different task, the cycle time should be at least 2 times the cycle time for CMC_Basic_Kernel function block.

## Axis data type Axis_Ref

The Axis_Ref is a structure that contains information on the corresponding axis. It is used as a VAR_IN_OUT in all motion control function blocks defined in this document. The content of this structure is implementation dependent and can ultimately be empty. If there are elements in this structure, the supplier shall support the access to them, but this is outside of the scope of this document. The refresh rate of this structure is also implementation dependent. According to IEC 61131-3 it is allowed to switch the Axis_Ref for an active function block, for instance from Axis1 to Axis2. However, the behavior of this can vary across different platforms, and is not encouraged to do.

Axis_Ref data type declaration:
TYPE Axis_Ref : STRUCT
(Content is implementation dependent)
END_STRUCT

```
Example: TYPE Axis_Ref : STRUCT
    AxisNo: UINT; AxisName: STRING (255);
    END_STRUCT
```

## The single axis state diagram

The following diagram normatively defines the behavior of the axis at a high level when multiple motion control function blocks are simultaneously activated. This combination of motion profiles is useful in building a more complicated profile or to handle exceptions within a program. (In real implementations there may be additional states at a lower level defined). The basic rule is that motion commands are always taken sequentially, even if the PLC had the capability of real parallel processing. These commands act on the axis' state diagram.
The axis is always in one of the defined states (see diagram below). Any motion command that causes a transition changes the state of the axis and, as a consequence, modifies the way the current motion is computed. The single axis state diagram is an abstraction layer of what the real state of the axis is, comparable to the image of the I/O points within a cyclic (PLC) program. A change of state is reflected immediately when issuing the corresponding motion command.

The diagram is focused on a single axis. The multiple axis function blocks, MC_Camln, MC_Gearln and MC_Phasing, can be looked at, from a single axis state diagram point of view, as multiple single-axes all in specific states. For instance, the CAM-master can be in the state Continuous Motion. The corresponding slave is in the state Synchronized Motion. Connecting a slave axis to a master axis has no influence on the master axis.
The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the function blocks. The axis feedback is operational. If the MC_Power function block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.

Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating function block controls an axis, while the MC_Power function block with Enable=FALSE is called, the motion generating function block is aborted (CommandAborted).
The intention of the state ErrorStop is that the axis goes to a stop, if possible. There are no further inputs from function blocks accepted until a reset has been done from the ErrorStop state.
The transition Error refers to errors from the axis and axis control, and not from the function block instances. These axis errors may also be reflected in the output of the function blocks instances errors.
Issuing MC_Home in any other state than StandStill will go to ErrorStop, even if MC_Home is issued from the state Homing itself.
Function blocks which are not listed in the single axis state diagram do not affect the state of the axis, meaning that whenever they are called the state does not change. They are:

MC_ReadStatus; MC_ReadAxisError; MC_ReadParameter; MC_ReadBoolParameter; MC_WriteParameter; MC_WriteBoolParameter; MC_ReadActualPosition and MC_CamTableSelect.

Calling the function block MC_Stop in state StandStill changes the state to Stopping and back to Standstill when Execute = FALSE. The state Stopping is kept as long as the input Execute is TRUE. The output Done is set when the stop ramp is finished.

Fig. 317: Function block state behavior

$$
\begin{aligned}
& \text { 1. In this state ErrorStop or Stopping, all function blocks can be called, although } \\
& \text { they will not be executed, except MC_Reset and Error - they will generate the } \\
& \text { transition to StandStill or ErrorStop respectively. }
\end{aligned}
$$

2. Power.Enable=TRUE and there is an error in the Axis.
3. Power.Enable=TRUE and there is no error in the Axis.
4. MC_Stop.Done AND NOT MC_Stop.Execute.

## Visualizations

For usage with the PLCopen Library, a set of visualization objects is defined. These visualizations use the placeholder concept, which means that they could be used in an actual visualization several times and be instantiated by replacing the "placeholder" with an effective data-structure.

Two types of visualizations exist:

- As placeholder, an instance of Axis_Ref should be used. These are named:

MC_VISU_Axis_name. Here the name could be state machine or its actual.

- As placeholder, an instance of the respective PLCopen function block should be used. These visualizations are named MC_VISU_FB_name where "name" could be MoveAbsolute or MoveVelocity, so the complete element is named MC_VISU_FB_MoveAbsolute or MC_VISU_FB_MoveVelocity.
The background colour and the colour for the title of each element could be changed. The colours are defined in some global predefined variables in MC_VISU_COLOR_INFORMATION. By changing these values, different colours will be used.

## MC_VISU_COLOR_INFORMATION (GVL)

InOut:

| Name | Type | Initial | Comment |
| :--- | :--- | :--- | :--- |
| MC_VISU_BACKGROUND_COLOR | DWORD | $16 \# F F 888888$ | 16\#FFRRGGBB (* Color combination for the <br> Grey color $\left.{ }^{*}\right)$ |
| MC_VISU_TITLE_COLOR | DWORD | $16 \#$ FFFFFF00 | $16 \# F F R R G G B B ~(* ~ C o l o r ~ c o m b i n a t i o n ~ f o r ~$ <br> yellow*) |

Below, some existing visualizations are shown.

MC_VISU_Axis_ This shows the state machine of the axis according to PLCopen definition. The active state is StateMachine shown green except the ErrorStop which is shown red. Usually, it starts with Disabled. When no remote connection to the drive is available, it will switch to ErrorStop immediately.

The placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

MC_VISU_Axis_ This object shows some actual values.
The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

| Axis actual values |  |
| :--- | :--- |
| AxisRefX |  |
| Position | -6021340.889 |
| Velocity | 0.00 |
| Axis error | 0 |
| Drive error | 0 |

MC_VISU_Axis_ This object shows the error information connected to the PLCopen function blocks. This is NOT FB_error a drive error. If no error occurs in the execution of a function block, just the name is shown. If an error occurred, it shows the name of the function block as well as the error number and a short description. In the example below, the MC_Power function block recognized that no fieldbus connection to the drive was available.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

## Error codes

Besides the diagnosis information of the drive which is described in the respective drive documentation, there are a number of error codes directly related to the function blocks. These error codes are displayed at the output "ErrorID" of the function block.

| Error Code | Mnemonic | Explanation |
| :--- | :--- | :--- |
| 0 | MC_Ok | No Error |
| 1 | WRONG_STATE | A function block was activated not according <br> to the state machine, e.g. tried to start a <br> movement while in state Disabled. |
| 2 | DRIVE_PROBLEM | The drive indicates an error, e.g. tripped. |
| 3 | PARAM- <br> ETER_EXCEEDS_LIMIT | A parameter at the function block is outside <br> the possible range. This does not refer to the <br> parameter range which is allowed for the drive <br> but just to the 32-Bit Integer which is used for <br> internal calculation. |
| 4 | NO_FIELD_ACCESS | No fieldbus connection to the drive. |
| 5 | BUS_PROBLEM | Not used |
| 6 | ABS_SWITCH_ERROR | During Homing, (when done by function <br> blocks) limit switch not according to moving <br> direction e.g. the positive switch occurred <br> when moving in negative direction. |
| 7 | TIMEOUT | Timeout in block execution. |

| Error Code | Mnemonic | Explanation |
| :---: | :---: | :---: |
| 8 | NAK | Parameter access not applicable |
| 9 | MC_TimeLimitExceeded | Used by function blocks with TimeLimit. |
| 10 | MC_DistanceLimitExceeded | Used by function blocks with DistanceLimit. |
| 11 | MC_TorqueLimitExceeded | Used by function blocks with TorqueLimit. |
| 12 | NOT_IMPLEMENTED | Functionality not implemented for certain axis type. |
| 101 | ErrorID POSITION_FOLLOW | Following error, caused by > position error => ERRORSTOP. (parameter POS_LAG_PERCENTAGE) |
| 102 | ErrorID_POSSW | Positive software limit switch => ERRORSTOP. The actual position did exceed the positive Software limit switch position. This supervision has to be activated with MC_WriteParameter. |
| 103 | ErrorID_NEGSW | Negative software limit switch => ERRORSTOP. The actual position did exceed the negative Software limit switch position. This supervision has to be activated with MC_WriteParameter. |
| 104 | ErrorID_VELOCITY_FAUL T | The measured velocity and commanded velocity are > 50\% (related to maximum velocity) apart, for a certain time =>ERRORSTOP (parameter V_CHECKTIME) |
| 105 | ErrorID_INTERPOLATION_FAULT | following error, caused by interpolation problem =>ERRORSTOP. Position following error occurred, but reason most likely a interpo- lation problem, not drive problem (e.g. CAM Table, position step). |
| 110 | ErrorID_WARNING_VELO CITYLIMIT | Velocity or acceleration/deceleration are in limitation, set by parameter EnableLimitVelocity, MaxVelocityAppl, MaxDecelerationAppl |
| 111 | ErrorID_WARNING_POSITIONLIMITPOS | Position is in limitation towards position limit (SWLimit2DecPos), axis decelerates near positive software limit switch |
| 112 | ErrorID_WARNING_POSITIONLIMITNEG | Position is in limitation towards position limit (SWLimit2DecNeg)., axis decelerates near negative software limit switch |
| 113 | ErrorID_WARNING_POSITIONOVERRUN | A linear axis created a 32bit position overrun ( $>2147483647$ u=>inc) =>configure modulo |
| 114 | ```ErrorID_WARNING_ABOR T``` | Axis aborted due to too large position gap due to velocity limitation |
| 115 | ErrorID_WARNING_MOVE MENT_DIRECTION | Either positive or negative direction blocked by MC_Power |

## Error handling

All access to the drive/motion control is via function blocks. Internally these function blocks provide basic error checking on the input data. Exactly, how this is done is implementation dependent. For instance, if MaxVelocity is set to 6000, and the Velocity input to a function block is set to 10,000, a basic error report is generated. In the case where an intelligent drive is coupled via a network to the system, the MaxVelocity parameter is probably stored on the drive. The function block must take care of the errors generated by the drive internally. With another implementation, the MaxVelocity value could be stored locally. In this case the function block will generate the error locally.
Both centralized and decentralized error handling methods are possible when using the motion control function blocks.
Centralized error handling is used to simplify programming of the function block. Error reaction is the same independent of the instance in which the error has occurred.

Fig. 318: Function blocks with centralized error handling

Decentralized error handling gives the possibility of different reactions depending on the function block in which an error occurred.

Fig. 319: function blocks with decentralized error handling

## PLCopen parameter

Additional parameters are available by ReadParameter and WriteParameter function blocks.

Following function blocks can be used for the read and write operation. Functionality of these blocks and its variables are explained in the integrated documentation

- MC_ReadParameter
- MC_WriteParameter
- MC_ReadBoolParameter
- MC_WriteBoolParameter

| Parameter numbe r (PN) | $\begin{aligned} & \text { Nam } \\ & \text { e } \end{aligned}$ | Datatype | Min. | Max. | Default | R/W | Comments |

0* means: no limitation of jerk is performed.
**Axis will stay in stop.
***is modified by CMC_Axis_Control_Parameter, the max. Value is calculated in increments, the value which is delivered by ReadParameter will be given in [u].

In addition to the above parameters certain other operation can be done using the below parameters from the data type "Axis_Parameter"

| Name | Type | Initial | Comment |
| :---: | :---: | :---: | :---: |
| paraFilterVariant | INT |  | Filter for actual velocity $\begin{aligned} & 0=\text { PT1 } \\ & 1 \text { = LinearRegression } \end{aligned}$ |
| paraFilterTime | INT | 10 | Time in PLC cycles, used with paraFilterVariant |
| paraFilterForecast | INT | 0 | Time in PLC cycles, used with paraFilterVariant = 1 |
| paraReverseDirection | INT | 0 | Changes the direction for actual and reference positions based on the mode selected. <br> $0=$ normal direction <br> 1 = reverse input position <br> 2 = reverse output position and speed reference <br> 3 = reverse both |
| paraEarlyClosedLoop | BOOL | FALSE | TRUE: hold the position when Drive_Release is set (not wait for Drive_InOperation = TRUE) |
| paraLateOpenLoop | BOOL | FALSE | TRUE: hold the position until Drive_InOperation $=$ FALSE |

Limits
Table 762: Limitations for the inputs of PLCopen function blocks when used with CMC_Basic_Kernel

| Parameter | Min. | Max. |
| :--- | :--- | :--- |
| Velocity | 0 | $x$ |
| Acceleration, Deceleration | 0 | $x$ |
| Position | -2147483647 | 2147483647 |

## General restrictions

Restrictions for the available function blocks

- As buffered mode, MC_Aborting is realized as a default. This does NOT mean that the axis stops when another movement is started while an ongoing movement is still active. It means instead that the new movement will take control immediately and change the velocity to its own velocity by using its own acceleration or deceleration.
- The buffered mode MC_Buffered could be reached with using the axis state StandStill as enable signal for the Execute of the next block.
- From the Extended Inputs and Outputs at the function blocks, the following are not realized:
- BufferedMode: The realization just supports the MC_Aborting mode.
- The following Outputs at ReadStatus are not supported: ConstantVelocity, Accelerating and Decelerating.
- TorqueLimit for Homing function blocks.

MC_Aborting The diagram shows the behavior with BufferMode MC_Aborting, which is the only available Mode BufferMode. When the second Block is activated, it will take control and will continue on its own velocity. The velocity is changed by using the acceleration value from the second function block. The movement will not be stopped in between. The first function block shows CommandAborted when the second function block is activated.

MC_Buffered A behavior according to BufferMode MC_Buffered could be reached by using the Done output from the first function block to enable the Execute of the second function block.

## Behavior of the function block inputs and outputs

## General rules

Table 763: General rules

| Output exclusivity | The outputs Busy, Done, Error, and CommandAborted are mutually <br> exclusive: <br> Only one of them can be TRUE on one function block. If Execute <br> is TRUE, one of these outputs has to be TRUE. Only one of the out- <br> puts Active, Error, Done and CommandAborted is set at the same <br> time. |
| :--- | :--- |
| Output status | The outputs Done, InGear, InSync, InVelocity, Error, ErrorID and <br> CommandAborted are reset with the falling edge of Execute. How- <br> ever, the falling edge of Execute does not stop or even influence <br> the execution of the actual function block. It must be guaranteed <br> that the corresponding outputs are set for at least one cycle if the <br> situation occurs, even if execute was reset before the function block <br> completed. If an instance of a function block receives a new exe- <br> cute before it has finished (as a series of commands on the same <br> instance), the function block will not return any feedback, like Done <br> or CommandAborted, for the previous action. |
| Input parameters | The parameters are used with the rising edge of the execute input. <br> To modify any parameter, it is necessary to change the input param- <br> eter(s) and to trigger the motion again. |
| Missing input parame- <br> ters | According to IEC 61131-3, if any parameter of a function block input <br> is missing (open) then the value from the previous invocation of <br> this instance will be used. In the first invocation the initial value is <br> applied. |
| Position versus distance | Position is a value defined within a coordinate system. Distance is a <br> relative measure related to technical units. Distance is the difference <br> between two positions. |
| Sign rules | Velocity, Acceleration, Deceleration and Jerk are always positive <br> values. Position and Distance can be both positive and negative. |
| Error Handling Behavior | All function blocks have two outputs, which deal with errors that can <br> occur while executing that function block. These outputs are defined <br> as follow: |
| Error Rising edge of Error informs that an error occurred during the <br> execution of the function block. <br> ErrorID: Error number |  |
|  | Bera |

|  | The outputs Done, InVelocity, InGear, and InSync mean successful completion so these signals are logically exclusive to Error. <br> Types of errors: <br> - Function blocks (e.g. parameters out of range, state machine violation attempted), <br> - Communication, <br> - Drive Instance errors do not always result in an axis error (bringing the axis to StandStill). The error outputs of the relevant function block are reset with falling edge of Execute. |
| :---: | :---: |
| Function block naming | In case of multiple libraries within one system (to support multiple drive/ motion control systems), the function block naming may be changed to MC_FunctionBlockName_SupplierID. |
| Behavior of Done output | The outputs Done, InGear, InSync... are set when the commanded action has been completed successfully. With multiple function blocks working on the same axis in a sequence, the following applies: <br> When one movement on an axis is interrupted with another movement on the same axis without having reached the final goal, Done of the first function block will not be set. |
| Behavior of CommandAborted output | CommandAborted is set, when a commanded motion is interrupted by another motion command. The reset-behavior of CommandAborted is like that of Done. When CommandAborted occurs, the other output-signals such as InVelocity are reset. |
| Inputs exceeding application limits | If a function block is commanded with parameters which result in a violation of application limits, the instance of the function block generates an error. The consequences of this error for the axis are application specific and thus should be handled by the application program. |
| Behavior of Busy output | Every function block can have an output Busy, reflecting that the function block is not finished. Busy is SET at the rising edge of Execute and RESET when one of the outputs Done, Aborted, or Error is set. It is recommended that this function block should be kept in the active loop of the application program for at least as long as Busy is true, because the outputs may still change. For one axis, several function blocks might be busy, but only one can be active at a time. <br> Exceptions are MC_SuperImposed and MC_Phasing, where more than one function block related to one axis can be active. |
| Output Active | The output Active is required on buffered function blocks. This output is set at the moment the function block takes control of the motion of the according axis. For un-buffered mode the outputs Active and Busy can have the same value. |
| Enable and Valid/Status | The input Enable is coupled to output Valid. Enable is level sensitive, and Valid shows that a valid set of outputs is available at the function block. The output Valid is TRUE as long as an output value of Valid is available and the input Enable is TRUE. The relevant output value can be refreshed as long as the input Enable is TRUE. If there is a function block error, the output is not Valid (Valid set to FALSE). When the error condition disappears, the values will reappear and output Valid will be set again. |

Fig. 320: Behavior of the Execute/Done style function blocks.

Why is the command input edge sensitive?
The input Execute for the different function blocks described in this document always triggers the function with its rising edge. The reason for this is that with edge triggered Execute new input values may be commanded during execution of a previous command. The advantage of this method is a precise management of the instant a motion command is performed. Combining different function blocks is then easier in both centralized and decentralized models of axis management. The output Done can be used to trigger the next part of the movement. The example given below is intended to explain the behavior of the function block execution.
The following figure illustrates the sequence of three function blocks First, Second and Third controlling the same axis. These three function blocks could be for instance various absolute or relative move commands. When First is completed the motion its rising output First.Done triggers Second.Execute. The output Second.Done AND $\ln 13$ triggers the Third.Execute.

Fig. 321: Function blocks to perform a complex movement

## The input ContinuousUpdate

Like described in the previous chapter, the input Execute triggers a new movement. With a rising edge of this input the values of the other function block inputs are defining the movement. Until version 1.1 of PLCopen there was the general rule that a later change in these input parameters does not affect the ongoing motion.
Nevertheless, there are numerous application examples, where a continuous change of the parameters is needed. The user could retrigger the input Execute of the function block, but this complicated the application.
Therefore, the input ContinuousUpdate has been introduced. It is an extended input to all applicable function blocks. If it is TRUE, when the function block is triggered (rising Execute), it will - as long as it stays TRUE - make the function block use the current values of the input variables and apply it to the ongoing movement. This does not influence the general behavior of the function block nor does it impact the single axis state diagram. In other words it only influences the ongoing movement and its impact ends as soon as the function block is no longer Busy or the input ContinuousUpdate is set to FALSE.

If ContinuousUpdate is FALSE with the rising edge of the input Execute, a change in the input parameters is ignored during the whole movement and the original behavior of previous versions is applicable. The ContinuousUpdate is not a retriggering of the input Execute of the function block. A retriggering of a function block which was previously aborted, stopped, or completed, would regain control on the axis and modify its single axis state diagram. Opposite to this, the ContinuousUpdate only effects an ongoing movement. Also, a ContinuousUpdate of relative inputs (e.g. Distance in MC_MoveRelative) always refers to the initial condition (at rising edge of Execute).

## Example

- MC_MoveContinuousRelative is started at Position 0 with Distance 100, Velocity 10 and ContinuousUpdate set TRUE. Execute is Set and so the movement is started to position 100.
- While the movement is executed (let the drive be at position 50), the input Distance is changed to 130, Velocity 20.
- The axis will accelerate (to the new Velocity 20) and stop at Position 130 and set the output Done and does not accept any new values.

## Unit of length

The only specification for physical quantities is made on the unit of length (noted as [u]) that is to be coherent with its derivatives i.e. (velocity [u/s]; acceleration [u/s $\left.{ }^{2}\right]$; jerk $\left[\mathrm{u} / \mathrm{s}^{3}\right]$ ). Nevertheless, the unit [ $u$ ] is not specified (manufacturer dependent). Only its relations with others are specified.

## Aborting versus buffered modes

Some of the function blocks have an input called BufferMode. With this input, the function block can either work in a Non-buffered mode (default behavior) or in a Buffered mode. The difference between those modes is when they should start their action:

- A command in a non-buffered mode acts immediately, even if this interrupts another motion,
- A command in a buffered mode waits till the current function block sets its output Done (or InPosition, InVelocity...).
- The library just supports the mode "aborting" (MCAborting)

The following examples describe the different behavior of these modes:

## Example 1: <br> Standard <br> behavior of two <br> following abso- <br> lute move- <br> ments

Fig. 322: Basic example with two MC_MoveAbsolute on same axis

Fig. 323: Timing diagram for example above without interference between function block 1 and function block 2

## Example 2: <br> Aborting <br> motion

Fig. 324: Timing diagram for example above with function block 2 interrupting function block 1 (McAborting Mode)

If an on-going motion is aborted by another movement, it can occur that the braking distance is not sufficient due to deceleration limits.

In rotary axis, a modulo can be added. A modulo axis could go to the earliest repetition of the absolute position specified, in cases where the axis should not change direction and reverse to attain the target position.
In linear systems, the resulting overshoot can be resolved by reversing, as each position is unique and therefore there is no need to add a modulo to reach the correct position..

## PLCopen examples

Example: A The following figure shows an example where the function block (MC_MoveVelocity) is used
function block instance controls different motions of an axis
to control AxisX with three different values of Velocity. In a Sequential Function Chart (SFC) the velocity 10,20 , and 0 is assigned to V . To trigger the input Execute with a rising edge the variable E is stepwise set and reset.

Fig. 325: Single function block with SFC
The following timing diagram explains how it works:

Fig. 326: Timing diagram for a usage of single function block

The second InVelocity is set for only one cycle because the Execute has gone low before the ActualVelocity equals CommandedVelocity.

Example: Dif- Different instances related to the same axis can control the motions on an axis. Each instance ferent function will then be responsible for one part of the global profile.
blocks
instances control the
motions of an
axis

### 6.5.10.3.5 PLC-based motion control

## PLC-based motion control architecture

With PS5611-Motion different motion control system structures are possible. Independent of the system structure a typical motion control application consists of the following system elements:

- An application program which contains PLCopen function blocks that defines the general application behavior and logics.
- A profile generator which generates a position profile based on the dynamic specifications of the application program to guide the axis to the desired positions.
- A position control loop which outputs a speed reference signal to minimize the following error.

To achieve the best system structure for an application these components can be separated into different devices. Each type of structure has its own kind of interface and type of signals which need to be transferred between the interacting devices.

> All shown motion control system structures (Central motion control with or without position control loop) can be combined together in the same application program for a motion control project.

With the function blocks of motion library a motion control profiler can be used inside the PLC. As shown in the following figure it is needed to provide the actual position of the drive. The output can be either a position or a velocity reference signal. The used output signal will then be used to move the axis in the desired way.

There are 2 possibilities to send a reference value to the drive:

- When the position control loop is closed by the PLC by a CMC_Basic_Kernel function block, the output Speed_Reference should be connected to the drive. The value of Speed_Reference can be scaled with the axis parameters Max_Rpm and Ref_Max.
- When the position control loop is closed by the drive, the output Position_Reference should be connected to the drive. The unit for the output Position_Reference is incremented as well as the input Drive_ActualPosition.

Fig. 330: Architecture for centralized motion control

In general the programming of a machine consists of two layers as shown in the figure above.
In the application layer function blocks according to PLCopen motion control are used to program the application sequences with all necessary types of movements and administrational commands. Due to the standard PLCopen motion control this can be reused in any other machine programs that used PLCopen function blocks.

The axis implementation layer is responsible for the execution of the commands from the application layer and can be programmed for each axis in a different way depending on the used hardware components.

Table 764: Needed function blocks for an application with PLC-based motion control

| Library | Content |
| :--- | :--- |
| ABB_MotionControl_AC500.library | Kernel function block, Parameters function <br> block, Axis Simulation function block |
|  | Data types for AC500 motion control |
|  | Motion control function blocks according to <br> PLCopen |

The library design is independent from any bus architecture or any specific drive features.

| Example for a possible system architecture | System | Velocity reference | Position feedback |
| :---: | :---: | :---: | :---: |
|  | System A | Output via analog output channel as voltage or current | From incremental encoder connected to CD522 I/O module |
|  | System B | Output via EtherCAT network | Input via EtherCAT network |
|  | System C | Output as frequency signal of CD522 I/O module | From incremental encoder connected to CD522 I/O module |
|  | System D | Output via PROFINET IO network | Input via PROFINET IO network |
|  | System E | Output via PTO \& PWM channel in eCo V3 | Input via either encoder (included in onboard IO), or the PTO or PWM pulse count. |

In case the velocity reference value is used from the kernel function block the position control loop is closed inside the drive. In this case, it is necessary to adjust the related parameters from the parameters function block. When the position reference will be used the position control loop is closed inside the drive. In this case, the internal control loop is just used to monitor the position and velocity.

The drive's status should be managed by a specialized function block that supports the used type of drive as shown in the figure above. The kernel function block is the main function block which is needed to operate an axis with PLC-based motion control. It must be used with the parameter function block which is the interface to input parameters which are used to setup the axis.

The drive has to be accessed outside the CMC_Basic_Kernel function block. Actual values and reference values might be transferred by a synchronized fieldbus or by I/Os. The function block CMC_Basic_Kernel has to be called every cycle and at least once before any function block MC or MCA is activated.
The following figure shows an example with an axis simulation. The main data signals are drawn in bold lines. Here, the drive will receive a speed reference signal which means that the position control loop is closed inside the PLC by the central motion function blocks. The time behavior of the simulated drive can be set by the parameter T1 at the axis simulation function block. If the time constant is to slow and the axis parameter Control_Time is too short the simulation axis will run into instability - like a real drive. Sample values ${ }^{\sharp}$ Chapter 6.5.10.3.5.2.3 "How to use the axis simulation" on page 4005

A different option to create a virtual or simulated axis is to engage the Enable_Virtual input at CMC_Basic_Kernel. This virtual axis will follow the speed reference without additional delay, whereas the CMC_Axis_Simu creates a first order delay.

The following figure shows an example with a CiA402 drive on an EtherCAT network. The main data signals are drawn in bold lines. Here, the drive will receive a position reference signal which means that the position control loop is closed inside the drive.

In the example the main signals are to be transferred via EtherCAT network. The drive control function block for the Microflex e190 can be found in the ABB_Ecat_CiA402_AC500.library.

If using the eCo V3 PLCs, use the OBIO_PTOMotionKernel function block (separate library ABB_MotionControlEco_AC500.library) instead of CMC_Basic_Kernel for the PTO functionality.

| OBIO_PTOMotionKernel |  |
| :---: | :---: |
| Enable BOOL | BOOL Error |
| Drive_Ref_Ok BOOL | ERROR_ID ErrorId |
| Drive_InOperation BOOL | BOOL Drive_Reset_Fault |
| Drive_ActualPosition DINTT | BOOL Drive_Release |
| Axis Axis_Ref | BOOL Drive_Set_Ref |
| Control_Parameter CMC_Axis_Control_Parameter | DINT Drive_Set_Position |
| IO CMC_Axis_IO | DINT Speed_Reference |
| Enable_Virtual BOOL | DIVT Position_Reference |
| PTO_Motion_Parameter OBIO PTO Motion_Parameter | AC500 OnboardiO.Error ID PTO_ErrorID |

In the eCo V3 PLC, if PWM is used in the configuration, use the kernel function block OBIO_PWMMotionKernel function block instead of CMC_Basic_Kernel function block.

## Basic functionalities

## How to connect a drive

The connection to a drive must be done with the inputs and outputs of the function block CMC_Basic_Kernel. All inputs and outputs of the kernel function block with the prefix "Drive_" are intended to be used with a drive, but in some cases not all of them are needed. In all cases the input Drive_ActualPosition has to be connected with the actual position of the axis. This value can be received by an I/O module of the PLC or via a fieldbus.

Depending on which device closes the position control loop either the output Speed_Reference or Position_Reference output has to be used. The value of Speed_Reference can be connected to an analog output module or be transferred via a fieldbus. The value of Position_Reference should be exclusively sent via a real-time fieldbus like EtherCAT.

## Example 1:

 Analog drive Motor with incremental encoderIn the example the position control loop will be closed by the PLC, therefore the input Drive_ActualPosition and the output Speed_Reference are to be used.
In combination with the I/O module CD522 and the corresponding function block CD522Encoder32Bit the position of the encoder can be used. For the effective resolution of the encoder parameter Inc_Per_R of the parameter function block has to be used.
The output Speed_Reference can be written directly to the global variable of an output channel of an analog module but can also be transferred via a fieldbus. The scaling of this output value can be done with the parameters Ref_Max and Max_Rpm of the function block CMC_Axis_Control_Paramter_Real.

The scaling of the Speed_Reference value can be set with the inputs Ref_Max and Max_Rpm of the parameter function block.

In order to finish a homing sequence which is done by the function block MC_StepRefPulse the outputs Drive_Set_Ref and Drive_Set_Position from the kernel function block have to be connected with the inputs EN_RPI and START_VALUE of the CD552 I/O module function block. Also the output RdyRpi of the CD552 I/O module function block has to be connected with Drive_Ref_Ok from the kernel function block.
To enable and disable the drive Drive_Release could be connected to a binary output to activate the drive. Drive_InOperation could be connected to a binary input to get the information that Drive_Release was successful.

## How to enable and disable a drive

In order to enable a drive the function block MC_Power has to be used within the applicational layer. The kernel function block will then, if possible, output a rising edge on the output Drive_Release which can be connected to the drive-control function block which performs the needed actions on the drives control word to enable the drive. As soon the drive states enabled, this signal can be connected to the input Drive_In_Operation of the kernel function block. The axis state according to the single axis state diagram of PLCopen will then switch from Disabled to Standstill.

Fig. 331: Enabling sequence of a drive

As long as the drive is in state Disabled or ErrorStop the input Drive_Actual_Position will be copied to the output Position_Reference of the kernel function block. The output Speed_Reference will be zero.

When the axis is in operation, which means it is not in state Disabled or ErrorStop, then the output Position_Reference will be calculated by the kernel function block and the position control loop will be closed, which outputs non zero value for the output Speed_Reference in case of a following error. The input Actual_Position should then follow the position reference. The difference of both values is the following error and will be supervised by the kernel function block.

In case of drive problem, Drive_InOperation should be reset. The function block will open the position control loop and Speed_Reference will be set to zero.
For the most drives the status is control by the drives control word whereas the drives status word represents its actual status. In order to enable the drive it might be necessary to pass through several drives states according a defined scheme which depends on the used drive. Therefore the library ABB_Ecat_CiA402_AC500.library is added to PS5611-Motion package which contains function blocks to operate with different drives on an EtherCAT network. There is also the PS5605-DRIVES library package which can be used to control the state of other ABB drives and other protocols.

## How to use the axis simulation

It is possible to use a simulated axis instead of a real drive.
The axis simulation can be used in the following use cases:

- When the real drive is not available the simulation can be used to test all available motion functionalities to verify the application program.
- The simulation can be used to create a virtual master axis and synchronize other axes to it.

The simulation is realized by the function block CMC_Axis_Simu or input Enable_Virtual = TRUE can be used at the KERNEL-block.

Homing will be possible if the limit-switches (data type CMC_Axis_IO) are simulated also. This is not done by CMC_Axis_Simu but could be realized in the PLC program.

Fig. 332: Example for Simulation
The drive velocity is simulated by PT1-Characteristic. The input T1 gives the time constant for this PT1 as multiple of the cycle time. All other properties are simulated according to the CMC_Axis_Control_Parameter.

#### Abstract

The value of the time behavior from the axis simulation function block set by the input $T 1$ has to be at least four times smaller than the value of the axis parameter Control_Time from the parameter function block. If Enable_Virtual = TRUE is used, no delay will be applied to the simulated drive speed, $\overline{\text { and }}$ it will not be possible to test the position-control loop, but it will be fine to be used as virtual axis.

## How to perform a homing

The homing of an axis is a procedure which consists of up to two phases. For each phase there are different function blocks available. The available function blocks are according to PLCopen and belong to the application layer.

Table 765: Overview of the available homing function blocks

|  | Phase 1 | Phase 2/Finish Homing |
| :--- | :--- | :--- |
| MC_StepAbsSwitch | X |  |
| MC_StepDirect |  | X |
| MC_StepLimitSwitch | X |  |
| MC_StepRefPulse |  | X |

In order to create a complete homing sequence one function block of each phase can be used.

First phase The used function blocks will change the axis state to Homing and will move the axis to approach installed limit switches or a dedicated absolute switch in the desired directions. No manipulation of a position value will be done in this phase. The use of function blocks of this phase is optional for a homing.

The signals of the installed limit switches have to be written to a variable of the data type CMC_Axis_IO.

Second phase Function blocks from this phase will also change the axis state to Homing if this has not already happen and will finish the homing. Therefore a new position will be set to the axis. The axis state will then switch back to Standstill.

The use of a function block of the second phase is mandatory for a homing.
In general with AC500 PLC-based motion control there are two position values: One position value will represent the encoder counts of a drive or the CD522 module which is connected to the input Drive_ActualPosition of the kernel function block. The other position is a user defined scaled unit which is used for PLCopen function blocks.
There are different ways to finish the homing by manipulate and adjust a position value. Which value should be manipulated depends on the used drive or module and its capabilities. See the following types $A, B$ and $C$.

Type A The user defined position unit will be changed only. The function block MC_StepDirect must be used here. This type of homing is less complex than the other types but also less precise.

Fig. 333: Homing Type A

Type B The Drive or the CD522 module will change its own position value, the encoder counts.

Application Layer
Axis Implementation Layer

Fig. 334: Homing Type $B$
The process will be started by the execution of the function block MC_StepRefPulse.
The axis will start to move.
The output Drive_Set_Ref of the kernel function block will then set the drive to sense for a digital signal. At the same time the kernel function block outputs a preset value which will replace the actual encoder count value at the moment the digital signal occurs.
This signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In the same cycle when the new position value is set there also has to be a boolean signal stating a new position value at the input Drive_Ref_Ok of the kernel function block. The user defined position value will then be shifted accordingly.

Type C The encoder count position value will not be changed but involves registration capabilities of a drive or the CD522 module.

Fig. 335: Homing Type C
The process will be started by the execution of the function block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library).

The axis will start to move.
The output Drive_Set_Ref of the kernel function block will then command the drive or the CD522 module to activate the Touch Probe functionality. This will configure the drive to latch a position at the moment a digital signal occurs. The digital signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.
In combination with the latched position value there is a boolean signal which states that a new latch value has been received. In case of the module CD522 this encoder count position value has to be converted from encoder counts to equivalent user scaled units by the use of the function "CMC_Get_Units_From_Inc" (ABB_MotionControl_AC500.library) before it can be connected to the fünction block ECAT̄_HomingŌnTouchProbe_APP.
To manage the Touch Probe objects of a drive within the CiA402 profile (e.g. Microflex e190) the function block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library) can be used. This will also cover the conversion from encoder counts to user scaled units.

At the end of the process the function block ECAT_HomingOnTouchProbe_APP will manipulate the user scaled position value according to the latched position from the drive and the users settings.

For further information see:
AN00220-001 - AC500 and MicroFlex e190 - EtherCAT Homing Methods

## How to Use a CAM curve

The CAM functionality is only available in combination with the kernel function block CMC_Basic_Kernel.

From Automation Builder 2.5 .0 onwards user can make use of inbuild Cam Configurator to generate Cam Table. For more details on how to use Cam Configurator please refer Automation Builder Help file.

It is recommended to use the CAM Editor from Automation Builder for those who are new to Cam table or to get the structure of the Cam Table. User can create the complete CAM Table using Cam Editor or can make a copy of CAM Table (IEC Code) and adapt it directly in the IEC code if needed.

Details on the CAM Table structure and different parameters to be considered while creating the CAM is described below.

General usage The usage of a CAM function is based on the following elements:

- CAM table defined with the data type MC_PProfile.
- An instance of the function block MC_CamTableSelect
- An instance of the function block MCA_Cam_Extra (optional)
- An instance of function block MC_CamIn
- An instance of function block MC_CamOut

The following steps are necessary to use a CAM table

1. Declare a CAM table as an array of the data type "MC_PProfile" in the program.
2. Write data to this array.
3. Use the address of the CAM table at the input "CamTable" of the function block "MC_CamTableSelect".
4. Execute the function block "MC_CamTableSelect" to process the data of the CAM table with the function block's input parameters
5. Additionally you can execute the function block "MCA_Cam_Extra" for optional parameters after the processing of the function block "MC_CāTTableSelect".
6. Execute the function block "MC_CamIn" to start the slave axis movement according to the CAM table data and parameters.
$\Rightarrow$ The axis will operate in the axis state "Synchronized Motion".
7. To leave the axis state you can execute the function block "MC_CamOut".
$\Rightarrow$ The axis state will switch to state "Continuous Motion" and maintains its last velocity as long as there is no other command.
8. You can also use any other motion command interrupt the "Synchronized Motion".

Preconditions to use
"MC_CamIn"
and
"MCA CamInDir
ect" function
blocks

## 1. Use no sync option

| Behavior | Precondition | Howto | Possible problems |
| :--- | :--- | :--- | :--- |
| Start directly with <br> cam table positions, <br> previous movement <br> will be aborted if <br> the master is out- <br> side the cam table <br> area, the slave posi- <br> tion is not changed <br> $=>$ velocity=0. | Move master and <br> slave to matching <br> positions (according <br> to cam table) before <br> MC_CamIn OR start <br> the cam with posi- <br> tions=0 and use <br> relative=TRUE OR <br> compensate the posi- <br> tion offset with Mas- <br> terOffset and Slave- <br> Offset (MC_CamIn). | Use MC_CamIn Mas- <br> terStartDistance =0 | A position jump, if pre- <br> condition is not met. |

2. Synchronize to a dedicated position while the master moves from (MasterSyncPosi-tion-MasterStartDistance) to (MasterSyncPosition)

| Behavior | Precondition | Howto | Possible problems |
| :--- | :--- | :--- | :--- |
| Sync is started <br> when the master <br> passes (MasterSync- <br> Position -MasterStart- <br> Distance). | Master position < <br> (MasterSyncPosition | Use MC_CamIn <br> -MasterStartDistance) <br> (for positive move- | MasterStartDis- <br> ments), position can <br> tance>0 <br> be outside the cam <br> table position range. <br> Slave has to be in <br> standstill. |

3. Synchronize while the master moves a certain distance (MasterStartDistance)
$\left.\begin{array}{|l|l|l|l|}\hline \text { Behavior } & \text { Precondition } & \text { Howto } & \text { Possible problems } \\ \hline \begin{array}{l}\text { Sync is started } \\ \text { from the actual posi- } \\ \text { tion and velocity }\end{array} & \text {-slave axis in standstill } & \text { OR } & \begin{array}{l}\text { Use MC_Cam_ID. } \\ \text { and "inSync" when } \\ \text { the master has } \\ \text { moved "MasterStart- } \\ \text { Distance". }\end{array}\end{array} \begin{array}{l}\text {-master already } \\ \text { moving in the right } \\ \text { direction. }\end{array} \quad \begin{array}{l}\text { Acceleration and } \\ \text { sition = TRUE (molocity } \\ \text { data structure, output } \\ \text { from MC_CamTable- } \\ \text { process not limited. }\end{array}\right]$.
4. Synchronize as fast as possible, master can move or standstill

| Behavior | Precondition | Howto | Possible problems |
| :--- | :--- | :--- | :--- |
| Use a given acceler- <br> ation and velocity <br> to move the slave <br> to the position which <br> matches the actual <br> master position. | The master position <br> should be within <br> the cam table posi- <br> tion range, actual <br> velocity=0 or actual <br> velocity <>0 is pos- <br> sible. | MCA_CamInDirect | The allowed acceler- <br> ation and velocity <br> must be higher than <br> required by the cam <br> movement, so the <br> slave axis can catch <br> up. |

It is important to give higher velocity and acceleration values for "MCA_CamInDirect" than to be expected during the cam movement!!

CAM table CAM data is done with one table (two dimensional - describing master and slave positions together).
The data of the elements (array of data type MC_PProfile) can either be assigned within the declaration or can be assigned during run time before the execution of the function block MC_CamTableSelect.

It can be filled with data in the following ways:

- To use a predefined variable list.
- To calculate the values within the program (before using the MC_CamTableSelect).
- To send values by any communication access to the PLC.

In order to use the new data it is necessary to execute the function block MC CamTableSelect again. In case the CAM table is executed the function block MC_CamTableSelect may not be executed.

Elements of the data type MC_PProfile $\stackrel{y}{4}$ Chapter 6.5.10.3.3.5 "Overview of data types" on page 3966

The inputs MasterSyncPosition and MasterSyncDistance of the function block MC_CamIn can be used to define a distance to synchronize the slave axis onto the CAM table during the start. In case master axis moves with negative velocity the parameter MasterSyncDistance can be negative. The MasterSyncPosition should always be within the range of the CAM table master position.
MasterSyncDistance $=0$ will deactivate the synchronization. In this case the slave axis should be moved on the CAM curve before MC_CamIn is executed, otherwise a following error can occure.

Fig. 336: CAM profile figure
The master position in the CAM table must be strictly monotonic rising.
The length of a CAM table is just restricted by the memory size of the PLC. When long tables are used, it is recommended to call CamTableSelect in a task with lower priority as it will need a considerable computing time.
It is possible to hold several CamTables as a pool and to switch from one to another. This has to be done at matching positions as no means for synchronization are available.

The offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

The parameters at MC_CamTableSelect, MC_CamIn and function and MCA_Cam_Extra also modify the behavior:

| Parameter MC_Cam- <br> TableSelect | Type | Default <br> value | Comment |
| :--- | :--- | :--- | :--- |
| MasterAbsolute | BOOL | FALSE | TRUE=Master_position from MC_PProfile <br> equals the master axis absolute position. <br> FALSE=CAM is executed relative to the <br> master axis actual position at start. |
| SlaveAbsolute | BOOL | FALSE | TRUE=interpolation_point from MC_PProfile <br> equals the slave axis absolute position. <br> FALSE=CAM is started from actual slave posi- <br> tion. The values "interpolation_point" are rela- <br> tive to the slave axis position at start. |
| iType | MC_ABB_- <br> iTypes_E <br> NUM |  | Interpolationtype. |
| Number_of_pairs | INT |  | Number of points used in TimePosition Array. |

$\left.\left.\begin{array}{|l|l|l|l|}\hline \begin{array}{l}\text { Parameter } \\ \text { MC_CamIn }\end{array} & \text { Type } & \begin{array}{l}\text { Default } \\ \text { value }\end{array} & \text { Comment } \\ \hline \text { MasterOffset } & \text { LREAL } & 0 & \begin{array}{l}\text { Just used with MasterAbsolute=TRUE, } \\ \text { ignored otherwise. } \\ \text { Used position for cam-table is: Master axis } \\ \text { position-Masteroffset. }\end{array} \\ \hline \text { SlaveOffset } & \text { LREAL } & 0 & \begin{array}{l}\text { Just used with SlaveAbsolute=TRUE, ignored } \\ \text { otherwise. Used position is slave axis posi- } \\ \text { tion=interpolation_point+Slaveoffset. }\end{array} \\ \hline \text { MasterScaling } & \text { LREAL } & 1 & \begin{array}{l}\text { The position used for interpolation is multiplied } \\ \text { by MasterScaling, e.g MasterScaling=2, the } \\ \text { scaled master will pass the position range with } \\ \text { double velocity and within the half distance } \\ \text { compared to its real velocity and position. }\end{array} \\ \hline \text { SlaveScaling } & \text { LREAL } & 1 & \begin{array}{l}\text { Interpolation result is multiplied by Slave- } \\ \text { Scaling, e.g SlaveScaling=2: Slave axis will } \\ \text { run twice the distance. }\end{array} \\ \hline \text { MasterSyncPosition } & \text { LREAL } & 0 & \begin{array}{l}\text { Start synchronization at master } \\ \text { axis position=MasterSyncPosition-Master- } \\ \text { StartDistance+MasterOffset, meet the CamT- } \\ \text { able at master axis position=MasterSyncPosi- } \\ \text { tion. } \\ \text { In case of MasterAbsolute=FALSE: start }\end{array} \\ \hline \text { MasterStartDistance } & \text { LREAL } & 0 & \begin{array}{l}\text { actualPosition+MasterSyncPosition-Mas- } \\ \text { terStartDistance", meet the CamTable at }\end{array} \\ \text { "actualPosition+MasterSyncPosition"!!! It is } \\ \text { just possible to use the "sync" mechanism } \\ \text { when the axis is in StandStill on start. }\end{array} \right\rvert\, \begin{array}{l}\text { A negative value will create a reverse syn- } \\ \text { chronization mode, which means the master } \\ \text { should move in negative direction to syn- } \\ \text { chronize. It is independent from the Reverse- } \\ \text { Bit which indicates how to end the movement. }\end{array}\right\}$

These 2 parameters are "extras" to be written with the MCA_Cam_Extra function. When the parameters are used, the MCA_Cam_Extra has to be called after the MC_CamTableSelect.

| Parameter <br> MC_CamIn | Type | Default <br> value | Comment |
| :--- | :--- | :--- | :--- |
| Periodic | BOOL | TRUE for <br> master <br> "Modulo", <br> FALSE for <br> master <br> linear axis | CamTable will not reach "EndOfProfile" but <br> will be repeated periodically. When the master <br> is a linear axis, it has to move forward and <br> backward within the CamTable position range, <br> but even when it leaves this position range, <br> the CamTable will stay active. |
| Reverse | BOOL | FALSE | Just necessary when a CamTable is <br> NOT "periodic" and will run in reverse <br> direction (master with negative velocity) <br> Reverse=FALSE, the CamTable is ready when <br> the master leaves the position range in posi- <br> tive direction, e.g. when it moves from 359 <br> to 0 on a rollover axes Reverse=TRUE, the <br> CamTable is ready when the master leaves <br> the position range in negative direction. |

## Example for

 CAM curve

In the example, the slave will run from 0 to 2000 while the master runs from 0 to 1000 . The slave will start and end with velocity $=0$, no matter which velocity the master has during start. The slave will reach the maximum velocity when it is at position 1000 and the master is at position 500.

## How to use an external axis

To use multiaxis PLCopen function blocks with an externally sensed axis as master axis the following structure can be used for the axis implementation:

Fig. 337: Structure synchronization to an external axis
The use of a feed forward filter function block is needed if the slave axis has to follow the position of the external axis. In this case there will be a time delay between sensing the position of the external axis and moving the follower axis along the sensed position. The filter function block will then add a certain distance to the external axis' position depending of its speed.

The filter function block MATH_LINEAR_REGRESSION from the library ABB_MathFunctions_AC500.library can be used here.

| MATH_LINEAR_REGRESSION |  |
| :---: | :---: |
| ENABLE BOOL | LREAL NEXT_VALUE |
| ACTUAL LREAL | DWORD NEXT_BINARY |
| HISTORY DIVT |  |
| FORECAST LREAL |  |
| POSITIVE_LIMIT DWORD |  |
| NEGATIVE_LIMIT DIVT |  |

Fig. 338: Filter function block to feed forward an externally sensed position
For an axis which is following the external axis, the value "mcActualValue" (from MC_Source enumeration) for the input "MasterValueSource" for multi-axis PLCopen function blocks has to be used.
When the filter function block MATH_LINEAR_REGRESSION is used to process an actual position, 2 different purposes are fulfilled:

- A jitter or noise can be compensated
- It is possible to calculate a forecast-position to compensate for a delay in position measurement

Process the actual position or any other master axis always before the slave axis.

Otherwise, an additional one cycle-delay is introduced.

The MATH_LINEAR_REGRESSION function block calculates the progress for a variable which is captured in equidistant periods of time and is assumed to follow a linear curve. It uses the Gauss "least squares" -algorithm to do so. The line is calculated in a way that the sum of squares for the distances from the measured points to the assumed straight line is minimized.
A noise or jitter influence of the value is compensated and a predictive value for the variable with an adjustable forecast horizon can be calculated.
Linear equation:

$$
\text { Line }[\mathrm{i}]=\text { gradient }{ }^{*} \mathrm{i}+\text { offset }
$$

Sum of squares:

$$
\text { sum }=\sum_{i=1}^{\infty \text { history }}(\mathrm{x}[\mathrm{i}]-\text { line }[\mathrm{i}])^{2}
$$

The gradient and offset for the line are calculated in a way that "sum" is minimized. Then these 2 values are used to calculate the forecast value:

$$
\text { NEXT_VALUE: }=\text { gradient * FORECAST }+ \text { offset }
$$

FORECAST=0 would mean: value right now, no future or past considered.
When the ACTUAL value is a modulo value, for example a single turn encoder or a rollover axis, this has to be considered in the calculation. The 2 input values POSITIVE_LIMIT and NEGATIVE_LIMIT can be used to configure this. They define the upper and lower limit for ACTUAL. Also, the NEXT_BINARY will as a result be limited to these borders.

## Example

Fig. 339: Next Value_Forecast

## How to use an encoder/drive with <> 32-bit position overrun

The incremental position as actual position at the function block CMC_Basic_Kernel is usually assumed as position with a 32-bit position overrun. As well as it is the reference position which is sent to the drive.

Any modulo-axis configuration should be done inside the PLC.
Some drives are requested to correct their positions themselves for a non-linear axis which should constantly run into the same direction.
In this case, the drive has to be configured as a modulo-axis and the function block CMC_Basic_Kernel needs some additional function blocks to create the 32-bit value ${ }^{4}>$ Chapter 6.5.10.3.5.6.5 "Roll-Over axis" on page 4031.

Fig. 340: Kernel
The function block CMC_Modulo2Binary will convert any position with any Modulo_Range to a 32-bit binary position.

The actual_position is assumed to run between 0 to Modulo_Range.
The actual_position should not change > 1/4 Modulo_Range between two scan cycles.
The function block CMC_Modulo2Binary will convert the 32-bit binary position reference from CMC_Basic_Kernel to a position reference which runs from 0 to Modulo_Range.

## How to do position correction "on the fly"

Sometimes it is required to have a position correction "on the fly". For example, it can happen that a position is wrong due to mechanical slip and that a switch which is passed by during the movement is used to capture a position value.

In other cases, it is required to synchronize the position to a print mark, so an actual_position has to be corrected, but not the movement of the printed material.

For both applications, the function block MCA_SetPositionContinuous can be used. It will use ramps and a limited velocity for the correction, so it will be tolerable to execute it during an ongoing movement and while the axis is activated in a multi-axis movement.

Fig. 341: MCA_Set_PositionContinuous_V3
The block can be used in any axis state except ERRORSTOP and HOMING.
Two different operation modes are possible:

1. SuperImp=FALSE

- The actual_position will be modified.
- The block will not cause any movement.
- If a PLCopen block in DISCRETE_MOTION (positioning) is active during the execution, this block will not reach Done as the actual_position is modified.
- If a slave axis is coupled to an axis while MCA_SetPositionContinuous is executed (with SuperImp=FALSE) it will follow.
- This mode is possible while the axis is in state DISABLED.

2. SuperImp=TRUE

- The actual_position will stay constant.
- A mechanical movement is executed (without changing the axis state machine).
- A slave axis will not follow.
- This behavior is similar to a superimposed movement.
- It is not possible when the axis is in state DISABLED.

The block can just be aborted by another MCA_SetPositionContinuous.

## How to limit the movement

It is possible to limit the movement by position (software limit switches) and by velocity. By default, no software limit switches are activated in PS5611-Motion. It is possible to activate them by accessing some PLCopen parameter.
The functionality described below is just available with linear axes.
$\left.\begin{array}{|l|l|l|l|l|l|l|l|}\hline & \text { Parameter } & \text { Data type } & \text { Minimum } & \text { Maximum } & \text { Default } & \text { R/W } & \text { Description } \\ \hline 2 & \begin{array}{l}\text { SWLi- } \\ \text { mitPos }\end{array} & \text { DINT } & \begin{array}{l}21474836 \\ 47\end{array} & \begin{array}{l}21474836 \\ 47\end{array} & \begin{array}{l}214748364 \\ 7\end{array} & \begin{array}{l}\text { R/W }\end{array} & \begin{array}{l}\text { Positive software } \\ \text { limit switch posi- } \\ \text { tion. }\end{array} \\ \hline 3 & \begin{array}{l}\text { SWLLi- } \\ \text { mitNeg }\end{array} & \text { DINT } & \begin{array}{l}21474836 \\ 47\end{array} & \begin{array}{l}21474836 \\ 47\end{array} & \begin{array}{l}214748364 \\ 7\end{array} & \text { R/W } & \begin{array}{l}\text { Negative soft- } \\ \text { ware limit switch } \\ \text { mosition. }\end{array} \\ \hline 4 & \text { BOOL } & \text { FALSE } & \text { TRUE } & \text { FALSE } & \text { R/W } & \begin{array}{l}\text { Enable positive } \\ \text { software limit } \\ \text { switch. }\end{array} \\ \hline \begin{array}{l}\text { EnableLi- } \\ \text { mitNeg }\end{array} & \text { BOOL } & \text { FALSE } & \text { TRUE } & \text { FALSE } & \text { R/W } & \begin{array}{l}\text { Enable negative } \\ \text { software limit } \\ \text { switch. }\end{array} \\ \hline 2003 & \begin{array}{l}\text { Enable- } \\ \text { Limit2Dec } \\ \text { elerate }\end{array} & \text { BOOL } & \text { FALSE } & \text { TRUE } & \text { FALSE } & \text { R/W } & \begin{array}{l}\text { Enable software } \\ \text { limit switches to } \\ \text { decelerate }\end{array} \\ \hline \begin{array}{l}\text { EnableLi- } \\ \text { mitAbort }\end{array} & \text { BOOL } & \text { FALSE } & \text { TRUE } & \text { FALSE } & \text { R/W } & \begin{array}{l}\text { Enable that soft- } \\ \text { ware limit } \\ \text { switches will } \\ \text { abort ongoing } \\ \text { movement } \\ \text { FALSE = Limits } \\ \text { position and } \\ \text { velocity, deceler- } \\ \text { ates and shows } \\ \text { a warning until } \\ \text { the position limit } \\ \text { is reached, then } \\ \text { ERROR STOP }\end{array} \\ \text { TRUE = } \\ \text { Switches off any } \\ \text { ongoing motion } \\ \text { and decelerates } \\ \text { to the position }\end{array}\right\}$

The following different behavior is possible:

- No limitation at all (default)
- Limit position with ERRORSTOP:
- Limit position between SWLimitNeg to SWLimitPos, axis to state ERRORSTOP in case the position range is left.
- Limit velocity and acceleration:
- Limit velocity to paraMaxVelocityAppl and acceleration/deceleration to paraMaxDecelerationAppl, create WARNING_VELOCITY, not state changes for axis, abort movement is optional when MaxPositionGap is reached due to limitation.
- Limit Position with ramp-down:
- In addition, it is possible to limit the position between SWLimit2DecNeg and SWLimit2DecPos. paraMaxDecelerationAppl is used to ramp down.

When activated with EnableLimitPos or EnableLimitNeg, the reaction will be as follows:

- When the control position reaches the respective limit switch, the axis will go to state ERRORSTOP, and Drive_Release will be switched off. The actual_position might be behind, depending on the following error. It is assumed that a drive or application specific braking is performed. The axis will be stopped behind the limit.
- The axis could be switched on again by MC_Power. A movement in the opposite direction will be possible.
- The functionality of EnableLimitPos and EnableLimitNegis unchanged.

You can use the limitation of movement to achieve a soft or adjustable braking in advance before reaching the software limit switch. The limitation is activated by three Boolean parameter and will calculate a position distance to the limit switch, which depends on the actual velocity and given deceleration ramp. "paraMaxDecelerationAppl" is used for deceleration. It will decelerate the axis by the given deceleration ramp when the calculated position is reached and stop at the software limit switch. The original behavior is not modified, so if also these software limit-switches are activated, the axis might be set to state ERRORSTOP.

There are 2 different modes:

- EnableLimitAbort = TRUE

Any ongoing motion will be aborted immediately (when the distance to stop is reached, as shown in the above diagram), a warning is shown
The axis will be decelerated to reach the software limit switch.

- EnableLimitAbort =FALSE, EnableLimitDecelerate=TRUE

A warning is shown and the velocity is reduced, with respect to the given deceleration and position limit.
The ongoing motion is not aborted. If it was just a "tight fit", e.g. in a master slave movement and the direction is turned soon enough, it might be possible to continue the movement.
As the ongoing movement is not interrupted, an activated movement might not be completed, for example a MC_MoveAbsolute will never reach its target position. A warning is shown at function block CMC_Basic_Kernel.
When EnableLimitPos = TRUE or EnableLimitNeg = TRUE, and the values for SWLimitPos or SWLimitNeg are set, the axis will be set to state ERRORSTOP when these position limits are reached.

In addition, the function block will allow to limit the velocity. With EnableLimitVelocity = TRUE, it will monitor the velocity demand from the position reference and limit the position reference, so the given velocity limit will not be exceeded. A warning will be shown. The velocity used for limitation is MaxVelocityAppl.

The velocity limitation can be used to prevent short-term velocity peeks. The limited position will be caught up later, whenever possible. This can result in not-expected behavior. The WARNING issued by CMC_Basic_Kernel can be checked and used to stop a movement. The movement will be aborted automatically when the position is by MaxPositionGap behind.

- For a single axis movement, the commanded velocity is limited at the beginning. No position gap will occur.
- In a multi-axis movement, the slave axis follows a master. This can result in a position gap. A velocity peek from the master axis can be reduced by using the limitation. If the master is too fast because of the value for MaxPositionGap, the movement will be aborted.

When EnableLimit2Decelerate or EnableLimitAbort are used, the velocity is limited to MaxVelocitySystem with EnableLimitVelocity = FALSE. The function modifies the position reference. This modified position reference is used to control the drive. Whenever the limitation interferes the kernel will show a warning or an error. The warning or error message will disappear when the situation is cleared.

| Parameter <br> Number | Parameter Name | Value | Comments |
| :--- | :--- | :--- | :--- |
| 4 | EnableLimitPos | TRUE | ERRORSTOP when positions <br> exceed, no previous warning <br> or deceleration. |
| 5 | EnableLimitNeg | TRUE |  |
| 2003 | EnableLimit2Decelerate | FALSE |  |
| 2004 | EnableLimitAbort | FALSE |  |
| 2005 | EnableLimtVelocity | FALSE |  |

| Parameter <br> Number | Parameter Name | Value | Comments |
| :--- | :--- | :--- | :--- |
| 4 | EnableLimitPos | FALSE/TRUE | Reduce the velocity when <br> reaching a position limit within <br> the deceleration distance cal- <br> culated by using MaxDeceler- <br> ationAppl. Display a warning <br> at CMC_Basic_Kernel. The <br> underlying movement stays <br> active. With EnableLimitPos <br> = TRUE or EnableLimitNeg <br> = TRUE: When the Position <br> limit is reached, the axis is <br> set to mode ERRORSTOP <br> also if EnableLimitPos or Ena- <br> bleLimitNeg are used. Other- <br> wise, just the movement is <br> limited, without affecting the <br> state machine. An activated <br> positioning movement will not <br> reach its target. Velocity is <br> limited to MaxVelocitySystem. |
| 5 | EnableLimitNeg | FALSE/TRU | TRUE |
| 2003 | EnableLimit2Decelerate | FALSE | FALSE |
| 2004 | EnableLimitAbort | EnableLimtVelocity |  |

| Parameter <br> Number | Parameter Name | Value | Comments |
| :--- | :--- | :--- | :--- |
| 4 | EnableLimitPos | FALSE/TRUE | Reduce the velocity when <br> reaching a position limit within <br> the deceleration distance cal- <br> culated by using MaxDeceler- <br> ationAppl. Display a warning <br> at CMC Basic_Kernel. The <br> underlying movement stays <br> active. With EnableLimitPos <br> =TRUE or EnableLimitNeg <br> TRUU: When the Position <br> limit is reached, the axis is <br> set to mode ERRORSTOP <br> also if EnableLimitPos or Ena- <br> bleLimitNeg are used. Other- <br> wise, just the movement is <br> limited, without affecting the <br> state machine. An activated <br> positioning movement will not <br> reach its target. Velocity is <br> limited to MaxVelocitySystem. |
| 5 | EnableLimitNeg | FALSE/TRU | EnableLimit2Decelerate |
| 2003 | EnableLimitAbort | TRUE | The active PLCopen function <br> block is aborted as soon <br> as the warning is issued. <br> With EnableLimitPos = TRUE <br> or EnableLimitNeg = TRUE: <br> When the Position limit is <br> reached, the axis is set to <br> mode ERRORSTOP. |
| 2004 | EnableLimtVelocity | FALSE |  |

| Parameter <br> Number | Parameter Name | Value | Comments |
| :--- | :--- | :--- | :--- |
| 4 | EnableLimitPos | --- | The velocity is checked and <br> also limited to the value Max- <br> VelocityAppl. A warning is <br> shown. The active movement <br> is not aborted. This function- <br> ality works independent from <br> software limit switches. |
| 5 | EnableLimitNeg | --- | --- |
| 2003 | EnableLimitDecelerate | --- | TRUE |

## Programming guidelines

To achieve the best results for motion control the actual position has to be transferred in best possible quality (with minimal jitter) to the PLC. The position feedback is expected to be in increments as the data type is a DINT.

The kernel function block (CMC_Basic_Kernel or OBIO_PTOMotionKernel or OBIO_PWMMotionKernel) has to be called every cycle and its task requires a fixed cycle time.

A variable of type Axis_Ref is used to connect to the PLCopen function blocks and their kernel function block.

The function block CMC_Axis_Control_Parameter has to be used for the axis configuration. ̌ Chapter 6.5.10.3.5.6 "Axis parameters" on page 4026
The signal of the limits switches and the absolute switch should be connected to the elements of the data type CMC_Axis_IO. The signal of the absolute switch must be TRUE in case the axis hits the sensor. The signal of a corresponding limit switch has to be true when the axis leaves the area surrounded by the limit switches. If needed the signal has to be inverted before it is connected to the elements of the data type.

Task configura- The kernel function block and the transfer of axis IO data should be processed in a cyclic tion task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.
In order to save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real-time task with the axis implementation as shown in the figure below.

## Optional: <br> Unsynchronized Task Execution

## Synchronized Task Execution

All PLCopen function blocks which must be called in the same task than the kernel function block:

- MC_CombineAxes
- MCA_MoveByExternalReference

In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following figures show an example for EtherCAT:

Fig. 342: Task of axis layer

Fig. 343: Task of application implementation

Visualization
The structure of the position control loop is also as visualization element CMC_Visu_FB_Basic_Kernel. included in ABB_MotionControl_AC500.library. As placeholder, an instance of CMC_Basic_Kernel has to be used. The visualization shows all numbers as they are really used inside the block, the adjustment for different resolution or cycle times is already included.

## Kernel function block

Kernel Arithmetic

The "KERNEL" function blocks are available in two variants.
The OBIO_PTOMotionKernel / OBIO_PWMMotionKernel function blocks are solely to be used in eCo V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs. Use the PTO or PWM specific kernel block based on your configuration ${ }^{*} \boldsymbol{y}$ Chapter 5.2.1.1.2.1 "Functionality" on page 196.

The CMC_Basic_Kernel block is designed to be used in any V3 PLCs and can either work with drives connected to a fieldbus or IOs.

| Topic | OBIO_PTOMotion- <br> Kernel/ <br> OBIO_PWMMotion- <br> Kernel | CMC_Basic_Kernel |
| :--- | :--- | :--- |
| Recommended PLC | eCo V3 PLC | All V3 PLC‘s |

How does the parameter for jerk influence the axis move-
ments

Fig. 344: Velocity reference with different jerk values
The diagram shows the result with different jerk values and the same velocity and acceleration. The time needed for acceleration with jerk $=0$ is:

Time1=velocity/acceleration=(20/100)s=0.2s
The additional time with jerk $=500$ will be:
Time2=acceleration/jerk=(500/100)s $=5 \mathrm{~s}$
So the total time is:
Time $=$ Time $1+$ Time2 $=0.2 s+5 s=5.2 s$
In the last example with jerk=100, the velocity and acceleration values are not reached.

Axis parameters

## General

The parameters for axis configuration and adjustment are set by the function blocks CMC_Axis_Control_Parameter.
Depending on the version of the kernel function block the corresponding version of the parameters function block has to be used. The instance will then be connected to the kernel function block by its instance name.

| Example | ControlParameter |
| :---: | :---: |
|  |  |

In the example the control structure is a simple position control loop with just proportional gain. When the application does not require minimized position following error it should be used this way as it is simple to adjust, robust and requires minimal performance. The proportional gain is then adjusted by Control_Time. Just change values at CMC_Axis_Control_Parameter when the position control loo $\bar{p}$ is open (Drive_Release=FALSE, the axis state is Disabled). The values are sending to the control loop whit a positive edge at "Enable". The CMC_Basic_Kernel function block needs to be already enabled.

## Supervision

Pos_Lag_Per- This parameter configures the position window for the supervision of the following error.
The default value is $150[\%]$. A value of $0[\%$ ] will deactivate the supervision function.
The size of the position window depends on the setting of the parameters Control_Time and Max_Rpm «y "Control_Time" on page 4028.
Position Window [Increments] = (Inc_Per_R) * (Max_Rpm/60) * (Control_Time/1000)
Position Window [Units] = (U_Per_Rev_Nominator/ U_Per_Rev_Denominator) * (Max_Rpm/60)

* (Control_Time/1000)

| Example | Position Window [Increments] $=(10000) *(6000 / 60) *(50 / 1000)=50000$ [Increments] |
| :--- | :--- |
| Position Window [Units] $=(1 / 1) *(6000 / 60) *(50 / 1000)=5[$ Units] |  |

A value of $100 \%$ will result in a position window which corresponds to the expected following error with the giving Control_Time at Max_Rpm. Therefore it is recommended to use values higher than 100[\%]. In case the parameter FF_Percentage is used smaller values can be used. If the supervised position window is exceeded the axis state will change to ERRORSTOP.

V_Check_Time After the configured time the drive's actual velocity has to be at least $50 \%$ of the commanded velocity. This function can also be used in case the Position Reference is transferred to the drive.
A value of 0 will deactivate this supervision function.
If the supervised velocity window is exceeded the axis state will change to ERRORSTOP.

## Position control loop

Fig. 345: Basic structure of position control loop

Control_Time The default value is 100 which leads to a proportional gain of 10 .

In case the value of Control Time is too short the position control loop will run into instability.

In case the position control loop is not used this parameter must not be set to 0 .

Fig. 346: Control Time and static following error in case the feed forward of velocity and the integrational part of the position control loop is not used.

The static following error depends on the axis velocity and can be calculated easily: Control Time multiplied by the axis velocity ( $p$ _error = v*CT ).
In general it should be aimed to reach a high position control loop gain with a short Control Time to achieve a small following error. As the reaction times take account in the possible Control Time of the complete system (parameters of the drive control loop, PLC cycle time as well as the communication fieldbus) should be considered.

As a basic rule the Control Time should be at least four times longer than the reaction time between the output of the Speed Reference and the input of actual position.

When the time Ts and Tt is measured, a control_time of 4 * (Ts + Tt) will result in an aperiodic damping of the position control loop. It is important to measure the values from inside the PLC (e.g. Trace) to have the complete reaction times included. Practical values for Control_Time might be from 50-500ms. The PLC cycle time as well as bus cycle times and mechanical reaction will influence the value.

FF_Percentage The default value is 0 .
In case a velocity feedforward has to be configured a value of up to 80 is recommended. For larger values than 80 the parameter Horizon needs to be used as the resulted position will overshoot otherwise.
A value of 100 adds a velocity to the Speed Reference output which corresponds exactly to the ongoing Position Reference value.

Integral_Part The integral part of the position control loop can be used to eliminate a permanent positioning error, e.g. in case of hanging loads.

The time value can be regarded as the time the integrator needs to sum up the input value to reach the same value for its output.

In case the Integral Part Time is too short the position control loop will run into instability.

Horizon A communication delay of the Speed Reference value to the drive system can cause an overshoot during positioning caused by the velocity feedforward gain.
This function will compensate this communication delay to prevent an overshoot by time shifting the signals Velocity Feed Forward and Position Reference relatively to each other.

The value of Horizon can be approximately assumed to be the time delay of the communication delay.

The delay time might be caused by the cycle time of the control loop and by any delay in sending the speed reference, delay in the drive to build up the torque and delay to receive the actual position. To overcome this delay, a Horizon > 0 might be used. The feed forward reference will be created in advance, while the proportional gain is applied to the original motion profile. The delay is then compensated.
This function should not be used if the feed forward parameter FF_Percentage is 0 .
A value of 0 will deactivate this function, which is the default value.
While this function is used, it will increase the needed PLC calculation time for this axis.

Fig. 347: Result with Horizon=0

Fig. 348: Result with Horizon>0

## PLC cycle time

Cycle
This parameter represents the cycle time in which the kernel function block of the axis is called. If the configured cycle time is not correct the resulting acceleration and speed of an axis will be not correct also.
In case the task execution of the axis is synchronized to a fieldbus (e.g. EtherCAT) the cycle time of the fieldbus has to be used.

## Roll-Over axis

If the Position Reference value is used, the drive must able to perform a position over-run after 32 bit. If the drive's position over-run is different, it can be adapted with the function blocks CMC_Binary2Modulo and CMC_Modulo2Binary from the library ABB_MotionControl_AC500.library. Incompatibility can cause an axis to trip after hours of operation.
The possible position following error has to be smaller the $1 / 2$ Modulo_Range. Make sure that the modulo range is large enough.

Position following error = (100-FF_Percentage) * Max_Rpm * Inc_Per_R * Control_Time/6000000. This is the maximum value at constant velocity.

En_Modulo With this parameter the axis can be configured as a roll-over axis.

Modulo_Range The modulo range will be defined in drive position counts (DINT). It will result that the scaled unit position which is used by the PLCopen function blocks will stay within the defined range.

## Example

```
En Modulo = TRUE
Mo\overline{dulo_Range = 20000}
Inc_Pe\overline{r_Rev = 10000}
U_Per_Rev Nominator = 360 (e.g. degree)
U_Per_Rev_Denominator = 1
```

The scaled unit's position will cover the range from 0 to 720 (degrees).
In some cases it is not suitable to set the modulo range of an application with the DINT value of the parameter Modulo_Range only. In such cases the parameters 2001 Modulo_Nominator and 2002 Modulo_Denominator can be used to scale the parameter Modulo_Range to a more precise value.
Parameter
Modulo_Nomi-
nator and
Modulo_Denom-
inator (sup-
ported with
CMC_Basic_Ker
nel)

These parameters can be used to modify the Modulo_Range in a way that fractions of an increment could be used for 1 modulo (=rollover) distance

- Default: Modulo_Nominator=1 and Modulo_Denominator=1: the actual position for an axis is limited between 0 and Modulo_Range increments.
- Limitations: Modulo_Range*Modulo_Nominator < 2147483647. Otherwise: default values will be used.
- When modifying these parameters, the position control loop should be opened.

## Example

```
En Modulo = TRUE
Mo\overline{dulo_Range = 1024}
Modulo_Nominator = 10
Modulo_Denominator = 3
Inc Pe\overline{r R = }1024
U_Pe\overline{r_Re}v_Nominator = 80*5*3
U_Per_Rev_Denominator = 10
```

Result of parameters Modulo_Range, Modulo_Nominator and Modulo_Denominator: The modulo range will cover one revolution of the toothed-belt wheel.

Result of parameters U_Per_Rev_Nominator and U_Per_Rev_Denominator: One scaled unit corresponds to one mm of the tooth belt.

## Example:

Gearbox 10.1

|  | Option1 | Option2 |
| :--- | :--- | :--- |
| En_Modulo | TRUE | TRUE |
| Modulo_Range | 10240 | 10240 |
| Modulo_Nominator | 1 | 1 |
| Modulo_Denominator | 1 | 1 |
| Inc_Per_R | 1024 | 10240 |
| U_Per_Rev_Nominator | 36 | 360 |
| U_Per_Rev_Denominator | 1 | 1 |
| Max_Rpm | 3000 | 300 |

The two options above describe exactly the same configuration. The Modulo_Range is equivalent to 10 motor revolutions and is 10240 increments. For the position, 14 means $1^{\circ}$ and the resolution is $360^{\circ} / 10240 \mathrm{inc}=0,035^{\circ} / \mathrm{Inc}=1^{\circ} / 28,44 \mathrm{Inc}$.

| Example: |  |  |  |
| :--- | :--- | :--- | :--- |
| Gearbox $\mathbf{1 0 . 3}$ |  | Option1 | Option2 |
|  | En_Modulo | TRUE | TRUE |
|  | Modulo_Range | 1024 | 10240 |
|  | Modulo_Nominator | 10 | 1 |
|  | Modulo_Denominator | 3 | 3 |
|  | Inc_Per_R | 1024 | 10240 |
|  | U_Per_Rev_Nominator | 108 | 1080 |
|  | U_Per_Rev_Denominator | 1 | 1 |
|  | Max_Rpm | 3000 | 300 |

The two options above describe exactly the same configuration. The gearbox is $10: 3$, so the Modulo_Range is equivalent to $1024 * 10 / 3=3413+1 / 3$ increments. For the first option, the resulting modulo range is calculated $1024^{*} 10 / 3$, for option2, it is $10240^{*} 1 / 3$. For the position, 1u means $1^{\circ}$ and the resolution is $108^{\circ} / 1024 \mathrm{inc}=0,105^{\circ} / \mathrm{Inc}=1^{\circ} \% .481 \mathrm{Inc}$.

## Scaling of the unit of length

Inc_Per_R With this parameter the number of the drive position counts each revolution of the motor (DINT) have to be entered.

U_Per_Rev_Den ominator \& U_Per_Rev_No minator

With these two parameters the number of units which correspond to one revolution of the motor have to be entered.
The units of length can be scaled to values like: mm, inch, degree, ...
All dynamic parameters of the PLCopen function blocks like velocity, acceleration and jerk are based on seconds. Velocity [units/s], acceleration [units/s²], jerk [units/s ${ }^{3}$ ]

Example 1

```
Inc_Per_Rev
    = 10000
U_Per_Rev_Nominator = 360
U_Per_Rev_Denominator = 1
```

This will scale one unit to one degrees of the motor shaft. Correspondingly a velocity [units/s] of 360 will turn the motor shaft one revolution per second.

Example 2 In the example one unit will be scaled to one millimeter of the conveyor.

Fig. 349: Scaling units
How many units will pass after one revolution of the motor? $(80 * 5 \mathrm{~mm}) / 5=80$

```
Inc Per Rev
    = 1024
U_Pe\overline{r_Rēv Nominator = 80}
U_Per_Rev_Denominator = 1
```

Example 3 In the example one unit will be scaled to one millimeter of the conveyor.

Fig. 350: Scaling units
How many units will pass after one revolution of the motor? $(80 * 5 \mathrm{~mm}) / 32=12,5=125 / 10$

```
Inc_Per_Rev
    = 1024
U_Pēr_Rēv_Nominator = }12
U_Per_Rev_Denominator =}1
```

## Scaling of the speed reference output

These two parameters are used to scale Speed Reference output of the kernel FB in order to reach the intended velocity by the output value and to limit the highest possible output value.

Ref_Max Highest possible output value of the Speed Reference output. The Speed Reference value that corresponds to the parameter Max_Rpm should be used.

Max_Rpm Maximum speed of the motor in revolutions per minute.
Example - Analog Drive: 1000 rpm at 2 Volts, 3200 rpm at 6,4 Volts (max.)

- Analog output module: 10 Volts output at digital value 27648
- Ref_Max = 17695 ( $=27648 / 10$ * 6,4 )
- Max_Rpm = 3200

## Access and modify parameters

All modifications will be effective immediately. There is no extra plausibility check and values are not checked for limitations.

Use this functionality with care.

Some parameters are collected inside a structure in Axis_Ref, and can be accessed and modified immediately. They are the same parameters as used with function blocks MC_WriteParameter and MC_ReadParameter $\stackrel{y}{ }{ }^{\circ}$ Chapter 6.5.10.3.4.8 "PLCopen parameter" on page 3977.
The differences are:

- Only available with CMC_Basic_Kernel
- The parameter values are LREAL instead of DINT and can be used with decimals.
- The parameters will be effective immediately.
- There is no check for consistency or limits.
- The parameters for position control can be checked and modified by accessing the structure Axis_Parameter.CMC_Pos_Control in addition.

| Parameter for position con- <br> trol | Description |
| :--- | :--- |
| KP | Proportional gain in positive direction. Used directly to multiply <br> the following error and create the Reference_Prop. |
| KF | Feed forward in positive direction. Used directly to multiply the <br> speed reference and create the Reference_FF. |
| KP_BACK | Proportional gain in negative direction. Used directly to multiply <br> the following error and create the Reference_Prop. |
| KF_BACK | Feed forward in negative direction. Used directly to multiply the <br> speed reference and create the Reference_FF. |
| TI | Integration time. When parameter is used the position con- <br> trol loop has an additional integral part. In TI cycle, the Ref- <br> erence_ITG will reach the value of Reference_Prop, when <br> KI=100*KP. |
| KI | Proportional gain, used for integral part of position control loop. |
| KF_100 | Value for feed forward gain, if 100\% would be used. |
| Max_Time | Delay time used for supervision of velocity. With Max_Time=0, <br> no supervision is executed. |
| D_XS_Max | Maximum possible velocity in [u/cycle]. <br> The maximum allowed following error is part of the parameter <br> structure, PLCopen parameter paraMaxPositionLag. |
| Ref_Max | Limit for Speed_Reference. |

Element actual of Axis_Ref

The element actual represents actual values from inside the position control loop.

| Value | Description |
| :--- | :--- |
| Position | Actual position in [u] to control the axis. |
| Control_Position | Reference position in [u] which is actually used for control <br> loop. |
| D_XS | Distance in [u] to be moved per cycle. |
| D_XSS | Following error in [u]. |
| Reference_Prop | Proportional part for Speed_Reference. |
| Reference_FF | Feed forward part for Speed_Reference. |
| Reference_ITG | Integral part for Speed_Reference. |

Possible to use See parameter KP/KP_BACK and KF/KF_BACK. different gain for forward/ backward movement, possible improvement for hydraulic axis or vertical movement

Limitation for velocity and

From library version 3.1 on, these values are not limited to the 16-bit range of values (32767). The limit for velocity is calculated by the values given at CMC Axis Control Parameter and the acceleration and acceleration is limited such that this velocity can not be reached faster than $\overline{1}$ cycle.
deceleration

## ABB specific data structures

## General

Not all data structures are defined by PLCopen. Some specific structures are described in the following chapter. In addition to the data in these arrays, the movement is modified by offset and scaling values at the respective function block. These offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

## PositionPositionProfile

The data type MC_PProfile is used for CamTable. An array has to be defined and provided at MC_CamTableSelect. Several CamTables could be defined and the axis could change between them on the fly. There is no routine of smooth movement from one table to the next so the user has to take care just to switch on appropriate positions. Details are described in the documentation included with the library.

## Declaration example <br> CAM_table

```
ARRAY[1..3] OF MC_PProfile:=
        (Master_positíon:= 0 ,interpolation_point :=
0 ,Velocíty_ratio:= 0 ,Acceleration_ratio:= 0 ),
    (Master_position:= 50 ,interpolation_point :=
25 ,Velocity_ratio:= 0 ,Acceleration_ratio:= 0 ),
(Master_position:= 100 ,interpolation_point :=
0 ,Velocity_ratio:= 0 ,Acceleration_rätio:= 0 );
```

## PositionTimeProfile

This structure is used for time based profiles, e.g. MC_PositionProfile:

## Interpolation types for profiles

The curves defined by an array of MC_PProfile hold master position points and according slave positions. When the master position is between 2 points, the according position for the slave is interpolated. Different types of interpolation are possible. The type is defined in MC_ABB_iTypes_Enum . The master could be a real axis or some virtual axis which could be created by just writing values for position and velocity to the Axis_Master variable as shown in the example. The same interpolation types could be used on MC_TProfile.

Table 766: Overview of different interpolations

| Interpolation Types | Results in | Requires |
| :--- | :--- | :--- |
| MCA_LINEAR | Linear interpolation <br> with constant velocity <br> between interpolation <br> points. | profile.MC_PProfile_Array[x].master_posi- <br> tion, profile.MC_PProfile_Array[x].interpola- <br> tion_point |
| MCA_SPLINE_NAT- <br> URAL | Cubic spline interpola- <br> tion without jerk. | profile.MC_PProfile_Array[x].master_posi- <br> tion, profile.MC_PProfile_Array[x].interpola- <br> tion_point |
| MCA_SPLINE_COM- <br> PLETE | Cubic spline interpola- <br> tion without jerk, start <br> and end of profile with <br> velocity=0. | profile.MC_PProfile_Array[x].master_posi- <br> tion, profile.MC_PProfile_Array[x].interpola- <br> tion_point |
| MCA_POLY3 | Polynomial interpola-- <br> tion with linear velocity <br> between interpolation <br> points. | profile.MC_PProfile_Array[x].master_posi- <br> tion, profile.MC_PProfile_Array[x].inter- <br> polation_point, profile.MC__PPro- <br> file_Array[x].velocity_ratio |
| MCA_POLY5 | Polynomial interpola- <br> tion with linear accel- <br> eration between inter- <br> polation points. | profile.MC_PProfile_Array[x].master_posi- <br> tion, profile.MC_PProfile_Array[x].inter- <br> polation_point, profile.MC_PPro- <br> file_Array[x].velocity_ratio, <br> profile.MC_PProfile_Array[x].accelera- <br> tion_ratio_ |

The interpolations allow to run on smooth curves without the need to define a large number of points. The following chapter shows the results with different interpolation modes for a sinus-curve with 10 interpolation points. The following table gives the mean deviation.

| Interpolation Type | Mean deviation [ppm] |
| :--- | :--- |
| MCA_LINEAR | $19686=1.9 \%$ |
| MCA_SPLINE_NATURAL | $151=0.0151 \%$ |
| MCA_SPLINE_COMPLETE | $25510=2.5 \%$ |
| MCA_POLY3 | $131=0.0131 \%$ |
| MCA_POLY5 | 0.37 |

The original curve is represented by y_sinus for position and v_sinus for velocity. The diagrams show the result which is achieved by different interpolation types.

## MCA_LINEAR

Fig. 351: Results from linear interpolation
The velocity is constant between the interpolation points.
MCA_POLY3

Fig. 352: Results from polynomial interpolation
The result looks almost identical to the original curve. The mean deviation shows that MCA_POLY3, MCA_POLY5 and MCA_SPLINE_NATURAL produce results which follow the original curve really good and are almost identical. The spline interpolation produces a jerk-free curve without the need of providing velocity values and acceleration values in advance.

## MCA_COMPLETE

Fig. 353: Results from complete spline interpolation
In the beginning and the end, the curve does not follow the original curve. The reason is that it starts with velocity $=0$ and produces a jerk free result.
So the favoured result has to be considered in advance to choose the right interpolation method. With these different methods it is not necessary to provide a large number of interpolation points to get good results and smooth acceleration and deceleration ramps.

## PLC-based motion control - Load control / fluid power extensions

The ABB_MotionControlLoad_AC500 library is an extension to ABB_MotionControl_AC500 library based on PLCopen part 6 called "fluid power" and basically can be used to implement load control as a simple form of torque profiling. It can be used together with all other motion control package libraries. The same structure and general rules are applied and all the above chapters in this document is relevant for ABB_MotionControlLoad_AC500 library as well. It is recommended to read through all the above chapters before start using the function blocks from this library. A difference is that the position control loop has to be closed inside the PLC as it is to be synchronized with the load control loop which is also realized. The implementation of Load function blocks is based on the PLCopen part 6 - Fluid power.
Overview of the defined extended function blocks:

Table 767: Overview of the defined function blocks

| Administrative |  | Motion |  |
| :--- | :--- | :--- | :--- |
| Single axis | Multiple axis | Single axis | Multiple axis |
| MC_LimitLoad | - | MC_LoadControl | - |
| MC_LimitMotion | - | MC_LoadSuperlm- <br> posed | - |
| - | - | MC_LoadProfile | - |
| - | - | MC_TorqueControl | - |

> As per PLCopen MC_TorqueControl is a part 1 function block, however due to its implementation as a wrapper for the load control and limit load blocks this is added to ABB_MotionControlLoad_AC500 library.

The following state diagram is based on the version as defined in 'Part 1 - Function Blocks for Motion Control', Version 2.0.

This specification adds three load function blocks to the state diagram:

- MC_LoadControl
- MC_LoadSuperImposed
- MC_LoadProfile

MC_TorqueControl function block also follows the same state diagram.
Function blocks not listed in the state diagram do not affect the state diagram, meaning that whenever they are called the state does not change.

The state diagram shows synchronized motion because the position-axis follows the load, and the state is related to the position axis.

Note 1: From any state. An error in the axis occurred.
Note 2: From any state. MC_Power.Enable = FALSE and there is no error in the axis
Note 3: MC_Reset and MC_Power.Status = FALSE
Note 4: MC_Reset and MC_Power.Status = TRUE and MC_Power.Enable = TRUE
Note 5: MC_Power.Enable = TRUE and MC_Power.Status = TRUE
Note 6: MC_Stop.Done = TRUE and MC_Stop.Execute = FALSE

## Kernel function block - Fluid power

The basic block is the CMC_Load_Motion_Kernel. It has to be called every cycle and at least once before any MC... block is activated. It is used to combine the position and velocity functionality from CMC_Basic_Kernel with the load control functionality which is utilized by the MC_Load... blocks.

The reference which is used by the CMC_Load_Motion_Kernel is equivalent with the Speed_Reference at CMC_Basic_Kernel, as long as no LOAD-functionality is activated. The documentation from CMC_Basic_Kernel applies to the identical inputs and outputs. Some inputs and outputs are added to serve the load control functionality.

The Load_Ref is used instead of Axis_Ref for the MC_Loadxxx blocks. When the CMC__Load_Motion_Kernel is used, Load_Ref replaces Axis_Ref and user can use āll PLC̄open-BTocks.

The actuator (drive) has to be accessed outside the CMC_Load_Motion_Kernel block. Actual values and reference values might be transferred by a synchronised bus or by l/Os.

- •All inputs and outputs of the function block which are named "DRIVE_xxxx" should be used to connect to the actuator (drive). It does not matter whether this connection is done by fieldbus or by conventional IOs.
The Axis-structure is used to connect to the PLCopen blocks
- The Load_Axis structure is used to connect the fluid-power PLCopen blocks
- The control_parameter-structure is used for configuration of control loop.
- The IO-structure gives a connection to limit- or reference switches.

When the function block will take control (close loop) the output "Drive_Release" is set. The PLC-Program should then start the actuator (actuator (drive)) and set "Drive_InOperation = TRUE" when successful. In case of actuator (actuator (drive)) problem, "Drive_InOperation" should be reset. The function block will then open the position control loop and Speed_Reference will be 0 .

The homing is done with PLCopen-blocks. As the interface to the actual position is outside the CompactMotion, the bit "Drive_Set_Ref" is set when the state is reached to evaluate the zerotrack. When the zero-track was found, Drive_ActualPosition has to be set to "Drive_Set_Position", this has to be indicated by "Drive_Ref_Ok".
The output "Drive Reference" should be send to the actuator (drive). This value is scaled with Max_Rpm and Max_Reference which means: when "Drive_Reference" equals Max_Reference, the motor is expected to run with Max_Rpm.

Load control The function block holds a position control loop and a load control loop. The load control loop is a PIDT1-Block. Both control loops are alternately activated, depending if a MC_Load..block or a MC_Move... block is active. There is a bumbless transition realized between the different control loops.
The PIDT1 controller has a proportional, integral and derivative part. The integral and derivative part can be switched of by using a time value $=0$.

Transfer function

Control algorithm: Simple rectangle rule:

| KP**D | KP | XD |  | T1_TZ |  | 1 | TV | KP |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $Y=$ | + | * | $+\mathrm{YI}(\mathrm{z}-1)$ | + | * (YDTI(z-1) | $+$ | * | - | * (XD - XD(z-1))) |
| 100 | 100 | TN_TZ |  | 1+(T1_TZ) |  | T1_TZ | TZ | 100 |  |

Where:
$\mathrm{Yl}(\mathrm{z}-1)$ : The integral portion from the previous program
(YDTI(z-1) The differential portion from the cycle previous program cycle
$X D(z-1)$ : Control system difference from the previous program cycle

All 3 parts of the control loop are added up. The integral or derivative part could be disabled by setting the respective time constant to 0 , so the following structures are possible:

- $P$
- PDT1
- PI
- PIDT1

The Load_MaxRef and Load_MinRef values will limit the controllers output Y and also apply to the controller's internal integral part. I.e the integral part can only hold values between the high and low limits. If the manipulated variable $Y$ reaches one of the two limits, the controller's integral part is no longer changed. This prevents the integral part from holding meaningless values and, in certain circumstances, not returning to the operating range for a long time. This behavior of a controller is also referred to as a "special anti-reset windup measure".

## Example - Fluid power extensions

MC LimitLoad
In the diagram below, an example is explained. SFC is used here to distinguish between a movement where the MC_LimitLoad functionality has become 'Active' or not. In Step 2 there is a movement like 'MoveA ${ }^{\text {bibsolute', which is limited by the MC_LimitLoad functionality. If the }}$ absolute position is reached without MC_LimitLoad becoming active, the transition via done to step 3 is applicable. However, if the MC_LimitLoad becomes 'Active', the transition to the 'Halt' step is applicable, issuing a MC_Halt.

Fig. 354: MC_LimitLoad used in SFC

MC_LimitMotion e.g. force fitting

The function block is intended to be used in conjunction with a MC_LoadControl or MC_TorqueControl having primary control on the axis. The MC_LimitMotion should be enabled by the 'Active' output of the MC_LoadControl / MC_TorqueControl. If motion values on the axis exceed the given limit, appropriate measures are taken to keep to these limits, implying that the load/torque will not follow the programmed trajectory but depend on the external load conditions. However, the 'Active' output of the MC_LoadControl/MC_TorqueControl will stay TRUE in this case, following the modified PLCopen definition "The 'Active' output indicates, that the FB has control on the set-value generation of the axis". This is despite the fact, that physically only the load-conditions or the movement of an axis can be controlled. With actual motion states below programmed limits, the programmed load/torque trajectory will proceed. Enabling the limiter block with activation of the MC_LoadControl/MC_TorqueControl ensures that limits are only supervised when the MC_LoadControl/MC_TorqueControl takes control on the axis for the first time. Disabling the limiter block with de-activation of the MC_LoadControl/MC_TorqueControl ensures that limits are no more supervised when the MC_LoadControl/MC_TorqueControl loses control on the axis by 'CommandAborted' or 'Error'.

MC_ LoadSuperImposed

Possible Application: Actuator: hydraulic cylinder with fluid pressure sensor actuates the press of plastic injection molding machine in a continuous load operation.
Request: Prior to MC_LoadSuperImposed call, a MC_LoadControl block is 'Active' with a command of $7,500 \mathrm{kPa}$ to press melted plastic into the mold. Once the MC_LoadControl 'InLoad' condition is achieved a superimposed pressure of $5,000 \mathrm{kPa}$ is added several times to cause a hammering effect to relieve stresses in the plastic.

Result: the MC_LoadControl pressure command of $7,500 \mathrm{kPa}$ is superimposed with a discrete pressure command of $5,000 \mathrm{kPa}$. Once the 'LoadSuperlmposed' command is active the system pressure rises to $12,500 \mathrm{kPa}$.

When the superimposed pressure command has been achieved the MC_LoadSuperlmposed block is done and the original command given by the MC_LoadControl resumes the original pressure command. The MC_LoadSuperlmposed block is executed several times without affecting the original pressure command given by the MC_LoadControl block.

MC_TorqueControl

The example (below) opposite signs for 'Direction' \& 'Torque' are used (e. g. Retention or brake control). (In the function block: +Direction -Torque). It is like an unwinding application with torque on the material, and a break in the material. When the material breaks, as shown in the middle of the figure this causes a drop in the real Torque value (in absolute terms): The velocity will decrease, limited by the fastest "deceleration" limit specified by the 'Deceleration' VAR_INPUT down to zero velocity (with no tension there is a risk of having shock breakings, so we have to limit to the fastest). In this case the torque setpoint might not be achieved.

In an unwinding application (derived from this brake control) material tension is the target, not motor torque. The instantaneous diameter of the roll should be taken into account to transform the "User tension setpoint". Also, additional inertia compensation by modification of the torque setpoint for acceleration / deceleration is common from instantaneous weight data (weight is commonly estimated from diameter). Additionally, in unwinding applications, in the case of loose material (same condition as material break), a negative slow velocity reference is usually applied to "rewind" the loose material. In this case, this must be provided by external programming.

## Appendix

List of all PLCopen and ABB specific function blocks in PS552-MC (for V2 PLC) and PS5611Motion (for V3)

| SNo | Funktion block <br> type | Funktion block name | Motion Library <br> V2 (PS552-MC) | Motion Library <br> V3 <br> (PS5611- <br> Motion) |

PLCopen Part 4-Coordinated Motion is only available for V2 PLC and not yet available for V3 PLC.

## Examples

Prerequisite: Install the related library package with Automation Builder, Installation Manager "Modify"

Use cases and how to handle the function blocks of a certain library is described in sample projects. After the respective library has been installed the corresponding sample projects are available in the default path AutomationBuilder Examples. If the default path is inaccessible, click "Help $\rightarrow$ Project examples" in the Automation Builder menu.

### 6.5.11 MQTT client library

### 6.5.11.1 Structures and enumerations

MQTT_ERROR_I
D (Enum)

| Parameter | Value | Description |
| :--- | :--- | :--- |
| MQTT_ERR_NO_ERROR | 0 | No error. |
| MQTT_ERR_CONN_ <br> SERVICE_UNAVAIL | $16 \# 3001$ | The Network Connection has been made <br> but the MQTT service is unavailable on the <br> specified port. |
| MQTT_ERR_COMMUNI- <br> CATION_TIMEOUT | $16 \# 3013$ | The timeout value for the communication <br> has been exceeded. |
| MQTT_ERR_REC_PACKE <br> T_TOO_LONG | $16 \# 3017$ | Received topic is too long. |
| MQTT_ERR_PING_NO_A <br> NSWER | $16 \# 301$ A | The MQTT broker did not answer the ping. <br> MQTT client has passed the KeepAlive or <br> MQTT broker is unreachable. |
| MQTT_ERR_CONN_CLIE <br> NT_ID_NOT_ALLOWED | $16 \# 301 F$ | The Client identifier is correct UTF-8 but <br> not allowed by the Server. |
| MQTT_ERR_CONN <br> REFUSED_PROTOCOL | $16 \# 3020$ | The Server does not support the level <br> of the MQTT protocol requested by the <br> Client. |
| MQTT_ERR_CONN_REFU <br> SED_CONNECTION | $16 \# 3025$ | Connection refused, maybe the IP address <br> is malformed. |
| MQTT_ERR_UNSPECI- <br> FIED_ERROR | $16 \# 302 \mathrm{~B}$ | Internal library returned an unspecified <br> error. |
| MQTT_ERR_NET- <br> WORK_ERROR | $16 \# 302 D$ | General network error. |
| MQTT_ERR_CONN_AUTH | $16 \# 3217$ |  |
| FAILED |  |  |

| Parameter | Value | Description |
| :---: | :---: | :---: |
| MQTT_ERR_INPUT_02_0 | 16\#4020 | Function block Input 02 error (error case 0 ), specific error depends on used function block: <br> - MqttConnectWithCertBuffer (FB): Parameter Conn of function block was not set. <br> - MqttConnectWithCertFile (FB): Parameter Conn of function block was not set. <br> - MqttGetReceivedPacket (FB): Parameter Conn of function block was not set. <br> - MqttPublish (FB): Parameter Conn of function block was not set. <br> - MqttSubscribe (FB): Parameter Conn of function block was not set. <br> - MqttUnsubscribe (FB): Parameter Conn of function block was not set. MqttPing (FB): Parameter Conn of function block was not set. |
| MQTT_ERR_INPUT_03_0 | 16\#4030 | Function block Input 03 error (error case 0 ), specific error depends on used function block: <br> - MqttGetReceivedPacket (FB): Pointer payload not initialized. <br> - MqttPublish (FB): Publish topic name must not contain wildcard characters (+ or \#). <br> - MqttSubscribe (FB): Topic is missing. <br> - MqttUnsubscribe (FB): Topic is missing. |
| MQTT_ERR_INPUT_03_1 | 16\#4031 | Function block Input 03 error (error case 1), specific error depends on used function block: <br> - MqttPublish (FB): Payload is not set in MQTT_MESSAGE. |
| MQTT_ERR_INPUT_04_0 | 16\#4040 | Function block Input 04 error (error case 0 ), specific error depends on used function block: <br> - MqttConnectWithCertBuffer (FB): Check if Port number has been set correctly ( 0 is not accepted). <br> - MqttConnectWithCertFile (FB): Check if Port number has been set correctly (0 is not accepted). |
| MQTT_ERR_INPUT_06_0 | 16\#4060 | Function block Input 06 error (error case 0 ), specific error depends on used function block: <br> - MqttConnectWithCertFile (FB): Server certificate file was not found. |
| MQTT_ERR_INPUT_07_0 | 16\#4070 | Function block Input 07 error (error case 0 ), specific error depends on used function block: <br> - MqttConnectWithCertFile (FB): Client certificate file was not found. |

| Parameter | Value | Description |
| :--- | :--- | :--- |
| MQTT_ERR_INPUT_08_0 | $16 \# 4080$ | Function block Input 08 error (error case <br> o), specific error depends on used function <br> block: <br> - <br> MqttConnectWithCertFile (FB): Client <br> key file was not found. |
| MQTT_ERR_INPUT_12_0 | $16 \# 4120$ | Function block Input 12 error (error case <br> 0), specific error depends on used function <br> block: <br> - MqttConnectWithCertBuffer (FB): <br> Couldn't initialize Last Will message <br> because the topic is not set. <br> MqttConnectWithCertFile (FB): <br> Couldn't initialize Last Will message <br> because the payload is not set. |
| MQTT_ERR_INPUT_12_1 | 16\#4121 | Function block Input 12 error (error case <br> 1), specific error depends on used function <br> block: <br> - MqttConnectWithCertBuffer (FB): <br> Couldn't initialize Last Will message <br> because the topic is not set. |
|  |  | MqttConnectWithCertFile (FB): <br> Couldn't initialize Last Will message <br> because the payload is not set. |
| MQTT_ERR_FATAL_ERR | 16\#5FFFF | Fatal error state machine. |
| OR |  |  |

MQTT_QOS (Enum)

| Parameter | Value | Description |
| :--- | :--- | :--- |
| QOS_0 | - | Fire and forget (At most once delivered). |
| QOS_1 | - | Simple acknowledgement (At least once delivered). |
| QOS_2 | - | Complex acknowledgement (Exactly once delivered). |

MQTT_MES- This structure is used for messages which can be published or used for LastWill on MqttConSAGE nect(FB).

| Variable name | Data type | Default <br> value | Description |
| :--- | :--- | :--- | :--- |
| sTopic | STRING(MQTT_M <br> AX_TOPIC_LEN $)$ | Empty <br> string | Topic where this message belongs to. |
| pbyPayload | POINTER TO <br> BYTE | 0 | Payload which should be sent. |
| dwLen | DWORD | 0 | Length of the payload. |
| eQos | MQTT_QOS | QOS_0 | Quality of Service level. |
| xRetainFlag | BOOL | FALSE | True $=$ message must be stored by the <br> server, False $=$ server must not store <br> this message. |

MQTT_CON- Internal data required by the library to operate. This structure allocates memory and it is used to NECTION identify the MQTT connection you want to work with

| Parameter | Data type | Range |
| :--- | :--- | :--- |
| abyConn | Array | MQTT_CLIENT_STRUCT_SIZE |
| abyTxBuf | Array | MQTT_TX_BUF_SIZE |
| abyRxBuf | Array | MQTT_RX_BUF_SIZE |
| abyMsgBuf | Array | MQTT_MSG_BUF_SIZE |

### 6.5.11.2 Global variables

MQTT_CONSTANTS

| Parameter | Datatype | Value | Description |
| :--- | :--- | :--- | :--- |
| MQTT_MAX_IP_ADDRESS_L <br> EN | Word | 15 | Maximum length of the IP <br> address. |
| MQTT_MAX_PEM_KEY_LEN | Word | 2048 | Maximum length of the PEM <br> key. |
| MQTT_MAX_PEM_CERT_LE <br> N | Word | 3072 | Maximum length of the PEM <br> certificate. |
| MQTT_MAX_FILE_PATH_LEN | Word | 255 | Maximum length of the file path <br> to the certificate files. |
| MQTT_MAX_CLIENT_ID_LEN | Word | 250 | Maximum length of the client <br> id. |
| MQTT_MAX_USER- <br> NAME_LEN | Word | 250 | Maximum length of the user- <br> name. |
| MQTT_MAX_PASS- <br> WORD_LEN | Word | 250 | Maximum length of the pass- <br> word. |
| MQTT_MAX_TOPIC_LEN | Word | 255 | Maximum length of the topic. <br> MQTT_CLIENT_STRUCT_SIZ <br> E <br> Word <br> MQTT_TX_BUF_SIZE |
| Word | 1024 | Size of the internal connection <br> structure representing the con- <br> nection state. |  |
| MQTT_RX_BUF_SIZE | Word | 1024 | Size of the internally used <br> output buffer. |
| Size of the internally used input |  |  |  |
| buffer. |  |  |  |

### 6.5.12 PLCopen libraries

### 6.5.12.1 Common function block state machine

6.5.12.1.1 General

Most of the V3 function blocks follow the behavior model and style as recommended by PLC Open.

- Clear separation between "Edge triggered FBs" ("Execute") or "Level triggered FBs" ("Enable")
- Binary status outputs: "Done", "Busy", "Error" (exclusive)
- Standardized state machine
- CamelCase naming for function block and all inputs and outputs

Example: Edge_Triggerd_Function_Block_EthOwnIP according to PLCopen
Currently the following "function block state machines" are used:

- "Edge Triggered" (Input "Execute"), for example EthOwnIP
- "Level Controlled" (Input "Enable")
- "Level Controlled Continuous" (Input "Enable", no "Done" output, for example PID)

In contrast to AC500 V2 POUs, either "Done" or "Error" is set, not both outputs at the same time in case of an error.

The state machines are explained in the following chapters.

### 6.5.12.1.2 Edge triggered (AbbETrig)

After a rising edge at the input "Execute" the state goes from "Dormant" to "Busy". In the first cycle all inputs are sampled and stored.

When the task is completed successfully the state goes from "Busy" to "Done".
In case of an error the state goes to "Error".
The states "Done" or "Error" are stable for minimum one cycle and as long as "Execute" is "TRUE". With a falling edge of "Execute", the state goes via Reset to "Dormant".

## Description of standard inputs and outputs:

- "Execute"

A rising edge starts the operation, the output "Busy" goes to "TRUE". In the first cycle all other inputs are read and stored, afterwards they are ignored.
A falling edge does not stop the operation.
After "Done $=$ TRUE" or "Error $=$ TRUE" and "Execute $=$ FALSE" all outputs will be reset.

- "Busy"

Operation is running (while outputs "Done" and "Error" are "FALSE")

- "Done"

Operation is completed without error (while outputs "Busy" and "Error" are "FALSE"). This output is "TRUE" for at least one cycle or until "Execute" is set to "FALSE"

- "Error"

Operation is stopped with error (while outputs "Busy" and "Done" are "FALSE").
This output is "TRUE" for at least one cycle or until "Execute" is set to "FALSE".
The output "ErrorID" gives more details about the error.

### 6.5.12.1.3 Level controlled (AbbLCon)

After a rising edge at the input "Enable" the state goes "Dormant" to "Busy". All inputs are sampled and considered continuously.

When the task is completed successfully the state goes from "Busy" to "Done".
In case of an error the state goes to "Error".
The states "Done" or "Error" are stable for minimum one cycle and as long as "Enable is TRUE". With a falling edge of "Enable", the state goes via Reset to "Dormant".
The Busy state can be aborted from outside by setting the "Enable" input to "FALSE".
After Aborting is done the state goes back to "Dormant".
Description of standard inputs and outputs:

- "Enable"

A rising edge ("Enable = TRUE") starts the operation, the output "Busy" goes to "TRUE". All other inputs are read and considered continuously. A falling edge ("Enable = FALSE") aborts the operation.
During Aborting the Busy is still "TRUE". Afterward all outputs are reset.

- "Busy"

Operation is running (while outputs "Done" and "Error" are "FALSE")

- "Done"

Operation is completed without error (while outputs "Busy" and "Error" are "FALSE"). This output is "TRUE" for at least one cycle or until "Enable" is set to "FALSE"

- "Error"

Operation is stopped with error (while outputs "Busy" and "Done" are "FALSE"). This output is "TRUE" for at least one cycle or until "Enable" is set to "FALSE". The output "ErrorID" gives more details about the error.

### 6.5.12.1.4 Level controlled continous (AbbLConC)

This state machine is a special case of "Level Controlled". Only difference is that this function block type is never done, for example a PID which never stops.

Therefore these function blocks have no "Done" output.
Description of standard inputs and outputs:

- "Enable"

A rising edge ("Enable = TRUE") starts the operation, the output "Busy" goes to "TRUE". All other inputs are read and considered continuously.
A falling edge ("Enable = FALSE") aborts the operation.
During Aborting the "Busy" is still "TRUE". Afterward all outputs are reset.

- "Busy"

Operation is running (while output "Error is FALSE")

- "Error"

Operation is stopped with error (while output "Busy is FALSE").
This output is "TRUE" for at least one cycle or until "Enable" is set to "FALSE".
The output "ErrorID" gives more details about the error.

### 6.5.12.1.5 Error_ID

Each library contains an enumeration "ERROR_ID", which is valid for this library but not across all libraries

## Inputs/Outputs Documentation

## ERROR_ID (ENUM)

TYPE ERROR_ID
InOut:

| Name | Initial | Comment |
| :--- | :--- | :--- |
| NO_ERROR | 0 | No error |
| ERR_FAlLED | 1 | General error |
| ERR_PARAMETER | 2 | Parameter error |
| ERR_JOB_PARAMETER | 3 | Job could not be created |
| ERR_TIMEOUT | 5 | Timeout error |
| INVALID_INPUT_ETH | $16 \mathbb{1 0 4 0 2 0}$ | Wrong value on input \#2 (ETH) |
| INVALID_INPUT_IPADR | $16 \# 4030$ | Wrong value on input \#3 (IP address) |
| FATAL_ERROR | 16\#5FFF | Fatal error state machine |

Only the following errors are unique:

- 16\#5FFF FATAL_ERROR from state machine
- $16 \# 4000$ errors are used for input errors, same scheme like in V2:

## 4000hex...4FFFhex - Block Input Error

The error $4 x x x h e x$ is used in case of detected Function Block input parameter errors. The error is structured as follows:

```
4 X X X HEX
```

```
\(0=\) Invalid value
1 = Value too low
\(2=\) Value too high
\(3=\) Wrong combination of the parameters
1...FF = Number of the input
```

### 6.5.12.1.6 Compatibility with V2 function blocks

In order to ensure compatibility with V2 applications a lot of ABB function blocks are delivered together with a compatible version in classic style:
Names in CAPITAL letters, input "EN" and outputs "DONE", "ERR" and "ERNO":

The classic blocks internally use the PLCopen style function blocks. The inputs and outputs are mapped in the following way:

### 6.5.13 Pumping library V3

6.5.13.1 Overview of the PS5608 pumping library

The PS5608 - pumping library V3 stands as an upgrade of PS571 - pumping library V2. Specifically designed for pumping stations equipped with up to eight pumps, this library encompasses a comprehensive set of function blocks. This library helps in configuring and monitoring the various pumps in pumping stations.
Depending on the pumping station requirement and objectives, the available process modes typically include pressure control, flow control, and level control.

- Pressure control: This mode focuses on maintaining a specific pressure level within the system. It is ideal for applications where pressure regulation is paramount, such as in water supply systems or hydraulic systems.
- Flow control: Flow control mode is employed to regulate the rate at which the fluid is pumped through the system. It is essential in applications where maintaining a consistent flow rate is critical, such as in chemical manufacturing or irrigation systems.
- Level control: Level control mode is employed to manage the height or volume of liquid in a reservoir or tank. It is commonly used in wastewater treatment plants, industrial storage tanks, and sewage systems.
Depending on the specific operational needs and desired level of control and efficiency for the pumping stations, it offers various operational modes, each tailored to meet different requirements:
- Multimode - all VFD pumps: In this mode, all pumps are equipped with Variable Frequency Drives (VFDs). VFDs allow for precise control of pump speed, making it ideal for applications where fine-tuning flow rates and pressure is essential. This mode provides high efficiency and flexibility.
- Traditional mode - One pump VFD, other DOL pumps: This configuration combines the advantages of a VFD pump with the simplicity of direct-on-line (DOL) pumps. Typically, one pump is equipped with a VFD for precise control, while the others operate using a traditional DOL starter. This mode balances control and cost-effectiveness.
- DOL Mode - All DOL Pumps: In this mode, all pumps operate using direct-on-line (DOL) starters, which provide basic on/off control without speed variation. It's a cost-effective choice for applications where precise control is less critical.

Basic block diagram of a pumping station is as shown below.

The key features supported by the library includes:

- Configuration functions for pump station that permits:
- Users to customize pump parameters like pump station name, number of pumps, process mode of pumps, pump combination and pump speed.
- Communication with all pumps in the field that are run by DOL/VFD motors by configuring the pump settings and collecting the pump operation status.
- Pumping functions of the pump that supports:
- Precise management of emptying and filling operations by comparing actual fluid level with the set fluid level for level control.
- Uniform fluid level distribution across multiple tanks and reservoirs by providing ON/OFF command to the pumps for level control.
- Maintenance of flow in the network for flow control.
- Stabilization of pressure in the network for pressure control.
- Closed loop control of pressure and flow using PID control.
- Pump turn off/on sequence generation based on demand.
- Auxiliary functions of the pump that include:
- Cleaning up of the pump using antijam functionality.
- Capability to calculate and monitor energy consumed and saved.
- Calculation of pump flow rate using pump head flow and pressure flow rate curve characteristics.
- Computation of maintenance schedule for the pump.
- Offering analog and binary protection mechanisms to safeguard pumps against operational risks.
- Conserving energy by enabling pumps to enter sleep mode during periods of low demand.
- Soft fill functionality that ensures gradual pump start up to prevent water hammer and system stress.
- Simulation functions of the library that help in system test and validation consists of:
- DOL (Direct-on-line pumps) simulation
- VFD (Variable Frequency Drive) simulation
- Pumptank simulation for tank behavior.

This PLC library for pumping stations is a comprehensive solution that together optimize pump control, energy efficiency, maintenance, protection, and system simulation. It stands as an invaluable tool in the field of industrial automation, ensuring reliability, efficiency, and cost-effectiveness across a wide range of pumping applications.

### 6.5.13.2 Comparison of V2 and V3 pumping library

The below table compares the function blocks in the V2 library package and corresponding adapted function blocks in the V3 library package.

Table 768: Comparison of V2 and V3 pumping library

| PS571-Pumping library package (V2) |  | PS5608-Pump library package (V3) |  |

## 6．5．13．3．2 Installation

The library is part of the Automation Builder 2．6．1 or higher．Use theLibrary Manager to add the library into project．
For more details on the package，refer to the release notes of the latest Automation Builder．

## 6．5．13．3．3 Compatibility

| Requirement | Specification |
| :--- | :--- |
| Hardware | AC500 V3 midrange and eCo PLCs |
| Software | Automation Builder 2．6．1 or higher |
| Library | ABB＿Pump＿AC500．compiled library <br> ABB＿PumpEco＿AC500．compiled library |
| License | Runtime license required |

### 6.5.13.3.4 Required sensors

A minimal sensor equipment is required for the following measurements:

- Actual pressure measurement for pressure control.
- Actual flow measurement for flow control.
- Actual level measurement for level control.

The pressure sensor can be at the input and/or at the output. The flow sensor should be only at the output. Often, at the input a sensor, typically pressure, is placed for advanced protection and diagnosis.

### 6.5.13.4 Control philosophy of pumping library

The Pumping library is used for controlling the following three water pumping processes:

- Pressure control
- Flow control
- Level control - Emptying or filling

The figure below gives an overview of the pumping library and explains how the library processes the data from the user and then controls the processes.

To run any process, the pumping library follows the four stages described below:

### 6.5.13.4.1 Stage 1: Comparator

The set process value (e.g., pressure in psi, flow rate in $\mathrm{m}^{3} / \mathrm{h}$ ) is compared with the measured actual value. The distributor uses the output of the comparator to decide the number of pumps and their operating speeds to meet the demand.

- Pressure control and Flow control:
-Pressure control and Flow control: In pressure and flow controls, the function block "PmpPid acts" as a comparator which gives the "PidOut" in [\%] to the function block "PmpPressureDistributor" or "PmpFlowDistributor". In the distributor the PID output is then converted as reference speed set point to the pumps.
- Emptying or Filling mode:
- Emptying or Filling mode: In emptying or filling modes, the function block
"PmpLevelComparator" is used to compare the actual level of the tank with the set levels to start or stop the pumps. This information is sent to the distributor by the output "NumberOfPumpDemand". For example, in filling mode, at lower actual level more pumps are needed to run, to fill the tank.

### 6.5.13.4.2 Stage 2: Sequence generator

The "PmpSequenceGen" function block is used. The following functions are included:

- Decides which pump is ready to run in the auto mode.
- Decides which pump to start in the sequence, based on the least actual runtime hours. Exception - when the pump station is traditional type (with master pump on VFD, rest on DOL), then the pump ID = 1 which is attached to the VFD will always run as master and is first to start and last to stop.
- Decides which pump to stop in the sequence, based on the highest actual runtime hours. Exception - when the pump station is traditional type (with master pump on VFD, rest on DOL), then the pump ID = 1 which is attached to the VFD will always run as master and is first to start and last to stop.
- Assigns a master status to the pump in the sequence.
- Indicates how many pumps are ready for automation and how many are running.

The figure below explains a use case where the demand increases and then decreases. The sequence is generated based on these criteria by the function block "PmpSequenceGen".

| DEMAND | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Master | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Next Pump to Start | 2 | 3 | 4 | 5 | 6 | 7 | 8 |  | 2 | Whichever pump has minimum runtime will start next |  |  |  |  |  |
| Next Pump to Stop | 1 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 1 |
| Pumps Running | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |  |
|  |  | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |  |
|  |  |  | 3 | 3 | 3 | 3 | 3 | 3 | 4 | 5 | 6 | 7 | 8 |  |  |
|  |  |  |  | 4 | 4 | 4 | 4 | 4 | 5 | 6 | 7 | 8 |  |  |  |
|  |  |  |  |  | 5 | 5 | 5 | 5 | 6 | 7 | 8 |  |  |  |  |
|  |  |  |  |  |  | 6 | 6 | 6 | 7 | 8 |  |  |  |  |  |
|  |  |  |  |  |  |  | 7 | 7 | 8 |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  | 8 |  |  |  |  |  |  |  |

### 6.5.13.4.3 Stage 3: Distributor

The distributor function block distributes the start/ stop command and speed reference to all VFD operated pumps.

- Pressure control: For pressure control, the function block "PmpPressureDistributor" is used. The PID output coming from the function block "PmpPid" (comparator) is converted as reference speed setpoint to the master pump. The function block works based on the reference speed of the master pump. If the reference speed is higher, a greater number of pumps are needed to meet the demand. If the reference speed is lower, the already running pumps in the network need to be stopped. The function block:
- Calculates the speed reference of the master pump and then starts/ stops the follower pumps based on the settings in the inputs "StartSpeedFwr" or "StopSpeedFwr".
- Distributes the speed references to VFD follower pumps based on the settings in the input "FollowerMode".
- Flow control: For flow control, the function block "PmpFlowDistributor" is used.
- In the flow distributor the number of pumps to run is decided by the following ratio: "FlowSetpoint"/ (Number of pumps in station * Nominal flow of pump).
- The function block distributes the speed references to VFD follower pumps based on the settings in the input "FollowerMode".
- Emptying/Filling mode: For emptying or filling operation, the function block PmpLevelDistributor is used. The function block starts/ stops the pumps based on the input "NumberOfPumpDemand" (demand) which it receives from function block "PmpLevelComparator".
- If the actual level is in the normal range, then the speed reference of the pumps are based on the input "NormalSpeed".
- If for example while filling the actual level reaches below the "LowLevel", then all pumps run at "HighSpeed", to quickly fill the pump. Similar analogy is followed when the pump is in emptying mode.

### 6.5.13.4.4 Stage 4: DRIVE or DOL system

The output of the distributors ("AutoStartCmd" and "AutoSpeedRef") is connected to function block "PmpInterfaceVFD" and "PmpInterfaceDol". The function blocks establish the link between library and field devices i.e., pumps.

- For pumps driven by VFD motors, the function block "PmpInterfaceVFD" can be connected with the drives communication function blocks to establish communication and control with the VFD.
- For pumps driven by DOL motor, the function block "PmpInterfaceDol" can be used for start/stop controls.
For more information, see the detailed control philosophy in the following sections.

### 6.5.13.5 Features in pumping library

Pumping library is mainly designed to use in various application of water industries for example, wastewater treatment, stormwater overflow tank, water association and well stations etc. Maximum 8 pumps can be configured for pressure, flow and level control.

### 6.5.13.5.1 Types of pumping stations

This section explains the possible combination of library features with different types of pumping stations:

1. "Multi pumping" stations - maximum 8 pumps each fed by variable frequency drive.
2. "Traditional pumping" station - maximum 8 pumps, where one pump (mandatory) fed by variable frequency drive and rest by the direct online motor.
3. "DOL pumping" station - maximum 8 pumps running by direct online motors.

## Multi pumping station

This multi pumping station configuration has the best overall and operation economics:

- The library is working in the PLC which controls the operation of the variable frequency drives based on the process requirements.
- All the pumps are connected to the motor which is fed by the VFD. This type of pumping station is most flexible and has optimal process control efficiency performance.
- Based on the load requirements the number of pumps operating can vary and the pumps in operation can be kept as much as possible in their "best efficiency point".

## Traditional pumping station

This pumping station configuration has following features:

- One lead pump is connected to the VFD, and others are connected to the DOL motors.
- The library is working in the PLC which controls the operation of the variable frequency drive of the lead pump. The operation of the DOL motors is based on the process requirements.
- Based on the load requirements the number of pumps operating can vary but the lead pump with the VFD always operates.

## Direct-on-line (DOL) pumping station

This pumping station configuration has all the pumps running by the direct-on-line (DOL) motors. This is the most investment cost-effective configuration. It has following features:

- The pump library runs on the AC500 PLC.
- The pump library controls the ON/OFF the pumps based on the process demands.

### 6.5.13.5.2 Process control vs. pump combinations

The table below explains the applicability of the three process controls and their pump combinations.

| Process control | Pump combinations |  |  |
| :--- | :--- | :--- | :--- |
|  | DOL | Multi pump | Traditional |
| Flow | $\boldsymbol{\checkmark}$ | $\boldsymbol{\checkmark}$ | $\boldsymbol{\checkmark}$ |
| Level | $\boldsymbol{\checkmark}$ | $\boldsymbol{\checkmark}$ | $\boldsymbol{\checkmark}$ |
| Pressure | $\boldsymbol{x}$ | $\boldsymbol{\checkmark}$ | $\boldsymbol{\checkmark}$ |

### 6.5.13.5.3 Process control types

There are three main application and control function blocks:

- Pressure control function blocks
- Flow control function blocks
- Level control function blocks

## Pressure control function blocks

Pressure control process flow diagram.

Pressure control is used in applications with individual or multiple water consumers like in water distribution networks. A typical pressure control application diagram is shown below.

1 Suction tank
2 Parallel operating pumps P1 ... P8
3 Pressure setpoint, discharge pressure
4 Consumer
5 Water distribution network
6 Water tower buffer tank
H Water head between the levels in the suction tank and water tower buffer tank

Using pressure
Pressure control in the pumping library can help in the following operations:

- Water consumption fluctuates always and may be discontinuous over a time period, because of which it is difficult to have a continuous flow rate like in the flow control process.
- The number of pumps and the pump speed is decided by the water consumption in the water distribution system.
- Water is supplied to the pump station through suction pipeline from a suction tank.
- The pumps may be operating in parallel.
- The discharge pressure is measured in the discharge pipeline. The measured discharge pressure is controlled according to the pressure set point.
- Each pump must be started with a minimum speed to build up the pressure which is required to produce a minimum flow.
- The pressure to deliver a minimum flow depends of the water head $(\mathrm{H})$ between the water levels in the suction tank and target tank.
- If there is pump station shutdown due to protection shutdown input, the pumps must be stopped sequentially to prevent water hammering.

Variable speed drives should be stopped through a speed ramp. Otherwise, the water hammering will quickly wear out the pipeline connections and the pump station equipment.

Pump combina- Pressure control mode works for two types of pump combinations: Multi pump and traditional tions for pressure control pump.
The combination of function blocks to execute a pressure control is shown in the figures below.

- Multi pump - In this mode all pumps are run using VFDs.

Traditional pump - In this mode only one pump will run using the VFD and the rest of the pumps will run using the direct-on-line motors. The pump, which is fed by VFD will always be master or lead pump.

Based on the load requirement the number of pumps operating can change but the pump fed by VFD will always be operating.

The pressure control mode cannot be supported by a DOL pump.
The combination with any VFD pump is necessary.

## Control philosophy of pressure control mode

The pressure control mode follows this sequence of operation:

1. When the process is started, the first pump runs at "MinimumSpeed" for the time defined in the "TimeToRunMinSpeed" duration. With this process the pipe starts filling gradually and then the normal operation of PID control takes over.
2. The PID compares the required pressured and the actual pressure to generate the output in terms of percentage. This output must be connected to the function block "PmpPressureDistributor".
3. The function block "PmpPressureDistributor" receives the "PidOut". The distributor converts the PID output in terms of speed for the master pump.
4. The function block "PmpSequenceGen" has the "MasterPump" information.
5. The "PidOut" is scaled in terms of speed in this method:

Speed reference of "MasterPump" = ("NominalSpeed" of "MasterPump") * ("PidOut"/100)
6. As the PID output increases, the speed of the master pump increases. A higher PID output indicates a high demand. In case one pump is not able to cater the requirement, then more pump (followers) are needed to start and supply water to maintain the pressure.
7. If speed reference of the "MasterPump" increases such that it is more than the "StartSpeedFwr[1]", then the first follower in the network will start. The information about which pump to start comes from function block "PmpSequenceGen" at the output "NextPumpToStart".
8. If the speed reference of the "MasterPump" increases further such that it is more than "StartSpeedFwr[2]", then second follower pump starts. This sequence is followed till there is an increase in demand. See the timing diagram below.

Speed set point of Master Pump = PidOut \% * Nominal speed of master pump
Start Delay: Delay time [s] to start the next pump
9. Similar when the demand decreases, the speed reference of master decreases. See the timing diagram below. As the speed reference of the master pump goes below "StopSpeedFwr[1]", the first follower stops. The ID of next pump to stop comes from "PmpSequenceGen" as "NextPumpToStop". If the speed reference of the "MasterPump" decreases further such that it is less than "StopSpeedFwr[2]", then second follower pump stops. This sequence is followed till there is a decrease in demand.

The follower pumps in the above figure is considered to be in the "FollowerMode"= 1, copy master speed. They can also run at their individual speed if "FollowerMode"= 2, fixed speed.

Stop Delay: Delay time [s] to stop the next pump

### 6.5.13.5.4 Flow control process flow diagram

Flow control is used in applications where continuous flow distribution to one or more target tanks or reservoirs is needed.

A typical flow control application diagram is shown below.

1 From supply station
2 Suction tank
3 Parallel operating pumps P1 ... P8
4 Flow setpoint, discharge pressure
5 Water distribution network
6 Target tank/Reservoir
7 To next station or distribution network
H Water head between the levels in the suction tank and target tank

### 6.5.13.5.5 Using flow control

Flow control in the pumping library can help in followings pumping operations:

- Supplying water to the pump station through the suction pipeline from a suction tank.
- Operating pumps in parallel.
- Controlling continuous water flow over a time period.
- Measuring the discharge flow in the discharge pipeline.
- Defining the number of pumps and pump speed based on water flow demand (flow set point).
- Starting each pump with minimum speed to build up the pressure required to produce a minimum flow.
The pressure depends on the water head ( H ) between the water levels in the suction tank and the target tank.
- In case of station shutdown stops the pumps sequentially to prevent water hammering.
- Stops variable speed drives through a speed ramp.

### 6.5.13.5.6 Pump combinations for flow control

Flow control works for all the three types of pump combinations: Multi pump, traditional pump, and DOL pump.

- Multi pump - In this mode all pumps are run using VFDs. See the example diagram below.

- Traditional pump - In this mode only one pump is run using the VFD and rest are run using the Direct On Line (DOL) motors. See the example diagram below.

- DOL Pump - In this mode all the pumps are operated by DOL motors. The function block PMP_PID is not configured as there is no possibility to change the speed of the pump. See the example diagram below.

### 6.5.13.5.7 Control philosophy of flow control mode

The above figures show the combination of function blocks to execute the flow control. As it can be seen,

- When the process is started, the first pump runs at the "MinimumSpeed" for the time defined in the "TimeToRunMinSpeed" duration. This is to gradually start filling the pipe. After this the normal operation of PID control takes over.
- The PID acts as a comparator: the PID compares the required flow and the actual flow to generate output in terms of percentage. This needs to be connected to the "PmpFlowDistributor".
- "PmpFlowDistributor" takes the "PidOut". Then converts this output in terms of speed for the master pump. The information of master pump comes from the "MasterPump" of the "PmpSequenceGen". The scaling of the "PidOut" in terms of speed is done in following ways. Speed reference "MasterPump" = ("NominalSpeed" of "MasterPump") * ("PidOut"/ 100)
- This speed reference is given to the master and the follower (if Follower Mode $=1$ ). If Follower Mode $=2$, then follower pumps will run at their fixed speed given in the input "FollowerSpeed" [1..8].
- The distributor then decides about the number of pumps to operate based on the following formula, Number of pumps = "FlowSetpoint""NominalFlow", here it is assumed that all pumps are of same rating.

It is assumed that all the Pumps are of the same capacity.

- As the flow set point increases, the demand of pumps increases.
- Example: if each pump is of capacity = 100 cubic meters per hour and the flow set point is 400 cubic meters per hour, then four pumps will start together. This is unlike the pressure control where the pumps do not start together but based on speed reference of the master pump.

- Similarly when the demand decreases, the speed reference of the master decreases. As the speed reference of the master pump goes below than "StopSpeedFwr[1]", the first follower stops. The ID of next pump to stop comes from "PmpSequenceGen" as "NextPumpToStop".
- If the speed reference of the "MasterPump" decreases further such that it is less than "StopSpeedFwr[2]", then second follower pump stops. This sequence is follows till there is a decrease in demand.

The follower pumps in the above figures are considered to be in the "FollowerMode" = 1, copy master speed.
They can also run at their individual speed if "FollowerMode" $=2$, fixed speed.

### 6.5.13.5.9 Level control function blocks

## Level control process flow diagram

Level control is used in applications where continuous flow distribution into one target tank or reservoir is needed.
A typical flow control application diagram is shown below.

1 From supply station
2 Suction tank
3 Parallel operating pumps P1 ... P8
4 Water distribution network
5 Target tank/Reservoir
6 To next station or distribution network
H Water head between the levels in the suction tank and target tank

## Using level control

Level control in the pumping library can help in followings pumping operations:

- Emptying the target tank/reservoir by the next pump station or water distribution network.
- Filling the suction tank from a supply station.
- Defining the number of running pumps based on water level in the water tank.
- Start/stop the pumps with predefined start/stop levels.
- In case of a station shutdown, stop pumps sequentially to prevent water hammering.

## Pump combinations for level control

Level control works for all the three types of pump combinations: Multi pump, traditional pump, and DOL pump.

- Multi pump - In this mode all pumps are run using VFDs. See the example diagram below.

- Traditional pump - In this mode only one pump is run using the VFD and rest using the Direct On Line (DOL) motors. See the example diagram below.

- DOL Pump - In this mode all the pumps are operated by DOL motors. In this case the PMP_PID is not configured as there is no possibility to change the speed of the pump. See the example diagram below.

## Control philosophy of level control mode

The level control is based on two modes.

- Emptying mode
- Filling mode

The level control mode follows this sequence of operation:

- The "PmpLevelComparator" compares the actual level ("ActLevel") with the set start levels ("StartLevel" [1...8]). Based on which the comparator decides the demand - "NoOfPumpDemand". This demand goes as an input information to the "PmpLevelDistributor".
- The "PmpLeveIDistributor" then starts the required pumps. In case the pumps are driven by VFD, the distributor also gives the speed reference to each pump. The information of which pump to start in the sequence is given to the distributor by "PmpSequenceGen".

Time diagram:
Emptying mode
Emptying Mode

Time diagram:
Time diagram

Filling Mode

6.5.13.6 Auxiliary functions

The various auxiliary functions supported in this library are described in the following chapters

### 6.5.13.6.1 Antijam overview

The pump antijam function is used to prevent building up of solids on the pump impellers or pip-ing. The function consists of a programmable sequence of forward and reverse runs of the pump to shake off any residue on the impeller or piping. This function is mostly used with booster and wastewater pumps. See timing diagram below:

The function block PmpAntijam performs the antijam function by running the pump at high speeds without any ramp up/down time.

### 6.5.13.6.2 Pump energy calculation functionality

The function block "PmpEnergyCalc" calculates the energy consumption of the pumping station run by variable frequency drive and gives the information on cumulative flow in cubic meters. The function includes following calculations:

- Total energy consumed.
- Total energy saved.
- Total cost saved.
- Reduced CO2 emission.

### 6.5.13.6.3 Pump flow calculation functionality using $H Q$ and $P Q$ curves

The function blocks "PmpFlowCalcHQ" and "PmpFlowCalcPQ" calculates the flow rate of pumps using the pump head flow (HQ) and pump pressure flow rate ( PQ ) curve characteristics respectively. These functions are applicable only for pumps run by variable frequency drives.
The flow calculation function provides a reasonably accurate calculation of the flow without the installation of a separate flow meter. The flow is calculated based on the pump characteristics. The user can define the PQ (Power vs Flow) or HQ (Head vs Flow) values for the performance curve at the inputs of the function block for the five coordinate points. The values of the PQ and $H Q$ are generally provided by the pump manufacturer and all points defined must be within the operating range of the pump. These points are taken at the maximum operation speed and scaled down by the block according to the actual speed. By this method a good accuracy is achieved with limited parameterization effort.

### 6.5.13.6.4 Pump maintenance functionality

The function blocks "PmpMaintenance" is used to record the maintenance schedule of the pump. The function block maintains an hourly counter to track the pump maintenance interval and generates timely reminders and alarms.

### 6.5.13.6.5 Pump protection functionality using analog/binary inputs

The function blocks "PmpProtectionAnalog" and "PmpProtectionBinary" monitors analog inputs and binary inputs respectively and generates signals to shut down or to block the starting of pump or the process.
The function block sends the signals to shut down or to block the starting of pump through inputs "ProtectionShutdown" or "StartBlocker" of these distributor and pump interface function blocks: "PmpLeveIDistributor", "PmpFlowDistributor" "PmpPressureDistributor", "PmpInterfaceVfd" and "PmpInterfaceDol".

### 6.5.13.6.6 Pump sleep functionality

The function block "PmpSleep" stops all pumps in the pressure control process during low demand. The function works only for pressure control (when function block "PmpConfiguration" has the input ProcessMode $=1$ (Pressure control) with multi pump station or traditional pump station.

### 6.5.13.6.7 Pump soft fill functionality

The function block "PmpSoftFilling" enables slow filling operation in pipes in the beginning of the process to avoid damages. If this operation is selected, it is executed before the actual process control takes over.

Note:

- This function block cannot run when the "PumpComb" $=3$, DOL mode in
"PmpConfiguration". Soft filling needs the VFD drive to run and execute gradual filling of the water.
- In case of master pump failure when process is running (pumps running):
- If softfill - disabled, next pump to start in sequence is becoming master and running in the normal mode.
- If softfill- enabled, next pump to start in sequence is becoming master but it is not going to the normal mode.

Softfill will only be performed for the master pump when there are no pumps running and the process is started for the first time.

### 6.5.13.7 Simulation functions

For the testing of the program in test environment where the real drives or pumps and tanks are missing, these three simulation blocks are provided which can be used.

The outputs of the function block may or may not be as accurate as real process. Use this function block only for simulation testing and not on the actual system.

### 6.5.13.7.1 Pump DOL simulation block

The function block "PmpDolSimu" is a simple simulation of the direct online pumps. This block can be used to test the behavior of the system when there is start and stop of pumps and external faults are introduced.

### 6.5.13.7.2 Pump drive simulation block

The function block "PmpDriveSimu" is used to simulate the variable frequency drive (VFD) pumps and for PLC communication. This block can be used to simulate the behavior of the VFDs to check the behavior of system during maximum speed or power, external faults and to check Start and stop sequence of the pumps.

### 6.5.13.7.3 Pump tank simulation block

The function block "PmpTankSimu" is used to simulate the water tank. This simulation can be used in all the three process control modes:

- Pressure
- Flow
- Level

This block can be used to check the start and stop sequence of the pumps and fault conditions during process control mode when the tank is not available by providing the dimensions of the tank, it can be used in combination with "PmpDolSimu" and "PmpDriveSimu" function blocks to simulate a test environment.

### 6.6 Engineering interfaces and tools

### 6.6.1 Export and import interfaces

### 6.6.1.1 Exporting and importing ECAD data (PBF)

### 6.6.1.1.1 Introduction

Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.
Automation Builder - ECAD interface supports various flexible workflows:

- Enables PLC hardware planning and configuration in the ECAD tool and allows importing the exported data from the ECAD tool through the PBF file (process integration bus interchange format) into the Automation Builder project with diff and merge functionality, providing full control on selective import/merge.
- Enables PLC hardware configuration in Automation Builder and allows exporting the configuration to the ECAD tool through a PBF file.
- Supports bi-directional roundtrip engineering with loss less data exchange between Automation Builder and the ECAD tool.

Automation Builder uses the rack information to identify the relations between:

- PLC and devices plugged to I/O bus or extension bus.
- Fieldbus slave and attached IO devices.

It is recommended to assign the PLC, IO devices, communication modules and fieldbus slaves properly to the rack in the ECAD project. If the rack information is missing, devices will be imported to the device pool and must be arranged manually in the Automation Builder project or mapped to already existing devices.

### 6.6.1.1.2 Requirements on EPLAN electric P8

- EPLAN Electric P8 with PLC and Bus Extension. It is recommended to use version 2.3 or later.
- Use of appropriate part data and macros for ABB devices. This can be achieved by getting the part data and macros from the EPLAN data portal.

### 6.6.1.1.3 Importing PLC data from the ECAD tool

You can create a new Automation Builder PLC project from the existing PLC hardware configuration in your ECAD tool, by importing the exported PBF file to Automation Builder.

Import PBF file
to Automation
Builder

1. From the main menu, select "Project $\rightarrow$ Import $\rightarrow$ ECAD (PBF)".
2. From the file system, select the $P B F$ file.

Automation Builder starts importing the devices and its associated signals from the PBF file. After a successful import, the result is displayed in the Project Compare -Differences view. You can now decide and selectively merge the differences.
\& Chapter 6.4.1.21.3.5.21 "Command 'Compare'" on page 2607
3. Select the DevicePool node and click "Accept Block" to accept the complete PLC structure in the ECAD tool.
4. Select the PLC node and click "Accept Block" to accept all child device nodes.

The DevicePool node holds all devices coming from the ECAD tool without any hierarchy information. The missing hierarchy information can be defined after closing the editor.
5. Close the Project Compare - Differences view to accept the changes.
6. Arrange unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.

$\Rightarrow$ The I/O signals assigned to I/O devices in the PBF file are imported and allocated to IO devices. IO signals can be viewed in I/O mapping editor of the I/O devices.

### 6.6.1.1.4 Importing third party devices

Prerequisite: To import third party devices from ECAD to Automation Builder, install third party fieldbus devices (for example, GSD, GSDML and EDS files) using "Tools $\rightarrow$ Device repository" in Automation Builder.

1. From the main menu, select "Project $\rightarrow$ Import $\rightarrow$ ECAD (PBF)".
2. From the file system, select the ECAD pbf file which consists of third party devices.
$\Rightarrow$ When the device identifier of the third party device installed in Automation Builder does not match with the device identifier of the device imported from ECAD, an error window is shown with the devices which are failed to import with error identifier 14.
To import third party devices, it is required to assign ECAD identifier (PLC type designation/order number) in Automation Builder in "Tools $\rightarrow$ Device ECAD data". Click the link in the Import window to see the error messages in a text file.
3. Click "Continue" in the Import window to import valid devices to the project that are imported successfully or click "Cancel" to cancel the import process.
4. In Automation Builder, click "Tools $\rightarrow$ Device ECAD data".
5. In the Device ECAD data editor, add the ECAD identifier for the devices shown in the import errors window with error identifier 14, to enable these devices for export and import.

$\Rightarrow$ Also, add the ECAD identifiers for all devices which need to support export/import in ECAD.
6. Reimport the pbf file to import the third party devices.

### 6.6.1.1.5 Exporting PLC data to ECAD tool

1. Open the existing PLC project.
2. In the device tree, right-click "PLC $\rightarrow$ Export $\rightarrow$ ECAD (PBF)".
3. Select the desired location in the file system to save the $P B F$ file.

The ECAD user can import the exported PBF file from Automation Builder and can use the imported PLC data for electrical engineering purpose. If the user modifies imported PLC data in the ECAD project, the data can be imported back to the Automation Builder project which supports the round trip engineering efficiently with loss less synchronization of the data.

### 6.6.1.1.6 Exporting third party devices

1. Right-click on a PLC device, click "Export" and select "ECAD (PBF)".
2. Save the file to the desired location in the file system.

If the third party devices does not contain assigned ECAD identifiers, a message is displayed showing which devices cannot be exported.
$\Rightarrow$ To add ECAD identifiers to the devices, see Importing third party devices $\Leftrightarrow$ Chapter 6.6.1.1.4 "Importing third party devices" on page 4192.

After adding ECAD identifiers to the third party devices, execute "Export" to export the devices including third party devices.

### 6.6.1.1.7 Importing ECAD PLC data to existing $A B$ project

Automation Builder ECAD interface supports concurrent engineering by importing the ECAD data to the existing Automation Builder PLC project.

1. From the main menu, select "Project $\rightarrow$ Import $\rightarrow$ ECAD (PBF)".
2. Select the PBF file which has been created during the export from the ECAD tool.
3. Select the PLC from the list and click "OK".
$\Rightarrow$ A dialog window is displayed if the Automation Builder project provides PLCs of the identical type as defined in the PBF file.

By selecting "None" in the dialog window a new PLC is defined in the ECAD tool.
4. In the Project Compare - Differences view, click 直 to merge device signals.
$\Rightarrow$ The differences between the current PLC hardware configuration in Automation Builder and the ECAD PLC data are displayed.
5. Select the differences as desired and click "Accept Single" to accept the selected difference block.
6. Close the Project Compare - Differences view to accept the changes.

### 6.6.1.1.8 Arrange or map devices imported to the device pool

Devices that are imported to the device pool because of missing hierarchy information (mainly rack information) must be arranged manually in the Automation Builder project or mapped to already existing devices.

Arrange devices Arrange the unassigned devices in the DevicePool to the PLC hardware structure by drag-andimported to the drop.
device pool
Map devices If the devices are already added to the Automation Builder project prior to the import, you have imported to the to map the instances of the same type manually (one instance in the Automation Builder project device pool tree and one instance in the DevicePool).

After mapping the devices, you can selectively merge the device parameter or signal in the difference view.

To map pool devices, proceed as follows:

1. In the device tree, select the Device Pool node, click "Project" and select "Map pool devices".
2. Map the device pool instances of identical types in the project from the drop-down list and click "OK".
$\Rightarrow$ Pool devices which are mapped are removed from the device pool and mapped to the corresponding Automation Builder device. Differences between the signals of the mapped I/O devices are displayed. e.g. AI523_1 device:

### 6.6.1.1.9 Limitations

The following limitations are considered when working with the Automation Builder ECAD interface:

- The scope of a PBF file is limited to one single PLC including all connected devices.
- There is no representation of XC variants of devices in Automation Builder. Therefore, always use the standard variant for export. This might lead to part data mismatch when importing into the ECAD tool.
- In reimport or round trip import cases, if any changes are made in ECAD by adding a new communication module with connecting to one of the PLC slot or replacing existing communication module, then those device changes to the communication modules are not displayed as connected to PLC slots during the import in Automation Builder diff and import, instead those CM modules are added under the device pool. After merging and importing is completed, to work with device pool devices $\stackrel{y}{m}$ Chapter 6.6.1.1.8 "Arrange or map devices imported to the device pool" on page 4194.
- IO mapping data cannot be imported for IO devices plugged to an EtherCAT slave when they are imported individually to the device pool because of missing hierarchy information. After arranging the devices properly in the device tree, the import can be done again to import also the IO mapping data.

### 6.6.1.2 Exporting and importing I/O mapping (CSV)

The I/O module mappings of an Automation Builder project can be exported to CSV for bulk editing in MS Excel or other documentation purposes. I/O mappings can be exported at single I/O module level or at PLC level.

Further, the I/O module mappings can be imported with the option of displaying differences and merging each single changed or import all signals at once by overwriting existing I/O module signals.

### 6.6.1.2.1 Exporting IO mapping data to CSV

To export I/O mappings to a CSV signal list, proceed as follows:

1. In the device tree, right-click "PLC $\rightarrow$ Export $\rightarrow$ IO mapping (CSV)".
2. Save the IO mappings CSV to the desired location in the file system.

If the CSV signal list has been exported successfully, a success message is displayed.
The status of the export is shown in the dialog.
3. In the export dialog, click the link to open the exported IO mapping CSV file in MS Excel.

The template can only be opened if MS Excel is installed and configured to open .csv files.
4. In the IO mapping (CSV) file, change Variable and Description fields to edit I/O mappings.

Do not modify other field's data in IO mapping (CSV) file.

### 6.6.1.2.2 Importing I/O mapping data from CSV

To import an edited I/O mapping (CSV) file, proceed as follows:

1. From the main menu, select "Project $\boldsymbol{\rightarrow}$ Import $\rightarrow$ IO mapping (CSV) $\rightarrow$ Open".
2. A CSV signal list import dialog is displayed.
$\Rightarrow$ With "YES", all I/O mappings will be imported without difference view. With "NO", the difference view is displayed with the I/O mapping differences.
3. In the Project Compare - Differences view, click 直 to merge I/O mappings.
4. Select the signal row for which the difference is to be accepted. Select the Variable field and click "Accept Single" to merge the I/O mappings.
5. Close the Project compare - Differences view to accept the changes and merge the I/O mappings with the Automation Builder project.

### 6.6.1.3 Exporting and importing device list (CSV)

### 6.6.1.3.1 General

The Automation Builder project devices can be exported to CSV for bulk device renaming or adding device tag labels to devices in MS Excel or other documentation purposes. A devices export is only possible at PLC level.
Automation Builder provides importing devices in bulk based on device type, instance and hierarchy information provided in the CSV file.

### 6.6.1.3.2 Exporting device list to CSV

To export a CSV device list, proceed as follows:

1. In the device tree, right-click "PLC $\rightarrow$ Export $\rightarrow$ Device list (CSV)".
2. Select the desired location in the file system to save the Device list (CSV).

If the CSV device list is exported successfully, a success message is displayed.
3. In the Export dialog, click the link to open the exported CSV device list.

The exported CSV device list consists of all devices connected to the PLC that is exported. Each row represents a device with its device type and hierarchy information.

### 6.6.1.3.3 Creating CSV device list

To create the devices in CSV, use the device list template provided in Automation Builder.
$\triangleright \quad$ In the main menu, click "Tools $\rightarrow$ Create CSV Device list". $\Rightarrow$ The device list template is opened in the MS Excel.

In this file, add each device in a separate row with device information like Device Type (Order Num or Device Type Name) and instance details (name, tag) and hierarchy information (parent Device name, parent Device Tag, position). The mandatory information required to import CSV is only Device Type. All other fields are optional. After editing the device list CSV file, save it in the file system and close.

### 6.6.1.3.4 Importing a device list from CSV

To import devices from CSV in bulk, proceed as follows:

1. From the main menu, click "Project $\boldsymbol{\rightarrow}$ Import $\boldsymbol{\rightarrow}$ Device list (CSV)".
2. Select the device list CSV file from the file system and click "Open" in the Import dialog.

All devices that are defined in the CSV are imported. The Project Compare - Differences view displays the current project and the project that has been updated by the import file.
3. Select the desired devices and click "Accept Block" to accept all the devices and its child device nodes or "Accept Single" to accept only a single device.
4. After closing the Project Compare - Differences view, the devices are imported to the Automation Builder project.
$\Rightarrow$ The devices (except PLC) are placed under the device pool if the valid device hierarchy information is not provided in the CSV device list file. By drag-and-drop devices can be assigned to the desired PLC hardware structure ${ }_{c} \stackrel{y}{c}$ Chapter 6.6.1.1.8 "Arrange or map devices imported to the device pool" on page 4194.
If a device tag is provided for a device in CSV, it appears next to each device node in the device tree.

### 6.6.1.3.5 Renaming devices

To rename the devices, proceed as follows:

1. In the device tree, right-click "PLC $\rightarrow$ Export $\rightarrow$ Device list (CSV)".
2. Select the desired location from the file system to save the CSV device list.
3. Rename the device names in the column Device Name:

4. Click "Project $\rightarrow$ Import $\rightarrow$ Device list (CSV)".
5. Select the updated CSV file from the file system.

Open the Project Compare - Differences view. If only the device names have been changed in the CSV file, the difference view does not show the changes.

Device Name changes are not displayed as changes in the difference view.
6. Close the Project Compare - Differences view. The Renamed Devices dialog is displayed with the current name and the new name provided in the CSV file.
7. In the Rename Devices window, select the desired devices and click "OK". The device names are updated in the Automation Builder project.

### 6.6.2 CODESYS Security Agent

### 6.6.2.1 Integration in CODESYS Development System

At this time, you can configure and create certificates of the controller with the CODESYS Security Agent. You can then configure encrypted communication with the controller, as well as encrypt the boot application, download, and online change.

- $\quad$ Chapter 6.6.2.2 "Encrypted Communication with Devices via Controller Certificates" on page 4201
- $乡$ Chapter 6.6.2.3 "Encryption of the Boot Application, Download, and Online Change" on page 4202

### 6.6.2.2 Encrypted Communication with Devices via Controller Certificates

Encrypted and An application can be encrypted and signed in order to protect a running application in an signed applica- AC500 V3 PLC and to protect a configured project. How to set-up the user management, the tions communication and the boot application in order to prevent unauthorized access is explained in the application note AC500 V3 - Encrypt and sign your application.

Requirement: A digital signature for certificate exchange is configured. ③ Chapter 6.4.1.9.18 "Protecting an application" on page 1915

## No certificate use in live system

Self-signed certificates should never be used on production or public websites.
The certificates that are created in the following steps are self signed.

We assume that there is still no certificate on the controller that is intended for encrypted communication. In the following steps, you generate this kind of certificate and encrypt communication:

1. Configure the active path to the controller.
2. Open the "Security Screen" view by double-clicking the symbol in the status bar or by clicking "View $\rightarrow$ Security Screen". Select the "Devices" tab.
3. Click the button to refresh the list of available devices and their certificate stores.
4. Select the corresponding device on the left side.
$\Rightarrow$ On the right side, there is still no license listed for the "Encrypted communication" use case.
5. On the right side, select "Encrypted Communication" and click the ${ }_{4}{ }^{*}$ button to create a new certificate on the device.

Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.
$\Rightarrow$ The certificate is generated and listed in the table with its properties. The symbol before "Encrypted communication" now appears as such: $\mathbb{E}_{\Delta}$. The field in the "Valid until" column is highlighted in green because the remaining time is still at least twothirds of the entire validity period.
6. In this step, you activate encrypted communication with the controller.

Open the "Security Screen" view of CODESYS ("Users" tab). In the "Security Level" group, select the "Enforce encrypted communication" option.
$\Rightarrow$ As of this point, communication with all controllers is possible only as long as the certificate is valid on the controller and you have a key for it.
The connecting line between the development system, the gateway, and the controller is displayed in yellow on the "Communication Settings" tab of the device editor of the controller.
As an alternative to the "Enforce encrypted communication" option that was just described and which applies to all controllers, you can also encrypt communication with a specific controller only. To do this, open the "Communication" tab in the device editor of the controller. Click "Encrypted Communication" in the "Device" list box.
7. Now log back in again to the controller.
$\Rightarrow$ A dialog opens with the notification that the certificate of the controller is not signed by a trusted source. In addition, the dialog displays information about the certificate and prompts for you to install it as a trustworthy certificate in the local store in the "Controller Certificates" folder.
8. Confirm the dialog.
$\Rightarrow$ The certificate is installed in the local store and you are logged in to the controller.
In the future, communication with the controller will be encrypted automatically with this control certificate.
Note: When logging in to the controller, the expiration date of the certificate currently in use is checked. You get a warning if the remaining time is just one-third of the entire time or less. Then you can renew the certificate in time in the security screen.

- 宏 Chapter 6.6.2.4.1 "View 'Security Screen' - 'Devices"" on page 4205
- «y Chapter 6.6.2.1 "Integration in CODESYS Development System" on page 4201

### 6.6.2.3 Encryption of the Boot Application, Download, and Online Change

Encrypted and An application can be encrypted and signed in order to protect a running application in an signed applications AC500 V3 PLC and to protect a configured project. How to set-up the user management, the communication and the boot application in order to prevent unauthorized access is explained in the application note $\underline{\text { AC500 V3-Encrypt and sign your application. }}$

Aim: You want to encrypt boot applications, downloads, and online changes with a certificate to make sure that the application on the controller cannot be exchanged at will. To do this, you need to download a corresponding certificate of the type "Encrypted Application" from the controller and install it to the "Windows Certificate Store" of your computer. This certificate is required for all development environments that need to make changes to the application on the controller. For example, if this application has to be downloaded from another computer, then the certificate also has to exist on this computer.
See also

- «y Chapter 6.6.2.1 "Integration in CODESYS Development System" on page 4201
- CODESYS Help: "Security", "Encryption", "Certificate"

Requirement: The active path to the controller is configured.
en the "Properties" dialog of the application.
2. Click the "Encryption" tab. Set "Encryption Technology" to "Encryption with certificates". $\Rightarrow$ The "Encryption Wizard" button is available in the "Certificates" field.
3. Click the "Encryption Wizard" button.
$\Rightarrow$ The "Encryption Wizard" dialog opens. The status is Not connected and under "Details" is Ready.
4. Click the "Start" button.
$\Rightarrow$ The wizard searches for suitable certificates on the controller. If necessary, the controller creates a new certificate which is registered in the Certificate Store of your computer.
NOTE: A certificate obtained this way is automatically accepted as trusted.
If a certificate for application encryption already exists on the controller, then it is used.
If a new certificate has to be created on the controller for your CODESYS, then the "Certificate Settings" dialog opens for configuring the key length for the private key and the validity period.
5. In the "Certificate Settings" dialog, click "OK" to confirm the default or edited values for key length and validity period.
$\Rightarrow$ CODESYS saves the values in the CODESYS options as the default for the next certificate configuration of this kind.

In the "Details" of the wizard, you see a description of the performed actions and the thumbprint of the recently created certificate.
6. When the status reaches "Wizard finished", close the wizard.
$\Rightarrow$ The new certificate is listed in the "Certificates" field of the properties dialog. In the "Certificate Store", it is listed under "Controller Certificates". In the "Security Screen" view, on the "Devices" tab, the certificate is displayed in the right window with the "Encrypted Application" information.
7. Confirm the "Properties" dialog of the application.
8. Open the "Security Screen" view.
$\Rightarrow$ On the "Project" tab, in the "Encryption of boot application, download and online change" group, the certificate is displayed with the "Encrypted Application" information.

Boot application, download, and online change are therefore encrypted and only possible as long as the configured certificate and signature are valid.

## Encrypting the boot application, download, and online change without the encryption wizard

Requirement: The active path to the controller is configured. There is still no certificate on the controller that is suitable and valid for encryption.

1. Open the "Security Screen" view by double-clicking the symbol in the status bar or by clicking "View $\rightarrow$ Security Screen". Open the "Devices" tab.
2. Click the $\downarrow$ "Refresh the list of available devices and their certificate stores" button.
3. Select the device listed on the left side.
4. Select "Encrypted Application" on the right side and click the "Create a new certificate on the device" button.
Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.
$\Rightarrow$ The certificate is created and listed in the table with the 圈 symbol.
5. Double-click the certificate entry.
$\Rightarrow$ The Windows "Certificate" default dialog opens.
6. Click the "Install certificate" button on the "General" tab.
$\Rightarrow$ The "Certificate Import Wizard" opens.
7. In the "Certificate Store" dialog, select the "Place all certificates in the following store" option and select the "Controller Certificates" folder for "Certificate Store".
$\Rightarrow$ The controller certificate is imported to the "Controller Certificates" directory and it is immediately available for the encryption of downloads, online changes, and boot applications.
8. Open the "Project" tab and double-click the application entry in the "Encryption of boot application, download and online change" group.
$\Rightarrow$ The "Properties" dialog of the application opens.
9. Click the "Encryption" tab and set "Encryption Technology" to "Encryption with certificates". Then click ${ }^{3}$. Note: If the "Enforce encryption of downloads, online changes and boot applications" option is selected in the "Security Screen", then "Encryption with certificates" is already preset.
10. In the "Certificate Selection" dialog, select the corresponding certificate from the "Controller Certificates" folder and click 回.
11. Click "OK" to confirm the dialog.
$\Rightarrow$ The certificate is displayed in the properties dialog.
12. As above when using the wizard, steps 7 and 8 .

Enforcing the encryption of boot applications, downloads, and online changes
$\triangleright \quad$ Open the "Users" tab in the "Security Screen". In the "Security level" group, select the
$\Rightarrow$ Only with a valid certificate is it possible to change the application on the controller.

### 6.6.2.4 Reference, User Interface

6.6.2.4.1 View 'Security Screen' - 'Devices' ..... 4205
6.6.2.4.2 Dialog 'Encryption Wizard' ..... 4207

### 6.6.2.4.1 View 'Security Screen' - 'Devices'

Symbol: (3)
Function: The tab allows for the configuration and the transfer of controller certificates for encrypted communication with the controller.
Call: Menu bar: "View"

The "Devices" tab shows all PLC devices configured in the project and their certificate store. If the communication path to the controller is configured, then you see the certificates that are stored in memory. Here you can create and configure new certificates on the controller. If a certificate currently in use is about to expire, then you get a warning when you log in to the device. From there you can also switch directly to the "Security Screen" to renew the certificate.

| Left side: "Information" | Devices and certificate store <br> Shows the individual devices as expandable nodes, each with the controller- <br> specific certificate store below it. |
| :--- | :--- |
| Toolbar (left side) | ¢: Refresh the display <br> D: Download: Transfer the selected certificate to the PLC |

Right side:
"Information"

If the active path to the controller is set and a device node is selected, then every use case for controller certificates is displayed on the right side.

- "OPC UA Server": Encrypted communication over an OPC UA server
- "Encrypted Communication": Encrypted communication between the development system and the controller
- "Encrypted Communication": Encryption of the boot application
- "Web server": Encrypted communication with the web server

As long as a certificate is not available for one of these use cases, it is displayed with the ${ }_{\#}^{* *}$ symbol as "(not available)".
When a certificate store is selected on the left side, all certificates in it are displayed on the right side with the following information:
"Information": Use case (currently the controller component in question is displayed: for example "CmpSecureChannel".)
"Created for": Name of the computer for which the certificate was created (for example, "MyLocalPC")
"Created by": Name of the computer on which the certificate was created (for example, "MyLocalPC")
"Valid as of": Date (for example, "07/20/2017 15:09:29")
"Valid until": Date (example: "07/20/2022 00:00:00". Depending on the remaining time of the certificate, the highlight color of the field changes: green -> yellow (two-thirds expired) -> orange (nine-tenths expired) -> red (expired). Note: When logging in to the controller, you get a warning when two-thirds or more of the validity period have expired. Then you can renew the certificate here in the "Security Screen".
"Thumbprint": Hash value from specific properties of the certificate for purposes of identification (for example, "279e1a46b86bd636c8e6f19fd51c222469ec49a8")
This thumbprint can be used together with the Mqtt library. Refer to the Mqtt library documentation in the Library Manager.
Double-clicking a certificate entry opens the default Windows "Certificate" dialog. As a result, you can import a controller certificate into the Windows Certificate Store in the "Controller Certificates" folder, so that it is available for the encryption of boot applications, downloads, and online changes.
If multiple certificates are available for one use case, then the system follows the steps below to determine the certificate that is used:

- Certificate that was created directly by the user (currently not supported)
- Filtering of existing certificates by:
- 1. Subject (user of the certificate)
- 2. Key usage
- 3. Extended key usage
- 4. Valid time stamp
- Dividing of detected, valid certificates as "signed" and "self-signed"
- Filtering of signed certificates, and the self-signed certificates by the following criteria:
- 1. Longest validity period
- 2. Strongest key

|  | Drag\&Drop: Moving of the certificate to another certificate store of the same device <br> Double-clicking a certificate entry opens the default Windows dialog for displaying all certificate information. |
| :---: | :---: |
| Toolbar (right side) | Creates a new certificate for a specific use case <br> The "Certificate Settings" dialog opens for configuring the "Validity period" of the certificate and the "Key length" for the private key. Clicking "OK" saves the specified values in the CODESYS options. The values are reset at the next operation. <br> As long as the certificate is being created, ""(computing)"" is shown after the use case. You cannot cancel the creation operation, but you can close and continue working with the "Security Screen". <br> $\mathbf{x}$ : Delete the selected certificate. <br> 7: Upload and save the selected certificate to the local file system. <br> IIAB: Details about the selected certificate: Opens the "Certificate" dialog with the "General" tab, "Details" tab, and "Certification Path" tab. <br> Pind $_{n}$ Renew the selected certificate. Opens the "Certificate Settings" dialog to create an additional new certificate for a certificate that will expire soon, with the same purpose and specified key length. The predefined values in the dialog are adapted, if necessary, depending on the selected certificate. |

### 6.6.2.4.2 Dialog 'Encryption Wizard'

Function: The wizard makes sure that a certificate for the encryption of downloads, online changes, and boot applications is downloaded from the controller. If a valid certificate does not exist on the controller for this purpose, then the wizard makes sure that a certificate is created. Changes to the application on the controller (download, online change, boot application) are possible only when this certificate exists.
Call: "Properties" dialog of an application, "Encryption" tab, "Encryption with certificates" setting, "Encryption Wizard" button
Requirement: "Encryption Technology" is set to "Encryption with certificates".
\(\left.$$
\begin{array}{|l|l|}\hline \text { "Status" } & \begin{array}{l}\text { Statuses while the wizard:is in action: } \\
\text { - } \\
\text { "Not connected": The connection to the controller has not been established } \\
\text { yet or the device cannot be reached. } \\
\text { "Error connecting to the device": The network path to the controller has not } \\
\text { been set correctly. } \\
\text { "Connecting...": A connection to the controller is being established. } \\
\text { - "Processing request..." The wizard is checking for available certificates } \\
\text { and if necessary makes sure that the controller creates a new certificate. } \\
\text { The certificate downloaded from the controller is automatically classified as } \\
\text { "trusted" and registered in the Certificate Store of the computer. } \\
\text { "Wizard finished" }\end{array} \\
\hline \text { "Details" } & \begin{array}{l}\text { Description of the individual actions of the wizard with corresponding notices in } \\
\text { the case of failures }\end{array} \\
\hline \text { "Start" } & \begin{array}{l}\text { If the connection path to the controller is set correctly in the device editor, } \\
\text { then the wizard starts the necessary actions for encrypting downloads, online } \\
\text { changes, and boot applications with a certificate. } \\
\text { If an expired certificate exists, then a corresponding warning is displayed with }\end{array}
$$ <br>
a dialog prompt whether or not a new certificate should be created by the con- <br>
troller. When this is confirmed, the new certificate is created and loaded to the <br>
local Certificate Store. In this case, the existing boot application may not start <br>

anymore and must be created again with the new certificate.\end{array}\right\}\)| The "Certificate Settings" dialog opens when a new certificate is to be created |
| :--- |
| on the device. Here you configure the "Key length (bit)" and the "Validity period |
| (days)" for the certificate. |

### 6.6.3 CODESYS Static Analysis

### 6.6.3.1 Introduction

Already when programming in CODESYS, CODESYS Static Analysis helps to write more readable code and to detect contradictory or unsupported settings. In particular, potential sources of error can be identified, such as test code or pointers that have not been checked for 0 before dereferencing. With specific checks, you can make sure that the code is portable. Example: The analysis should report the use of language resources for object orientation because the code is to run on platforms that do not support object orientation.
The analysis checks the source code of the CODESYS project and reports any deviations from certain coding rules, naming conventions, or permitted keywords and identifiers. CODESYS Static Analysis is based on the rule set defined in the PLCopen Coding Guidelines and extends it with additional test options.
You can display the detected deviations as errors or warnings in the message view before the project is downloaded to the target system. For errors that are reported by Static Analysis based on precompile information, there is support for an immediate error handling ("Quickfix").
You activate Static Analysis either explicitly by clicking "Build $\rightarrow$ Run Static Analysis", or you let it execute automatically at each code generation. You activate the automatic execution in the "Static Analysis" dialog of the projects settings. In this dialog, you also configure what is to be checked in detail. You can use pragma statements to exclude individual parts of the code from the check.
To evaluate the code quality, you can also display selected metrics that CODESYS Static Analysis detects in your code in a separate view. An example of this is the McCabe metric, which measures the cyclomatic complexity and indicates the number of execution paths that can be processed during code execution.

## NOTICE!

The analysis is performed only for the code of the applications in the current project. Libraries are not taken into consideration.

The CODESYS development system contains a light version of Static Analysis that is extended by CODESYS Static Analysis.

## Application example

The Pro Static Analysis tool can be used to check the source code during programming or for debugging purposes in order to identify possible weaknesses of the code. Usage and benefits of the Pro Static Analysis tool are described in the application example Pro Static Analysis tool.

## - Chapter 6.6.3.3.2.2 "Dialog 'Static Analysis Settings' - 'Settings'" on page 4217 ${ }^{4}$ Chapter 6.6.3.3.1 "Commands" on page 4212 <br> - ${ }^{\circ}$ Chapter 6.6.3.4.1 "Pragmas and Attributes" on page 4228

### 6.6.3.2 Configuring and Running Static Analysis

Using a basic sample project below, you will find the most important steps and options for configuring and running a static analysis.

Requirements: CODESYS Static Analysis is installed.

Sample project If you want to reproduce the example project, create a standard project and insert the POUs below the application in the device tree. Then configure the communication settings for the connection to your local CODESYS Control Win V3.

```
FUNCTION BLOCK fb1
VAR_INPUT
    iVar fblin1 : INT;
    ivar fblin2 : INT;
    rVar_fblin3 : REAL;
END VAR
VAR_OUTPUT
    iVar_fb1out:INT;
END VAR
VAR }\mp@subsup{}{}{-
    P_fSampleProperty : INT;
        rVar : REAL;
            PRO : BOOL;
END_VAR
iVar_fb1out:=iVar_fb1in1 + 1;
FUNCTION_BLOCK fb2
VAR_INPUT
        iVar fb2in:INT;
END_VAR
VAR_OUTPUT
        iVar_fb2out:INT;
END_VAR
VAR
END_VAR
```

## Checking for compliance to rules

```
PROGRAM PLC_PRG
VAR
    fb1_inst: fb1;
    fb2-inst: fb2;
END VAR
fb1-inst(iVar fb1in1 := 99);
fb2-inst(iVar_fb2in := 22);
fb2_inst(iVar_fb2in := 1);
```

1. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". Switch to the "Rules" tab.
$\Rightarrow$ A list is displayed containing all possible rule checks. They are organized in a tree structure by topical category. The rule number is added in parentheses (for example, "Unused variables (33)" in category "Unused objects").
2. Click the check box of the first line a few times ("Rules" node).
$\Rightarrow$ Clicking toggles the activation status. The check boxes in the entire tree have a red or orange check mark, or no check mark at all.
3. In this way, activate all entries with a red check mark. This means that CODESYS Static Analysis should report any detected rule violations as errors.
4. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Run Static Analysis".
$\Rightarrow$ Errors are reported in the message view. The message texts are tagged with a § and begin with the error number "SA<rule number>".
5. Double-click the first message SA0033: Unused variables 'iVar_fb2out'.
$\Rightarrow$ The focus moves to the declaration part of function block fb 2 and the relevant variable is selected. The variable is declared, but not used. This is checked in Rule 33 ("Unused variables"). In the code, the relevant locations are underlined with a wavy line.
6. To test the automatic execution of the analysis, click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". On the "Settings" tab, select the "Perform static analysis automatically" option. Click "OK" to exit the dialog.
7. Click "Online $\rightarrow$ Login".
$\Rightarrow$ A dialog prompt indicates that compile errors exist. The errors reported by the code analysis are displayed again in the message view.
8. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". Switch to the "Rules" tab.Now clear all of the rules in the dialog. In the "Unused Objects" category, explicitly activate Rule SA0035 ("Unused input variables (35)") with an orange-colored check mark to report a warning. See the tooltip for the rule text: "This rule corresponds to the following PLCopen rules: CP24"). Click "OK" to exit the dialog.
In the project settings, click "OK".
9. Click "Build $\rightarrow$ Generate Code".
$\Rightarrow$ The analysis is performed automatically. Two errors are reported in the message view: § SA0035: Unused input variable 'iVar_fb1in2 and § SA0035: Unused input variable 'iVar_fb1in3.
10. Double-click the message and comment or remove the declaration. Perform the code analysis again.
$\Rightarrow$ No error messages are displayed.

## See also

- $\boldsymbol{y y}^{2}$ Chapter 6.6.3.3.2.2 "Dialog 'Static Analysis Settings' - 'Settings'" on page 4217
- $\quad$ Chapter 6.6.3.3.2.3 "Dialog 'Static Analysis Settings' - 'Rules'" on page 4218

## Checking for compliance to defined naming conventions

1. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". Click the "Naming Conventions" tab.
$\Rightarrow$ You see a table in a tree structure that is divided into expandable categories of variables and program blocks.
2. Expand the "Prefixes for Variables" - "Prefixes for Types" category, and in the "Prefix" column, specify I for "INT (14)".

Expand the "Prefixes for POUs" - "Prefixes for POU Type" category: In the "Prefix"column, specify the prog for "PROGRAM (122)" and fb for "FUNCTIONBLOCK (103)".
3. Select the "First character after prefix should be an upper case letter" option. Clear all other options.
4. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Run Static Analysis".
$\Rightarrow$ Error messages:

- NC0102: Invalid name 'PLC_PRG': Expect prefix 'prog'because PLC_PRG does not have the required prefix
- First character after prefix should be uppercase: 'ivar_fb1in2' because ivar_fb1in2 : INT; in fb1
- NCOO14: Invalid variable name P_fSampleProperty: Expect prefix 'i' because this integer variablē does not have the required prefix

See also

- 号 Chapter 6.6.3.3.2.4 "Dialog 'Static Analysis Settings' - 'Naming Conventions'" on page 4219

## Checking for forbidden symbols

1. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". Click the "Forbidden Symbols" tab.
$\Rightarrow$ A line editor allows for specifying character strings that should not to be used in the code.
2. As an example, double-click the blank line and type in the invalid character string PRO directly. Double-click the next blank line and click ... to open the input assistance. From "Standard Types", select "REAL". Click "OK" to exit the dialog.
3. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Run Static Analysis".
$\Rightarrow$ The error messages Forbidden symbol 'REAL' and Forbidden symbol ' PRO' are displayed in the message view. Double-click the message text to jump to the relevant line of code.

See also

- $\quad$ y Chapter 6.6.3.3.2.6 "Dialog 'Static Analysis Settings' - 'Forbidden Symbols'" on page 4227

## Displaying of CODESYS Static Analysis performs selected tests on the code, and you can display the results metrics in a view.

1. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ Settings". Click the "Metrics" tab. $\Rightarrow$ The metrics that CODESYS Static Analysis applies to the code are listed in a table.
2. For this example, activate the "Number of inputs variables" metric and specify the permitted range of values: lower limit 1 and upper limit 2. Activate some more metrics, for example "Code size" and "Number of calls".
3. Click "Build $\rightarrow$ Static Analysis $\rightarrow$ View Standard Metrics".
$\Rightarrow$ The view includes a table with a line for each "Program unit" of the sample program. For each activated metric, there is a column showing the measured values. Values that are outside of the range of values defined in the settings are highlighted in red. In the case of this specific example, this is at least the "PLC_PRG/Inputs" field because the number of input variables in this POU is greater than the defined upper limit of 2 .

$$
\text { 6.6.3.3.1.1 Command 'Settings'........................................................................ } 4212
$$

6.6.3.3.1.2 Command 'Run Static Analysis'.................................................... 4212
6.6.3.3.1.3 Command 'View Standard-Metrics'.............................................. 4213
6.6.3.3.1.4 Command 'Extract function'.......................................................... 4215
6.6.3.3.1.5 Command 'Detect clones'............................................................. 4216

## Command 'Settings'

Function: The command opens the "Static Analysis Settings" dialog.
Call: Menu bar: "Build $\rightarrow$ Static Analysis"

## Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

See also

- ⓨ Chapter 6.6.3.3.2.2 "Dialog 'Static Analysis Settings' - 'Settings'" on page 4217

## Command 'Run Static Analysis'

Symbol: §
Function: The command starts the static analysis for the active application and displays the results in the message view.

## Call: Menu bar: "Build $\rightarrow$ Static Analysis"

During the code analysis, CODESYS generates code just like the "Build $\rightarrow$ Generate Code" command. The results of the analysis are displayed as errors § and warnings § in the message view ("Build" category). The numbers refer to the corresponding rules as they are defined in the project settings. The syntax for the displayed messages is "SA<rule number:<rule text>".

See also

- ⓨ Chapter 6.6.3.4.2 "Rules" on page 4233

## Command 'View Standard-Metrics'

Symbol:
Function: The command starts the static analysis for the active application and displays the metrics for all POUs in a table.

Call: Menu bar: "Build $\rightarrow$ View Standard Metrics"
The metrics (code numbers) to be displayed are activated in the project settings. You can access the configuration by clicking "Configure" in the context menu of the displayed table. If a value is outside of the configured upper and lower limits, then the field in the table is highlighted in red.

See also

- ${ }^{4}$ Chapter 6.6.3.3.2.5 "Dialog 'Static Analysis Settings' - 'Metrics'" on page 4226

## Standard Metrics

| Metric | Description |
| :--- | :--- |
| "Code size" | Number of bytes |
| "Variable size" | Number of bytes |
| "Stack size" | Number of bytes |
| "Calls" | Number of calls |
| "Tasks" | Number of calls from tasks |
| "Global" | Number of different global variables |
| "I/Os" | Number of direct object accesses |
| "Local" | Number of local variables |
| "Inputs" | Number of input variables |
| "Outputs" | Number of output variables |
| "NOS" | Number of statements |
| "Comments" | Percentage of comments |
| "McGabe" | McGabe complexity |
| "Prather" | Prather complexity of nesting |
| "DIT" | Depth of inheritance tree |
| "NOC" | Number of children |
| "RFC" | Response for class |
| "Elshof" | Elshof complexity of reference |
| "CBO" | Coupling between objects |
| "LCOM" | Lack of cohesion in methods |
| "n1 (Halstead)" | Number of different used Halstead (n1) opera- <br> tors |

| Metric | Description |
| :--- | :--- |
| "N1 (Halstead)" | Number of Halstead (N1) operators |
| "n2 (Halstead)" | Number of different used Halstead (n2) oper- <br> ands |
| "N2 (Halstead)" | Number of operands (N2) |
| "HL (Halstead)" | Halstead length (HL) |
| "HV (Halstead)" | Halstead volume (HV) |
| "D (Halstead)" | Halstead difficulty (D) |
| "SFC branches" | Number of SFC branches |
| "SFC steps" | Number of SFC steps |

## Commands in the context menu

The following commands are provided in the context menu of the table:

- "Calculate": The values are refreshed.
- "Copy Table": The table is copied to the clipboard. The separators are tabs.
- "Print Table": The default dialog for setting up a print job opens.
- "Export Table": The table is exported as a CSV file. The separators are semicolons.
- "Kiviat Diagram": Requirement: At least three metrics have defined upper and lower limits. A radar chart is created for the selected POU. This visualizes the quality of POU code with respect to a given standard.
Each metric is depicted as an axis with its origin at the center (value 0 ) which radiates outward into three concentric ring zones. The inner ring zone represents the range of values below the lower limit defined for the metric. The outer ring represents the range of values above the upper limit. The axes of the metrics are distributed uniformly around the circle. The current values of the individual metrics on the axes are connected by a line. In the ideal case, the complete line is located in the middle zone.
- "Configure": The table for selecting the desired metrics opens. This corresponds to the table in the project settings.
- "Open POU": The POU opens in the editor.

See also

- $\quad \Longleftrightarrow$ Chapter 6.6.3.3.2.5 "Dialog 'Static Analysis Settings' - 'Metrics'" on page 4226

## Command 'Extract function'

Function: The command opens the "Extract Function Configuration" dialog.
The command extracts selected code from the ST editor and creates a new method or function containing this code. The affected code in the ST editor is replaced by a correct call. When code is extracted from a function block or the child of a function block, a new method is created from the code. When code is extracted from a program or a function, a new function is created from the code.

## Call: Context menu: "Refactoring"

Requirements: When the selected code consists of one or more statements:

- The selected code does not contain any compile errors.
- The selected code is located in the implementation part of an ST POU.
- The selected code does not contain any exiting jumps

Examples of exiting jumps include the following:

- Using RETURN to exit the enclosing function
- Using CONTINUE or EXIT to exit a loop enclosing the code

[^52]Table 770：Dialog＂Extract Function Configuration＂

\begin{tabular}{|c|c|}
\hline ＂Name＂ \& Name of the recently created function or method The default name can be changed． <br>
\hline ＂Return value＂ \& Determines the return value of a function if there are multiple output and／or input／ output parameters <br>

\hline ＂Parameter＂ \& \begin{tabular}{l}
Display of the available POUs <br>
Configuration whether the parameters are used as input，output，or input／output variables
$\square$ ：Input variables
$\square$
$\square$ Output variables
$\square$

$\square$
$\square$ ：Input／Output variables
\end{tabular} <br>

\hline 6 \& The changes made for＂Name＂，＂Return value＂，or＂Parameter＂are undone． <br>
\hline Upper code window \& Recently created code of the call location <br>
\hline Lower code window \& Recently created code of the function or method <br>
\hline ＂OK＂ \& The displayed code changes are accepted in the ST POUs and the dialog is closed． <br>
\hline ＂Cancel＂ \& The displayed code changes are rejected and the dialog is closed． <br>
\hline
\end{tabular}

## Command＇Detect clones＇

Function：The command scans the program code of the open CODESYS project for copied code，and opens the＂Clone detection results＂view to display the detected cloned code blocks． In the process，only code blocks larger than a specific size are considered to be clones．Very small chunks of code are not displayed as clones．

## Call：

－Menu bar：＂Build $\rightarrow$ Static Analysis＂
－Context menu：＂Static Analysis＂
Requirement：The CODESYS project is open．
Two code positions are considered clones if they have the following properties：
－Same structural composition
－Variables have the same data type．
－Variable names may be different（exception：component access）．However，an identifier that is contained multiple times in the code has to be in the same place in both code positions．
－Literals have the same data type．
－Literals may be different．A literal that occurs multiple times in the code has to occur at the same place in both code positions．

Table 771：View＂Clone detection results＂

| •＂Summary＂ | Tab to display the search results <br> $\bullet \quad$＂Number of found cloned code sequences＂ <br> $\bullet$＂Number of statements compared＂ |
| :--- | :--- |
|  | $\bullet$＂Number of statements in cloned code＂ <br> $\bullet$＂Clone ratio＂：Specified as a percentage：＂Number of statements in cloned <br> code＂／＂Number of statements compared＂ |
|  |  |

| Q "Results" | The tab displays the code clones in a tree view and provides commands and filter options. <br> The first occurrence of a duplicate from the set of duplicates is taken as the root node. The background color of the child nodes indicates whether the code is different or completely identical. Same colors mean the "same code". The contents of the tree view are sorted in descending order by the number of statements of the duplicated code. |
| :---: | :---: |
| Commands and filters on the $q$ "Results" tab |  |
| "Subnodes/Clone" | Number of subnodes (statements) in the code block If the number of subnodes is less than 20, then the code clone is not considered. |
| "Filter on Object" | Input field for an "Object", by which the clone list is filtered |
| "Show selected clones" | Requirement: Two child nodes of the same parent node are selected. <br> Both programming objects are displayed in the upper part of the view for comparison. In the process, the code duplicates are highlighted and differences (for example, different variable names) are highlighted in a different color. |
| List of code clones | Columns <br> - "Description" <br> - "Subnodes/Clone" <br> - "Object" <br> - "Position" <br> Double-clicking a child node opens the corresponding programming object, and the duplicated code block is selected there. |

### 6.6.3.3.2 Dialogs

6.6.3.3.2.1 General.................................................................................. 4217
6.6.3.3.2.2 Dialog 'Static Analysis Settings' - 'Settings'................................ 4217
6.6.3.3.2.3 Dialog 'Static Analysis Settings' - 'Rules'.................................... 4218
6.6.3.3.2.4 Dialog 'Static Analysis Settings' - 'Naming Conventions'.............. 4219
6.6.3.3.2.5 Dialog 'Static Analysis Settings' - 'Metrics'................................. 4226
6.6.3.3.2.6 Dialog 'Static Analysis Settings' - 'Forbidden Symbols'............... 4227

## General

For the dialogs for the configuration of static code analysis, click "Build $\rightarrow$ Static Analysis
$\rightarrow$ Settings". Requirement: A CODESYS project is open.

## Dialog 'Static Analysis Settings' - 'Settings'

Function: In the dialog, you select automatic static analysis, and save or load the project settings for static analysis as a CSA file.

## Call:

- Menu bar: "Project $\boldsymbol{\rightarrow}$ Project Settings", "Static Analysis" category, "Open configuration dialog" link
- Menu bar: "Build $\rightarrow$ Static analysis $\boldsymbol{\rightarrow}$ Settings"

## Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

| "Perform static analysis | $\square:$ CODESYS performs the code check automatically at each code generation <br> automatically" <br> (for example, when the "Build $\rightarrow$ Generate Code" command is executed or <br> before a download. <br> $\square:$ The code check is not performed automatically, but it can be performed <br> explicitly by means of the "Build $\rightarrow$ Static Analysis $\rightarrow$ Run Static Analysis" <br> command. |
| :--- | :--- |
| "Load" | Opens the "Load Static Analysis Configuration" dialog for selecting the project <br> settings for the static analysis as a CSA file in the file system. When you click the <br> "Open" button, the selected CSA file is loaded. |
| "Save" | Opens the "Save Static Analysis Configuration" dialog for saving all project set- <br> tings in the "Static Analysis" category as a CSA file in the file system. |

## Dialog 'Static Analysis Settings' - 'Rules'

Function: In the dialog, you select the rules that are checked during the static analysis of the source code of a project.

## Call:

- Menu bar: "Project $\rightarrow$ Project Settings", "Static Analysis" category, "Open configuration dialog" link
- Menu bar: "Build $\rightarrow$ Static analysis $\rightarrow$ Settings"

## Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

This tab shows a tree structure of all rules that can be checked during static analysis. By default, every rule is activated, with the exception of SA0016, SA0024, SA0073, SA0101, SA0105, SA0106, SA0133, SA0134, SA0150, SA0162, and all strict IEC rules.

Each rule has a unique number. When the rule is checked and a violation is detected, the rule number and an error description are shown in the message view in the "Build" category in the following format: SA<rule number>, where SA stands for "Static Analysis" (example: "SA003" for rule 3).

The list of available rules can be extended by specific plug-ins.

Some rules that are activated in the dialog can be deactivated temporarily in the application by applying a pragma.
When you click the check box, the setting toggles between $\square, \square$, and $\square$.
When you activate or deactivate a parent node, all child rules are also activated or deactivated, respectively.
"Filter":

- Input field for the strings to be searched for
- ${ }^{\text {© }}=$ : Rules are grouped by category.
- "Structured by Importance": Sorting by "Importance High", "Importance Medium", and "Importance Low"
- "Default": Default structuring of the rules in CODESYS Static Analysis
- $\bar{\equiv}$ : Rules are displayed as a flat list. By clicking on the corresponding column header, the list can be sorted by rule number, activation/deactivation, rulespecific configuration, or importance.

| Columns |  |
| :---: | :---: |
| "Rules" | List of rules with rule number |
| Rule check | - $\square$ : The rule is not checked. <br> - 回: If the result of the check is positive, then an error ( $\S$ ) for the static analysis is displayed in the message view. <br> - $\square$ : If the result of the check is positive, then a warning ( $\$$ ) for the static analysis is displayed in the message view. |
| "Precompile" | Rules which can be checked during precompile are identified by a check mark $\qquad$ in this column. <br> An immediate bugfix (Quickfix) is possible for these rules. You can execute an automatic, immediate error handling directly at the affected code positions. |
| "Rule specific configuration" | For some rules, you can double-click the field to open a rule-specific dialog to configure the rule. |
| "Importance": | Importance of the rule: <br> - 3 red stars: High <br> - 2 orange stars: Medium <br> - 1 gray star: Low |

## Dialog 'Static Analysis Settings' - 'Naming Conventions'

Function: In the dialog, you define the prefixes for the data types and scopes of variables, as well as prefixes for POUs and user-defined data types (DUTs). Static analysis checks compliance with the naming conventions. When a convention is not observed, the static analysis reports an error message in the "Messages" view.

## Call:

- Menu bar: "Project $\boldsymbol{\rightarrow}$ Project Settings", "Static Analysis" category, "Open configuration dialog" link
- Menu bar: "Build $\rightarrow$ Static analysis $\boldsymbol{\rightarrow}$ Settings"

## Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

The error messages are displayed in the following format: § NC <prefix convention number> : <message text>. NC stands for "Naming Convention". For example, the error message "§"NC0102: Invalid name...'" means a violation of naming convention 102 for POUs of type PROGRAM.

You can use the pragma 'naming' to deactivate naming conventions for individual identifiers. The identifiers can begin with anything, not necessarily with the prefix.

[^53]| Table with the naming conve |  |
| :---: | :---: |
| "Names" | Nodes and elements for which a prefix can be defined. <br> The number in parentheses after each element (for example, "PROGRAM (102)") is the prefix convention number that is reported in the case of noncompliance with a naming convention. |
| "Prefix" | Input field of the prefix <br> - Multiple prefixes can be specified by means of comma separation. <br> Example: <br> "Prefix for POUs", PROGRAM (102): prog, PRG_ <br> "Prefix for POUs", FUNCTION (103): fun, FUN_ <br> - Regular expressions (RegEx) are also possible for prefixes. To do this, an @ has to be prepended. <br> Example: <br> The name has to begin with x and may contain one character from the scope $a-d A-D: ~ @ x[a-d A-D]$. <br> - For variables of type "Alias" and POUs of type "Property", the prefix can be defined with the placeholder \{datatype\}. |
| "Prefixes for variables" | Organizational node for all variables for which a prefix can be defined dependent on data type or scope. |
| "Prefixes for POUs" | Organizational node for all POU types and method scopes for which a prefix can be defined |
| "Prefixes for DUTs" | Organizational node for the DUT data types (structure, enumeration, alias, or union) for which a prefix can be defined |
| "Prefixes for custom types" | Organizational node for special custom types (particularly those from libraries) You can extend the list with conventions: Click the blank space below it. In the "Input Assistant" dialog, specify the name of a custom type or select a custom type. <br> To delete a convention, select it and press the [Del] key. <br> Note: These conventions have priority over the prefixes which are defined with the attribute \{attribute 'nameprefix' := '<prefix>'\}. |

| Options |  |
| :--- | :--- |
| "First character after prefix |  |
| should be an upper case letter" | variable name after the defined prefix is not an uppercase letter. |

| "Combine scope prefix with data type prefix" | As its namespace, a variable must have the defined prefix followed by the defined prefix for its data type. <br> Example: The following prefixes are defined: g for "VAR_GLOBAL", and r for the data type "REAL". The code analysis reports errors for global REAL variables that do not have the prefix g_r. $\square$ If conventions for the namespace are specified for a variable, then these conventions are taken into account. As a result, any data type conventions are ignored. <br> Example: The following prefixes are defined: g _ for "VAR_GLOBAL", and r for the data type " $R E A L$ ". The code analysis reports exclusively errors for global REAL variables that do not have the prefix $g_{-}$. |
| :---: | :---: |
| "Recursive prefixes for combinable data types" | Variables of combined data types have to have compound prefixes that follow the defined naming conventions. <br> Example: <br> ppiVariable : POINTER TO POINTER TO INT; <br> The prefix $p$ was defined for variables of data type POINTER, and the prefix I was defined for the data type INT. Static analysis reports errors for all variables of type POINTER TO POINTER TO INT which do not have the prefix ppi. <br> refaiVar : REFERENCE TO ARRAY[1..3] OF INT; <br> The prefix ref was defined for the data type REFERENCE TO, the prefix a for an array, and the prefix I for the data type INT. Static analysis reports errors for all variables of type REFERENCE TO ARRAY[1..3] OF INT which do not have the prefix refai. |

Example The following naming convention corresponds for the most part to the recommendations described in the "Identifiers" chapter.

| Names | Prefix |
| :---: | :---: |
| - Prefixes for variables |  |
| -- Prefixes for types |  |
| BOOL (3) | x |
| BIT (4) | bit |
| BYTE (5) | by |
| WORD (6) | w |
| DWORD (7) | dw |
| LWORD (8) | Iw |
| SINT (13) | si |
| - INT (14) | i, n |
| - DINT (15) | di |
| - LINT (16) | li |
| USINT (9) | usi |
| - UINT (10) | ui |
| - UDINT (11) | udi |
| $\cdots$ ULINT (12) | uli |
| REAL (17) | r |
| LREAL (18) | Ir |
| STRING (19) | s |
| WSTRING (20) | ws |
| - TIME (21) | tim |
| - LTIME (22) | Itim |
| DATE (23) | dat |
| DATE_AND_TIME (24) | dt |
| TIME_OF_DAY (25) | tod |
| POINTER (26) | p |
| REFERENCE (27) | ref |
| SUBRANGE (28) | range |
| ARRAY (30) | a |
| Function block instance (31) | fb |
| Interface (36) | iff |
| Structure (32) | struct |
| ENUM (29) | e |
| - Alias (33) | \{datatype |
| Variables with data type UNION (34) |  |
| - _ XWORD (35) | xw |
| -_- UXINT (37) | xui |
| -..._XINT (38) | xi |
| $\pm$ Prefixes for scopes |  |
| $\pm$ Prefixes for POUs |  |
| $\pm$ Prefixes for DUTs |  |

| Names | Prefix |
| :---: | :---: |
| $\pm$ Prefixes for variables |  |
| - Prefixes for POUs |  |
| - Prefixes for POU type |  |
| PROGRAM (102) | PRG_ |
| FUNCTIONBLOCK (103) | FB_ |
| FUNCTION (104) | fun_ |
| METHOD (105) | meth_ |
| ACTION (106) | act_ |
| PROPERTY (107) | prop_\{datatype\} |
| - INTERFACE (108) | ITF_ |
| - Method scope |  |
| PRIVATE (121) |  |
| - PROTECTED (122) |  |
| - INTERNAL (123) |  |
| - PUBLIC (124) |  |
| - Prefixes for DUTs |  |
| Structure (151) | S_ |
| - Enumeration (152) | E_ |
| Variables with data type UNION (153) | U_ |
| .-. Alias (154) | A_ |

## Example The naming convention (1) refers to the standard POU TON. As a result, declarations of the special library POU are checked for the prefix "ton_". Click the blank space (2) to insert more naming conventions.

## Filter

| Names | Prefix |
| :--- | :--- |
| $\pm$ Prefixes for variables |  |
| $\pm+$ Prefixes for POUs |  |
| $\pm$ Prefixes for DUTs |  |
| - Prefixes for custom types |  |
| Standard.TON | 1 |
|  | 2 |
|  |  |

## Combine scope prefix with data type prefix

First character after prefix should be an upper case letter$\square$ Recursive prefixes for combinable data types

Dialog 'Static Analysis Settings' - 'Metrics'
Function: In the dialog, you select the metrics to be displayed for each POU in the "Standard Metrics" view by means of the "Build $\rightarrow$ Static Analysis $\rightarrow$ View Standard Metrics" command.

## Call:

- "Open configuration dialog" button in the menu "Project $\rightarrow$ Project Settings", "Static Analysis" category
- Menu bar: "Build $\rightarrow$ Static analysis $\rightarrow$ Settings"

## Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

The "Code size", "Variable size", "Stack size", and "Calls" metrics are reported only for POUs from libraries which are integrated in the project.

Violations of the upper and lower limits of the activated metrics can be reported as build errors by means of static analysis rule SA0150.

| "Metrics" | All selectable metrics are displayed in the column. |
| :--- | :--- |
| "Active" | 凹: The metric is displayed for each POU in the "Standard Metrics" view following <br> the "Build $\rightarrow$ Static Analysis $\rightarrow$ View Standard Metrics" command. <br> $\square:$ The metric is not displayed in the "Standard Metrics" view following the "Build <br> $\rightarrow$ Static Analysis $\rightarrow$ View Standard Metrics" command. |
| "Lower limit" | Lower value from which the "Metric" is displayed |

### 6.6.3.4 Reference, Programming

6.6.3.4.1 Pragmas and Attributes................................................................. 4228
6.6.3.4.2 Rules.............................................................................................. 4233

### 6.6.3.4.1 Pragmas and Attributes

## General

CODESYS Static Analysis provides pragmas and attributes for activating or deactivating individual rules or naming conventions for static code analysis.
Requirement: The rules or conventions are activated or defined in the project settings.
Attributes are inserted in the declaration part of a POU to deactivate specific rules for an entire programming object.
Pragmas are used in the implementation part of a POU to deactivate specific rules for individual lines of code. One exception is Rule 164, which can also be switched off in the declaration part.

Rules that are deactivated in the project settings cannot be activated by means of pragmas or attributes.

Rule SA0004 cannot be deactivated by means of a pragma or an attribute.

See also

- $\sum^{4}$ Chapter 6.6.3.4 "Reference, Programming" on page 4227

## Pragma 'analysis'

This pragma is used to deactivate the code rules for individual code lines of a POU. You deactivate code rules by specifying the rule numbers with a prepended minus sign ("-"). A prepended plus sign ("+") activates the rule. You can specify any number of rules in the pragma.
Insert location: Deactivation: In the implementation part, with \{analysis - . . \} before the first code line where the code analysis is deactivated. Activation: With \{analysis + . . \} after the last line of the deactivation. For Rule 164, the pragma can also be inserted in the declaration part before a comment.

## Syntax:

```
Deactivation of rules:
{analysis -<rule number> ( , -<additional rule number> )* }
* : optional none, one or more additional rule numbers
Activation of rules:
{analysis +<rule number> ( , +<additional rule number> )* }
* : none, one or more additional rule numbers
```

Example $\quad$ Rule 24 is deactivated for two lines and then reactivated. As a result, rule 24 is not checked in these lines so that nTest:=DINT\#99 is allowed for example.

```
        {analysis -24}
nTest := 99;
iVar := INT#2;
{analysis +24}
```

Deactivating multiple rules:

```
{analysis -10, -24, -18}
```

## See also

- ${ }^{4}$ Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

## Attribute 'analysis'

The attribute deactivates specific rules for an entire programming object. You deactivate the code rules by specifying the rule numbers with a prepended minus sign ("-"). You can specify any number of rules in the attribute.

Insert location: In the declaration part of a POU, in the first line.

## Syntax:

```
{attribute 'analysis' := '-<rule number> ( , -<additional rule
number> ) * '}
* : none, one or more additional rule numbers
```

Example Rules 33 and 31 are deactivated for the entire structure:

```
{attribute 'analysis' := '-33, -31'}
TYPE My_Structure :
STRUCT
            iLocal : INT;
            uiLocal : UINT;
            udiLocal : UDINT;
END_STRUCT
END_TYPE
```

Rule 100 is deactivated for the array:

```
{attribute 'analysis' := '-100'}
PROGRAM PLC_PRG
VAR
    aBigData: ARRAY[1..10000] OF DWORD;
    aBigDATA_2: ARRAY[1..10000] OF DWORD;
END_VAR
;
```

See also

- ${ }^{\mu}$ Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

## Attribute 'naming'

The attribute marks the code lines that are excluded from the analysis of naming convention.
An off is assigned to the pragma attribute before the first code line where the code analysis is deactivated. An on is assigned after the last line. When an omit is assigned, only the next code line is ignored.
Insert location: Deactivation: In the declaration part of POUs and DUTs, above the affected lines. Activation: Below the affected lines.

## Syntax:

```
{attribute 'naming' := '<switch state>'}
<switch state> : on | off | omit
on : naming is switched on
off : naming is switched off
omit : only next code line is switched off
```

```
variables: cccVar, aVariable, and bVariable.
```

```
VAR
```

VAR
{attribute 'naming' := 'off'}
{attribute 'naming' := 'off'}
iVarA : INT;
iVarA : INT;
iVarB : INT;
iVarB : INT;
{attribute 'naming' := 'on'}
{attribute 'naming' := 'on'}
iVarC : INT;
iVarC : INT;
END VAR
END VAR
VAR
VAR
{attribute 'naming' := 'omit'}

## Attribute 'nameprefix'

The attribute defines a prefix for variables of a structured data type. The prefix must be prepended to the identifier of variables that are declared by this type.

Insert location: In the line before the declaration of a structured data type
Syntax:

```
{attribute 'nameprefix' := '<prefix>'}
```

```
Example In the following example, Static Analysis issues a message for pB because the variable name
does not begin with "point".
```

```
{attribute 'nameprefix' := 'point'}
```

{attribute 'nameprefix' := 'point'}
TYPE DATAPOINT :
TYPE DATAPOINT :

- \(\Rightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{Attribute 'analysis:report-multiple-instance-calls'}

The attribute marks a function block for checking for rule 105: Only function blocks with this attribute are checked whether the function block instances are called more than one time. If rule 105 is deactivated in the project settings, then the attribute does not have any effect.

Insert location: Top line in the declaration part of a function block.

\section*{Syntax:}
```

{attribute 'analysis:report-multiple-instance-calls'}

```

\section*{Example}
```

// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DOA
VAR_INPUT
END - VAR
VAR_OUTPUT
END_VAR
VAR
iA : INT;
END_VAR

\section*{SA0001: Unreachable code}

Detects lines of code that are not executed, for example due to a RETURN or CONTINUE statement

Justification: Unreachable code should always be avoided. The test often indicates that test code still exists which should be removed.

Importance: High

\section*{PLCopen rule: CP2}

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xReturn_Before_End: BOOL;
xContinue_In_LOop_FUN: BOOL;
iCounter: INT;
END_VAR
xContinue In Loop FUN := FALSE;
FOR iCounter := INT\#O TO INT\#5 BY INT\#1 DO
CONTINUE;
xContinue_In_Loop_FUN := FALSE;
END_FOR
--> SA0001: Unreachable code detected in 'PLC_PRG'

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0002: Empty objects}

Detects POUs, GVLs, data type declarations, or interfaces that do not contain any code
Justification: Empty objects should be avoided. They are often a sign that an object has not been implemented completely. Exception: In some cases, no code is specified in the body of a function block when it should be used by interfaces only. In other cases, a method is created only because it is required by an interface without a sensible implementation being possible for the method. No matter the case, this kind of situation should be commented.

Importance: Medium
See also
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0003: Empty statements}

Detects lines of code that have a semicolon (; ) but not a statement Justification: An empty statement can be a sign for missing code.
Note: There are good reasons for using empty statements. For example, in a CASE statement it can make sense to explicitly program out all cases, even those where there is nothing to do. When this kind of empty CASE statement contains a comment, Static Analysis does not generate an error message.

Importance: Low

\section*{Examples}
```

CASE value OF
1:DoSomething();
2:;
3:DoSomethingElse();
END_CASE
--> SA0003: Empty statements
CASE value OF
1:DoSomething();
2:; //nothing to do
3:DoSomethingElse();
END_CASE
--> No SA error

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0004: Multiple write access on output}

Detects outputs that are written to more than one location
Justification: The maintainability is degraded when an output is written in different locations in the code. Then it is uncertain which write access is the one that actually has an effect in the process. Good practice is to calculate the output variables in auxiliary variables and assign the calculated value at one location at the end of the cycle.
Importance: High
PLCopen rule: CP12

An error is not issued when an output variable (VAR_IN_OUT) is written in different branches of IF and CASE statements.

A pragma cannot deactivate this rule.
```

Example

```
```

VAR_GLOBAL

```
VAR_GLOBAL
    g_xVar AT %QXO.0 : BOOL ;
    g_xVar AT %QXO.0 : BOOL ;
    g_iTest AT %QWO : INT ;
    g_iTest AT %QWO : INT ;
END_VAR
END_VAR
PROGRAM PLC_PRG
PROGRAM PLC_PRG
IF g_iCondition < INT#O THEN
IF g_iCondition < INT#O THEN
    g_xVar := TRUE;
    g_xVar := TRUE;
    g_iTest := INT#12;
    g_iTest := INT#12;
END_IF
END_IF
CASE g_iCondition OF
CASE g_iCondition OF
    INT#1:
    INT#1:
        g xVar := FALSE;
        g xVar := FALSE;
    INT#2:
    INT#2:
            g_iTest := INT#11;
            g_iTest := INT#11;
    ELSE
    ELSE
        g_xVar := TRUE;
        g_xVar := TRUE;
        g_iTest := INT#9;
        g_iTest := INT#9;
END_CASE
END_CASE
--> SAO004: Multiple write access on output '%QXO.O'
--> SAO004: Multiple write access on output '%QXO.O'
--> SAOOO4: Multiple write access on output '%QWO'
```

--> SAOOO4: Multiple write access on output '%QWO'

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0006: Write access from several tasks}

Detects variables that are written by more than one task
Justification: A variable that is written in multiple tasks may change its value unexpectedly. This can lead to confusing situations. String variables (and on some 32 -bit systems also 64-bit integer variables) can even reach an inconsistent state if the variable is written to two tasks simultaneously.
Exception: In specific cases, it may be necessary for several tasks to write a variable. For example, use semaphores to make sure that access does not lead to an inconsistent state.
Importance: High
PLCopen rule: CP10

\section*{Example}
```

VAR_GLOBAL
g_iTemp1: INT;
END_VA}
PROGRAM PLC_PRG // Controlled by MainTask
g_iTemp1 := g_iTemp1 + INT\#2;
PROGRAM PLC_PRG_1 //Controlled by SubTask
g_iTemp1 := - g_iTemp1 - INT\#3;
--> SA0006: Concurrent write access to 'g_iTempl' in Tasks
MainTask, SubTask

```

\section*{See also}
- y Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0007: Address operator on constants}

Detects lines of code where the operator ADR is applied for a constant
Justification: Using a pointer to a constant variables overrides the CONSTANT property of the variable. The variable can be changed by means of the pointer without any notification from the compiler.

Exception: In rare cases, it might be useful to pass a pointer to a constant to a function. However, you have to make sure that this function does not change the transferred value. Whenever possible, use VAR_IN_OUT CONSTANT.

Importance: High

When the "replace constants" option is selected in the "Compiler options" of the project settings, the address operator is not permitted for scalar constants (integer, BOOL, REAL) and a complie error is issued. (Constant strings, structures, and arrays always have an address.)

\section*{Example}
```

PROGRAM PLC_PRG
VAR CONSTANT
c iValue : INT := INT\#15;
END_VA}
VAR
poiValue : POINTER TO INT;
END_VAR
poiV
--> SA0007: Address to constant variable 'c_iValue'

```

\section*{See also}
- \(y^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0008: Check subrange types}

Detects out-of-range violations of subrange types. Assigned literals are already checked by the compiler. When constants are assigned, then the values must be within the defined range. When variables are assigned, then the data types must be identical.

Justification: If subrange types are used, then make sure that this subrange is not exited. The compiler checks for these kinds of subrange violations only for assignments of constants.

Importance: Low

The check is not performed for CFC objects because the code structure does not allow for it.

\section*{Example}
```

VAR_GLOBAL
iVarGlob:INT;
END_VAR
PROGRAM PLC_PRG
VAR
iSubr1: INT (INT\#1..INT\#10);
iSubr2: INT (INT\#1..INT\#1000);
iCount: INT;
by_SubType : BYTE (BYTE\#O..BYTE\#11);
iVar : INT (-4095..4095);
END_VAR
iSubr1 := nCount; // SA0008
iSubr1 := subr2; // SA0008
iSubr1 := gvl.iVarGlob; // SA0008
//byBYTE_SubType := BYTE\#123; //already detected by compiler,
error "Cannot convert type..."
--> SA0008: Subrange variable 'iSubrl' maybe out of allowed range

```

\section*{See also}
- «y Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0009: Unused return values}

Detects function, method and property calls in which the return value is not used Justification: When a function or method returns a return value, it should also be evaluated. The return value often indicates whether or not the function was executed successfully. If not, then you will not be able to identify later whether the return value was forgotten or if it is actually not needed.

Exception: If a return value is irrelevant to the call, then you can document this and omit the assignment. Error returns should never be ignored.
Importance: Medium
PLCopen rule: CP7 / CP17
Example
```

FUNCTION Return_BOOL : BOOL
VAR_INPUT
END_VAR
VAR
xTest : BOOL;
END_VAR
xTes̄t := FALSE;
Return_BOOL := xTest;
PROGRAM PLC_PRG
Return_BOOL (); // SA0009
--> SA0009: Ignoring return value of 'Return_Bool'

```

\section*{See also}
- \({ }^{\mu}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0010: Arrays with only one component}

Detects arrays with only one element
Justification: An array with one element can be replaced by a base-type variable. Access to this variable is considerably faster than access by index to the variable.
Exception: The length of an array is often determined by a constant and is a parameter for a program. Then the program can work with arrays of different lengths and does not have to be changed if the length is only 1 . This kind of situation should be documented accordingly.
Importance: Low
Example
```

PROGRAM PLC_PRG
VAR
aoiEmpty : ARRAY [22..22] OF INT;
aorEmpty : ARRAY [1..1] OF REAL;
END_VAR
aoiEmpty;
aorEmpty;
--> SA0010: Vacuous array element in variable 'aoiEmpty'
--> SA0010: Vacuous array element in variable 'aorEmpty'

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0011: Useless declarations}

Detects structures or enumerations with only one component
Justification: This kind of declaration can be confusing for the reader. A structure with only one element can be replaced by an alias type. An enumeration with only one element can be replaced by an constant.
PLCopen rule: CP22 / CP24
Importance: Low

\section*{Example}
```

TYPE SingleStruct :
STRUCT
iPart : INT;
END_STRUCT
END_TYPE
TYPE myUnion :
UNION
lrValue : LREAL;
END_UNION
END_TYPE
TYPE SingleEnum :
(
OnlyOne := 1
);
END_TYPE
--> Useless declaration 'SingleStruct'
--> Useless declaration 'myUnion'
--> Useless declaration 'SingleEnum'

```

See also
- \({ }^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

SA0012: Variable which could be declared as constants
Detects variables that are not accessed with write permission and therefore could be declared as constants

Justification: If a variable is written only at the declaration point and is otherwise used only for reading, then the static analysis assumes that the variable should also not to be changed. Firstly, a declaration as a constant results in checking that the variable is not changed when the program is changed. Secondly, the declaration as a constant may result in faster code.
```

NOTICE!
If multiple applications exist in one project, then only the objects below the currently active application are affected. If there is only one application, then the objects in the common POU pool are also affected.

```

Importance: Low
Example
```

PROGRAM PLC_PRG
VAR
iVar : INT := INT\#17;
iTest : INT;
END_VAR
iTest := iTest + iVar; // SA0012: iVar could be declared as
constant
--> SA0012: Variable 'iVar' could be declared as constant

```

\section*{See also}
- \(\Rightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0013: Declarations with the same variable name}

Detects variables with names that are already used by other variables (for example, global and local variables with the same name). Also detects variables with names of functions, actions, methods, or properties which are used in the same access scope. Variables are also detected that are declared in a GVL in the "Devices" view or in the POUs pool. For this, however, the GVL of the "POUs" view have to be used in the application program.

Justification: The same names can be confusing when reading the code, and they can cause errors if the wrong object is accessed unintentionally. We recommend that you use naming conventions to avoid these situations.

PLCopen rule: N5 / N9
Importance: Medium
```

Example

```
```

VAR_GLOBAL

```
VAR_GLOBAL
    xVar1 : BOOL;
    xVar1 : BOOL;
    iVar3 : INT;
    iVar3 : INT;
END_VAR
END_VAR
PROGRAM PLC_PRG
PROGRAM PLC_PRG
VAR
VAR
    xVar1 : BOOL; // SA0013
    xVar1 : BOOL; // SA0013
    iVar3 : INT; // SA0013
    iVar3 : INT; // SA0013
END_VAR
END_VAR
xVar1 := NOT GVL.xVar1;
xVar1 := NOT GVL.xVar1;
iVar3 := iVar3 + INT#2;
iVar3 := iVar3 + INT#2;
iVar3 := GVL.iVar3;
iVar3 := GVL.iVar3;
--> SA0013: Declaration of 'iVar1' hides symbol 'GVL.iVar1
--> SA0013: Declaration of 'iVar1' hides symbol 'GVL.iVar1
--> SA0013: Declaration of 'xVar3' hides symbol 'GVL.xVar3
```

--> SA0013: Declaration of 'xVar3' hides symbol 'GVL.xVar3

```

Example The function block POU has the action ACT and the method METH.
```

FUNCTION_BLOCK POU
VAR
ACT : UINT; // SA0013
METH : BYTE; // SA0013
END_VAR
--> SA0013: Declaration of 'ACT' hides symbol 'POT.ACT'
--> SAOO13: Declaration of 'METH' hides symbol 'POT.METH'

```

\section*{See also}
- \({ }^{\text {n }}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0014: Assignment of instances}

Detects assignments to function block instances. In the case of instances with pointer or reference variables, these assignments are potentially risky.
Justification: This is a performance warning. When an instance is assigned to another instance, all elements and subelements are copied from the one instance to the other instance. Pointers to data are also copied, but not their referenced data, so that the target instance and the source instance contain the same data after the assignment. Depending on the size of the instances, this kind of assignment could last a long time. For example, if an instance should be passed to a function for processing, then it is much more efficient to pass a pointer to the instance. If you want to selectively copy values from one instance to another, then a copy method is useful: inst_First.Copy_From(inst_Second).
Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
inst_First : My_FB;
inst_Second : My_FB;
END VAR
inst_First();
inst_Second := inst_First; // SA0014
--> SA0014: Assignment of instances

```

\section*{See also}
- « Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0015: Access to global data via FB_Init}

Detects the access of a function block to global variables by means of the method FB_Init. The value of this variable depends on the order of initializations.
Justification: Depending on the declaration location of the POU instance, an uninitialized variable could be accessed if the rule is violated.
Importance: High

\section*{Example}
```

VAR_GLOBAL
g_xTest1 : BOOL;
g_iTest3 : INT;
END_VAR
METHOD PUBLIC fb_init : BOOL
VAR INPUT
bInitRetains : BOOL; // If TRUE, the retain variables are
initialized (warm start / cold start)
bInCopyCode : BOOL; // If TRUE, the instance afterwards gets
moved into the copy code (online change)
END_VAR
g_x\overline{Test1 := NOT g_xTest1; // SA0015}
g_iTest3 := g_iTest3 + INT\#1; // SA0015
--> SA0015: FB_Init method of function block 'POU' accesses global
data

```

\section*{See also}
- «. Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0016: Gaps in structures}

Detects gaps in structures or function blocks that are caused by the alignment requirements of the currently set target system. If possible, you should remove the gaps by resorting the structure elements or filling them with a dummy element. If this is not possible, then you can deactivate the rule for the affected structures by means of the analysis pragma.
Justification: Due to different alignment requirements on different platforms, there may be a different layout in the memory for these kinds of structures. Then the code can perform differently, depending on the platform.
Importance: Low
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    myStruct : Unpadded_Structure;
    myStruct : Unpadded_Structure;
END VAR
END VAR
myS\overline{truct.iTest := 0;}
myS\overline{truct.iTest := 0;}
TYPE Unpadded_Structure :
TYPE Unpadded_Structure :
STRUCT
STRUCT
    xTest : BOOL;
    xTest : BOOL;
    iTest : INT; // SA0016
    iTest : INT; // SA0016
    byTest : BYTE;
    byTest : BYTE;
    wTest : WORD;
    wTest : WORD;
END_STRUCT
END_STRUCT
END_TYPE
END_TYPE
--> SA0016: Structure 'Unpadded_Structure' must be padded (pack-
--> SA0016: Structure 'Unpadded_Structure' must be padded (pack-
mode=8)
```

mode=8)

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0017: Non-regular assignments}

Detects assignments to pointers that are neither addresses (ADR operator, pointer variables) nor constants 0

Justification: If a pointer contains a value that is not a valid address, then an access violation exception occurs when dereferencing the pointer.
Importance: High
Example
```

PROGRAM PLC_PRG
VAR
pInt : POINTER TO INT;
dwAddress : DWORD;
END VAR
dwA\overline{d}dress := dwAddress + DWORD\#1;
pInt := dwAddress; // SA0017
--> SA0017: Non-regular assignment

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0018: Unusual bit access}

Detects bit access to signed variables. However, the IEC 61131-3 standard permits only bit access and bit shift operations on bitfields. See also the strict rules SA0147 and SA0148.
Justification: Signed data types should not be used as bitfields and the other way around. The IEC 61131-3 standard does not provide for this kind of access, and therefore you should comply with this rule when you write portable code.
Importance: Medium

> Exception for flag enumerations: When an enumeration is declared as a flag by means of the \{attribute 'flags'\} pragma attribute, the SA0018 error is not issued for bit access with the OR, AND or NOT operators.

Example
```

PROGRAM PLC_PRG
VAR
iTemp1 : INT;
diTemp3 : DINT;
uliTemp4 : ULINT;
siTemp5 : SINT;
usiTemp6 : USINT;
byTemp2 : BYTE;
END_VAR
iTemp1.3 := TRUE; // SA0018
diTemp3.4 := TRUE; // SA0018
uliTemp4.18 := FALSE; // no error because this is an unsigned data
type
siTemp5.2 := FALSE; // SA0018
usiTemp6.3 := TRUE; // no error because this is an unsigned data
type
byTemp2.5 := FALSE; // no error because the byte is a bitfield
--> SAOO18: Unusual bit access

```

- \(\quad\) Chapter 6.6.3.4.2.49.13 "SA0148: Unusual bit access - strict" on page 4294

\section*{SA0020: Possibly assignment of truncated value to REAL variable}

Detects operations on integer variables for which a truncated value could be assigned to a REAL data type variable

Justification: Static analysis issues an error when the result of an integer calculation is assigned to a REAL or LREAL variable. The programmer should be alerted to a possible incorrect interpretation of this kind of assignment: lrealvar := dintvar1 * dintvar2. Because the range of values of LREAL is greater than that of DINT, one could assume that the result of the calculation could always be represented in LREAL. But that is not the case. The processor calculates the result of the multiplication as an integer and then casts the result to LREAL. An overflow in the integer calculation would be lost. To work around the problem, the calculation has to be done as a REAL operation: lreal_var := TO_LREAL (dintvar1) * TO_LREAL (dintvar2).
Importance: High
Example
```

PROGRAM PLC_PRG
VAR
rx : LREAL;
di : DINT;
END VAR
rx \overline{:= di * di // SA0020}
rx := TO_LREAL(di) * TO_LREAL(di) // No message
--> SA0020: Possibly assignment of truncated value to REAL variable

```

See also
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0021: Transporting the address of a temporary variable}

Detects address assignments of temporary variables (on the stack) to non-temporary variables
Justification: Local variables of a function or method are created on the stack and they exist only while the function or method is being processed. If a pointer points to this kind of variable after processing the method or function, then you can use this pointer to access undefined memory, or to access an incorrect variable in another function. This situation should be avoided at all costs.

Importance: High

\section*{Example}
```

FUNCTION TempVarInFUNC : DWORD
VAR
uiTemp : UINT;
END_VAR
Temp\overline{p}VarInFUNC := ADR(uiTemp); // SA0021
PROGRAM PLC PRG
VAR
dwTest : DWORD;
END VAR
dwTest := TempVarInFUNC();
--> SA0021: Transporting address of temporary variable to outer
scope symbol

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0022: (Possibly) unassigned return value}

Detects all functions and methods that include an execution thread without an assignment to the return value
Justification: An unassigned return value in a function or method is an indication of missing code. Even if the return value always has a default value, it is always useful to assign it again explicitly to avoid confusion.

Importance: Medium

\section*{Example}
```

FUNCTION FUN : DINT
VAR_INPUT
bTest : BOOL;
END_VAR
IF bTest THEN
RETURN;
END IF
FUN-
--> SAOO22: (Possibly) unassigned return value

```

See also
- \({ }^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0023: Complex return values}

Determines complex return values that cannot be returned with a simple registry copy of the processor. This includes structures, arrays, and return values of type STRING (regardless of the size of the used memory).
Justification: This is a performance warning. If large values are returned as the result of a function, method, or property, then the processor copies them multiple times when executing the code. This can lead to runtime problems and should be avoided whenever possible. Performance can be improved by passing a structured value as VAR_IN_OUT to a function or method and filling it in the function or method.
Importance: Medium

\section*{Example}
```

TYPE LargeStructure :
STRUCT
a : LINT;
b : BOOL;
END_STRUCT
END_TYPE
FUNCTION Large_Return_Value_FUNC : LargeStructure // SA0023
--> SA0023: Complex return values

```

\section*{See also}
- 4 Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0024: Untyped literals / constants}

Detects untyped literals and constants
Justification: CODESYS assigns types for literals depending on their use. In some cases, this can cause unexpected problems, which should be resolved better with a typed literal. For example: dw := ROL(DWORD\#1, i)
Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iTemp1 : INT = 10; // SA0024
diTemp2 : DINT;
liTemp3 : LINT;
rTemp4 : REAL;
lrTemp5 : LREAL;
END_VAR
iTemp1 := iTemp1 + INT\#34;
diTemp2 := diTemp2 + 23; // SA0024
liTemp3 := liTemp3 + 124; // SA0024
rTemp4 := rTemp4 + 1.1; // SA0024
lrTemp5 := lrTemp5 + 3.4; // SA0024
--> SA0024: Untyped literal found

```

See also
- \(\boldsymbol{y y}^{\text {• }}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0025: Unqualified enumeration constants}

Detects enumeration constants for which a qualified name does not prepend the enumeration Justification: Qualified access makes the code more readable and easier to maintain. Without forcing qualified variable names, an additional enumeration could be inserted when the program is extended. This enumeration contains a constant with the same name as an existing enumeration (see the example below: "red"). This would result in ambiguous access to this piece of code. We recommend to always use only enumerations with the \{attribute 'qualified-only'\}.
Importance: Medium

\section*{Example}
```

TYPE COLOR
(red,green,blue);
END_TYPE
PROGRAM PLC_PRG
enumVar : COLOR;
enumVar := COLOR.red; // SA0025
enumVar := red; // SA0025
--> SA0025: Enumeration constant 'red' not qualified

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0026: Possible truncated strings}

Detects string assignments and string initializations that do not use sufficient string length Justification: When strings of different lengths are assigned, a string could be truncated. This can have unexpected results.

Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
strVar1 : STRING[10];
strVar2 : STRING[6];
strVar3 : STRING[6] := 'abcdefghi'; // SA0026
END_VAR
strVar2 := strVar1; // SA0026
--> SA0026: Truncation of string 'abcdefghi'
--> SA0026: Possible truncation of string 'strVarl'

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0027: Multiple uses of identifiers}

Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project
Justification: Same names can be confusing when reading the code. They can cause errors if the wrong object is accessed accidentally. Define and follow naming conventions to avoid any situation like this.

The following cases are detected:
- The name of an enumeration is identical to the name of another enumeration in the application or in an integrated library.
- The name of a variable is identical to the name of another object in the application or in an integrated library.
- The name of a variable is identical to the name of an enumeration constant in an enumeration in the application or in an integrated library.
- The name of an object is identical to the name of another object in the application or in an integrated library.
Importance: Medium
```

Example The Standard library is integrated in the project and provides the TON function.

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
ton : INT;
ton : INT;
END_VAR
END_VAR
--> Variable name 'ton' in 'PLC_PRG' already used for an object in
--> Variable name 'ton' in 'PLC_PRG' already used for an object in
library 'standard, ...'
```

library 'standard, ...'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0028: Overlapping memory areas}

Detects the lines of code where two or more variables reserve the same memory Justification: When two variables reserve the same memory, the code may behave with unexpected results. This situation should be avoided at all costs. If you cannot avoid using a value in different interpretations (for example, one time as DINT and another time as REAL), then you should define a UNION. You can also use a pointer to access a value with a different type without the value being converted.
Importance: High

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iVvar1 AT %QB21: INT;
dwVar2 AT %QD5: DWORD;
END_VAR
--> The following variables access the same memory:
--> SA0028: iVar1 AT %QB21
--> SA0028: dwVar2 AT %QD5

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0029: Notation in code different to declaration}

Detects the code locations where the notation of an identifier is different from the notation in its declaration

Justification: The IEC 61131-3 standard defines identifiers as not case-sensitive. This means that a variable declared as "varx" can also be used as "VaRx" in the code. However, this is confusing and misleading and should be avoided.
Importance: Medium
```

Example A POU PLC_PRG and a POU fnc (function) exist in the device tree.
PROGRAM PLC_PRG
VAR
iVar: INT;
123test_var_: INT;
END_V/VAR
ivar := iVar + 1; // SA0029
_123TEST_var_ := _123test_var_; // SA0029
Fnc(); - - // SA0029
--> SAO029: Notation in code (ivar) must equal declaration (iVar)
--> SA0029: Notation in code (_123TEST_var_) must equal declaration
(_123test_var_)
--> SA0029: Notation in code (Fnc) must equal declaration (fnc)

```

\section*{Unused Objects}
6.6.3.4.2.28.1 SA0031: Unused signatures ..... 4249
6.6.3.4.2.28.2 SA0032: Unused enumeration constants ..... 4250
6.6.3.4.2.28.3 SA0033: Unused variables ..... 4250
6.6.3.4.2.28.4 SA0035: Unused input variables. ..... 4251
6.6.3.4.2.28.5 SA0036: Unused output variables ..... 4251

\section*{SA0031: Unused signatures}

Detects programs, function blocks, functions, data types, interfaces, methods, properties, and actions that are not called within the compiled program code
Justification: Unused objects unnecessarily increase the size of the project and can be confusing when reading the code.
Importance: Low
PLCopen rule: CP2

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the POU pool are also affected.

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0032: Unused enumeration constants}

Detects enumeration constants that are not used in the compiled program code
Justification: Unused enumeration constants unnecessarily increase the size of the enumeration definition and can be confusing when reading the program.

PLCopen rule: CP24
Importance: Low

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example
```

TYPE My_Enum :
(
one := 1, two := 2
);
END_TYPEE
--> SA0032: Unused enumeration constant 'one'
--> SA0032: Unused enumeration constant 'two'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0033: Unused variables}

Detects variables that are declared but not used within the compiled program code
Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium
PLCopen rule: CP22 / CP24

For GVL variables:If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iCounter1 : INT;
iCounter2 : INT; // SA0035
END_VAR
ICounter1 := 100;
--> SA0035: Unused Variable 'iCounter2'

```

\section*{See also}
- \(\Rightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0035: Unused input variables}

Detects input variables that are not used by any function block instance
Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.
Importance: Medium
PLCopen rule: CP24

\section*{Example}
```

FUNCTION_BLOCK AFB
VAR_INPUT
iIn1: INT;
iIn2: INT;
END_VAR
VAR_OUTPUT
iOut1: INT;
END_VAR
PROGRAM PLC_PRG
VAR
Fb1: AFB;
END_VAR
Fb1(iIn1 := 99)
--> SA0035: Unused input 'iIn2'

```

See also
- «A Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0036: Unused output variables}

Detects output variables that are not used by any function block instance
Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.
Importance: Medium
PLCopen rule: CP24
Example
```

FUNCTION_BLOCK AFB
VAR_INPUT
iIn1: INT;
iIn2: INT;
END_VAR
VAR_OUTPUT
iOut1: INT;
END_VAR
PROGRAM PLC_PRG
VAR
Fb1: AFB;
END_VAR
Fb1(iIn1 := 99)
--> SA0036: Unused output 'iOut1'

```

See also
- \({ }^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0034: Enumerations with incorrect assignment}

Detects values that are assigned to an enumeration variable. Only defined enumeration constants of an enumeration variable are permitted to be assigned.

Justification: A variable of the enumeration type should have only the intended values, otherwise the code that uses this variable may not work correctly. We recommend to always use enumerations with the \{attribute 'strict'\}. Then the compiler already checks the correct use of the enumeration components.
Importance: High

\section*{Example}
```

TYPE COLOR :
(
Red := 0,
Green,
Yellow
);
END_TYPE
PROGRAM PLC_PRG
VAR
eColor1: COLOR;
END_VAR
eColor1 := COLOR.Red;
eColor1 := 1; // SA0034
--> SA0034: Use enumeration value instead of 'INT\#1'

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0037: Write access to input variable}

Detects input variables (VAR_INPUT) that are accessed with write permission within the POU Justification: According to the IEC 61131-3 standard, an input variable must not be changed within a POU. This kind of access is also a cause for errors and makes the code poorly maintainable. This is an indication that a variable is used as both an input variable and an auxiliary variable. This kind of dual use should be avoided.
Importance: Medium

\section*{Example}
```

VAR_GLOBAL
g_xGlob AT %QXO.0 : BOOL;
END_VAR
PROGRAM PLC PRG
VAR_INPUT
xVarIn1:BOOL;
xVarIn2:BOOL;
END_VAR
VAR
iCondition : INT;
END_VAR
iCondition := iCondition + INT\#1;
CASE iCondition OF
INT\#1:
g_xGlob := xVarIn1;
INTT\#2:
g_xGlob := xVarIn2;
ELSE
g_xGlob := FALSE;
xVarIn1 := FALSE; // SA0037
END_CASE
--> SA0037: Write access to input variable 'xVarIn1'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0038: Read access to output variable}

Detects output variables (VAR_OUTPUT) that are accessed with read permission within the POU

Justification: According to the IEC 61131-3 standard, it is prohibited to read an output within a POU. This is an indication that the output is not only used as an output but also as a temporary variable for intermediate results. This kind of dual use should be avoided.
Importance: Low

\section*{Example}
```

VAR_GLOBAL
g_xGlob AT %QXO.0 : BOOL ;
g_iGlob AT %QW1 : INT ;
END_VAR
PROGRAM PLC_PRG
VAR_OUTPUT
xVarOut1:BOOL;
xVarOut2:INT;
xVarOut3:INT;
END VAR
VAR
iCondition : INT;
END VAR
iCondition := iCondition + INT\#1;
CASE iCondition OF
INT\#1:
xVarOut1 := g_xGlob;
xVarOut2 := g_iGlob;
INT\#2:
xVarOut3 := xVarOut2; // SA0038
ELSE
xVarOut1 := FALSE;
g_xGlob := xVarOut1; // SA0038
xVarOut2 := INT\#0;
xVarOut3 := INT\#-1;
END_CASE
--> SA0038: Read access to output variable 'xVarOUT2'
--> SAO038: Read access to output variable 'xVarOUT1'

```

\section*{See also}
- « Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0040: Possible division by zero}

Detects code locations where there is possible division by zero
Justification: Division by zero should never occur, and a variable denominator should always be checked for 0 first.
Importance: High
```

Example

```
```

VAR_GLOBAL

```
VAR_GLOBAL
    g_iVar AT %QW1 : INT ;
    g_iVar AT %QW1 : INT ;
END_VĀR
END_VĀR
PROGRAM PLC_PRG
PROGRAM PLC_PRG

VAR
    iCounter : INT;
    iCounter : INT;
    iSumme:INT;
    iSumme:INT;
    iMid:INT;
    iMid:INT;
    iVal1:INT := INT#2;
    iVal1:INT := INT#2;
    iVal2:INT;
    iVal2:INT;
    iVal3:INT := INT#3;
    iVal3:INT := INT#3;
    iVal4:INT := INT#4;
    iVal4:INT := INT#4;
    iVal5:INT;
    iVal5:INT;
END_VAR
END_VAR
IF iVal2 <> 0 THEN
IF iVal2 <> 0 THEN
iVal1 := iVal1/iVal2; // no error
iVal1 := iVal1/iVal2; // no error
END_IF;
END_IF;
iMi\overline{d}}:= iSumme / iCounter; // SA004
iMi\overline{d}}:= iSumme / iCounter; // SA004
iCounter := iCounter + INT#1;
iCounter := iCounter + INT#1;
iSumme := g_iVar + iSumme;
iSumme := g_iVar + iSumme;
IF iMid < INTT#100 THEN
IF iMid < INTT#100 THEN
    iVal1 := iVal1 / iVal2; // SA0040
    iVal1 := iVal1 / iVal2; // SA0040
END_IF
END_IF
--> SAO040: Possible division by zero
--> SAO040: Possible division by zero
--> SAOO40: Possible division by zero
```

--> SAOO40: Possible division by zero

```

\section*{SA0041: Detect possible loop invariant code}

Detects assignments in loops that calculate the same value for each loop cycle. These lines of code could possibly be inserted outside of the loop.
Justification: This is a performance warning. Code that is executed in a loop, but does the same thing in each loop cycle, can be executed outside of the loop.
Importance: Medium
Example
```

PROGRAM PLC_PRG
VAR
iCounter, iVar1, iVar2: INT;
END_VAR
FOR iCounter := 0 TO 10 DO
iVar1 := 100; // SA0041
iVar2 := iVar2 + iVar1;
END_FOR
--> SANO041: Possible loop invariant code 'iVar1 := 100'

```

See also
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0042: Usage of different access paths}

Detects the usage of different access paths for the same variable
Justification: Different access to the same element decreases the readability and maintainability of a program. We recommend the consistent usage of \{attribute 'qualified-only'\} for libraries, global variable lists, and enumerations. This forces a fully qualified access.
Importance: Low

\section*{Example}
```

VAR_GLOBAL
iTemp:INT;
instPOU:POU;
END_VAR
FUNCTION_BLOCK POU
VAR
a:INT;
END_VAR
a := INT\#1;
PROGRAM SAO042
VAR
ptiTemp:POINTER TO INT;
sTemp:STRING;
END_VAR
ptiTemp := ADR(iTemp);
ptiTemp^:= INT\#1;
iTemp:= INT\#2; // SA0042 - direct access
on variable
GVL.iTemp := INT\#3; // SA0042 - access on
variable via GVL
sTemp := CONCAT( 'ab', 'cd'); // SA0042 - direct access on
function
sTemp := Standard.CONCAT( 'ab', 'cd'); // SA0042 - access on
function via Standard
instPOU(); // SA0042 - direct access
on POU instance
GVL.instPOU(); // SA0042 - access via GVL
--> SA0042: Different access paths for 'CONCAT'
--> SA0042: Different access paths for 'Standard.CONCAT'
--> SA0042: Different access paths for 'instPOU'
--> SA0042: Different access paths for 'GVL.instPOU'
--> SA0042: Different access paths for 'iTemp'
--> SA0042: Different access paths for 'GVL.iTemp'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0043: Use of a global variable in only one POU}

Detects the use of a global variable in only a single POU
Justification: A global variable that is used in only one location should also only be declared at this location.
Importance: Medium

PLCopen rule: CP26

\section*{Example}
```

VAR_GLOBAL
g_\overline{x}Var AT %QX0.0 : BOOL ;
g_iTest AT %QW1 : INT ;
g_wTest AT %QW2 : WORD;
END_VA}
PROGRAM prog1
VAR
iCondition : INT;
bTemp : BOOL;
END_VAR
iCondition := iCondition + INT\#1;
IF iCondition < INT\#O THEN
bTemp := g_xVar; // SA0043 - g_xVar only read in this POU
ELSIF iCondition = INT\#O THEN
bTemp := g_xVar; // SAO043 - g_xVar only read in this POU
ELSE
bTemp := g_xVar; // SA0043 - g_xVar only read in this POU
g_wTest := WORD\#4; // g_WTest used also in prog2 -> OK
END_IF
PROGRAM prog2
VAR
iCondition : INT;
END VAR
iCoñdition := iCondition + INT\#1;
CASE iCondition OF
INT\#1:
g_iTest := WORD_TO_INT(g_wTest); // SA0043 - g_iTest only
written in this POU
INT\#2:
g_iTest := INT\#2; // SA0043 - g_iTest only
written i\overline{n}\mathrm{ this POU}
ELSE
g_iTest := INT\#3; // SA0043 - g_iTest only
written i\overline{n}\mathrm{ this POU}
END_CASE
--> SA0043: Global variable 'g_xVar' only used in 'prog1'
--> SA0043: Global variable 'g_iTest' only used in 'prog2'

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0044: Declarations with reference to interface}

Detects declarations with REFERENCE TO interfaces and declarations of VAR_IN_OUT variables with interfaces (implicitly implemented by means of REFERENCE TO)
Justification: An interface type is always implicitly a reference to an instance of a function block that implements this interface. A reference to an interface is therefore a reference to a reference and can result in unwanted behavior.
Importance: High
```

Example ITF is an interface that is defined in the project.

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
            inst:POU;
            inst:POU;
            itf_inst1 : ITF;
            itf_inst1 : ITF;
            itf}\mp@subsup{}{-}{-
            itf}\mp@subsup{}{-}{-
END_VAR FUNCTION_BLOCK POU
END_VAR FUNCTION_BLOCK POU
VAR_INPUT
VAR_INPUT
            inst itf2 : ITF;

6.6.3.4.2.37.6 SA0134: Explicit signed/unsigned conversions ..... 4262

\section*{SA0019: Implicit pointer conversions}

Detects implicitly generated pointer conversions
Justification: In CODESYS, pointers are not strictly typed and they can be assigned to each other in any way. This is often used and therefore not reported by the compiler. However, it can also accidentally cause unexpected access. If you assign a POINTER TO BYTE to a POINTER TO DWORD, then you can unintentionally overwrite memory using the latter pointer. Therefore, always check this rule and block the message for cases in which you intentionally want to access a value with a different type.
Implicit data type conversions are reported with a different message.
Importance: High
PLCopen rule: CP25
Exception: BOOL <-> BIT

\section*{Example}
```

PROGRAM PLC_PRG
VAR
pINT : POINTER TO INT;
byteVar : BYTE;
END_VAR
pINT := ADR(byteVar);
--> SA0019: Implicit conversion from pointer to 'POINTER TO BYTE'
to pointer to 'POINTER TO INT'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0130: Implicit expanding conversions}

Detects implicit conversions from smaller data types to larger data types
Justification: The compiler permits any assignments of different types when the value range of the source type is completely contained within the value range of the target type. However, the compiler will build a conversion into the code as late as possible. For an assignment of type lint := dint * dint, the compiler performs the implicit conversion only after multiplication: lint := TO_LINT (dint * dint). An overflow is therefore truncated. To prevent this, you can already convert the elements: lint := TO_LINT (dint) * TO_LINT (dint). Therefore, it may be useful to report locations where the compiler implements implicit conversions in order to check whether these are exactly what is intended. Furthermore, explicit conversions can be used to improve portability to other systems when those systems have more restrictive type checks.
Importance: Low
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    byTemp : BYTE;
    byTemp : BYTE;
    usiTemp : USINT;
    usiTemp : USINT;

\section*{Use of Direct Addresses}
\[
\text { 6.6.3.4.2.38.1 SA0005: Invalid addresses and data types.............................. } 4263
\]
6.6.3.4.2.38.2 SA0047: Accesses to direct address ..... 4264
6.6.3.4.2.38.3 SA0048: AT-declarations on direct addresses. ..... 4264

\section*{SA0005: Invalid addresses and data types}

Detects invalid addresses and data type specifications. Valid size prefixes in addresses: X for BOOL B for 1-byte data types, W for 2-byte data types, and D for 4-byte data types.

Justification: Variables located on direct addresses should preferably be associated with an address that corresponds to their data type width. It can be confusing for the reader of the code, for example, if a DWORD is assigned to a BYTE address.

Importance: Low

\section*{Example}
```

PROGRAM Check_Address_Type_PRG
VAR
iVar AT %QBO : INT ; // OK e. g.: %QWO
xTest AT %QW1 : BOOL ; // OK e. g.: %QX1.0
END_VAR
iVar := iVar + INT\#1;
xTest := NOT xTest;
--> SA0005: Invalid address for data type 'iVar'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0047: Accesses to direct address}

Detects direct address access in the implementation code
Justification: Symbolic programming is always preferable. A variable has a name that can also have a meaning. An address cannot indicate what it is used for.
Importance: High

\section*{PLCopen rule: N1 / CP1}

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xVar : BOOL;
byVar : BYTE;
END_VAR
xVar := %IX0.0;
%QXO.O := xVar;
%MX0.1 := xVar;
%MB1 := byVar;
--> Access to direct address '%IX0.0'
--> Access to direct address '%QX0.0'
--> Access to direct address '%MX0.1'
--> Access to direct address '%MB1'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0048: AT-declarations on direct addresses}

\section*{Detects AT declarations on direct addresses}

Justification: The use of direct addresses in the code is problematic because the address then appears in multiple locations: first in the controller configuration where the assignment of a physical object to an address is defined, and second in the program where variables are assigned to these addresses. If the addresses are relocated because the configuration is changed, then you have to reassign variables to addresses at a completely different location in the program. This is a cause of error and results in poorer readability and maintainability of the code. Therefore, it is best to perform all assignments in the I/O mapping of the device editor.
Importance: High

PLCopen rule: N1 / CP1
Note: We recommend that you use direct addresses ONLY in the "//O Mapping" tab of the device editor.

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xVar1 AT %IX0.0 : BOOL;
byVar1 AT %IB1 : BYTE;
xVar2 AT %QX0.0 : BOOL;
END_VAR
--> SA0048: Declaration uses direct address '%IXO.0'
--> SA0048: Declaration uses direct address '%IB1
--> SA0048: Declaration uses direct address '%QXO.0'

```

\section*{SA0051: Comparison operations on BOOL variables}

Detects comparison operations on variables of type BOOL
Justification: CODESYS permits these kinds of comparison, but they are very unusual and can be confusing. The IEC 61131-3 standard does not provide for these comparisons. By avoiding them, you increase the portability of the code to other development systems.

Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xBool1, xBool2 : BOOL;
xResult : BOOL;
END VAR
xRe\overline{sult := xBool1 > xBool2; // SA0051}
xBool1 := NOT xBool1; // OK!
xBool2 := xBool2 XOR xBool1; // OK!
--> SA0051: Comparison operations on BOOL varables

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0052: Unusual shift operation}

Detects shift operations (bit shift) on signed variables. In the case of shift operations on bitfield data types (Byte, DWORD, LWORD, WORD), an error is not reported.

Justification: CODESYS permits shift operations on signed data types. However, these operations are unusual and can be confusing. The IEC 61131-3 standard does not provide for these kinds of operations. Therefore, they should be avoided in order to increase the portability of the code to other development systems.
Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iTemp : INT;
dwTemp1 : DWORD;
byTemp2 : BYTE;
diTemp3 : DINT;
siTemp4 : SINT;
liTemp5 : LINT;
END_VAR
//the following lines each will cause an SA0052:
iTemp := SHL(iTemp, BYTE\#2);
diTemp3 := SHR(diTemp3, BYTE\#4);
siTemp4 := ROL(siTemp4, BYTE\#2);
liTemp5 := ROR(liTemp5, BYTE\#2);
//no error SAO052 because DWORD and BYTE are bit field data types:
dwTemp1 := SHL(dwTemp1, BYTE\#3);
byTemp2 := SHR(byTemp2, BYTE\#1);
---> SAOO52: Unusual shift operation

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0053: Too big bitwise shift}

Detects whether or not the data type width of the operand has been exceeded in the case of a bitwise shift (bit shift) of operands

Justification: If a shift operation exceeds the data type width, then a constant 0 is generated. If a rotation shift exceeds the data type width, then it is difficult to read. Therefore, the rotation value should be shortened.
Importance: High

\section*{Example}
```

PROGRAM PLC_PRG
VAR
byTemp1 : BYTE;
wTemp2 : WORD;
dwTemp3 : DWORD;
lwTemp4 : LWORD;
END VAR
byTemp1 := SHR(byTemp1, BYTE\#25);
wTemp2 := SHL (wTemp2, BYTE\#45);
dwTemp3 := ROR(dwTemp3, BYTE\#78);
lwTemp4 := ROL(lwTemp4, BYTE\#111);
--> SA0053: Too big bitwise shift

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0054: Comparisons of REAL/LREAL for equality / inequality}

Detects whether or not the comparison operators \(=\) (equality) and \(<>\) (inequality) compare the operands of type REAL or LREAL

Justification: REAL/LREAL values are implemented as floating-point numbers according to the IEEE 754 standard. This standard implies that specific, apparently simple decimal numbers cannot be represented with precision. As a result, there may be different representations as LREAL for the same decimal number.

Consider the following lines of code:
```

lr11 := 1.1;
lr33 := 3.3;
lrVar1 := lr11 + lr11;
lrVar2 := lr33 - lr11;
botest := lrVar1 = lrVar2;

```

In this case, botest returns FALSE, even if the variables \(\operatorname{lrVar1}\) and \(\operatorname{lrVar} 2\) both return the monitoring value of 2.2. This is not an error of the compiler, but a property of the floating point units of all conventional processors. You can avoid this by specifying a minimum value by which the values may differ: botest \(:=\) ABS (lrVar1 - lrVar2) < 0.1 ;

Exception: A comparison with 0.0 is not reported by this analysis. For the 0 , there is an exact representation in the IEEE 754 standard, and therefore the comparison functions normally as expected. Therefore, for better performance, it makes sense to permit a direct comparison here.

Importance: High
PLCopen rule: CP54
```

Example
PROGRAM PLC_PRG
VAR
rTest1 : REAL;
rTest2 : REAL;
lrTest3 : LREAL;
lrTest4 : LREAL;
xResult : BOOL;
END_VAR
//the following lines each will cause an SA0054:
xResult := rTest1 = rTest1;
xResult := rTest1 = rTest2;
xResult := rTest1 <> rTest2;
xResult := lrTest3 = lrTest3;
xResult := lrTest3 = lrTest4;
xResult := lrTest3 <> lrTest4;
//the following lines each will not cause an SA0054:
xResult := rTest1 > rTest2;
xResult := lrTest3 < lrTest4;
--> SA0054: Comparisons of REAL/LREAL for equality / inequality

```

See also
- . Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0055: Unnecessary comparisons of unsigned operands}

Detects unnecessary comparisons with unsigned operands. An unsigned data type is never less than zero. This can be used as a sign check.

Justification: A comparison detected with this check yields a constant result and is an indication of an error in the code.
Importance: High
Example
```

PROGRAM PLC_PRG
VAR
byTest: BYTE;
END_VAR
WHILE byTest >= 0 DO
byTest := byTest - 1;
END_WHILE;
--> SA0055: Unnecessary comparisons of unsigned operands

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0056: Constant out of valid range}

Detects literals (constants) outside of the valid range of the operator
Justification: The message is issued in cases when a value is compared with a constant that is outside of the range of this value. Then the comparison constantly returns TRUE or FALSE. This is an indication of a programming error.
```

Importance: High

```

\section*{Example}
```

PROGRAM PLC_PRG
VAR
byTestVar: BYTE;
END_VAR
WHILE byTestVar >= 260 DO
byTestVar := byTestVar + 1;
END_WHILE
--> SA0056: Constant out of valid range

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0057: Possible loss of decimal places}

Detects statements with possible loss of decimal places
Justification: A piece of code of the following type (diTemp2 := 1 rTemp1 := TO_REAL (diTemp2 / DINT\#2)) can cause a misinterpretation. The author or reader of this line of code can assume that the division would be performed as a REAL operation, and in this case the result would be REAL\#0.5. However, this is not true. It is an integer operation. The result is cast to REAL and rTemp1 gets the value REAL\# 0 . To avoid this, use a cast to make sure that the operation is performed as a REAL operation: rTemp1 := TO_REAL (diTemp2) / REAL\#2.

Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
rTemp1 : REAL;
diTemp2 : DINT;
liTemp3 : LINT;
END_VAR
diTemp2 := diTemp2 + DINT\#11;
rTemp1 := DINT_TO_REAL(diTemp2 / DINT\#3); // SA0057
rTemp1 := DINT_TO_REAL(diTemp2) / REAL\#3.0;
liTemp3 := liTemp\overline{3 + LINT\#13;}
rTemp1 := LINT_TO_REAL(liTemp3 / LINT\#7); // SA0057
rTemp1 := LINT_TO_REAL(liTemp3) / REAL\#7.0;
--> SA0057: Possible loss of decimal places

```

See also
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0058: Operations on enumeration variables}

Detects operations on variables of the enumeration data type Assignments are permitted.
Justification: Enumerations should not be used as ordinary integer values. You can also define an alias data type or use a subrange type.

Importance: Medium
Exception: If an enumeration is tagged with the pragma \{attribute 'strict'\}, then the compiler already reports this kind of operation.
If an enumeration is declared as a flag by the pragma \{attribute 'flags'\}, then an error is not issued for AND, OR, NOT, or oder XOR operations.

\section*{Example}
```

TYPE My_Enum :
(
red := 1, blue := 2, green := 3, black := 4
);
END_TYPE
PROGRAM PLC_PRG
VAR
iTemp1 : INT;
abc : My_Enum;
END_VAR
iTemp1 := iTemp1 + INT\#1;
abc := My_Enum.red; // OK
iTemp1 := My_Enum.black / My_Enum.blue; // SA0058

\section*{SA0059: Comparison operations always returning TRUE or FALSE}

Detects comparisons with literals that always have the result TRUE or FALSE, and can already be processed during at the compile.
Justification: An operation that consistently yields TRUE or FALSE is an indication of a programming error.

Importance: High

\section*{Example}
```

PROGRAM PLC_PRG
VAR
byTemp1 : BYTE;
END_VAR
WHILE byTemp1 <= 255 DO
byTemp1 := byTemp1 + 1;
END_WHILE;
--> SAO059: Relational operator '<=' always evaluates 'TRUE'

```

\section*{See also}
- \(\Rightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0060: Zero used as invalid operand}

Detects operations where an operand with the value " 0 " causes an invalid or a nonsense operation

Justification: This kind of expression could be an indication of a programming error. In any case, it unnecessarily wastes runtime.

Importance: Medium
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    byTemp1 : BYTE;
    byTemp1 : BYTE;
    wTemp2 : WORD;
    wTemp2 : WORD;
            dwTemp3 : DWORD;
            dwTemp3 : DWORD;
END_VAR
END_VAR
byTemp1 := byTemp1 + 0;
byTemp1 := byTemp1 + 0;
wTemp2 := wTemp2 - WORD#0;
wTemp2 := wTemp2 - WORD#0;
dwTemp3 := dwTemp3 * DWORD#0;
dwTemp3 := dwTemp3 * DWORD#0;
--> SA0060: Zero used as invalid operand
```

--> SA0060: Zero used as invalid operand

```

\section*{SA0061: Unusual operation on pointer}

Detects operations one variables of type POINTER TO which are not = (equality), <> (inequality), + (addition), or ADR.

In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. Therefore, the addition of a pointer with an integer value is considered a common operation on pointers. This makes it possible to use a pointer to process an array of variable length. All other (unusual) operations with pointers are reported with SA0061.

Importance: High
PLCopen rule: E2 / E3

\section*{Example}
```

PROGRAM PLC_PRG
VAR
piTemp : POINTER TO INT;
iTemp : INT;
END_VAR
iTemp := iTemp + INT\#1;
piTemp := ADR(iTemp);
piTemp := piTemp * DWORD\#5; // SA0061
piTemp := piTemp / DWORD\#2; // SA0061
piTemp := piTemp MOD DWORD\#3; // SA0061
piTemp := piTemp + DWORD\#1;
piTemp := piTemp - DWORD\#1; // SA0061
--> SA0061: Unusual operation on pointer

```

\section*{See also}
- \(y^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0062: Uses of TRUE or FALSE in expressions}

Detects the use of the literals TRUE or FALSE in expressions
Justification: This kind of expression is obviously unnecessary and may indicate an error. In any case, the expression unnecessarily affects the runtime.
Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xTemp1, xTemp2 : BOOL;
END_VAR
xTemp1 := xTemp1 AND NOT TRUE;
xTemp2 := xTemp1 OR TRUE;
xTemp2 := xTemp1 OR NOT FALSE;
xTemp2 := xTemp1 AND FALSE;
--> Uses of TRUE or FALSE in expressions

```

See also
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0063: Possibly not 16-bit-compatible operations}

Detects 16-bit operations with temporary results. Background: On 16-bit systems, 32-bit temporary results can be truncated. Example: (int+10) can exceed 16 bits.
Justification: In the very rare case that you have to write code which should run on a 16-bit processor as well as on a 32-bit processor, this message should help to prevent any problems.

Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iVar : INT;
END VAR
iVar := (iVar + 10) / 2;
--> SA0063: Compatibility for 16 Bit - Possible truncated
intermediate result

```

See also
- \({ }^{\text {® }}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0064: Addition of pointer}

Detects the addition of pointers
Justification: In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. However, it is also a source of errors. Therefore, programming rules exist that generally prohibit pointer arithmetic. This test can check such a requirement.
Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iTest:INT;
ariTest:ARRAY[0..10] OF INT;
{attribute 'analysis':='-111'}
piTest:POINTER TO INT;
i:INT;
END_VAR
piTest := ADR(ariTest[0]); // OK
piTest^:= 0;
piTest := ADR(ariTest) + SIZEOF(INT); // SA0064
piTest^:= 1;
piTest := ADR(ariTest) + 6; // SA0064
piTest^:= 3;
piTest := ADR(ariTest[10]);
FOR i:=0 TO 10 DO
piTest^ := i;
piTest := piTest + 2; // SA0064
END_FOR
--> SA0064: Addition of pointer

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0065: Incorrect pointer addition to base size}

Detects pointer additions for which the value to be added does not match the base size of the pointer. Only literals of the base size can be added. Also multiplication products of the base size cannot be added.

Justification: In CODESYS (in contrast to C and \(\mathrm{C}++\) ), when adding a pointer with an integer value, only this integer value is added as the number of bytes, and not the integer value multiplied by the base size. Example in ST:
```

pINT := ADR(array_of_int[0])
pINT := pINT + 2 ; // In CODESYS, pINT then points to
array_of_int[1]

```

This code would function differently in C :
```

short* pShort
pShort = \&(array of short[0])
pShort = pShort + 2; // In C, pShort then points to array_of_short[2]

```

Therefore, in CODESYS, you should always add a multiple of the base size of the pointer to a pointer. Otherwise, the pointer may point to non-aligned memory which (depending on the processor) can lead to an alignment exception when accessing it.
Importance: High

\section*{Example}
```

VAR
pudiTest:POINTER TO UDINT;
udiTest:UDINT;
prTest:POINTER TO REAL;
rTest:REAL;
END_VAR
pudiTest := ADR(udiTest) + 4; // OK
pudiTest := ADR(udiTest) + ( 2 + 2 ); // OK
pudiTest := ADR(udiTest) + SIZEOF(UDINT); // OK
pudiTest := ADR(udiTest) + 3; // SA0065
pudiTest := ADR(udiTest) + 2*SIZEOF (UDINT); // SA0065
pudiTest := ADR(udiTest) + ( 3 + 2 ); // SA0065
prTest := ADR(rTest);
prTest := prTest + 4; // OK
prTest := prTest + ( 2 + 2 ); // OK
prTest := prTest + SIZEOF(REAL); // OK
prTest := prTest + 1; // SA0065
prTest := prTest + 2; // SA0065
prTest := prTest + 3; // SA0065
prTest := prTest + ( SIZEOF(REAL) - 1 ); // SA0065
prTest := prTest + ( 1 + 4 ); // SA0065
--> SA0065: Incorrect pointer addition to base size

```

- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0066: Uses of temporary results}

Detects the use of temporary results in statements with a data type that is less than the registry size. The implicit cast in this case may lead to unwanted results.

Justification: For performance reasons, CODESYS performs operations on the register width of the processor. Intermediate results are not truncated. This can lead to misinterpretations as in the following case: usintTest \(:=0\); xError \(:=\) usintTest - \(1<>255\); In CODESYS, xError is TRUE in this case because the operation usintTest - 1 is typically executed as a 32-bit operation and the result is not cast to the byte size. Then the value \(16 \# f f f f f f f f\) (not equal to 255 ) is located in the registry. To avoid this, you have to cast the intermediate result explicitly: xError := TO_USINT (usintTest - 1) <> 255;

\section*{NOTICE!}

If this message is activated, then many less problematic locations in the code will be reported. Although a problem can only occur when the operation produces an overflow or underflow in the data type, the static analysis cannot differentiate between the individual locations.

If you include an explicit typecast in all reported locations, then the code will be much slower and less readable.

Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
byTest:BYTE;
liTest:LINT;
xError:BOOL;
END_VAR
//type size smaller than register size;
byTest := 0;
IF (byTest - 1) <> 255 THEN //use of temporary result + implicit
casting -> SA0066
xError := TRUE;
ELSE
xError := FALSE;
END_IF
//type size equal to or bigger than register size;
liTest := 0;
IF (liTest - 1) <> -1 THEN // use of temporary result and no
implicit casting -> OK
xError := TRUE;
ELSE
xError := FALSE;
END_IF
--> SA0066: Use of temporary result: (byTest - USINT \#1)

```

\section*{SA0072: Invalid uses of counter variable}

Detects the use of a counter variable in a FOR loop
Justification: Manipulation of the counter variable in a FOR loop can easily result in an infinite loop. To prevent the execution of the loop for specific values of the counter variable, use CONTINUE or simply an IF.
Importance: High
PLCopen rule: L12

\section*{Example}
```

PROGRAM PLC_PRG
VAR_TEMP
iIndex : INT;
END VAR
FOR iIndex := INT\#O TO INT\#2O BY INT\#1 DO
iIndex := iIndex - INT\#1;
END_FOR
--> SA0072: Invalid use of counter variable 'iIndex'

```

See also
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0073: Uses of inadequate counter variable}

Detects the use of non-temporary variables in FOR loops.
Justification: This is a performance warning. A counter variable is always initialized each time a POU is called. You can create this variable as a temporary variable (VAR_TEMP). Access to it may be faster and the variable does not take up any permanent memory.
Importance: Medium
PLCopen rule: CP21 / L13

\section*{Example}
```

PROGRAM PLC_PRG
VAR
nIndex : INT;
iVar : INT;
END VAR
FOR nIndex := INT\#0 TO INT\#20 BY INT\#1 DO
iVar := iVar + nIndex;
END_FOR
--> SA0073: Inadequate counter variable

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0080: Loop index variable for array index exeeds array range}

Detects the FOR statements where the index variable is used to access an array index and exceeds the range of the array index

Justification: Arrays are typically processed in FOR loops. The start and end value of the counter variable should typically match (or at least not exceed) the upper and lower bounds of the array. A typical cause of error is detected here when array bounds are changed and constants are not carefully used; or when a different value is used accidentally in the FOR loop than in the array declaration.

Importance: High
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    iIndex1,iIndex2,iIndex3 : INT;
    iIndex1,iIndex2,iIndex3 : INT;
    arWord : ARRAY[1..100] OF WORD;
    arWord : ARRAY[1..100] OF WORD;
    arararINT : ARRAY[1..9,1..9,1..9] OF INT;
    arararINT : ARRAY[1..9,1..9,1..9] OF INT;
    arUSINT : ARRAY[0..99] OF USINT;
    arUSINT : ARRAY[0..99] OF USINT;
END_VAR
END_VAR
//1 violation of the rule(lower range is exeeded): SA0080
//1 violation of the rule(lower range is exeeded): SA0080
FOR iIndex1 := INT#O TO INT#100 DO
FOR iIndex1 := INT#O TO INT#100 DO
            arWord[iIndex1] := INT_TO_WORD(iIndex1);
            arWord[iIndex1] := INT_TO_WORD(iIndex1);
END_FOR
END_FOR
//6 violations (lower and upper range is exceeded for each array
//6 violations (lower and upper range is exceeded for each array
dimension): 3SA0080
dimension): 3SA0080
FOR iIndex2 := INT#0 TO INT#10 DO
FOR iIndex2 := INT#0 TO INT#10 DO
        arararINT[iIndex2, iIndex2, iIndex2] := iIndex2;
        arararINT[iIndex2, iIndex2, iIndex2] := iIndex2;
END_FOR
END_FOR
//l violation (upper range is exceeded by the end result of the
//l violation (upper range is exceeded by the end result of the
index), previous expressions on index are not evaluated -> OK
index), previous expressions on index are not evaluated -> OK
FOR iIndex3 := INT#0 TO INT#50 DO
FOR iIndex3 := INT#0 TO INT#50 DO
        arUSINT[iIndex3 * INT#2] := INT_TO_USINT(iIndex3);
        arUSINT[iIndex3 * INT#2] := INT_TO_USINT(iIndex3);
END_FOR
END_FOR
--> SA0080: Loop index range of 'Index1' exceeds array range
--> SA0080: Loop index range of 'Index1' exceeds array range
--> SA0080: Loop index range of 'Index2' exceeds array range
```

--> SA0080: Loop index range of 'Index2' exceeds array range

```

\section*{See also}
- \(\Leftrightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0081: Upper border is not a constant}

Detects the FOR statements where the upper bound is not defined with a constant value Justification: If the upper bound of a loop is a variable value, then it is no longer possible to see how often a loop is executed. This can result in serious problems at runtime. The worst case is an infinite loop.
Importance: High

\section*{Example}
```

PROGRAM PLC_PRG
VAR
i:INT;
iBorder1: INT := 10;
iBorder2: INT := 10;
iCounter: INT;
END VAR
VAR ' CONSTANT
ciBorder:INT := 10;
END_VAR
FOR i:=0 TO 10 DO //OK
iCounter := i;
END_FOR
FOR i:=O TO ciBorder DO // OK
iCounter := i;
END_FOR
FOR i:=0 TO iBorder1 DO // SA0081
iCounter := i;
END_FOR
FOR i:=0 TO iBorder2 DO // SA0081
iCounter := i;
IF iCounter = 10 THEN
iBorder2 := 50;
END_IF
END_FOR
--> SA0081: Upper border of a for loop must be a constant value

```

\section*{See also}
- « Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0075: Missing ELSE}

Detects CASE statements without an ELSE branch
Justification: Defensive programming requires the inclusion of an ELSE branch in every CASE statement. If there is nothing to do in the ELSE branch, then include a comment to indicate this. It is then clear to the reader of the code that the case was not simply forgotten.
Importance: Low
PLCopen rule: L17
```

Example
PROGRAM PLC_PRG
VAR
iVar : INT;
xTemp : BOOL;
END_VAR
iVar := iVar + INT\#1;
CASE iVar OF
INT\#1:
xTemp := FALSE;
INT\#2:
xTemp := TRUE;
END_CASE
--> SA0075: Missing ELSE in CASE statement

```

\section*{See also}
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0076: Missing enumeration constant}

Detects whether or not an enumeration variable is used as a condition and not all enumeration values are treated as CASE branches

Justification: Defensive programming requires the processing of all possible values of an enumeration. If an action is not required for a particular enumeration value, then you should add a comment to indicate this explicitly. It is then clear to the reader of the code that the value was not simply forgotten.
Importance: Low

\section*{Example}
```

TYPE My_Enum :
(
red := 1, blue := 2, green := 3, black := 4
);
END_TYPE
PROGRAM PLC_PRG
VAR
iVar : My_Enum;
xTemp : BOOOL;
END_VAR
iVa\overline{r := My_Enum.black;}
CASE iVar OF
My_Enum.red:
xTemp := FALSE;
My_Enum.blue, My_Enum.green:
xTemp := TRUE;
ELSE
xTemp := NOT xTemp;
END_CASE
--> SA0076: Missing enumeration constant 'black' in CASE statement

```

See also
- \#Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0077: Type mismatches with CASE expression}

Detects code locations where the data type of a condition does not match that of the CASE branch

Justification: If the data types between the CASE variable and the CASE itself do not match, then this could indicate an error.
Importance: Low

\section*{Example}
```

TYPE My_Enum :
(
eins := 1, zwei := 2, drei := 3, vier := 4
);
END_TYPE
PROGRAM PLC_PRG
VAR
diVar : DINT;
xTemp : BOOL;
END VAR
diVar := diVar + DINT\#1;
CASE diVar OF
DINT\#1:
xTemp := FALSE;
My_Enum.zwei, DINT\#3: //SA0077
xTemp := TRUE;
ELSE
xTemp := NOT xTemp;
END_CASE
--> SAOO77: Type mismatches with CASE expression

```

\section*{See also}
- \#Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0078: Missing CASE branches}

Detects CASE statements without CASE branches and only one ELSE statement Justification: A CASE statement without cases wastes execution time and it is difficult to read. Importance: Medium
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    iVar : INT;
    iVar : INT;
    xTemp : BOOL;
    xTemp : BOOL;
END_VAR
END_VAR
iVar := iVar + INT#1;
iVar := iVar + INT#1;
//in the following the case descriptions are missing:
//in the following the case descriptions are missing:
CASE iVar OF
CASE iVar OF
    ELSE
    ELSE
            xTemp := NOT xTemp;
            xTemp := NOT xTemp;
END_CASE
END_CASE
--> SA0078: CASE-Missing CASE branches
```

--> SA0078: CASE-Missing CASE branches

```

See also
- \(\Rightarrow\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0090: Return statement before end of function}

Detects whether or not the RETURN statement is not the last statement in a function, method, property, or program.

Justification: A RETURN in the code results in worse maintainability, testability, and readability of the code. A RETURN in the code is easily overlooked. Before each RETURN, it is often forgotten to insert code that should always be executed when exiting a function.

Importance: Medium
PLCopen rule: CP14

\section*{Example}
```

FUNCTION FUN : DINT
VAR INPUT
bTest : BOOL;
END_VAR
IF bTest THEN
RETURN;
END IF
FUN := 99;
--> SA0090: Return statement before end of function

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0095: Assignments in conditions}

Detects assignments in conditions of IF, CASE, or REPEAT constructs
Justification: An assignment (:=) and a comparison (=) can easily be mistaken. As a result, an assignment in a condition can easily be unintentional, and it is therefore reported. This can also confuse the reader of the code.

Importance: High
```

Example

```
```

PROGRAM PLC_PRG

```
PROGRAM PLC_PRG
VAR
VAR
    iCond1:INT := INT#1;
    iCond1:INT := INT#1;
    iCond2:INT := INT#2;
    iCond2:INT := INT#2;
    xCond:BOOL := FALSE;
    xCond:BOOL := FALSE;
    iVar : INT;
    iVar : INT;
END_VAR
END_VAR
IF INT_TO_BOOL(iCond1 := iCond2) THEN // SA0095
IF INT_TO_BOOL(iCond1 := iCond2) THEN // SA0095
    iCond\overline{1}}:= INT#1
    iCond\overline{1}}:= INT#1
    iCond2 := INT#2;
    iCond2 := INT#2;

SA0100: Variables greater than <n> bytes...
Detects variables that use more than n bytes, where n is defined by the current configuration. Default value: 1024 bytes. The value can be changed by double-clicking the line.
Justification: Some programming guidelines specify a maximum size for a single variable. This can be checked with this.
Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
aobyTest : ARRAY [0..1024] OF BYTE;
END_VAR
aobyTest[INT\#0] := aobyTest[INT\#0] + BYTE\#1;
--> SA0100: Variable 'aobyTest' greater 1024 bytes

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0101: Names with invalid length}

Detects names with invalid lengths. In the "Project Settings", double-click the rule entry to open a dialog where you can define the length of the name and define any exception.
Justification: Some programming guidelines specify a minimum length for variable names. This analysis can be used to check compliance.
Importance: Low
PLCopen rule: N6

\section*{Example}
```

PROGRAM PLC1
VAR
iVar1: INT; // SA0101
END_VAR
--> SA0101: Incorrect length of name 'PLC1'

```

\section*{See also}
- \& Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0102: Access to program/fb variables from the outside}

Detects external access to local variables of programs or function blocks
Justification: CODESYS permits external read access to local variables of programs or function blocks. This contradicts the principle of data encapsulation (hiding data) and does not comply with the IEC 61131-3 standard.

Importance: Medium
```

Example
PROGRAM PLC_PRG
VAR
iCounter : INT;
afb_Instance : AFB;
bfb_Instance : BFB;
END_VAR
iCounter := A PRG.iLocal; // SA0102
iCounter := b\overline{fb_Instance.iLocal; // SA0102}
A_PRG();
FUNCTION BLOCK AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
iLocal: INT;
END_VAR
MET\overline{HOD METH : INT}
VAR_INPUT
END_VAR
iLocal := iLocal + 1;
FUNCTION_BLOCK BFB EXTENDS AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;
PROGRAM A_PRG
VAR
iLocal: INT;
END_VAR
iLocal := iLocal + 1;
--> SA0102: Access to program/fb variable 'iLocal' from the outside

```

\section*{See also}
- « Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0103: Concurrent access on not atomic data}

Detects whether or not non-atomic variables (for example, with data type STRING, WSTRING, ARRAY, STRUCT, FB instances, 64-bit data types) are used in more than one task
Justification: When there is no synchronization during access, inconsistent values can be read when reading in one task and writing in another task at the same time.
Importance: Medium

For some data types, especially 64-bit integers, it depends on the platform whether or not access is atomic. Static analysis reports a problem only when the controller does not support atomic access to 64-bit integer data types.

This rule does not apply in the following cases:
- If the target system has a floating point unit (FPU), then access of multiple tasks to LREAL variables is not detected
- If the target system is a 64-bit processor or the corresponding target setting is set for the target device, then the rule does not apply to 64-bit data types
```

Example The project contains both programs, PRG1 and PRG2: The program PRG1 is called by the task
MainTask_1. The program PRG2 is called by the task MainTask_2.
GVL
VAR_GLOBAL
lrTest : LREAL; // Since the target system has an FPU, SA0103
does apply.
lint1 : LINT;
sTest : STRING; // SA0103
wsTest : WSTRING; // SA0103
END_VAR
PROGRAM PRG1
GVL.lrTest := 5.0;
GVL.sTest := 'welt';
GVL.wsTest := "welt";
GVL.lint1 := 99;
PROGRAM PRG2
GVL.lrTest := 5.0;
GVL.sTest := 'hallo';
GVL.wsTest := "hallo";
GVL.lint1 := 88;
--> SA0103: Concurrent access on not atomic data 'sTest'
--> SA0103: Concurrent access on not atomic data 'wsTest'

```

\section*{See also}
- \({ }^{*}\) Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0105: Multiple instance calls}

Detects the instances of function blocks that are called multiple times. To do this, the function blocks haves to be marked with the pragma \{attribute 'analysis:report-multiple-instance-calls'\}.
Justification: Some function blocks are designed in such as way that they can be called only one time in the cycle. This test checks whether or not a call is made in multiple locations.
Importance: Low
PLCopen rule: CP16 / CP20

\section*{Example}
```

// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DOA
VAR_INPUT
END - VAR
VAR_OUTPUT
END_VAR
VAR
iA : INT;
END_VAR
iA \overline{:= iA + 1;}
{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
iB : INT;
END_VAR
iB := iB +1;
PROGRAM PLC_PRG
VAR
fbA : FB_DoA;
fbB : FB_DoB;
ND_VAR
fbA();
fbB(); // SA0105
fbA();
fbB(); // SA0105
--> SA0105: Instance 'fbB' called more than once

```

See also
- Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0106: Virtual method calls in FB_INIT}

Detects method calls in the FB_Init method of a base function block, which are overwritten by a function block derived from a base function block
Justification: In these cases, it could be that the variables in the overwritten methods are not initialized in the base FB.

Importance: High
```

Example The function block FB_A includes the methods FB_Init and Meth_MyInit. FB_Init calls
Meth_MyInit for initialization. The function block FB_B is derived from FB_A. PLC_PRG
calls FB_B and therefore uses its mbMyDintB variable before it has been initialized.
FB_B.Meth_MyInit overwrites FB_A.Meth_MyInit.
FUNCTION_BLOCK FB_A
VAR
mbMyDintA : DINT;
END_VAR FUNCTION_BLOCK FB_B EXTENDS FB_A
VAR
mbMyDintB : DINT;
END_VAR METHOD FB_Init : BOOL
VAR_INPUT
bInitRetains:BOOL;
bInCopyCode:BOOL;
END_VAR
VAR
diDummy:DINT; // SA0106
END_VAR
mbMȳDintA := 123;
diDummy := Meth_MyInit(); METHOD Meth_MyInit : DINT
VAR_INPUT
END_VAR
mbMȳDintB := 123; // access to member of FB_B PROGRAM PLC_PRG
VAR
g_BInst : FB_B;
xVar-
END_VAR
xVa\overline{r := g_BInst.fb_init(TRUE, TRUE);}
//this instruction causes the following order of initializations:
//FB_A.fb_init
//FB_B.Me\overline{th_MyInit // SA0106}
//FB_B.fb_init
//FB_B.Meth_MyInit
--> SA0106: Virtual method call 'Meth_MyInit' in FB_INIT

```

- \({ }^{2}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0107: Missing formal parameters}

Detects whether or not formal parameters are missing Justification: Code becomes more readable when formal parameters are specified in the call. Importance: Low
```

Example

```
```

FUNCTION FUNA : BOOL

```
FUNCTION FUNA : BOOL
VAR_INPUT
VAR_INPUT
    bDO: BOOL;
    bDO: BOOL;
    bInit: BOOL;
    bInit: BOOL;
    bManual : BOOL;
    bManual : BOOL;
END_VAR
END_VAR
VAR
VAR
    iInit: INT;
    iInit: INT;
    iLocal: INT;
    iLocal: INT;
    iManual: INT;
    iManual: INT;
END_VAR
END_VAR
IF bInit = TRUE THEN
IF bInit = TRUE THEN
    iInit := iInit + 1;
    iInit := iInit + 1;
END_IF
END_IF
IF \overline{bDo = TRUE THEN}
IF \overline{bDo = TRUE THEN}
    iLocal := iLocal + 1;
    iLocal := iLocal + 1;
END_IF
END_IF
IF \overline{bManual = TRUE THEN}
IF \overline{bManual = TRUE THEN}
    iManual:= iManual + 1;
    iManual:= iManual + 1;
END IF
END IF
FUNA := TRUE;
FUNA := TRUE;
PROGRAM PLC_PRG
PROGRAM PLC_PRG
VAR
VAR
END_VAR
END_VAR
FUNA(bInit := TRUE, bDo := TRUE, bManual := FALSE); // OK
FUNA(bInit := TRUE, bDo := TRUE, bManual := FALSE); // OK
FUNA(TRUE, TRUE, bManual:= FALSE);
FUNA(TRUE, TRUE, bManual:= FALSE);
--> SA0107: Missing formal parameter for input 'TRUE'
```

--> SA0107: Missing formal parameter for input 'TRUE'

```

\section*{SA0111: Pointer variables}

Detects variables of type POINTER TO
Justification: The IEC 61131-3 standard does not permit pointers.
Importance: Low

\section*{Example}
```

VAR
piTemp : POINTER TO INT;
pbyTemp : POINTER TO BYTE;
END_VAR
--> SA0111: Data type POINTER not allowed

```

See also
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

\section*{SA0112: Reference variables}

Detects variables of type REFERENCE TO
Justification: The IEC 61131-3 standard does not permit references.
Importance: Low

\section*{Example}
```

VAR
ref int : REFERENCE TO INT;
ref_dw : REFERENCE TO DWORD;
END_\overline{VAR}
--> Data type REFERENCE not allowed

```

\section*{See also}
- «2 Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0113: Variables with data type WSTRING}

Detects variables of type WSTRING
Justification: Not all systems support WSTRING. The code is more easily portable without WSTRING.

\section*{Example}
```

VAR
wstrTemp : WSTRING;
END_VAR
--> SA0113: Data type WSTRING not allowed

```

\section*{See also}
- «2 Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0114: Variables with data type LTIME}

Detects variables of type LTIME.
Justification: Not all systems support LTIME The code is more easily portable without LTIME.
Importance: Low

\section*{Example}
```

VAR
ltVar : LTIME; // SA0114
END_VAR
--> SA0114: Data type LTIME not allowed

```

See also
- \({ }^{\Perp}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

\section*{SA0115: Variables with data type UNION}

Detects declarations of a UNION data type and variable declarations of the UNION type Justification: The IEC 61131-3 standard does not include unions. The code is more easily portable without unions.
Importance: Low
Example
```

TYPE u1: UNION
lrTemp : LREAL;
liTemp : LINT;
END UNION
END_TYPE
PROGRAM PLC_PRG
VAR
uVar: ul;
END_VAR
--> SA0115: Unions not allowed

```

See also
- \({ }^{*}>\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls'" on page 4231

\section*{SA0117: Variables with data type BIT}

Detects variable declarations of data type BIT (possible within structure definitions) Justification: The IEC 61131-3 standard does not include the data type BIT. The code is more easily portable without BIT.

Importance: Low

\section*{Example}
```

TYPE Struct1 :
STRUCT
bitVar : BIT;
iVar : INT;
bVar : BOOL;
END_STRUCT
END_TYPE
--> SA0117: Variables with data type BIT

```

\section*{See also}
- \({ }^{2}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0119:Object-oriented features}

Detects the use of object-oriented features, such as function block declarations with EXTENDS and IMPLEMENTS, or property and interface declarations. This rule is useful when you write code that is intended to be ported to other IEC 61131-3-compliant systems.

Justification: Not all systems support object-oriented programming. The code is more easily portable without object-orientation.

Importance: Low

\section*{Example}
```

//Function block extended by another and implementing an interface:
FUNCTION_BLOCK POU EXTENDS CTD IMPLEMENTS ITF //SA0119
// Declaration parts of property methods assigned to a function
block:
POU.Prop.Get //SA0119
POU.Prop.Set //SA0119
--> SA0119: Object-oriented features not allowed

```

\section*{See also}
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

\section*{SA0120: Program calls}

Detects program calls
Justification: According to the IEC 61131-3 standard, programs can be called in the task configuration only. The code is more easily portable when you do not call programs from other locations.

Importance: Low
```

Example

```
```

PROGRAM prog_control

```
PROGRAM prog_control
VAR
VAR
END_VAR
END_VAR
PROGRAM PLC PRG
PROGRAM PLC PRG
VAR
VAR
END_VAR
END_VAR
prog_control();
prog_control();
--> SA0120: Program call to 'prg_control' not allowed
```

--> SA0120: Program call to 'prg_control' not allowed

```

\section*{See also}
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0121: Missing VAR_EXTERNAL declarations}

Detects the use of a global variable in function blocks without them being declared there as "VAR_EXTERNAL"
Justification: According to the IEC 61131-3 standard, access to global variables is permitted only by an explicit import by means of a VAR_EXTERNAL declaration.

Importance: Low
PLCopen rule: CP18

\section*{Example}
```

VAR_GLOBAL
iGlob1:INT;
END_VAR
PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
ivar:=iGlob1; // SA0121
--> SAO121: EXTERNAL declaration required for variable ''iGlob1'

```

\section*{Example: \\ Avoid error}
```

VAR_GLOBAL
iGlob1:INT;
END_VAR
PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
VAR EXTERNAL
iGlob1:INT;
END_VAR
ivar:=iGlob1; // OK

```

See also
- \({ }^{\boldsymbol{y}} \boldsymbol{y}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0122: Array index defined as expression}

Detects the use of expressions in the declaration of array indexes Justification: Not all systems permit expressions as array limits.

Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR CONSTANT
c_iValue : INT := INT\#15;
EN\overline{D VAR}
VAR
arr: ARRAY[0..c_iValue + 1] OF INT;
END_VAR
--> SA0122: Only constants allowed for array definition 'arr'

```

\section*{See also}
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

SA0123: Usages of INI, ADR or BITADR
Detects the use of the CODESYS-specific operators INI, ADR, and BITADR Justification: CODESYS-specific operators prevent the portability of code. Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
uiTemp: UINT;
TempVarInFUNC: DWORD;
END_VAR
TempVarInFUNC := ADR(uiTemp); //SA0123
--> SA0123: Operator 'ADR' not allowed

```

\section*{See also}
- \({ }^{4}\), Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

\section*{SA0147: Unusual shift operation - strict}

Detects bit shift operations that are not made to bitfield data types (BYTE, WORD, DWORD, LWORD)
Justification: The IEC 61131-3 standard permits bit access only to bitfield data types. However, the CODESYS compiler also permits bit shift operations with unsigned data types.
Importance: Low

\section*{See also the strict rule SA0018.}

\section*{Example}
```

PROGRAM PLC_PRG
VAR
in_byte : BYTE := 16\#45; // 2\#01000101
in_word : WORD := 16\#0045; // 2\#0000000001000101
in_uint : UINT;
in_dint : DINT;
erg_byte : BYTE;
erg_word : WORD;
erg_uint : UINT;
erg_dint : DINT;
n: \overline{BYTE := 2;}
END_VAR
erg_byte := SHL(in_byte,n); // no error because BYTE is a bit field
erg_word := SHL(in_word,n); // no error because WORD is a bit field
erg_uint := SHL(in_uint,n); // SA0147
erg_dint := SHL(in_dint,n); // SA0147
--> SA0147: Unusual shift operation - strict

```

\section*{See also}
- \({ }^{\star} \Rightarrow\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231
- 乡 Chapter 6.6.3.4.2.17 "SA0018: Unusual bit access" on page 4243

SA0148: Unusual bit access - strict
Detects bit access that is not made to bitfield data types (BYTE, WORD, DWORD, and LWORD). The IEC 61131-3 standard permits only bit access to bitfield data types. However, the CODESYS compiler also permits bit access to unsigned data types.

Example
```

PROGRAM PLC_PRG
VAR
iTemp1 : INT;
diTemp3 : DINT;
uliTemp4 : ULINT;
siTemp5 : SINT;
usiTemp6 : USINT;
byTemp2 : BYTE;
END_VAR
iTemp1.3 := TRUE; // SA0148
diTemp3.4 := TRUE; // SA0148
uliTemp4.18 := FALSE; // SA0148
siTemp5.2 := FALSE; // SA0148
usiTemp6.3 := TRUE; // SA0148
byTemp2.5 := FALSE; // no error because BYTE is a bit field
--> SA0148: Unusual bit access - strict

```

See also
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0118: Initialisations not using constants}

Detects initializations that do not assign constants
Justification: Initializations should be constant if possible and should not refer to other variables. In particular, you should avoid function calls during initialization because this can allow access to uninitialized data.

Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
dwTemp : DWORD := 22;
dwTest : DWORD := dwTemp; // SA0118
dwVar : DWORD := TempVarInFUNC(); // SA0118
END VAR
--> SAO118: Initialisations not using constants

```

\section*{See also}
- \(\quad>\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls'" on page 4231

\section*{SA0124: Pointer dereferences in declarations}

Detects pointer dereferences that are used for initialization in the declaration part
Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.
Importance: Medium
Example
```

FUNCTION_BLOCK FB_Test
VAR_INPUT
refStruct: REFERENCE TO ST_Test;
END VAR
VAR
xPointer : BOOL := refStruct.a; // SA0124
iCount : INT;
END_VAR
--> SA0124: Dereference access in initialisation

```

\section*{See also}
- \({ }^{4}\) ) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"" on page 4231

\section*{SA0125: References in initializations}

Detects reference variables that are used for initialization in the declaration part
Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium

\section*{Example}
```

PROGRAM PLC_PRG
VAR
xRef: REFERENCE TO INT;
iCount: INT := xRef;
END_VAR
--> SAO125: Reference used in initializations

```

\section*{See also}
- \({ }^{\Perp}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0140: Statements commented out}

Detects commented-out statements
Justification: Code is often commented out for debugging purposes. When this kind of comment is released, it is not always clear at a later time whether the code should be deleted, or whether it has been commented out for debugging purposes and unintentionally not uncommented.

Importance: High
PLCopen rule: C4
Example
```

PROGRAM PLC_PRG
VAR
iValuel: INT;
iValue2: INT;
END_VAR
iValue1 := 100;
iValue2 := 200;
// iValue2 := 300;
--> SA0140: Statement commented out:: iValue2 := 300

```

\section*{See also}
- \({ }^{\star}\), Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{Possible Use of Uninitialized Variables}
6.6.3.4.2.51.1 SA0039: Possible null-pointer deferences.............................. 4296
6.6.3.4.2.51.2 SA0046: Possible use of not initialised interface...................... 4297
6.6.3.4.2.51.3 SA0145: Possible use of not initialised reference.................... 4298

SA0039: Possible null-pointer deferences
Detects code locations where a null pointer is possibly dereferenced
Justification: A pointer should be checked before each dereferencing to make sure it is not equal to zero. Otherwise an access violation may occur at runtime.

Importance: High

\section*{Example}
```

PROGRAM PLC_PRG
VAR
ptiVar1:POINTER TO INT;
ptiVar2:POINTER TO INT;
ptiVar3:POINTER TO INT;
iVar:INT;
iCount :INT;
iCondition: INT;
END_VAR
iCount := iCount + INT\#1;
ptiVar1 := ADR(iVar);
ptiVar1^ := iCondition; // OK - valid reference
ptiVar2^ := iCondition; // SA0039 - null pointer dereferenciation
iVar := ptiVar3^; // SA0039 - null pointer dereferenciation
--> SA0039: Possible null pointer dereference 'ptiVar2^'
--> SA0039: Possible null pointer dereference 'ptiVar3^'

```

\section*{See also}
- \& Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

SA0046: Possible use of not initialised interface
Detects the use of interfaces that were not initialized before being used
Justification: An interface reference should be checked for <> 0 before it is used. Otherwise an access violation may occur during access.
Importance: High
```

Example
//declaration of INTERFACE ITF and assigned METH2:
METHOD METH2 : BOOL
VAR_INPUT
iInput2:INT;
END_VAR
//declaration of INTERFACE Master_ITF1 and assigned METH:
METHOD METH : BOOL
VAR INPUT
iInput:INT;
END_VAR
PROGRAM PLC_PRG
VAR
instPOU:POU;
instITF:ITF;
instMasterITF1:Master_ITF1;
instMasterITF2:Master__ITF2;
iDummy:INT;
xDummy:BOOL;
instNoInitITF:ITF;
instNoInitITF2:ITF;
instNoInitMasterITF1:Master_ITF1;
instNoInitMasterITF2:Master_ITF2;
END_VAR
instITF := instPOU;
xDummy := instITF.METH(iInput := iDummy); // OK
instMasterITF1 := instPOU;
xDummy := instMasterITF1.METH(iInput := iDummy); // OK
xDummy := instNoInitITF.METH(iInput := INT\#1); // SA0046
xDummy := instNoInitITF.METH2(iInput2 := INT\#2); // SA0046
xDummy := instNoInitMasterITF1.METH(iInput := INT\#3); // SA0046
iDummy := instNoInitMasterITF2.Prop; // SA0046
IF instNoInitITF <> O THEN
instNoInitITF.Prop; // OK, weil das Interface nicht 0
sein kann
END_IF
--> SAOO46: Possible use of not initialised interface
'instNoInitITF'
--> SA0046: Possible use of not initialised interface
'instNoInitITF'
--> SAOO46: Possible use of not initialised interface
'instNoInitMasterITF1'
--> SAOO46: Possible use of not initialised interface
'instNoInitMasterITF2

```

\section*{See also}
- \({ }^{4}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

SA0145: Possible use of not initialised reference
Detects any reference variables that may not be initialized before use and are not checked by the operator ISVALIDREF. This rule is applied in the implementation part of POUs. Rule SA0124 applies to the declaration.

Justification: A reference should be checked for its validity before access because an access violation may occur during access.
Importance: High
Example
```

PROGRAM PLC_PRG
VAR_INPUT
ref_iTest : REFERENCE TO INT;
END_VAR
ref_iTest := 99; // SA0145
IF __ISVALIDREF(ref_iTest) THEN
ref_iTest := 88;
END_IF
--> SA0145: Possible use of not initialised reference 'ref_iTest'

```

\section*{See also}
- ② Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231
- Hy Chapter 6.6.3.4.2.49.15 "SA0124: Pointer dereferences in declarations" on page 4295

\section*{SA0150: Violations of lower or upper limits or the metrics}

Detects the POUs that violate the activated metrics at the lower or upper limits
Justification: Code that complies with certain metrics is easier to read, easier to maintain, and easier to test.
Importance: High
PLCopen rule: CP9
Example Initial situation: The "Number of calls" metric is selected in "Project Settings \(\rightarrow\) Static Analysis \(\rightarrow\) Metrics". Lower limit: 0 ; upper limit: 3. Prog_1 is called five times.
When running the static analysis, the "SA0150: Metric violation for Prog_1. Report for metric calls (5) > 2" error is issued in the message view, in the "Build" category.

See also
- \({ }^{2}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0160: Recursive calls}

Detects recursive calls in actions, methods, and properties of function blocks. Also detects possible recursions from virtual function calls and interface calls.

Justification: Recursions lead to non-deterministic behavior and are therefore a source of errors. Importance: Medium
PLCopen rule: CP13

\section*{Example The following method Call is assigned to the function block FB_Test:}
```

FUNCTION_BLOCK FB_Test
VAR
bParameter: BOOL;
END_VAR
METHOD Call : BOOL
VAR_INPUT
END-VAR
Cal\overline{l}}:= THIS^.Call(); //SA0160
The program PLC_PRG calls FB_Test:
PROGRAM PLC_PRG
VAR
fbTest : FB_Test;
bValue : BOO}L
END VAR
bValue := fbTest.bParameter;
fbTest.Call();
--> SA0160: Recursive call detected: 'PLC_PRG -> FB_Test.Call ->
FB_Test.Call

```

See also
- \({ }^{2}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0161: Unpacked structure in packed structure}

Detects unpacked structures that are used in packed structures
Justification: The compiler typically sets an unpacked structure to an address that allows aligned access to all elements within the structure. If you create this structure in a packed structure, then aligned access is no longer possible. Furthermore, access to an element in the unpacked structure can lead to a misalignment exception.
Importance: High
```

Example The structure structSingleDataRecord is packed, but it contains the unpacked structures
struct4Byte and struct9Byte.
{attribute 'pack_mode' := '1'}
TYPE structSingle\overline{DataRecord :}
STRUCT
str9ByteData: struct9Byte; (* 9 BYTE *)
str4ByteData: struct4Byte; (* 4 BYTE *)
udil: UDINT;
udi2: UDINT;
udi3: UDINT;
usi4: USINT;
END_STRUCT
END_TYPE (* 9 BYTE *)
TYP\overline{E struct9Byte :}
STRUCT
usiRotorSlots: USINT; (* 1 BYTE *)
uiMaxCurrent: UINT;
usiVelocity: USINT;
uiAcceleration: UINT; (* 2 BYTE *)
uiDeceleration: UINT; (* 2 BYTE *)
usiDirectionChange: USINT; (* 1 BYTE *)
END_STRUCT
END_TYPE TYPE struct4Byte :
STRŪCT
//udiDummy : UDINT;
rRealDummy : REAL;
END_STRUCT
END_TYPE
--> SA0161: Declaration of an unpacked struct 'struct9ByteData'
inside a packed struct 'structSingleDataRecord'
--> SA0161: Declaration of an unpacked struct 'struct4ByteData'
inside a packed struct 'structSingleDataRecord'

```

\section*{See also}
- \({ }^{\star}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0162: Missing comments}

Detects uncommented locations in the program
Justification: Complete commenting is required by many programming guidelines, and it increases the readability and maintainability of the code.
Importance: Low
PLCopen rule: C2
Comments are required in the following cases:
- Declaration of variables (Comments are located either above the declaration or to the right of the declaration.)
- Declaration of programs, function blocks, or methods (Comments are located above the declaration in the first line.)

\section*{Example}
```

PROGRAM PLC_PRG
VAR
iMaxValue: INT;
END_VAR
--> SA0162: Missing comment for 'PLC_PRG'
--> SA0162: Missing comment for 'iMaxValue'

```

\section*{See also}
- \({ }^{2}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0163: Nested comments}

Detects nested comments
Justification: Nested comments should be avoided because they are difficult to read.
Importance: Low
PLCopen rule: C3

\section*{Example}
```

{attribute 'do-analysis'}
(* That is
(* nested comment 1 *)
*)
PROGRAM PLC_PRG
VAR
(* That is
// nested comment 2
comment *)
iVal1: INT;
iVal2: INT;
(* That is
(* nested comment 3 *) *)
pVal3: POINTER TO DWORD;
hugo: INT;
END_VAR
(* That is
// nested comment 4
comment *)
iVal1 := iVal1 + 1;
(* That is
(* nested comment 5 *)
*)
(* Not that one *)
--> SA0163: Nested comment 'nested comment 1'
--> SA0163: Nested comment 'nested comment 2'
--> SA0163: Nested comment 'nested comment 3'
--> SA0163: Nested comment 'nested comment 4'
--> SA0163: Nested comment 'nested comment 5'

```

See also
- \({ }^{4}\) Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0164: Multiline comments}

Detects multiline comments that are coded as (* comment *). Only single-line comments that are coded as / / comment are permitted.

Justification: Some programming guidelines prohibit multiline comments in code because the beginning and end of a comment could get lost and the closing comment bracket could be deleted by accident.

You can deactivate this check by means of the pragma analysis, also for comments in the declaration part.

Importance: Low
PLCopen rule: C5

\section*{Example}
```

{attribute 'do-analysis'}
(*
This is a multi-line comment // SA0164
*)
PROGRAM PLC PRG
VAR
// This is a single line comment
a: DINT;
END_VAR
(* This is not a single line comment *) // SA0164
a := a + 1;

```

\section*{See also}
- \(\Leftrightarrow\) Chapter 6.6.3.4.1.3 "Attribute 'analysis'" on page 4229

\section*{SA0165: Tasks calling other POUs than programs}

Detects tasks that call function blocks or functions instead of a program
Justification: This rule is part of the PLCopen Coding Guidelines. Therefore, compliance is also checked in CODESYS. We do not see any problems with data consistency in CODESYS if tasks would call POUs other than programs. However, problems can occur if the code is to be ported to other platforms.

Importance: Low
PLCopen rule: CP16
Tasks are inserted below the task configuration. The POUs to be called are configured in the tasks. The POUs must be the "Program" type. The "Function block" and "Function" types are not permitted.
\begin{tabular}{|c|c|}
\hline Example & \begin{tabular}{l}
自！PLC Logic
Application通）Library Manager －FB（FB） －PLC＿PRG（PRG） \\
－Task Configuration －MainTask㥜 PLC PRG
\end{tabular} \\
\hline
\end{tabular}

\section*{See also}
－② Chapter 6．6．3．4．1．6＂Attribute＇analysis：report－multiple－instance－calls＂＂on page 4231

SA0166：Max．number of input／output／in－out variables．．．
Detects whether or not a defined number of input variables（VAR＿INPUT），output variables （VAR＿OUTPUT）or VAR＿IN＿OUT variables is exceeded in a POU．In the＂Project Settings＂， double－click the rule entry \(\overline{\text { to }}\) open a dialog where you define the maximum number．
Justification：This is about checking individual programming guidelines．Many programming guidelines provide for a maximum number of POU parameters．Too many parameters make the code unreadable and the POUs difficult to test．

Importance：Medium
PLCopen rule：CP23
Example In the project settings，for Rule 166，you have defined a maximum number of 1 for VAR＿IN＿OUT variables．
```

FUNCTION BLOCK FB1
VAR_INPU\overline{T}
xIn : BOOL;
END VAR
VAR IN_OUT
xInOut1 : BOOL;
xInOut2 : BOOL;
END_VAR
--> SA0166: Too many VAR_IN_OUT variables in POU 'FB1'

```

\section*{See also}
－\({ }^{4}\) Chapter 6．6．3．4．1．6＂Attribute＇analysis：report－multiple－instance－calls＂＇on page 4231

\section*{SA0167：Temporary function block instances}

Detects function block instances that are declared as temporary variables．This affects instances that are declared in a method or function or as VAR＿TEMP，and therefore are reinitial－ ized in each processing cycle or for each POU call．
Justification：Function blocks have a state that is usually maintained over multiple PLC cycles． An instance on the stack exists only for the duration of the function call．Therefore，it rarely makes sense to create an instance as a temporary variable．Secondly，function block instances are often large and need a lot of space on the stack（which is usually restricted to controllers）． Thirdly，the initialization and often also the scheduling of a function block can take a long time．

Importance: Medium

\section*{Examples}
```

PROGRAM PLC_PRG
VAR
END_VAR
VAR_TEMP
yafb: AFB;
END_VAR
FUNCTION Fun : INT
VAR_INPUT
END_VAR
VAR
funafb: AFB;
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
VAR
methafb: AFB; // SA0167
END_VAR
--> SA0167: Temporary function block instance: 'methafb'

```

\section*{See also}
- Chapter 6.6.3.4.1.6 "Attribute 'analysis:report-multiple-instance-calls"' on page 4231

\section*{SA0168: Unnecessary Assignments}

Detects assignments to variables which do not have any effect in the code.
Justification: When values are assigned to a variable multiple times without the variable being evaluated between assignments, the first assignments do not have any effect on the program. Importance: Low

\section*{Example}
```

PROGRAM PLC_PRG
VAR
dwVal1 : DWORD;
dwVal2 : DWORD;
END_VAR
dwVal1 := 1; // unnecessary assignment
IF dwVal2 > 100 THEN
dwVal2 := 0;
dwVal2 := dwVal2 + 1;
END_IF
dwVall := 2;
--> SA0168: The variable 'dwVall' is assigned but its value is
never used.

```

See also
- «Chapter 6.6.3.2 "Configuring and Running Static Analysis" on page 4209

\section*{SA0169: Ignored outputs}

Detects the outputs of methods and functions that are not specified when calling the method or function.

Justification: Ignored outputs can be a notice about an unhandled error or meaningless function calls because results are not used.
Importance: Medium

\section*{Example}
```

FUNCTION Fun1
VAR_INPUT
bIn : BOOL;
VAR END
VAR_OUTPUT
bOut : BOOL;
END_VAR
PROGRAM PLC_PRG
VAR
bValue :BOOl;
END_VAR
Fun1(bIn : TRUE);
--//SA0169: The output 'bOut' is ignored when called.

```

\section*{See also}
- \& Chapter 6.6.3.4.2.28.5 "SA0036: Unused output variables" on page 4251

\subsection*{6.6.4 Multi download tool}

The multi download tool for AC500 V3 PLCs in Automation Builder enables firmware updates and application downloads of the same project to several PLCs of the same type.

Preconditions - For application download: An AC500 V3 PLC with the desired target application is available as reference to create an online backup as input for the multi download tool (tbf backup file).
- For firmware download: The desired firmware must be provided as memory card image as input to the multi download tool.

It is recommended to close all Automation Builder instances and projects besides the multi download tool to avoid conflicts and performance reductions.

Create reference - For application backup: Create an online backup of your desired AC500 V3 PLC target data for download application via PLC device editor's "Backup and Restore" tab as tbf (target backup file). For further details, please refer to the help section.
\({ }^{\wedge}\) Chapter 6.4.1.21.2.8.6 "Tab 'Backup and Restore"' on page 2435
- For firmware download: Create a firmware memory card image of your target PLC application via context menu on the application node "Export \(\rightarrow\) Firmware (SD-card)...".

Usage of the The multi download tool can be launched within the Automation Builder via "Tools \(\rightarrow\) Options multi download tool

Selection The first editor section offers the possibility to select a firmware memory card image and/or an application backup file which shall be downloaded to the PLCs. Depending on the selection a firmware download and/or application download is then executed when executing the [Download] button.
The PLCs to download to can be defined in several ways:
- Execute a scan via [Scan] button and the found connected PLCs will be listed in the table.
- Import a corresponding PLC addresses configuration as csv-file into the table via [lmport list] button.
- Enter the IP addresses in the table manually or via copy and paste.

The PLCs to consider for download can be defined via the checkboxes in the first table column. A defined selection can be exported via the [Export list] button as csv-file for later reuse or external modification.

Device name, port, MAC address and serial number are shown as information only. The IP address itself is sufficient to identify the PLC.

Configuration General settings for the multi download tool can be configured by clicking the [Setting] button or settings via "Tools \(\rightarrow\) Options \(\rightarrow\) Multi download tool".
\begin{tabular}{|c|c|c|c|c|c|}
\hline Options & & & & & \(\times\) \\
\hline \begin{tabular}{l}
International Settings \\
Libraries \\
License Manager \\
Load and Save \\
Message View \\
Multi download tool \\
PLCopenXML \\
PROFINET \\
Proxy Settings \\
Python Scripting Editor \\
Refactoring \\
SFC editor \\
SmartCoding \\
Startup settings \\
Text editor \\
Visualization \\
Visualization styles \\
Visualization user management
\end{tabular} & \begin{tabular}{l}
Multi download tool \\
Network scan settings \\
Network scan timeout (seconds) \\
Blink timeout (seconds) \\
Multi download settings \\
Number of parallel downloads \\
Download timeout (minutes)
\end{tabular} & \[
\begin{aligned}
& 10 \\
& \hline 10 \\
& \hline \\
& \hline 10 \\
& \hline 5 \\
& \hline
\end{aligned}
\] & & & \\
\hline & & & QK & Cancel & \\
\hline
\end{tabular}
- "Network scan timeout": Maximum time to wait for the network scan results (by default 10 seconds).
- "Blink timeout": Maximum time to wait for the blink operation to execute (by default 10 seconds).
- "Number of parallel downloads": How many PLC downloads are executed in parallel (by default 10).
- "Download timeout": Depending on the network infrastructure the download might run into errors due to timeouts. The user will not be informed about these timeouts directly, but each timeout might result in errors. To avoid these timeouts the corresponding value can be adapted here in minutes (by default 5 minutes).

Specific settings like "Force download even when there are applications running on the PLC" and "Reboot PLC after download operation" can be defined directly in the lower part of the multi download tool editor.

Check Double-check the selection by executing the [Blink] button which triggers a display blinking of the checked PLCs which are connected to the PC. The connection status itself can be updated via the [Check connection] button indicating it in the "Connected" column.

Download The download of the defined firmware and/or application backup to the checked PLCs can be executed via the [Download] button.
If downloads to running PLCs shall be executed, the setting "Force download even when there are applications running on the PLC" must be enabled.

The PLC type of the application backup file/firmware memory card image is cross-checked with the PLC types of the checked PLCs before executing a download.

In case a firmware memory card image is selected for download process, first the firmware is download und updated. The status can be seen in the column "Firmware download". The selected application backup file is downloaded afterwards. The corresponding status is shown in the column "Application download".

If any error occurs, it is shown in the corresponding status column with additional information in the "Error message" column.
After successful download the PLCs are rebooted if the setting "Reboot PLC after download operation" is enabled.
The status of a download is shown as "Success", "Failed" or "In progress" for the firmware/application and the PLC state is shown with "Stop" and "Run" modes.

A running download can be cancelled via the [Cancel Download] button which finishes the currently running downloads and stops further executions afterwards.
An overall summary of executed and ongoing downloads can be found in the status line below the table. The results of the download can be documented via "Export Results".

\subsection*{6.6.5 Tool Calling Interface (TCI) implementation}

Automation Builder supports the Tool Calling Interface (TCI) up to conformance class 3 to engineer 3rd party safety devices.
The TCI from PROFINET organization offers a standard interface to call 3rd party configuration tools to e.g., configure iParameters in functional safety applications, calculate F_iPar_CRC values and write configurations via the PLC to the safety devices.

The corresponding vendor specific configuration tools must be installed manually on the same PC as the Automation Builder. As soon as a 3rd party safety device is added to the Automation Builder project and a matching configuration tool is found to be installed, corresponding context menus are offered on the device to call this tool via TCI (refer to screenshot below).

The offered functionality of those configuration tools strongly varies on the device manufacturer. In the following the functionalities and workflows are exemplarily shown with two tools.

TR TCI Device Tool
1. Install the "TR TCI Device Tool" on the same PC as the Automation Builder.
2. Install the required TR GSDML-files in the Automation Builder device repository.
3. Create the desired devices configuration in the Automation Builder device tree.
4. Define the required iParameter of the TR safety device in the Automation Builder.
5. Open the "TR TCI Device Tool" via context menu on the TR safety device.
6. Calculate the F_iPar_CRC in the "TR TCI Device Tool" and paste the value into the corresponding field in the Automation Builder editor.

In case an online connection is available you can also display the F-Destination-Address which can be set via rotary switches depending on the used hardware device and read/write maintenance data.
To enable an online connection, you must be online in Automation Builder, PLC needs to be in RUN and PROFINET must be running.

\section*{Siemens F-Des-tinationAddress Assign Device Tool}
1. Install the Siemens S7-Failsafe Configuration Tool on the same PC as the Automation Builder.
2. Install the required Siemens GSDML-files in the Automation Builder device repository.
3. Create the desired devices configuration in the Automation Builder device tree.
4. Change "F_Dest_Add" or "F_Source_Add" on the Siemens safety device in the Automation Builder project.
5. Set "F_Dest_Add" and "F_Source_Add" (if needed in offline mode).

6. Go online, PLC needs to be in RUN and PROFInet must be running.
7. Call the Siemens device tool and choose your preferred way of identification (LED blinking or serial number).

8. Select the check box at the module where the F-destination-address should be set.
9. Press the [Identification] button.
10. Press the [Assign PROFIsafe-address] button after you confirmed that either the correct module is blinking or the displayed serial numbers is matching.

The device tool has a build in timeout with only a view seconds. After that time the device tool cannot communicate with the slave anymore. In this case close the device tool and reopen it again.

\subsection*{6.6.6 Drive composer pro integration}

Drive Composer Pro is a start-up and maintenance tool for ABB's common architecture drives. The tool is used to view and set drive parameters, and to monitor and tune process performance.

Drive Composer Pro provides:
- Setting parameters,
- taking local control of the drive from the PC,
- event logger handling
- control diagrams,
- fast monitoring,
- working with multiple drives on the PC tool network,
- macro script editing for parameters and much more.
1. Add "Drive Composer Pro" object into the tree via add object dialog.
2. Open the "Drive Composer Pro" with double-click on the object.

In the following section important functions are described.

Import of 1. Import of FSO backup files (*.dcsafety) and Drive Parameters backup files (*.dcparamsbak) into Automation Builder project via the Drive Composer Pro object in the device tree.
2. View of integrated FSO backup files and Drive Parameters backup files in Automation Builder project - refer to figure below.

\(\Rightarrow\)
Drive Composer Pro can't be launched directly with integrated "FSO backup files" but they have to be loaded manually via context menu on the drive in Drive Composer Pro \(\rightarrow\) "Safety Settings".

Export of 1. Select the FSO and Drive Parameters backup files.
backup files
2. Export the selected file by clicking [Export].
\(\Rightarrow\) Select the desired storage path.

Remove of 1. Select the FSO and Drive Parameter backup files from Automation Builder project.
backup files
2. Remove the selected files by clicking [Remove].

View standard drive parameter backup files
1. Open the "Crane_follower12.dcparamsbak" with double-click.
2. The "Drive Composer Pro" starts automatically.

Standard Drive Parameter backup files (*.dcparamsbak) are automatically displayed under "File Drives".

3. Saved changes in the standard drive parameter backup file are automatically updated in the Automation Builder project.

\subsection*{6.6.7 Professional Version Control}

\subsection*{6.6.7.1 SVN integration in CODESYS}

Professional Version Control allows for the development of CODESYS projects under version control by Apache \({ }^{\text {TM }}\) Subversion®. Professional Version Control provides an SVN client integrated in CODESYS. The objects of your project are versioned in a central SVN repository.

As a rule, the SVN repository should be created in a server configuration and located on a server. For testing purposes, you can create a local SVN repository where you can access via file://.

Professional Version Control requires a valid license and can be installed using the Automation Builder Installer or the Automation Builder Installation Manager.

\subsection*{6.6.7.2 Getting Started}

The following steps are required in order to develop your CODESYS project with Professional Version Control with version control by Apache \({ }^{\text {TM }}\) Subversion®:
1. Install the Professional Version Control package in CODESYS.
2. Install an SVN server.
3. Create an SVN repository.
4. Open your CODESYS project in CODESYS.
5. Import the CODESYS project into the SVN project archive.
\(\Rightarrow\) The CODESYS project is saved in the SVN repository.
6. To edit and further develop the project with SVN version control, the project is edited in CODESYS and then committed to the SVN repository.

As of version 4.4.0.0, in the case of storage profile inconsistencies between the working copy and the project in the SVN repository, corresponding instructions will guide you further. Under certain circumstances, commit actions at the object level are then no longer possible.
See also
- \& Chapter 6.6.7.4 "Using an SVN Repository" on page 4316
- 帠 Chapter 6.6.7.5 "Using Working Copies" on page 4318

\subsection*{6.6.7.3 Version control}

What is version control?

Apache \({ }^{\text {TM }}\) Subversion® (SVN) is a tool for version and revision management of current and previous versions of files, such as source code, websites, and documentation. Apache \({ }^{\text {TM }}\) Subversion \(®\) is a registered trademark of the Apache Software Foundation.

Revision management (also known as version control, version management, and source code management) is the management of changes to documents, programs, and other information that is stored as computer files. Version control is employed frequently in software development when a team of employees works on the same files.
Tasks
- Tracking of changes in revisions: At any time, you can show who made which changes at which time.
- Restoring of old revisions of individual files: At any time, you can reverse accidental changes to files.
- Archiving of special revisions of a project: At any time, you can revert to older versions.
- Coordination of shared access of developers to data
- Development of a project at the same time in multiple branches

Script Engine Professional Version Control provides a scripting-interface for SVN.
SVN Add-on API

\subsection*{6.6.7.4 Using an SVN Repository}

An SVN repository usually saves information as a file system tree, a hierarchy of files, and directories. Any number of clients connects to the SVN repository and reads or writes changes to the files in revisions.

\section*{NOTICE!}

Consult with your IT specialists for more information, for example how to create an SVN repository. For production purposes, we recommend a strictly dedicated administrative SVN server.
We recommend that you create the suggested default directory structure in the SVN repository.
See also
- http://svnbook.red-bean.com/en/1.8/ svn.tour.importing.html\#svn.tour.importing.layout

Creating an SVN repository for testing purposes

\section*{NOTICE!}

Use the file: / / access method for testing purposes only.

You can reach SVN repositories that were created in format 1.8 or 1.9 via the file:// protocol.

For testing purposes, you can create a local SVN repository without installing your own server. The SVN repository is accessed via file:// and provides the same functionality as a server.

\section*{Creating a test repository with TortoiseSVN}
\(\square\) Requirement: The SVN client TortoiseSVN 1.9 is installed on the development system.
1. Create a new, empty folder on your local file system. The test repository will be created there.
\(\Rightarrow\) Example: D:\SVN repository
2. Click "TortoiseSVN \(\rightarrow\) Create repository here".
\(\Rightarrow\) The dialog "Create repository" opens.
3. Click "Create directory tree".
\(\Rightarrow\) The SVN repository is created.

See also
- Documentation TortoiseSVN Documentation TortoiseSVN

Accessing the SVN repository

Table 772: SVN repository URLs
\begin{tabular}{|l|l|}
\hline file:/// & Direct access to an SVN repository (on local hard drive) \\
\hline http:// & \begin{tabular}{l} 
Access via WebDAV protocol to Apache server that is sup- \\
ported by SVN
\end{tabular} \\
\hline https:// & As http://, but with SSL encryption \\
\hline svn:// & Access via own protocol to an svnserve server \\
\hline svn+ssh:// & As svn://, but tunneled via SSH \\
\hline
\end{tabular}
1. Open the CODESYS project that you want to save in the SVN repository.
\(\Rightarrow\) Example: A.project is open.
2. Click "Project \(\rightarrow\) SVN \(\rightarrow\) Import project to SVN".
\(\Rightarrow\) The "Browse SVN repository" dialog opens.
3. Select the directory file:///D:/SVN repository/trunk in the directory tree.
4. Select the \(\pm\) command.
\(\Rightarrow\) The "Create remote directory" dialog opens.
5. Specify the URL for the new directory.

Note: Because the new directory should contain the CODESYS project, specify the project name with extension here.
\(\Rightarrow\) file:///D:/SVN\%20repository/trunk/A.project
6. Click "OK" to close the dialog.
7. Select the new project and click "OK" to exit the "Browse SVN repository" dialog.
\(\Rightarrow\) The "Import Project to SVN" dialog opens. The directory file:///D:/SVN repository/trunk/A.project is specified in "URL of SVN repository".

See also
- \({ }^{*} \boldsymbol{y}\) Chapter 6.6.7.6.1 "Overlay Icons" on page 4319

\subsection*{6.6.7.5 Using Working Copies}

Checking out a You can copy CODESYS projects to your development system that are saved in the SVN project
Creating a working copy
1. Open CODESYS
2. Click "Project \(\rightarrow\) SVN \(\rightarrow\) Checkout".
\(\Rightarrow\) The "Checkout" dialog opens.
3. Specify the URL of the SVN repository and select a project in the SVN repository tree.

A CODESYS project is automatically identified by its file extension (.project, _project, . library or _library) as a "project" or "library project" at checkout.
4. In "Checkout to", specify the name and location of the working copy on your development system.
5. Click "OK" to close the dialog.
\(\Rightarrow\) The project opens in CODESYS. In the object tree of the project, the SVN link is shown with overlaid icons. Now the project is saved as a working copy on your development system.

See also
- „y Chapter 6.6.7.6.1 "Overlay Icons" on page 4319

\section*{Editing the working copy}

Changed working copy format in Professional Version Control V4.1.0.0 and later

Update the working copy before you start editing, especially if the project is revised by a team. This is how you avoid conflicts.
1. Open the working copy.
2. Click "Project \(\rightarrow\) SVN \(\rightarrow\) Update project" (symbol: \(\longleftarrow)\).
\(\Rightarrow\) You working copy is current.
3. Revise your project.
4. Click "Project \(\rightarrow\) SVN \(\rightarrow\) Edit SVN working copy".
\(\Rightarrow\) The dialog opens. There you can browse your changes.
5. Close the dialog.
6. If necessary, you can click "SVN \(\rightarrow\) Revert" in the context menu.
\(\Rightarrow\) The file is reverted back to the base revision and your changes are discarded.
7. If necessary, you can click "Compare" in the context menu of an edited object.
\(\Rightarrow\) The compare dialog opens. You can resolve any conflicts here.
8. Close the compare dialog.
9. Click "Project \(\rightarrow\) SVN \(\rightarrow\) Commit project" (symbol: »).
\(\Rightarrow\) The "Commit" dialog opens.
10. In "Message", specify a log entry that describes your changes. Example: Changes for customer ABC, request 1234.
\(\Rightarrow\) Your changes are saved in the SVN repository as a revision with a revision number.

See also
- \({ }^{4}\), Chapter 6.6.7.6.2.2 "Command 'SVN Repository Browser'" on page 4322

For projects in version Professional Version Control V4.1.0.0 and later, the working directory (working copy) has a new format.
If you open a project that was created with V4.0.4.0 or earlier, then the project is updated automatically to the new format when it is opened.
If you open a project that was created with V4.0.4.0 or earlier and the project is based on an older SVN version of \(1.7 . x\) or earlier, then you are prompted whether or not CODESYS should update the format. If you decline the update, then the SVN link of the project is deactivated. You can still load and edit the project.
The update does not have an effect on saving to the SVN server. You can also checkout projects with earlier versions of the client. The new format affects only the local working directory.

\subsection*{6.6.7.6 Reference, User Interface}

\subsection*{6.6.7.6.1 Overlay Icons}

Every object in CODESYS has a status value in the SVN repository. This status value is displayed in the object tree (in the "POUs", "Devices", or "Modules" views) for each object by overlay icons.

Table 773: Overlay icons
\begin{tabular}{|c|c|}
\hline + & Object is planned to be added to the SVN repository. \\
\hline 1 & Object conflicted \\
\hline \(\times\) & Object deleted \\
\hline \(\square\) & Object modified \\
\hline \(\square\) & Object with modification in the metadata \\
\hline \(\square\) & Object with modifications in the memory format \\
\hline * & Object normal \\
\hline - & Object write-protected (read-only) \\
\hline - & Object locked \\
\hline * & Object with deleted subobjects \\
\hline ¢ & Object ignored on commit \\
\hline \(\pi\) & External object \\
\hline ¢ & Ignored object \\
\hline \(?\) & Unversioned object \\
\hline \({ }^{\text {® }}\) & Object with modified subobjects \\
\hline T & The object is not saved in the SVN repository. It will be created again when loaded from SVN. \\
\hline - & SVN_VERSION_INFO temporarily unavailable, for example as with interface libraries \\
\hline 中 & The status of the object is not updated. \\
\hline U & The object was modified on the server (Update available). \\
\hline \% & The object was locked on the server by another user (or in another working directory). \\
\hline 4 & Tree conflict by changes to the structure of the project \\
\hline
\end{tabular}

\subsection*{6.6.7.6.2 Commands}

\section*{Availability of commands}

Not all commands are available in the logged in state because some SVN commands of the project could be changed.

\section*{Command 'SVN Repository Browser'}

Symbol:
Function: This command opens the SVN repository browser. The contents of an SVN repository is shown in a tree structure here. You can search through the repository in the browser.
Call: Menu bar: "Project \(\rightarrow\) SVN".
Depending on the selected object, the following commands are available in the context menu:
- "Show log"
- "Checkout"
- "Create folder"
- "Copy to"
- "Rename"
- "Delete"

Double-clicking the object with the right mouse button opens the log dialog.

\section*{Dialog 'SVN \\ Repository \\ Browser'}
\(\left.\begin{array}{|l|l|l|}\hline \text { "URL" } & \begin{array}{l}\text { URL in SVN repository } \\ \text { Example: https: / / svnserver/repository/trunk/ } \\ \text { ControlABC.project }\end{array} \\ \text { Tip: As soon as a valid SVN repository is specified, you can browse and select a } \\ \text { specific project by means of the adjacent button. }\end{array}\right]\)

See also
- © Chapter 6.6.7.6.3.3 "Dialog 'Select revision'" on page 4351

\section*{Command 'Edit SVN working copy'}

\section*{Symbol: 를}

Function: This command opens the dialog "Edit SVN working copy" and displays the working copy in a browser from the SVN view.

Call: Menu bar: "Project \(\boldsymbol{\rightarrow}\) SVN".
The functionality of the browser allows for:
- Access to and actions on objects that are not displayed in the "Devices" view.
- Actions on objects that can lead to exceptions in the "Devices" view.
- Editing of global objects that are modified, in conflict, or blocked.

\section*{Dialog 'Edit SVN}
working copy'
Table 775: "Edit SVN working copy: <project name> - <project URL>"
\begin{tabular}{|c|c|}
\hline "Path in the SVN repository" & \begin{tabular}{l}
Display of working copy from SVN view repository. The file and folder structure of the objects in the project are presented in a tree view here. As a result, the recursion depth of an object is visible. \\
Object selected for the following menu command
\end{tabular} \\
\hline "Name of object" & \begin{tabular}{l}
File name of the object \\
Example: Application
\end{tabular} \\
\hline "Node type" & The top node is the project root directory. \\
\hline "Text status" & \begin{tabular}{l}
Object status: \\
- "modified" \\
- "added" \\
- "deleted" \\
- "non-versioned" \\
- "Conflicted"
\end{tabular} \\
\hline "Property status" & \begin{tabular}{l}
Status in SVN repository: \\
- "modified" \\
- "added" \\
- "deleted" \\
- "Conflicted" \\
- "normal"
\end{tabular} \\
\hline "Revision" & Revision number \\
\hline "Conflict information" & File conflict, property conflict, or tree conflict \\
\hline "Lock" & For locked objects, the user who applied the lock is displayed. Example: b.mayer \\
\hline "Lock comment" & Lock message. Implicit, normal, or stolen lock. \\
\hline "URL" & URL of the object \\
\hline
\end{tabular}

Table 776: Menu commands
\begin{tabular}{|l|l|}
\hline\(\boxtimes\) & \\
\hline "Select \(\rightarrow\) All" & Selects all files. \\
\hline "Select \(\rightarrow\) None" & Deselects all files. \\
\hline "Select \(\rightarrow\) Modified" & Selects the modified files. \\
\hline "Select \(\rightarrow\) Conflicted" & Selects the conflicted files. \\
\hline "Select \(\rightarrow\) Locked" & Selects the locked files. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\(\leqslant\) & \begin{tabular}{l} 
Updates the working copy. Changes made by others are added from the SVN \\
repository to your working copy.
\end{tabular} \\
\hline "Update \(\rightarrow\) Project" & Updates all files of the project. \\
\hline "Update \(\rightarrow\) Selected nodes" & Updates only the selected files. \\
\hline \begin{tabular}{l} 
"Update \\
\(\overrightarrow{~ S ~ S e l e c t e d ~ n o d e s ~ a n d ~}\) \\
children"
\end{tabular} & Updates the selected files and subordinate files. \\
\hline
\end{tabular}

↔＂Clear＂ \(\left\lvert\, \begin{aligned} & \text { Discards your changes to the working copy．Then the object corresponds to the } \\ & \text { revision in the repository．}\end{aligned}\right.\) revision in the repository．
\begin{tabular}{|l|l|}

\hline ＂Delete \(\rightarrow\) Selected nodes＂ & Deletes the selected objects from the working copy．
\end{tabular}
\begin{tabular}{|l|l|}
\(\star\)＂Commit＂ & \begin{tabular}{l} 
Commits your changes to the SVN repository．Any locked objects will be \\
unlocked．
\end{tabular} \\
\hline ＂Commit \(\rightarrow\) Project＂ & Commits all files in the project． \\
\hline ＂Commit \(\rightarrow\) Selected nodes＂ & Commits only the selected files． \\
\hline \begin{tabular}{l}
＂Commit \\
\(\rightarrow\) Selected nodes and \\
children＂
\end{tabular} & Commits the selected files and subordinate files． \\
\hline
\end{tabular}
\begin{tabular}{|l|l|} 
白 & Commands for managing locks． \\
\hline ＂Locks \(\rightarrow\) Revalidate all＂ & \begin{tabular}{l} 
Checks the validity of locks in the working copy．Any invalid locks will be \\
unlocked．
\end{tabular} \\
\hline ＂Locks \(\rightarrow\) Release locks＂ & Releases the lock． \\
\hline ＂Locks \(\rightarrow\) Acquire locks＂ & Locks the object from editing by others． \\
\hline ＂Locks \(\rightarrow\) Steal locks＂ & \begin{tabular}{l} 
Locks the file for you and removes the lock of another user． \\
Tip：Avoid stealing a lock because the changes made by another user can be \\
lost．
\end{tabular}
\end{tabular}
\begin{tabular}{|l|l|}
\(\boldsymbol{\Delta}\) & Commands to resolve conflicts． \\
\hline ＂Conflicts \(\rightarrow\) Mark as resolved＂＂ & \begin{tabular}{l} 
Indicates a displayed conflict in the SVN repository as marked and resolved． \\
Note：Select the command if you edited and resolved the displayed conflict． \\
Then you can commit changes again．
\end{tabular} \\
\hline \begin{tabular}{l}
＂Conflicts \\
\(\rightarrow\) Resolve using theirs＂
\end{tabular} & \begin{tabular}{l} 
Resolves the conflict：In the SVN repository，the changes are accepted that were \\
committed by other users．Your changes are discarded．
\end{tabular} \\
\hline \begin{tabular}{l}
＂Conflicts \\
\(\rightarrow\) Resolve using mine＂
\end{tabular} & \begin{tabular}{l} 
Resolves the conflict：In the SVN repository，the changes to your working copy \\
are accepted and the changes by other users are discarded．
\end{tabular}
\end{tabular}

\footnotetext{
\(\square^{2}\)＂Show log＂
}

〕＂＂Change location＂

中＂Update＂
Opens the dialog＂Log－Application＂．The history of the selected node is shown here．The previous revisions are displayed with the respective actions．

Changes the storage location of the selected object within the working copy．
Example：You can resolve a tree conflict by saving the local object to another location．Then update the parent object to apply it to the locked children．
\(\square\)
｜Updates the browser view by rescanning the working copy．
Executes an SVN cleanup operation on the working copy．

\section*{Command 'Import project to SVN'}

Symbol:
Function: This command opens the "Import Project to SVN" dialog for importing a CODESYS project to the SVN repository.
Call: Menu bar: "Project \(\boldsymbol{\rightarrow}\) SVN".

\section*{Requirement}
- You have access to an SVN repository and you know its URL.
- You have read access to the entire project.

\section*{NOTICE!}
```

Projects are always saved unencrypted on the server. Therefore, take appropriate security measures (for example, respective access rights to the SVN server) for protecting your projects.

```

See also
- User and access management in Protect and save project

\section*{Dialog 'Import}

Project to SVN'
\begin{tabular}{|c|c|}
\hline "URL of SVN repository" & \begin{tabular}{l}
URL of the SVN repository with the new project folder where the files are imported \\
Example: https://svnserver/repository/trunk/ \\
ControlABC.project \\
Hint: When importing libraries, specify the extension .library or _library. For projects, specify the extension . project or project. Then the project type is recognized automatically at checkout and the options are set accordingly in the "Checkout" dialog.
\end{tabular} \\
\hline \(\cdots\) & Opens the "SVN Repository Browser" dialog The previous project structure is displayed and you can edit them here. \\
\hline "Import message" & \begin{tabular}{l}
Text for use as log message \\
Example: Control project for customer A
\end{tabular} \\
\hline "Recent messages" & Opens the "Recent Messages" dialog. There you can reuse the last log messages. \\
\hline "Generate SVN_VERSION_INFO" & \(\square\) : The object SVN_VERSION_INFO is not created automatically during the import operation. Therefore, the project does not get any global constants or variables for the project metadata. \\
\hline "OK" & Creates the current project in the SVN repository and imports the project objects. The local project in CODESYS Development System is linked to the SVN repository. Overlay icons show this in the object trees. \\
\hline
\end{tabular}

See also

\section*{Command 'Checkout'}

Symbol: «৷
Function: This command opens the "Checkout" dialog. Here you can checkout a project stored in the SVN repository as a working copy.
Call: Menu bar: "Project \(\boldsymbol{\rightarrow}\) SVN".

\section*{Dialog 'Check- \\ out'}

Table 777: "URL of SVN repository"
\begin{tabular}{|c|c|}
\hline  & \begin{tabular}{l}
URL of the project in the SVN repository \\
Example: https://svnserver/repository/trunk/ \\
ControlABC.project \\
Tip: As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in "Revision" and select a specific project.
\end{tabular} \\
\hline 15 & \begin{tabular}{l}
Opens the dialog "Select revision". \\
The button is labeled with the currently selected revision: \\
- "HEAD": Newest revision (top revision). Default \\
- " 15 ": Revision number of the selected revision \\
- "12/23/2016 11:59:59 (UTC)": Change date of the selected revision (UTC) \\
Note: The dialog provides the same options as the "Revision" group.
\end{tabular} \\
\hline \(\ldots\) & Opens the "SVN repository browser" dialog Here you can browse the SVN repository. \\
\hline
\end{tabular}

Table 778: "Checkout to"
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Name of the working copy \\
Example: ControlABC.project
\end{tabular} \\
\hline "Location" & \begin{tabular}{l} 
Storage location of the working copy \\
Example: /D:/svn/repository/trunk/ControlABC.project
\end{tabular} \\
\hline
\end{tabular}

Table 779: "Checkout as"
\begin{tabular}{|l|l|}
\hline "Project" & The project is saved as a CODESYS project "<project name>.project". \\
\hline "Library" & The project is saved as a CODESYS library file "<project name>. library". \\
\hline "Auto-detect" & \begin{tabular}{l} 
CODESYS attempts to recognize the project type by means of the extension. \\
The current implementation checks whether the URL of the project ends with \\
" library" or ". library". In this case, the project is recognized as a library \\
or a project.
\end{tabular} \\
\hline
\end{tabular}

Table 780: "Checkout options"
\begin{tabular}{|l|l|}
\hline "Omit externals": & \(\boxed{ } \quad\) : Externals (external objects) are not copied to the working directory. \\
\hline
\end{tabular}

Table 781: "Revision"
For a description, refer to the section "Dialog 'Select revision'".
Note: The group provides the same options as the "Revision" dialog.

\section*{"OK" \\ Checks out the project from the SVN repository, saves it locally to the specified} location, and opens it in CODESYS as the primary project.

If files were encrypted when imported to the SVN repository, or if they have been committed, then note the following:

When committing to the SVN repository, the information about an encrypted project file is included. However, the type of encryption is not included (password, Wibu security key, X509 certificate). Therefore, it may be necessary to encrypt the working copy again in the project settings. In this case, a dialog opens when exiting the command to notify you of this. Then you are able to switch directly to the project settings.

- "Version control with Subversion", Section "Revision identifier"

\section*{Command 'Commit', Command 'Commit Project'}

Symbol: ォ
Function: The command commits changes that were made in CODESYS to the SVN repository. The "Commit" dialog opens for this purpose.

\section*{Call:}
- Context menu: "SVN" to commit exactly this object
- "Project \(\rightarrow\) SVN \(\rightarrow\) Commit Project" to commit all changes in the project at the same time

Requirement: At least one object was modified. An object whose contents have been modified is overlaid in the object tree with the \(\square, \square\), or \(\square\) Symbol.
When you execute the command, the lock on the objects to be committed is lifted automatically.

\section*{Dialog 'Commit'}

Table 782: "Commit to: <URL project/object>"
\begin{tabular}{|l|l|}
\hline & \begin{tabular}{l} 
URL in SVN repository \\
Example: file:///D:/SVN repository/trunk/ControlABC.project
\end{tabular} \\
\hline "Log message" & \begin{tabular}{l} 
Type in a log message that comments your change. \\
Example: Bug fix error 123
\end{tabular} \\
\hline "Recent Messages" & \begin{tabular}{l} 
Opens the "Recent Messages" dialog for displaying the last log messages. You \\
can click a log message to accept it.
\end{tabular} \\
\hline
\end{tabular}

Table 783: "Changes made (double-click on object for compare, right-click on object for more operations)"

"Select/Deselect All"
All objects in the list are selected.
\begin{tabular}{|l|l|}
\hline "Keep Locks" & \(\boxed{\text { " }}\) : Your locked object remains in locked after the commit. \\
\hline "Keep Change Lists": & \(\boxed{\square}\) : The change list also remains after the commit. \\
& \(\square:\) The change list is not deleted after the commit.
\end{tabular}
\begin{tabular}{|c|c|}
\hline Button "Update Project" & \begin{tabular}{l}
Updates the project \\
Hint: Prevent conflicts by committing a previously updated project/object.
\end{tabular} \\
\hline \begin{tabular}{l}
"OK" \\
Keyboard shortcut [Ctrl]+ [Enter] \\
Keyboard shortcut [Ctrl]+ [Enter]
\end{tabular} & \begin{tabular}{l}
Checks the working copy first. Starts the commit of changes when the working copy is current. \\
Opens a dialog when the working copy is outdated. You can then select from the following: \\
- "Abort the commit, I want to investigate the issue." \\
- "Yes, I want to update this project now." \\
- "Continue with the commit, I know what I do." \\
Note: The history of the commit is displayed in the "Messages" view. \\
The messages are highlighted in color. \\
- Blue: Commit a change \\
- Green: Add an object \\
- Dark red: Delete/replace an object \\
- Black: Other messages (summary)
\end{tabular} \\
\hline
\end{tabular}

\section*{Handling external objects}

If the external object is in the same SVN repository, then changes in this external object are listed in the commit dialog and committed together with the internal project. If an external object is in another SVN repository, then you are notified about changes in the external project and you have to commit these separately.
An external object has the "externals" property.

\hline
\end{tabular}

\section*{Command 'Compare'}

\section*{Symbol:}

Function: This command opens a tab that shows the result of the comparison of your working copy and the BASE revision. The base revision is the top-level revision in the SVN repository.
Call:
- Menu bar: "Project \(\rightarrow\) SVN".
- Context menu

Requirement: The object is versioned, it was modified locally, and it does not contain any conflicts.
Multiple tabs can be open at the same time with the comparison of different objects.

\section*{Comparison by object type}

The comparison dialog makes use of the functionality of the CODESYS command "Project \(\rightarrow\) Compare". In this way, objects are compared according to their object type.

\section*{See also}
- \& Chapter 6.4.1.5 "Comparing projects" on page 1817

\section*{Command 'Compare with HEAD revision'}

Symbol: \&
Function: This command opens a tab that shows the result of the comparison of your working copy and the HEAD revision. The HEAD revision is the top-level revision in the branch. You can revert specific changes that were committed to the HEAD revision.
Call: Context menu: "SVN"
Requirement: The object is versioned and not conflicted.
Multiple tabs can be open at the same time with the comparison of different objects.

\section*{Comparison by object type}

The comparison dialog makes use of the functionality of the CODESYS command "Project \(\rightarrow\) Compare". In this way, objects are compared according to their object type.

\section*{See also}
- \& Chapter 6.4.1.21.3.5.21 "Command 'Compare"' on page 2607

\section*{Command 'Compare with revision'}

Symbol: Q

Function: This command opens the "Project log" dialog or "Log-<object>" where the version history is displayed from the project or an object of the CODESYS project. Here you can select a revision. A tab opens and shows the result of the comparison of your working copy and the revision.

Call: Context menu: "SVN"
Requirement: The object is versioned and not conflicted.
Multiple tabs can be open at the same time with the comparison of different objects.

\section*{Comparison by object type}

The comparison dialog makes use of the functionality of the CODESYS command "Project \(\rightarrow\) Compare". In this way, objects are compared according to their object type.

- 鼠 Chapter 6.4.1.21.4.11 "Dialog 'Properties'" on page 2753

\section*{Command 'Include externals to project', Command 'Include externals'}

Symbol: x
Function: These commands open the dialog "Include externals".
Call:
- Menu bar: "Project \(\rightarrow\) SVN".
- Context menu: "SVN"

Requirement: An object is selected in the object tree. The external objects are linked below that. If you have selected nothing or the project root directory, then the command "Include externals to project" is available. If you have selected an object, then the command "Include externals" is available.

The same external objects cannot be linked multiple times at different locations in the same project. This leads to problems in CODESYS because of conflicts with the internal identification of the object.

\section*{Dialog 'Include externals'}

Table 788: "URL of SVN repository"
\begin{tabular}{|c|c|}
\hline leillidisw repo A/tunk DSTest.proect/Source & \begin{tabular}{l}
URL of the external object that is linked. The object to be linked is versioned and can have sub-objects. \\
External objects are located at another location in the SVN repository than the project. It can even be in another SVN repository. \\
Example: file:///D:/SVN repo A/trunk/DSTest.project/ GlobalTextList \\
Note: The objects that should be linked below the selected object must have a matching object type. For example, only a task can be linked below the "Task configuration" object.
\end{tabular} \\
\hline 15 & \begin{tabular}{l}
Opens the dialog "Select revision". Here you can select a revision. \\
The button is labeled with the currently selected revision: \\
- "HEAD": Newest revision (top revision). Default \\
- "15": Revision number of the selected revision \\
- "12/23/2016 11:59:59 (UTC)": Change date of the selected revision (UTC) \\
Note: The dialog provides the same options as the "Revision" group.
\end{tabular} \\
\hline \(\ldots\) & Opens the "SVN repository browser" dialog Here you can browse the SVN repository. \\
\hline
\end{tabular}

Table 789: "Revision"
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{\begin{tabular}{l} 
Options for selecting a revision \\
Note: the current valid selection is also displayed in the buttons next to the SVN repository URL.
\end{tabular}} \\
\hline "HEAD" & \(\bullet\) : Latest revision (top revision) selected in a branch. \\
\hline "Revision" & \begin{tabular}{l} 
©: A specific revision by the revision number. \\
Example: 3
\end{tabular} \\
\hline "Date" & \begin{tabular}{l} 
©: A specific revision by the modification date. \\
Example: \(12 / 23 / 2016 \quad 11: 59: 59\)
\end{tabular} \\
\hline "Use UTC Time": & \(\boxed{V}:\) Modification date in universal time. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "OK" & \begin{tabular}{l} 
Adds the external object and its sub-objects with the property svn: externals \\
to your project (below the selected object). The working copy is updated and the \\
external object is overlaid with the 天symbol. \\
\\
Example: source (external device Source) \\
\\
\\
\\
Note: If the linking fails (for example when adding a device below a task configu- \\
ration), then the complete operation fails and reverts back. \\
\\
\\
Note: Renaming or moving individual external objects is permitted inly within an \\
external tree, whereby it is not permitted to move the top object. \\
\\
To move a complete tree, you have to remove it and link it to another location.
\end{tabular} \\
\hline
\end{tabular}

\begin{abstract}
".. You should seriously consider using explicit revision numbers in all of your externals definitions. Doing so means that you get to decide when to pull down a different snapshot of external information, and exactly which snapshot to pull. Besides avoiding the surprise of getting changes to third-party repositories that you might not have any control over, using explicit revision numbers also means that as you backdate your working copy to a previous revision, your externals definitions will also revert to the way they looked in that previous revision, which in turn means that the external working copies will be updated to match the way they looked back when your repository was at that previous revision. For software projects, this could be the difference between a successful and a failed build of an older snapshot of your complex codebase. ..."

This is cited from:
http://svnbook.red-bean.com/nightly/en/svn.advanced.externals.html).
\end{abstract}

\section*{Command 'Ignore on commit'}

Function: This command identifies an object and adds it to the "ignore-on-commit" list. Then it is deactivated in the commit dialog by default.

Call: Menu bar: "SVN"
Requirement: At least one object is available that is not in the change list ignore-oncomment.

Objects of the "ignore-on-commit" list are overlaid with the symbol in the object tree. By default, they are not selected in the commit dialog, unless a dependency of a selected object requires it. These objects can always be selected manually in the dialog.

See also
- \(\Leftrightarrow\) Chapter 6.6.7.6.2.27 "Command 'Un-Ignore on commit'" on page 4343

\section*{Command 'SVN Info'}

Function: This command provides information about the selected object in the SVN repository. The "SVN Information" dialog opens for this purpose.

Call: Context menu: "SVN"
Requirement: A versioned object (with SVN link) is selected in the object tree.

\section*{Dialog 'SVN}

Information

\section*{Example}
```

Name: Device_4\Plc Logic\Application\PLC_PRG
URL: file:///D:/SVN repository/trunk/ControlABC.project/Device/Plc
Logic/Application/PLC_PRG/svnobj
Repository Root: file:///D:/SVN repository/

Checksum: d5fb4d91ebaea06f26bcdb15942724d57932b6a3

```

\section*{Command 'Show properties'}

Symbol:
Function: This command opens the "SVN Properties" dialog. Here you can edit the properties of the versioned object.

Call: Context menu: "SVN"
Requirement: A versioned, unlocked object is selected.

\section*{Dialog 'SVN \\ Properties'}

Table 790: "properties for: <object name>"
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Name of the property \\
Example: myprop: customer-number \\
Note: SVN has some reserved properties. Example: svn:mime-type
\end{tabular} \\
\hline "Value" & \begin{tabular}{l} 
Example: 1234 \\
Double-click in the field to edit the value..
\end{tabular}
\end{tabular}
\begin{tabular}{|l|l|} 
"Add" & Opens a dialog to define another property with its value. \\
\hline "Remove" & Deletes the selected property.
\end{tabular}
"Show binary properties" |ی: The binary properties are also displayed.
\begin{tabular}{|l|l|} 
"Reset" & Resets the changes displayed in green. \\
\hline "OK" & Accepts the changes. \\
\hline
\end{tabular}

See also
- http://svnbook.red-bean.com.

\section*{Command 'Get lock'}

Symbol: e
Function: This command locks the object explicitly for you. The "Lock Message" dialog opens for this purpose.
Call: Context menu: "SVN"
Requirement: The versioned object is not locked (not overlaid with the symbol).

\section*{Dialog 'Lock \\ Message'}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Enter the reason why you lock \\
the object:"
\end{tabular} & \begin{tabular}{l} 
Lock message \\
Example: Locked for processing task 123
\end{tabular} \\
\hline Button "Recent Message" & \begin{tabular}{l} 
Shows message in the dialog that have already been used. There you select one \\
in order to use the lock message.
\end{tabular} \\
\hline "Recursive" & : The object is locked with all subordinate child objects. \\
\hline "OK" & \begin{tabular}{l} 
Locks the object \\
When the lock is successful, the object (in the object tree) is overlaid with the \\
symbol.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Steal locks'}

Symbol: :
Function: This command steal the lock of the object. The "Lock Message" dialog opens for this purpose.

Call: Context menu: "SVN"
Requirement: The versioned object is locked by someone else (overlaid with the \({ }_{0}\) symbol).

\section*{Dialog 'Lock \\ Message'}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Enter the reason why you lock \\
the object:"
\end{tabular} & \begin{tabular}{l} 
Lock message \\
Example: a.mayer had to steal the lock because the changes \\
need to be implemented so urgently.
\end{tabular} \\
\hline "Recent Message" & \begin{tabular}{l} 
Shows message in the dialog that have already been used. There you select one \\
in order to use the lock message.
\end{tabular} \\
\hline "Recursive" & 包: The lock is stolen by the object and all subordinate child objects. \\
\hline "OK" & \begin{tabular}{l} 
Steals the lock. \\
When the stolen lock is successful, the object (in the object tree) is overlaid with \\
the symbol.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Release lock'}

Symbol:
Function: This command releases the lock of an object.
Call: "Context menu \(\rightarrow\) SVN"
Requirement: The object is locked.

\section*{Command 'Release locks recursively'}

Symbol:
Function: This command releases the lock of an object explicitly with all of its subordinate objects.
Call: "Context menu \(\rightarrow\) SVN"
Requirement: The object is locked.

\section*{Command 'Show log', Command 'Show project log'}

\section*{Symbol: \(\equiv\)}

Function: These commands open the tab "Project log" or "Log - <object>". The version history of the project or an object of the CODESYS project is displayed in the tab.
Call:
- Menu bar: "Project \(\rightarrow\) SVN".
- "Context menu \(\rightarrow\) SVN"

If you select nothing or the base node in the object tree, then the history of the entire project is displayed ("Show project log"). If you select one or more objects, then the history of these elements is displayed ("Show log").
Multiple tabs can be open at the same time with the version history of different objects.

Tab 'Project log',
Dialog 'Log -
<object>'
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
Upper area \\
\(\bullet ~ " R e v i s i o n ": ~ R e v i s i o n ~\)
\end{tabular} \\
number
\end{tabular}\(\quad\)\begin{tabular}{l} 
List of all revisions of the project or the selected objects in the information. The \\
first 100 revisions are displayed by default. The "Next 100 " and "All" buttons are \\
provided for displaying more or all revisions. \\
- "Author" \\
- "Date" \\
"Message": Message \\
entered at commit
\end{tabular}\(\quad\)\begin{tabular}{l} 
context menu commands are described below.
\end{tabular}

Table 791: Dialog "Filter"
\begin{tabular}{|l|l|}
\hline "Revision range" & \begin{tabular}{l} 
The displayed revisions can be filtered by "Head", "Revision", or "Date". \\
V: The option fields for "Start revision" and "End revision" are editable.
\end{tabular} \\
& \begin{tabular}{l} 
"Use UTC time": Date display in universal time. \\
For more detailed information, refer to the description "Dialog 'Select revision'".
\end{tabular} \\
\hline "Message contains" & Display of revision logs that contain a special text in the "Message" \\
\hline "Author contains" & Display of revision logs of the specified author \\
\hline "Path contains" & Display of revision logs of the specified path \\
\hline
\end{tabular}

Table 792: Context menu commands of the revisions
\begin{tabular}{|l|l|}
\hline "Compare with base working \\
copy"
\end{tabular} \begin{tabular}{l} 
Compares the selected revision of the object with the base working copy (without \\
local changes).
\end{tabular}\(|\)\begin{tabular}{lll|}
\hline "Com with working copy" & Compares the selected revision of the object with the working copy. \\
\hline "Compare with HEAD revision" & Compares the selected revision of the object with the HEAD revision. \\
\hline \begin{tabular}{l} 
"Compare with previous \\
revision"
\end{tabular} & Compares the selected revision of the object with the previous revision. \\
\hline "Update item to revision" & \begin{tabular}{l} 
Updates the object to the selected revision. \\
Note: Changes of the project by this command cannot be committed. \\
For VSS users: This is comparable to loading an older version without checkout. \\
To revert a previous commit, the command "Revert to this revision" has to be \\
used.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline "Revert to this revision" & \begin{tabular}{l} 
Reverts the object to the selected revision. \\
This command does not have an effect on the SVN repository as long as the \\
changes are not committed. Internally, SVN reverts the merges for all changes \\
that were made after the selected revision in order to revert the changes of the \\
preceding commits.
\end{tabular} \\
\hline "Edit author" & Opens a dialog for changing the author of the revision. \\
\hline "Edit log message" & Opens a dialog for changing the log message of the revision. \\
\hline "Revision properties" & \begin{tabular}{l} 
Opens the dialog "Revision properties" where the properties are displayed. \\
In the dialog, you can activate the "Add" and "Remove" properties and the option \\
"Show binary properties".
\end{tabular} \\
\hline "Create branch/tag from this \\
revision" & Creates a branch or tag from the selected revision. \\
\hline "Browse SVN repository" & Opens the "SVN repository browser" dialog \\
\hline "Copy to clipboard" & \begin{tabular}{l} 
Copies log details of the selected revision to the clipboard This is the revision \\
number, author, date of revision, log message, and the list of changes objects for \\
each revision.
\end{tabular} \\
\hline
\end{tabular}

- \(\quad\) Chapter 6.6.7.6.3.3 "Dialog 'Select revision"" on page 4351

\section*{Command 'Revert', Command 'Revert project'}

\section*{Symbol: 子}

Function: This command opens the "Revert" dialog. In the dialog, select the objects whose local changes should be reverted, and those that are reverted to the state of the base revision of the working copy.

\section*{Call:}
- Menu bar: "Project \(\rightarrow\) SVN".
- "Context menu \(\rightarrow\) SVN"

If you select nothing or the main node in the device tree, then all modified objects are listed in this dialog ("Revert project"). If you selected one or more objects, then only the changes to this object are listed and recursively their sub-objects ("Revert").

\section*{Dialog 'Revert'}
\begin{tabular}{|l|l|}
\hline "Group externals" & \(\checkmark\) : The external definitions are grouped by their external storage locations. \\
\hline "Keep locks" & \(\boxed{\square}\) : The lock is retained for all files that are modified by the revert command. \\
\hline "Select/deselect all" & \\
\hline
\end{tabular}

When external objects are deleted, Professional Version Control cannot restore this data in SVN offline mode. The user is prompted how to proceed:
- Switch back to SVN online mode and call the external objects.
- Connect now to the SVN server one time in order to complete the current operation, but afterwards switch back to SVN offline mode.
- Skip the retrieval of the external objects. They can be fetched later by updating the project.

See also
- \(\Leftrightarrow\) Chapter 6.6.7.6.2.21 "Command 'Revert to revision', Command 'Revert project to revision'" on page 4340

\section*{Command 'Revert to revision', Command 'Revert project to revision'}

Symbol:
Function: This command opens the "Select revision" dialog. In this dialog, you select the revision to which the project or the selected objects revert.

Call:
- "Project \(\rightarrow\) SVN"
- "Context menu \(\rightarrow\) SVN"

If nothing or the base node is marked in the object tree, then the entire project is reverted to a specific revision ("Revert project to revision"). If one or more objects are selected, then these objects and their sub-objects are reverted ("Revert to revision").

Dialog 'Select For a description of the dialog, refer to the section "Select revision".
revision'

- \({ }^{*} \boldsymbol{y}\) Chapter 6.6.7.6.2.19 "Command 'Show log', Command 'Show project log'" on page 4337

\section*{Command 'Update', Command 'Update project'}

Symbol:
Function: This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.
Call:
- Menu bar: "Project \(\rightarrow\) SVN".
- "Context menu \(\rightarrow\) SVN"

If nothing or the main node is selected, then the entire project is updated ("Update project"). If one or more objects are selected, then these objects and their sub-objects are updated ("Update SVN").

The following cases are possible:
- Projects are added to the project that are present in the SVN repository, but not in the project. In this case, the message "Added <object>" is issued to the message view.
- Objects that no longer exist in the SVN repository, but are present in the project locally (and not marked as "added"), are treated according to the Subversion standard procedure: If local changes are present, then the object remains in the project as unversioned. If there are no local changes, then the object is also deleted locally because the user can retrieve the object from an older version at any time. In this case, "Deleted object" is issued to the message view.
- Versioned objects that exist in both the SVN repository and the project are updated if they are different. Three cases to observe:
- No local changes have been made since the last update: In this case, the local object is overwritten by the contents from the SVN repository. The message "Object updated" is issued to the message view.
- Local changes have been made since the last update and the corresponding object type can be merged. When versions have been merged successfully, the message "Objects merged" is issued to the message view. If the command is not executed successfully, then the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.
- Local changes have been made since the last update and the corresponding object type cannot be merged. In this case, the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.
If only some of the objects are updated, it may be that objects with the same name already exist. For example, this situation can come from moving objects to a folder.
For this conflict, you can react in the following ways:
- Do nothing and leave the conflict-causing objects as they are.
- Update (and remove) the conflicting objects in order to correct the conflict.
- Update the entire project in order to remove all conflicting objects and correct the conflict.

See also
- \& Chapter 6.6.7.6.2.23 "Command 'Update to revision"' on page 4341

\section*{Command 'Update to revision'}

Symbol:
SFunction: This command opens the "Update" dialog. In the dialog, the revision is defined for updating the project.
Call:
- "Project \(\rightarrow\) SVN"
- "Context menu \(\rightarrow\) SVN"

If you select nothing or the base node in the object tree, then the entire project is updated to a revision ("Update project to revision"). If you select one or more objects, then these objects are updated and their sub-objects are updated recursively ("Update to revision"). As an option, you can define that the sub-objects are not updated.
The behavior of the updating process (for example merging of conflicts) is similar to the "Update project" and "Update" commands.

\section*{Dialog 'Update'}
\begin{tabular}{|l|l|}

- \(\Rightarrow\) Chapter 6.6.7.6.3.3 "Dialog 'Select revision'" on page 4351

\section*{Command 'Update only this'}

Symbol: к
Function: The command updates the selected objects. In contrast to the "Update" and "Update to Revision" commands, the child objects are not updated.
Call: "Context menu \(\rightarrow\) SVN"
See also
- \(\Leftrightarrow\) Chapter 6.6.7.6.2.22 "Command 'Update', Command 'Update project' " on page 4340
- \({ }^{\circ}\) Chapter 6.6.7.6.2.23 "Command 'Update to revision'" on page 4341

\section*{Command 'Disconnect project from SVN'}

Symbol: \(x]\)
Function: This command deletes all connections of the current project to SVN by converting the project into a non-versioned project.
Call: Menu bar: "Project \(\rightarrow\) SVN".

Use the command "Connect to existing project" to connect to the SVN repository again at a later time.

See also
- \(\quad\) Chapter 6.6.7.6.2.31 "Command 'Connect to existing project"' on page 4345

\section*{Command 'Switch'}

\section*{Symbol: \(\uparrow\)}

Function: This command opens the "SVN switch" dialog. In this dialog, you specify a URL in the SVN repository to which the current working copy of the project is updated. The command switches a project from a branch or tag to another.
Call: Menu bar: "Project \(\rightarrow\) SVN".
Requirement: The project is versioned.

Dialog 'SVN
switch'
\begin{tabular}{|l|l|}
\hline "From" & Current SVN URL of the project \\
\hline "To" & Input field for the target URL in SVN \\
& \begin{tabular}{l} 
•HEAD": The "Select revision" dialog opens. \\
\\
\\
\\
\\
\hline\(\ldots .\). The "SVN Repository Browser" dialog opens. There you select the target \\
URE SVN repository.
\end{tabular} \\
\hline
\end{tabular}

See also
- \({ }^{\wedge}\) Chapter 6.6.7.6.2.2 "Command 'SVN Repository Browser'" on page 4322

\section*{Command 'Un-Ignore on commit'}

Function: This command removes an unversioned object from the ignore list so that the object is checked by default on commit.
Call: Context menu: "SVN"
Requirement: The command "Ignore on commit" was executed for the object. The object is marked with the symbol.
See also
- « Chapter 6.6.7.6.2.12 "Command 'Ignore on commit"" on page 4335

\section*{Command 'SVN Cleanup'}

Function: This command opens the "SVN Cleanup" dialog. In the dialog, you define actions that are performed when cleaning up the SVN working copy.
Call: Menu bar: "Project \(\rightarrow\) SVN".

\section*{Dialog 'SVN \\ Cleanup'}

Table 793

unlock of SVN internal data \\
structures (emergency only!)" & \begin{tabular}{l} 
V: Cleans up the internal SVN task queues and unlocks internal SVN data \\
structures. This should never be necessary during normal work by Professional \\
Version Control. \\
Note: Use this option only if errors occur for SVN commands due to locked \\
working copies. When this is the case, it refers to an error in Professional \\
Version Control. Then please send us an error report (if possible with steps to \\
repeat) to the CODESYS support. \\
Info: These are administrative locks that are internal locks in the SVN
\end{tabular} \\
working copy. These locks are not set up by context menu commands. For \\
more information, refer to the section "The three meanings of locks" in: \\
http://svnbook.red-bean.com/en/1.8/svn.advanced.locking.html
\end{tabular}
\begin{tabular}{|l|l|}
\hline \begin{tabular}{l} 
"Revert all local changes (use \\
with care!)"
\end{tabular} & Reverts all local changes to the original status in the SVN repository. \\
\hline "Release all locks" & \begin{tabular}{l} 
Releases all advisory locks in the project (locks visible to the user). These locks \\
are activated by "Acquire lock" and "Steal lock".
\end{tabular} \\
\hline \begin{tabular}{l} 
"Revalidate all locks against \\
the repository (they could have \\
been stolen)"
\end{tabular} & \begin{tabular}{l} 
Checks whether the locally available advisory locks are still valid or have been \\
stolen by someone else for example. All invalid locks are removed.
\end{tabular} \\
\hline "Status caches" & \begin{tabular}{l} 
"Clear all caches and refresh \\
status icons"
\end{tabular} \\
\begin{tabular}{l} 
Deletes all internal caches that Professional Version Control has and updates \\
the status icons. Required only if it issues an error in Professional Version \\
Control through which the caches or the status display are inconsistent.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Clear authentication data'}

Function: This command opens the "CODESYS" dialog. In this dialog, define the caches that will be deleted.

Call: Menu bar: "Project \(\rightarrow\) SVN".

\section*{Dialog 'CODE- \\ SYS'}

The authentication memory contains the authentication data of all SVN repositories for which the user has selected for saving the authorization data. This memory is deleted completely by this command.
"Clear the shared on-disk
The data saved on the computer is deleted. cache."
"Clear the RAM cache of this instance."

The authentication data saved on the computer is stored in \(\% A P P D A T A \%\) \Subversion \auth. This memory path is also used for most other Subversion client applications (for example, TortoiseSVN and AnkhSVN). Therefore, deleting the authentication data affects these applications as well.

\section*{Command 'Merge changes'}

Symbol: \(\uparrow\)
Function: This command opens the "Merge" dialog. In this dialog, you determine the revisions with the changes to be merged with the working copy of the project.

Call: Menu bar: "Project \(\rightarrow\) SVN".
Requirement: The project is linked to SVN.

\section*{Dialog 'Merge' 'c"}
\begin{tabular}{|c|c|}
\hline "Kind of merge" & \begin{tabular}{l}
- "Sync/Reintegrate/Symmetric merge": All missing changes from the trunk (or a different branch) are synchronized with this branch. \\
- "Cherry pick": Integrates specifically selected revisions from one branch to another branch. This is necessary, for example, if any error trapping has to be ported back to an older version.
\end{tabular} \\
\hline "Merge source" & \begin{tabular}{l}
SVN URL of the SVN repository \\
- Input field \\
- "HEAD": HEAD revision \\
- ....: Dialog "SVN Repository Browser" opens for selecting the SVN repository.
\end{tabular} \\
\hline "Define start and end revision" & Select this option to merge a cohesive range of revisions with the working copy. \\
\hline "Start revision" & Defines the range of revisions that are merged with the working copy: \\
\hline "End revision" & \begin{tabular}{l}
- "HEAD": HEAD revision \\
- "Revision": Start and end revision of the range \\
- "Date": Date of the start and end revisions
\end{tabular} \\
\hline "Define revision range" & \begin{tabular}{l}
Select this option to merge individual revisions with the working copy. You can also highlight the individual revisions in the "Log" dialog. \\
Note: When defining ranges, CODESYS SVN behaves like other graphical clients, such as Tortoise SVN), and not like the command-line client. Example: For a range of \(4-7\), revisions \(4,5,6\), and 7 are merged. \\
See also: Merging a Range of Revisions
\end{tabular} \\
\hline "Dry run (simulation)" & This command is executed without changing the working copy. Files that are changed during an actual merge are displayed, as well as ranges where conflicts occur. \\
\hline "Record only" & \: The revision is marked as "merged" without actually performing the merge. \\
\hline "Ignore ancestry" & \(\checkmark\) : SVN uses path-based differences only, not history-based differences. \\
\hline
\end{tabular}
- \({ }^{4}\) Chapter 6.6.7.6.3.3 "Dialog 'Select revision'" on page 4351
- \({ }^{4}\), Chapter 6.6.7.6.2.2 "Command 'SVN Repository Browser'" on page 4322

\section*{Command 'Connect to existing project'}

Symbol:
Function: This command opens the "Connect to SVN repository" dialog. In the dialog, you define the URL and the revision of the SVN repository with which the unversioned project is connected.

Call: Menu bar: "Project \(\rightarrow\) SVN".
Requirement: The project is disconnected from SVN.

\section*{NOTICE!}
```

Only users who have read access to the entire project (see the CODESYS user and access management) can import the project into the SVN repository or can link to an existing database project.

```

\section*{NOTICE!}

This command functions reliably only when the project has already been imported into SVN and then disconnected with the command "Disconnect project from SVN".

Dialog 'Connect
to SVN reposi-
tory'
\begin{tabular}{|l|l|}
\hline "URL of existing project" & \begin{tabular}{l} 
URL of the SVN repository \\
"HEAD": Selection of the revision in the "Select revision" dialog \\
\(\ldots\) \\
\(\ldots .\).
\end{tabular} \\
\hline "Chelection of the SVN repository in the "SVN Repository Browser"
\end{tabular}

See also
- \({ }^{\text {® }}\) Chapter 6.6.7.6.2.2 "Command 'SVN Repository Browser'" on page 4322

\section*{Command 'Resolve conflict'}

Symbol: Q
Function: This command opens the "<object>" dialog. In the dialog, the conflicts are displayed and functions for resolving conflicts are prepared in order to merge changes.
Call: Context menu of the object.
Requirement: The object has a conflict that has occurred by updating the object with local changes.

Dialog '<object>'
\begin{tabular}{|l|l|}
\hline "Compare" & \begin{tabular}{l} 
The local objects are displayed on the left side, and the version from the SVN \\
repository is displayed on the right side.
\end{tabular} \\
\hline "Use mine" & A local change is used. \\
\hline "Use yours" & A change of the version from the SVN repository is changed. \\
\hline "Apply" & \begin{tabular}{l} 
All changes are accepted that you made in this dialog. The status of the object is \\
changed.
\end{tabular} \\
\hline "Cancel" & \begin{tabular}{l} 
Cancels all changes that you made in this dialog. But the object keeps the \\
conflicted status.
\end{tabular} \\
\hline
\end{tabular}

\section*{Command 'Work in offline mode'}

Function: This command switches to SVN offline mode. In SVN offline mode, the implicit locking and all commands that access the SVN repository are not possible.

\section*{Call:}
- Menu bar: "Project \(\rightarrow\) SVN".
- Context menu: "SVN"

Requirement: The project is linked to SVN.
When switching back to SVN online mode, all present locks on the working copy are checked against the server. If this locking is invalid, then it is released.

The user on a machine wants to make changes to the project without disconnecting the connection. At the moment, there is not connection to the server. Despite this, when automatic locking is activated, work is possible because the SVN offline mode deactivates the automatic lock temporarily.

\section*{Command 'Copy (Branch/Tag)'}

Symbol: \(\uparrow\)
Function: This command opens the "SVN Copy Branch/Tag" dialog. There you can "Branch" or "Tag" a revision of your project. A specific revision of your project is saved there at this position. A branch is normally used in order to save changes isolated in one version. A tag is used for marking a specific state, for example a shipping version. Internally, it is copied not in the actual sense, but more refers to the revision.

Call: Menu bar: "Project \(\rightarrow\) SVN".
Requirement: The project is versioned.

Dialog 'SVN
Copy (Branch/
Tag)'
Table 794: "SVN repository"
\begin{tabular}{|l|l|}
\hline "From" & \begin{tabular}{l} 
SVN path of the current project \\
Example: https://svnserver/repository/trunk/ \\

\section*{Command 'Pending Changes'}

Symbol: ©
Function: The command opens the "Pending Changes" view. All objects are listed there which have changed from the base revision or which are locked.

Call: "View \(\rightarrow\) Pending Changes"

View 'Pending
Changes'

The modified or locked objects are displayed in the lower half of the view. You can use the "Commit", "Revert", and "Update" commands on single or multiple objects. You will find commands for comparing and displaying the version history in the context menu of a selected object.
CODESYS SVN first checks whether or not the storage format of the working copy matches the storage format of the project in the SVN repository. If the storage formats differ, then the revert must not be executed at the object level in order to prevent inconsistencies. In this case, you can delete the entire project (working copy) first with the Save as command as the appropriate storage format, which however can result in smaller data losses. After you select one of the revert options, you will be guided by corresponding dialog prompts.

Double-clicking the object opens the project comparison.
\begin{tabular}{|l|l|}
\hline "Select" & Selection or clearing of all objects \\
\hline "Commit" & Commits local changes to the SVN repository \\
\hline "Revert" & Reverts the local changes to the state of the base revision of the working copy \\
\hline "Update" & \begin{tabular}{l} 
The command commits changes in the SVN repository to the project. The \\
update is performed with the HEAD revision.
\end{tabular} \\
\hline "Keep Locks" & \(\boxed{\square}\) Lock is not released automatically after commit \\
\hline "Storage profile update" & \begin{tabular}{l} 
Note that the storage profile (storage version) of the repository in the working \\
copy differs from the one in the SVN repository. In this case, a commit will \\
change the storage profile in the repository. \\
For actions which require an exchange between the working copy and reposi- \\
tory, you will be guided by corresponding messages to match the storage profile.
\end{tabular} \\
\hline "Recent Messages" & Shows the last used log messages. You can click a log message to accept it. \\
\hline "Messages" & \begin{tabular}{l} 
Type in a log message that comments your change. Example: Bug fix error \\
123
\end{tabular} \\
\hline
\end{tabular}

\section*{Dialog 'Subversion Authentication'}

The dialogs are used for authenticating the server/client connection. A server or client authentication is performed depending on the initial situation and protocol.
Overview of possible protocols and dialogs
- svn: //: The SVN protocol; either unencrypted or SSL/TLS encrypted
- Can prompt for user name and password (even for an unencrypted connection)
- Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid (for TLS/SSL encryption)
- As an alternative or in addition to the user name and password prompt, the client can also be authenticated with client certificates (for TLS/SSL encryption). The dialogs for authentication open with the client certificate.
- http://: SVN via http, unencrypted
- Can prompt for user name and password
- https://: SVN via http, SSL/TLS encrypted.
- Can prompt for user name and password
- Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid.
- As an alternative or in addition to the user name and password, the client can also be authenticated with client certificates. The dialogs for authentication open with the client certificate.
- svn+ssh: //: The SVN protocol, encrypted through an SSH tunnel. SSH (Secure Shell) is the usual networking tool in Linux/Unix for accessing other computers.
- Can prompt for user name and password
- Prompts for server certificate in the dialog for authentication if the server is still unknown in order to be sure that it is the correct server.

Dialog for authentication with a server certificate

Initial situation: CODESYS (as a client) receives an unknown or defective server certificate.
This dialog shows information about the certificate. There you can confirm the identity of the server.
\begin{tabular}{|l|l|}

- \(\quad\) Chapter 6.6.7.6.3.2 "Dialog 'Project Settings' - 'SVN Settings'" on page 4350

\subsection*{6.6.7.6.4 Objects}
6.6.7.6.4.1 Object 'SVN_VERSION_INFO'.

4355

\section*{Object 'SVN_VERSION_INFO'}

Symbol: 䦗
The object contains the SVN metadata of the project as global constants or variables in a variable list. It is located in the "POUs" view. You can specifically retrieve the data of the global constants or variables by the application. By calling specific data, you can also reduce the memory usage on the controller.

The SVN metadata is provided for this purpose, subdivided over multiple global variable lists (GVLs):
- "SVN_VERSION_INFO"
- "SVN_Info_Summary"
- "SVN_Info_SummaryW"
- "SVN_Info_URI"
- "SVN_Info_Revisions"
- "SVN_Info_Flags"
- "SVN_info_LastChange"

The SVN_VERSION_INFO object is created automatically when a project is versioned by importing it into a SVN repository. To do this, the "Create SVN_VERSION_INFO" option has to be selected in the "Import project to SVN" dialog.
Furthermore you can create the object or remove it from the project with the option "Generate SVN_VERSION_INFO constants for IEC Access" (Dialog "Project \(\rightarrow\) Project Settings", category "SVN Settings").

Table 808: Global Constants
\begin{tabular}{|c|c|c|}
\hline Name & Data type & Description \\
\hline \begin{tabular}{l}
MINREVISIO \\
N
\end{tabular} & LINT & Lowest revision number of the working copy \\
\hline \begin{tabular}{l}
MAXREVISIO \\
N
\end{tabular} & LINT & Highest revision number of the working copy \\
\hline PARTIAL & BOOL & \begin{tabular}{l}
TRUE: The working copy is incomplete. \\
Example: Cancellation during the last update due to a network error or a checkout.
\end{tabular} \\
\hline MODIFIED & BOOL & TRUE: Local changes were made. \\
\hline SWITCHED & BOOL & TRUE: Parts of the project were branched (with the "Switch" command). \\
\hline VERSION & STRING & \begin{tabular}{l}
Version identification, similar to Apache \({ }^{\text {TM }}\) Subversion \({ }^{\circledR}\) (subversion.exe) \\
Example: 12:34M, means MINREVISION = 12, MAXREVISION = 34, MODIFIED = TRUE \\
For more information, refer to the documentation for Apache \({ }^{\text {TM }}\) Subversion \({ }^{\circledR}\).
\end{tabular} \\
\hline CLEAN & BOOL & \begin{tabular}{l}
TRUE: The version is clean. \\
This is the case when MINREVISION is equal to MAXREVISION, the working copy is complete, and non-versioned, and is was not switched.
\end{tabular} \\
\hline URL & WSTRING & \begin{tabular}{l}
SVN-URL of the project \\
Example: https://svnserver/repository/trunk/ \\
ControlABC.project
\end{tabular} \\
\hline
\end{tabular}

If a controller does not support the data type WSTRING, then a compiler error is issued when accessing the object SVN_VERSION_INFO.

\subsection*{6.6.8 Subversion}

\subsection*{6.6.8.1 Project Version Control with Subversion}

\subsection*{6.6.8.1.1 Introduction}

Automation Builder projects can be stored in Subversion (SVN) repositories by using the Project Version Control. The Project Version Control can be used to track changes on a project and to have access to historic versions of the whole project or objects in the project. It is possible to hold different versions of a project in branches and to compare these versions. The Project Version Control enables multiple engineers to work collaboratively on the same project.

\subsection*{6.6.8.1.2 Preconditions}

Basic knowl- Make yourself familiar with the concepts of SVN.
This manual about Project Version Control is additionally to the following information and describes mainly the specific behavior of Subversion in Automation Builder.
- Homepage of Subversion: http://subversion.apache.org/
- Online user manual for Subversion: http://svnbook.red-bean.com/
- Documentation on SVN integration in Automation Builder: Refer to subfolder .
\begin{tabular}{ll} 
Automation & - In Automation Builder, the Project Version Control must be installed. \\
Builder & - A valid license for the Project Version Control must be activated. \\
& - All collaborating users working on the same project need: \\
& - Automation Builder installed in the same version with the same features. \\
& - Sicense for same edition. \\
& - Same set of optional third party device descriptions. \\
&
\end{tabular}

SVN server The Project Version Control can be used in combination with an SVN server in version 1.6 or newer, the repository format should be 1.5, 1.6 or 1.7. Newer repository formats are not yet supported.
The usage of local repositories in the local file system or even on a network share is strongly discouraged.

\subsection*{6.6.8.1.3 Working with Project Version Control}
- All objects in the device tree or POU tree are represented by an object in the SVN repository, there might be hidden objects that are not visible in the tree but that exist in SVN.
- The smallest unit in the SVN repository is one object including all its data like name, parameters, device identification.
- Objects are identified in the SVN repository by their name. Renaming one object in Automation Builder means to delete it from the SVN repository and add a new one to the SVN repository. Renaming an object causes a break in the history of that object.
- By default objects are locked before they are changed to prevent other users from changing the object. The locking strategy can be changed in the user options.
- Objects can be compared to other versions of the same object, many differences/changes between the current object in the Automation Builder project and the compared object can be merged into the object in the Automation Builder project. Merging changes could be used to resolve conflicts in case concurrent changed can not be avoided.
- To ensure consistency it is required and also enforced that some changes can be committed or reverted only together.
- All changes to device objects in the hardware tree that are sub-nodes to the same top level device. Note: Objects that are not devices are excluded, e.g. the application node.
- All changes below the AC500 PLC application node.
- Most SVN operations can not be performed while other external applications like CODESYS or Panel Builder work on files that are embedded in Automation Builder project.
- Some operations like changing the target or updating the project to the latest device (description) versions do a recursive lock of the whole AC500 PLC. If the lock can't be obtained the operation is aborted.
- Some objects contain internal data that has no meaning to the end user but is also important. Changes on such data are not shown in the compare dialog or are summarized by a placeholder like "There are hidden changes".
- Including externals is not supported.

\subsection*{6.6.8.1.4 Recommendations on Working with Project Version Control}

Be collaborative - Multiple users that work collaboratively on the same project should agree on their responsibility for certain parts of the project where they do changes to avoid conflicts and tree conflicts.
- Agree on locking strategy used by all users working on the same project.
- Distribute the work between multiple users meaningful.
- It is suggested to setup the hardware structure at first before other users checkout a project to work on it and limit structure changes in the hardware tree to the minimum.
- Before adding objects, especially top level objects, users should agree that only one user adds objects at top level or below the same parent, or agree on unique names for the objects to add. The default naming scheme for new objects bears the risk of name conflicts. These conflicts could be resolved only by reverting the changes of the user who later tried to commit the changes.

Be careful - The SVN integration (and also project compare) gives lot of power to the user, users should be sure to do only things they fully understand. Especially by merging changes incomplete it is possible to create inconsistent data.
- Adding devices, removing devices or even changing parameters can have side effects to other devices, do not change objects/parameters to their original state by merging that were not done explicitly.
- Commit changes frequently to SVN.
- To release locks that you don't longer need.
- To reduce the risk of conflict with co-workers.
- To keep the sets of changes to commit small.
- Do frequent updates when collaborating in a team.
- To be up-to date.
- To keep the sets of changes to get from SVN small.
- To reduce the risk of losing work results in case of conflicts.
- To avoid conflicts, it is suggested to stay with the default setting to automatically lock objects before doing changes. Consider explicit recursive locks of sub-trees where you plan bigger changes.
- Prefer a clean checkout over using the switch command to change between different branches.
- Do not use the switch command to change between unrelated projects, this could corrupt the Automation Builder project (local copy, not in SVN) easily.
- Commit local changes to the SVN repository before creating a branch.

Be effective - Give objects good/correct names after adding them and use renaming of objects already committed to SVN sparely to maintain a continuous history in the SVN repository.
- The goal to revert only single changes of all changes done that must be committed/reverted together, could be achieved by using project compare or the object compare dialog.
- If changes can't be committed to the SVN repository because of locks hold by other users, it is possible to create a branch, use the switch command to change to this branch and commit the changes there. The branch and base line could be merged together later.

\subsection*{6.6.8.1.5 Known Issues and Troubleshooting}

Not all changes are shown for all objects, but hidden changes are also important.
The device pool may be changed as side effect of several operations, including opening the project.
When a project was corrupted (by performing an update that tried to add an AC500 communication module) it is possible to save this project and merge changes to a project that has been cleanly checked out by project compare.

\subsection*{6.6.8.2 SVN Support Examples}

\subsection*{6.6.8.2.1 Importing Automation Builder Project to SVN Repository}
1. In the Automation Builder main menu, go to "Project \(\rightarrow\) SVN
\(\rightarrow\) Import Project to Subversion".
2. Enter user credentials and click "OK".
3. Select SVN server repository to import Automation Builder project and click "OK".
\(\Rightarrow\) The Automation Builder project is imported into the selected repository and connected automatically to the repository. The imported project nodes are identified with green indicators.

\subsection*{6.6.8.2.2 Logging in User2}
1. In the Automation Builder main menu, go to "Project \(\rightarrow\) SVN \(\rightarrow\) Checkout".
2. Enter user credentials and click OK.
3. Select the repository location, project folder and revision if any and click "OK".
\(\Rightarrow\) The project will checked out of the repository, saved in the selected location and opened as a primary project.

The tables below provide the descriptions of the options availlable in the check-out dialog.

\section*{Checkout options}
\begin{tabular}{|l|l|}
\hline Omit externals & Do not checkout external objects. \\
\hline As library project & Saves the project as a CODESYS library file. \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Revisions & Checks out the Head revision. \\
\hline HEAD & \begin{tabular}{l} 
Allows to select the required revision of the \\
project.
\end{tabular} \\
\hline Revision & Allows to select a revision date of the project. \\
\hline Date
\end{tabular}

The following instances can occur in the workflow.
- If the project contains any updates, the specific project level node is indicated with
- If a new object is added to the project, the newly added node is indicated with
- If the project node is deleted, the specific node is indicated with \(\mathbf{x}\).

\subsection*{6.6.8.2.3 Examples}

Example 1 If User1 modifies Panel_CP600 project, then the node indicator turns to orange with lock symbols. If User2 need to modify the same Panel_CP600 project, the Panel_CP600 project appears with a lock symbol.
\begin{tabular}{|c|c|}
\hline Devices \(\quad \bigcirc \quad \square \times\) & Devices \(\quad\) - \(\quad \times\) \\
\hline  &  \\
\hline
\end{tabular}

To steal the lock of an affected object, proceed as follows:
1. Double-click "Panel_CP600" project.
\(\Rightarrow\) Automatic lock failed dialog is displayed.
2. Enable "Try to steal the lock for the affected objects" and click "OK" to steal the lock.
3. In the Lock Message window, enter the reason to steal the lock and click "OK".
4. User2 can modify and commit the project.

Example 2 If User1 adds a new object to the project and commit the changes, then User2 can update the project to see the latest modifications.
```

Devices * п >

# 人, -1 Project1

    Panel_CP600_1 (CP600 Control Panel)
    目f Panel Project
    PLC_AC500 (PM564-ETH)
    -- 周纤 Application
App
OBIO (6DI+6DO}+2\textrm{AI}+1\textrm{AO}
IO_Bus
*) Interfaces
El] COM1_Online_Access (COM1 - Online Access)
COM2_None (COM2 - None)
Ethernet
ETH1 (ETH1)
Protocols (Protocols)
zenon_Project

```

Example 3 The user can revert to any of the available project revisions．
1．Right－click on object node and select＂SVN \(\rightarrow\) Revert to Revision＂．
2．Select or enter the revision number and click＂OK＂．
\(\Rightarrow\) The revision command reverts local changes of this object back to the specific revision of the working copy．

3．Right－click on the object node and select＂SVN \(\rightarrow\) Commit＂．
4．In the commit window，enter the reason to change the project and click＂OK＂to make the changes．
\(\Rightarrow\) The project node is updated with the latest changes．

Example 4 SVN server allows to select the required revisions of Automation Builder project．You can checkout the project using＂Project \(\rightarrow\) SVN \(\rightarrow\) Checkout＂and then enter the credentials and click＂OK＂．
In the check－out dialog，do the following：
1．Select the project repository．
2．Activate＂Revision＂and select or enter the revision number and click＂OK＂．

The user can work on the selected revision．To commit the changes to the project，right－click on project and select＂SVN \(\rightarrow\) Commit Project＂．

\section*{6．6．9 Mail service with SMTP／SMTPS}

With the integration of the＂Mail Service SL＂library，the prerequisite for sending mails with the PLC has been created．After appropriate programming of the user requirements and the provision of appropriate hardware and software in the periphery（router，mail program）this service is available．

Mail Service SL This library can send, receive and delete emails. An SMTP server is required for sending, and library

Simple Mail
Transfer Protocol (SMTP)

SMTP is a communication protocol for the exchange of data (e-mails) in networks or in the internet. SMTP is primarily used for sending and forwarding e-mails. Other, specialized protocols (POP3/IMAP) are used to fetch e-mails.

\section*{Simple Mail \\ Transfer Protocol Secure \\ (SMTPS)} SMTPS is an independent further development of the SMTProtocol and authenticates the communication of the e-mail partners by additional encryption protocols (SSL/TSL). This happens before the message is even sent.

Application
example
How to send e-mails via the SMTP protocol and how to create the technical requirements for this is described in detail in the application example. AC500 V3 - Sending e-mails via the SMTP protocol

\subsection*{6.6.10 SNMP}

Simple Network Management Protocol (SNMP)

SNMP is a network protocol to monitor and control routers, servers, switches, printers, computers etc. from a central station. The protocol controls the communication between the devices and the monitoring station.

SNMP Service Use the SNMP Service SL library to read out information from devices via the SNMP protocol. SL Library The library provides function blocks for sending and receiving SNMP messages and is part of the software package "IloT Libraries SL".

In the integrated V3 library documentation (within the library manager) you find further information on a respective library as well as on the functionality and application area of the contained function blocks.

\begin{abstract}
Application example

The application example AC500 V3 - SNMP Protocol describes the SNMP communication in a scenario in which an AC500 PLC acts on the one hand as SNMP agent and on the other hand as SNMP manager. In this case, the SNMP protocol is used for network monitoring. The AC500 PLC can receive SNMP requests and respond to them as an agent. As a manager, it can query managed information from any network device that supports SNMP.
\end{abstract}

\subsection*{6.6.11 Scripting with Python}

\subsection*{6.6.11.1 Python}

\subsection*{6.6.11.1.1 Python script support}

Using scripts Scripting allows python scripts to be used to automate project configuration in Automation Builder. Parameters can be added to scripts, so that a generic script can be customized before execution. The user can add a script to most parts of the device tree. A script can be started either from the user interface (by a command or with the python scripting editor) or from the Windows command line and is saved with the project.

With the scripting feature commands or complex program operations can be automated.
Examples of use cases:
- Integration of Automation Builder in automatic build server environments:
- continuous integration (CI)
- continuous delivery (CD)
- continuous testing
- Integration with third-party software, for example:
- code generators
- creation of projects that are custom tailored to a specific machine configuration
- Creation of documentation
- Updating of libraries: Setting of project information during the release process
- Automatic testing: Mostly in connection with the Professional Test Manager
- Outputting variables via monitoring APIs

Licensing A valid license is required to use the scripting. If you open a project with the existing script object without a valid license, you are not allowed to add or edit the scripts. However, the scripts are not removed from the project.

> Scripting language

> The Automation Builder scripting language is modular and based on IronPython. For this purpose, the Automation Builder "ScriptEngine" component combines the IronPython interpreter with the Automation Builder development environment which makes the extensive python framework libraries available including file access in networks and much more.

\subsection*{6.6.11.1.2 Working with script objects}

Scripts to execute can be added to and stored in the Automation Builder project. Additionally, parameters can be added to scripts, so that generic scripts can be customized before execution.

\section*{Adding a script object to the project}
1. In the device tree, right-click on a node (e.g. a PLC node) and click "Add object".
2. Under "Scripting category" select "Script \(\rightarrow\) Add object".
\(\Rightarrow\) The 'Add Script' dialog is displayed.
3. Browse and select a script from the file system or create a new script by clicking [Add]. \(\Rightarrow\) A script is added below the selected node and the editor is opened.

4. The default parameter values are read from the script. The user can edit the default values as required.

The script objects can be reused within the project via copy-and-paste around the device tree.

\section*{Execution The user can execute the script with the parameter values via the execute button in the editor or} via right-click on the script object in the device tree by selecting "Script \(\rightarrow\) Execute".

Import The user can import the script from the file system. This will replace the contents of the current script object with the contents of the imported file. Optionally, parameter values will be preserved if the imported script has a matching named parameter. In the device tree, right-click on a script object and select "Script \(\rightarrow\) Import".

Export The user can export the selected script and saved it as a new file in the file system. The exported file does not include any edited parameter values. In the device tree, right-click on a script object and select "Script \(\rightarrow\) Export".

Parameters The following instructions help the user to create parameters in the python script:
- Parameters must be defined in the script.
- Parameters and values are optional.
- The ParameterName and the ParameterValue must be delimited with symbols. The format must be as follows:
"\#AutomationBuilder_Parameter \{"ParameterName"\} \{= "ParameterValue"\}
- \{ParameterName\} is the name given to the parameter. This allows the values to be referenced in the python script.
- \{ParameterValue\} is the default value given to the parameter. This value can be modified in the editor.
The example below shows the format of the ParameterName and ParameterValue in the script.
- \#AutomationBuilder_Parameter "numWidgets": creates a new parameter called numWidgets.
- \#AutomationBuilder_Parameter "numWidgets" = "4": creates a new parameter called numWidgets and initializes to the value 4.
Using parameters within the python script:
- Parameters can be used in the script by creating an instance of the parameter helper: parameterHelper = AutomationBuilder_Parameters.create()
- Individual parameters are retrieved by calling:

GetParameter(parameterName). devicename = parameterHelper.GetParameter("Name")

Python script A set of python script examples are available in the path \%Public\%\Documents\Automationexamples BuilderlExamples\Python scripts.

\subsection*{6.6.11.1.3 Execute Script}

You can execute Python script files (<file name>.py), which contain a sequence of commands for activating CODESYS functionalities, in the following way:
- In the CODESYS user interface by means of commands in the "Tools \(\rightarrow\) Scripting" menu
- From the CODESYS user interface by means of a customized, configured toolbar
- From the Windows command-line

\section*{Calling Scripts from Menu Commands}

Requirement: A valid Python script file <file name>. py is located in the file system. The CODESYS user interface is open.
1. (optional) To monitor the processing of individual commands used in the script, click "Tools \(\rightarrow\) Scripting \(\rightarrow\) Enable Script Tracing".
2. In CODESYS, click "Tools \(\rightarrow\) Scripting \(\rightarrow\) Execute Script File".
\(\Rightarrow\) The statements in the script are executed and, if script tracing is activated, listed in the message view.

\section*{Starting Scripts from the Command Line}

In automated environments such as Cl (Continuous Integration) servers or if scripts in CODESYS have to be controlled by other programs, menu commands are not appropriate for executing scripts. For these kinds of requirements, you can use the Windows command line to start CODESYS and execute scripts.

Requirement: A valid Python script file <file name>. py is located in the file system.
1. Create a cmd file using start to start CODESYS and with the option --runscript executes the script file. Other options are possible, for example --noUI, if the CODESYS- User interface should not be opened.
2. Open the Windows "Command prompt" and execute the CMD file.

You can pass arguments with additional information to the script. Python scripts can access arguments with the sys.argv [] list. The first element (Index 0) is always the name or path of the Python script that is executed, followed by the "actual" parameters. (This is similar to argclargv in C.) In addition, scripts can also access environment variables that are set before CODESYS is started with the corresponding Python or .NET APIs.
```

Example A CMD batch file argvtestbat.cmd has the following contents (all in one line).

```
```

"C:\Program Files (x86)\CODESYS

```
"C:\Program Files (x86)\CODESYS
3.5.17.0\CODESYS\Common\CODESYS.exe" --profile="CODESYS V3.5
3.5.17.0\CODESYS\Common\CODESYS.exe" --profile="CODESYS V3.5
SP17" --runscript="D:\Dokumente\Scripting\ArgvTestScript.py" --
SP17" --runscript="D:\Dokumente\Scripting\ArgvTestScript.py" --
scriptargs:'username password 3.14 "path=\"C:\temp\\\""' --noUI
```

scriptargs:'username password 3.14 "path=\"C:\temp<br>\""' --noUI

```

You have a matching script file ArgvTestScript. py.
```

from __future__ import print_function
import sys
print("sys.argv: ",
len(sys.argv),
" elements:")
for arg in sys.argv:
print(" - ", arg)

```

Now when you execute the CMD file, CODESYS starts and executes the script without opening the CODESYS main window. Then CODESYS is exited:

For a complete reference of all possible command line parameters, see the help page for the command-line interface in CODESYS in the section for "--runscript".
For information about the Python API, see:
https://docs.python.org/2/library/os.html\#process-parameters
For information about the .NET-API, see:
https://msdn.microsoft.com/de-de/library/77zkk0b6\%28v=vs.110\%29.aspx
- See also: \({ }^{\mu}\) Chapter 6.4.1.16 "Using the Command-Line Interface" on page 2028

\section*{Calling Scripts from Toolbar Icons}

You can provide your own toolbar in the CODESYS user interface with up to 32 icons for calling script files. For this you need an ICO file where the icon is stored, and a PY file where the Python script to be called is stored.
In the installation directory or in the program files directory under CODESYS, you create a subdirectory named Script Commands. In that directory, you create the config.json configuration file. Specify the call information outline for each icon in the file. Here you can configure a maximum of 16 icons. You can also store the ICO and PY files in the same directory.

\section*{Location}
- <CODESYS installation directory> \CODESYS \(\backslash\) Script Commands
- Users\<username>\AppData\Local\CODESYS\Script Commands

\section*{Example Default installation on Windows 10}
\[
\begin{aligned}
& C: \backslash \text { Program Files (x86) \CODESYS 3.5.14.0\CODESYS } \backslash \text { Script Commands } \\
& \text { C:\Users } \backslash r . \text { smith } \backslash \text { AppData\Local } \operatorname{CODESYS\backslash Script~Commands~}
\end{aligned}
\]

If you store a config. json file with different call information at each of the storage locations, then you can configure up to 32 different icons.

\section*{Configuration file}

Outline of the configuration file for 2 icons
```

[

```
    <icon call information>
    \},
    \{
        <last icon call information>
    \}
]

Outline of the call information <icon call information>
"Name": "<tooltip of the symbol button>",
"Desc": "<description of the symbol button>",
"Icon": "<icon file name>",
"Path": "<path of the script file>"

Table 809: Call information
\begin{tabular}{|l|l|}
\hline "Name" & \begin{tabular}{l} 
Required \\
Displayed as symbol tooltip \\
Example: "Name": "Pause"
\end{tabular} \\
\hline "Desc" & \begin{tabular}{l} 
Optional \\
Comment for the icon \\
Example: "Desc": "Operation pause" \\
Note: Not yet displayed in the user interface
\end{tabular} \\
\hline "Icon" & \begin{tabular}{l} 
Required \\
File path: <directory path>\<icon name>. ico of the icon \\
Example: "Icon": "pause.ico" \\
Hint: If the file is in the same folder as the config.json file, then the file name is \\
enough.
\end{tabular} \\
\hline "Path" & \begin{tabular}{l} 
Required \\
Path of the Python script <directory path>\<script name>. ico \\
Example: "Path": "stop.py" \\
Hint: If the file is in the same folder as the config.json file, then the file name is \\
enough.
\end{tabular} \\
\hline "Params" & Note: These parameters are not currently assessed. \\
\hline
\end{tabular}
```

Example File config.json
[
"Name": "Start",
"Desc": "Starts processing",
"Icon": "start.ico",
"Path": "goon.py"
},
{
"Name": "Pause",
"Desc": "Pause operation",
"Icon": "pause.ico",
"Path": "stop.py"
},
{
"Name": "Processing",
"Desc": "Process again",
"Icon": "VarStatSmall.ico",
"Path": "process.py"
}
]
The following files are located in the Script Commands:

```
```

config.json

```
config.json
goon.py
goon.py
stop.py
stop.py
process.py
process.py
start.ico
start.ico
pause.ico
pause.ico
VarStatSmall.ico
```

VarStatSmall.ico

```

\section*{Creating script calls for a toolbar button}
1. Create the Script Commands folder in one of the storage locations.
```

C:\Users\<username>\AppData\Local\CODESYS

```
2. Create executable Python files there.
\(\Rightarrow\) Example:
File copy.py
        print("The script COPY.PY is executed")
        File delete.py
        print("The script DELETE.PY is executed")
3. Create the ICO files for the scripts.
\(\Rightarrow\) Example: Copy_before.ico, Copy_below.ico, CopyAll.ico
4. Create a configuration file config.json there.
\(\Rightarrow\) The folder Users \<username>\AppData\Local\CODESYS \(\backslash\) Script Commands has the following content:

\section*{Name}

5. Open config.json and add the outlined call information.
\(\Rightarrow\) [
\{
        "Name": "Copy Before",
            "Desc": "Copy something",
            "Icon": "Copy_before.ico",
            "Path": "copy.py
    \},
    \{
        "Name": "Copy Below",
        "Desc": "Copy something",
        "Icon": "Copy_below.ico",
        "Path": "copy.py"
    \},
    \{
        "Name": "Copy All",
        "Desc": "Copy something",
        "Icon": "CopyAll.ico",
        "Path": "copy.py"
    \},
    \{
        "Name": "Delete",
        "Desc": "Delete something",
        "Icon": "Delete.ico",
        "Path": "delete.py"
    \}
    ]
6. Start CODESYS.
\(\Rightarrow\) The script files, configuration file, and symbol files are read and provided in the "Tools \(\rightarrow\) Customize" dialog on the "Command Icons" tab, in "ScriptEngine Commands" category.
7. Open the dialog "Tools \(\rightarrow\) Customize" and click on the tab .
8. Select the empty toolbar there and click the "Add Toolbar" button.
\(\Rightarrow\) A line editor opens at the empty toolbar.
9. Type in a name (example: User defined toolbar).
\(\Rightarrow\) The custom toolbar is displayed in the CODESYS window.
10. Add the recently imported commands and close the dialog.

11. Click one of the icons.
\(\Rightarrow\) The following output is displayed in the message view.

\section*{Script Messages}

\section*{Description}

The script COPY.PY is executed

\subsection*{6.6.11.1.4 Python script editor}

In Automation Builder a browser-based python script editor is integrated. This allows the user to modify the existing python script, to create a python script from the scratch and to finally execute the script. Moreover, it assists the user in writing the script with the following features:
- Auto suggest
- IntelliSense suggestions for the python syntax during typing.
- IntelliSense for CODESYS script engine and Automation Builder injected script objects.
- Built-in language service that provides complete code intelligence for objects, properties and methods.
- Details of the object with [CTRL] + [spacebar].
- Auto completion

Press the Enter key on a function suggested by IntelliSense in order to insert it.
- Python syntax highlighting (basic syntax colorization)

The function and its respective namespace is automatically colored in order to match colors.
- Matching brackets

Matching brackets are highlighted as soon as the cursor is near to one of them using the command palette.
- Zoom

Changes the font size of the editor's content.
- Find and replace

Support of 'Find' (search for a keyword) and 'Find and replace' (search and replace a keyword). This feature is supported in the editor, however not integrated in Automation Builder platform.
- Minimap

High level overview of the script for a quick navigation and code understanding.
- Copy/paste

Support of 'copy and paste' of the script text within and into the editor.
- Undo/redo

Support of 'undo/redo' for editing actions. This feature is supported in the editor, however not integrated in Automation Builder platform.
- Keyboard shortcuts

Keyboard shortcuts allow to perform most tasks directly from the keyboard (e.g. [CTRL]
\(+[Z],[C T R L]+[Y])\) including copy and paste. For further keyboard shortcuts refer to the command palette ([F1]).
- Folding

Support of folding and expanding script regions.
- Comment/uncomment the code

Support of commenting ([CTRL] + [K]) and uncommenting ([CTRL] \(+[C]\) ) code through shortcuts.
- 'Execution' button Executes the script directly in the editor window.
- In order to start a new script from the scratch the user can start with an empty editor. This can be done via the 'Add script' dialog without script file selection.
For further features that can be used in the python script editor refer to the command palette ([F1]).

Limitations with CODESYS script engine IntelliSense
- No IntelliSense available for return type of a property.
- No support of IntelliSense for keyword "None".
- No IntelliSense support for method overloading.
- No IntelliSense support for methods that return an object.
- Private methods are also part of IntelliSense. Refer to the CODESYS script engine document to verify the access modifier.

\subsection*{6.6.11.1.5 Configure port number for python editor server}

The python editor server is required for the usage of python script editor.
Earlier versions of Automation Builder than 2.6.0 do not have an option to change the port number of Python editor server via user interface. The user had to update the port number in Automation Builder configuration file if the port was already in use.

With Automation Builder 2.6 onwards, the user has an option to install multiple versions of Automation Builder on a system with separate Python editor servers. Since multiple servers cannot run on a single port, users are given an option to configure the port number from user interface ("Tools \(\rightarrow\) Options \(\rightarrow\) Python Scripting Editor") if the port number are in use.
Default port number of Python editor server is 11030 for Automation Builder versions before 2.6 and 11040 for Automation Builder 2.6 onwards.

\subsection*{6.6.11.1.6 Creating a Python Script}

Python is a dynamic language. You can start in a simple linear programming style ("batch files") and later add the necessary and more powerful means, such as conditions, loops, functions, exceptions, classes, and modules. The focus of the language is on easy and expressive code. Python is more typical at runtime and uses an automatic garbage collector to protect the programmer from accidental damage to the entire system.

IronPython is an implementation of Python for .NET and allows for full access to the .NET framework and classes. The implementation of the IronPython interpreter is based on Python Version 2.7.

There are a variety of free manuals and help pages on the Internet. See the following links for an introduction and detailed introduction about IronPython.
- http://forum.codesys.com/viewforum.php: "Script language Python..." area in the CODESYS forum
- Especially for CODESYS-specific questions
- Also includes some examples

- http://docs.python.org/release/2.7/: Official documentation for Python 2.7
- http://wiki.python.org/moin/BeginnersGuide: Useful manuals for learning IronPython
- http://wiki.python.org/moin/GermanLanguage: Collection of links for German help pages
- http://stackoverflow.com/: General community for programming For general question about (Iron)Python, not CODESYS-specific
- http://ironpython.net/: IronPython homepage
- http://ironpython.net/support/: Mailing list, FAQ, etc.
- https://gitter.im/IronLanguages/ironpython:: Chat channel for IronPython developers

Version incompatibility to Python V3.x
The Python programming language will soon be available in the new version V3.x. Some of the older program modules have been removed. CODESYS GmbH is planning an update to this new version. Scripting developers should take this into consideration and design their scripts accordingly, for example by using the expression from
future import print function. You can find more informa\(\overline{\text { tion }}\) about this topic at http://wiki.python.org/moin/Python2orPython3 and http://docs.python.org/release/3.1.2/whatsnew/3.0.html

\section*{Getting Started with Python for CODESYS}

See below for an simple application of a Python script in CODESYS:
1. In any text editor, create a text file hello.py with the following contents:
print("Hello, automation!")
2. Start CODESYS and click "Tools \(\rightarrow\) Scripting \(\rightarrow\) Execute Script File". Select the file hello.py in the file system.
\(\Rightarrow\) See the result in the message view:

For more detailed examples of Python scripts for different use cases with CODESYS, see the following help pages.

\section*{Tips for Python Programmers about .NET API Documentation}

The current prerelease of the script interface documentation has been generated automatically from the underlying .NET and C\# sources. Therefore, the documentation includes some expressions that are not familiar to Python programmers. The following overview provides some tips about how these expressions can be understood from the Python perspective.
- An interface is the contract that tells an instance of a class that implements the interface which members (methods, properties) it has to prepare. In IronPython, you can implement one or more .NET interfaces in one class by inheriting from a superclass. If a method is needed for the interface but is not available in the class definition, then an exception is thrown. (The DeviceImportFromSvn. py example shows a class that implements the ImportReporter interface.)
- Each parameter and each method in .NET is strictly typed. The type of parameter is separated by one space character before the parameter name, and the type of return value from a method by one space character before the method name. You can use instances from subclasses when you define a class (or interface). A method without a return value is marked void.
- You can overload methods. As a result, multiple methods with the same name can exist in one class. However, the number or the types of parameters have to be different. IronPython automatically takes care of the most appropriate method overloading being called.
- The data type int corresponds to an integer from -2,147,483,648 to 2,147,483,647. The data type bool corresponds to the Python type bool (True and False).
The data type string corresponds to the Python types str or unicode, which are identical in IronPython.
The IDictionary<object, object> data type corresponds to an ordinary Python dictionary. IronPython automatically converts between Python and .NET data types.
- When a T type is inherited from IBaseObject<T>, it means that this type can be extended by other plug-ins for additional members. The actual use of this extended type as a parameter or return value is marked by IExtendedObject<T>.
- The IEnumerable<T> interface to a \(T\) type means that you can use every Python sequence (generators, lists, tuples, etc.) which returns T type values (or a subclass). Returns the sequence of incompatible objects, and throws an exception at runtime.
- The IList<T> interface to a T type identifies a typified list which guarantees to include only elements of type \(T\) (or a subclass). An exception is thrown at runtime when any attempt is made to add an incompatible object.
- The params T[] name id for a parameter of type T corresponds to the Python mechanism * name for variable argument lists.
- In Python, enumerations (enum) do not exist as language constructs. Its purpose is to define an exact number of constant values for a specific purpose, for example the days of the week. Access to .NET enumerations from IronPython works by using "Name.Member", for example via OnlineChangeOption.Try.
There are also different approaches to emulate enums in Python.
For example, see: http://pypi.python.org/pypi/enum/
- The syntax \(T\) name \{ get; set; \} defines a property with name as the name and \(T\) as the type. If set; is missing, then the property is read-only. In Python, the respective construct is @property decorator.

\section*{Basic Syntax of Python (with Examples)}

Python is similar to the languages of the "C family", but there are some significant differences and unique properties.

The most obvious syntactic difference between Python and language such as C and ST is that the Python parser recognizes block structures by their indentation. There is no BEGIN/END or braces \{\} to identify the blocks of IF/ELSE conditions, FOR and WHILE loops, or functions.

Comments start with \# and extend to the end of the line. In the first and second line of the source code, you can set a special marker to declare the encoding of the file. We recommend that you use UTF-8 as the encoding if ASCII characters are not required.

For debugging purposes, you use print for easy output. With the \% operator, you achieve functionality similar to the \(C\) function printf(). The output is displayed in the message view of CODESYS.
```

Example:
print

```
```

# encoding:utf-8

```
# encoding:utf-8
# defining a function with the parameter i
# defining a function with the parameter i
def do something(i):
def do something(i):
        # if branch
        # if branch
        if i>0:
        if i>0:
            print("The value is: %i" % i)
            print("The value is: %i" % i)
+= i
+= i
            print("The new sum is: %i" % sum)
            print("The new sum is: %i" % sum)
        # else if (optional, there can be none or several elif branches)
        # else if (optional, there can be none or several elif branches)
        elif i=0:
        elif i=0:
            print("The sum did not change: %i" % sum)
            print("The sum did not change: %i" % sum)
        # and the final else branch (also optional).
        # and the final else branch (also optional).
        else:
        else:
            handle_error()
            handle_error()
# an endless while loop
# an endless while loop
while True:
while True:
    print("I got stuck forever!")
```

    print("I got stuck forever!")
    ```

Everything that belongs to the same block has to be indented the same distance. The size of the indentation is irrelevant. Elements such as brackets and braces have a higher priority than indentations. Therefore, the following code segment is completely correct, even if it is written in a "poor programming style":

\section*{Example:}

\section*{Indentation}
```

# warning: bad style below. Kids, don't try this at home!

if foo >= bar:
print("foobar")
else:
print(
"barfoo"
)

```

To avoid ambiguity, you should not mix tabs and spaces in a file.
```

                    At this time, mixing tabs and spaces gilt in Python 3 qualifies as a syntax error.
                    The official Python Style Guide recommends indentation of four spaces and
                    includes some examples of good and poor style. The Python tutorial provides a
            summary of coding style.
    Python is "case-sensitive", similar to C and in contrast to ST. Keywords, such as def, if, else, and while, have to be lowercase (in contrast to the ST rule: keywords are uppercase). Two identifiers, such as "i" and "I", also identify two different variables.
The following keywords are reserved in Python and not permitted for use as identifiers for variables, functions, etc.: and | as | assert | break | class | continue | def | del | elif | else | except | exec | finally | for | from | global | if | import | in | is | lambda | not | or | pass | print | raise | return | try | while | with | yield.

```

Python 3 defined four other keywords: False | None | True | nonlocal. While the first three are really new, the first three were already predefined constants in Python 2 and should not be used for any other purposes.

For more information, see: Python Style Guide and Python Tutorial

\section*{Variables and data types}

Python is a powerful, dynamically typed language -- all type information is evaluated at runtime. Variables hold references to objects, and the object knows its type, not the variable. When a programmer attempts to execute an operation that is not possible (for example, adding an integer and a string), Python throws an exception at runtime.

Consequently, there are no declarations of variables and their types. In Python, variables are created only to assign values to them. This is completely different in C and ST where types are strong and static. Every variable is declared with a type, and at compile time the compiler checks that the type and operators are permitted.
See the following examples for handling variables:

\section*{Example: Vari- \\ ables}
```

# assign the integer 1 to the variable i (also "creates" the

variable")
i = 1

# assign the string "foobar" to the variable s

s = "foobar"

# Add 5 to the integer i - this is equivalent to i = i + 5

i += 5

# i now holds the integer 6.

# Try to add i and s - this will throw an exception when executed

# TypeError: unsupported operand type(s) for +: 'int' and 'str'

result = i + s

# variables can also be "undeclared" by deleting them.

# Further access to the variable i will throw a NameError exception,

# as the variable does not exist any more.

del i
i += 5 \# now throws an exception: NameError: name 'i' is not defined

```

All existing variables reference one value only. There is not any unassigned or uninitialized variables in Python. To express the absence of a value, Python provides a special object: None. In C or ST, you would use a null pointer. Its only purpose is to express "no value here", although None is actually an existing instance of the class NoneType.

\section*{Numeric types and floating points}

In contrast to the dozens of integer types in IEC or C, there is only one integer type in Python. Integer types in Python do not have a fixed size. Instead, they grow as needed and are limited only by available memory.
```

Example:
Integers.py
from __future__ import print_function
i = 1
print(i)
j = 0x1234 \# hex number, is 16\#1234 in IEC and 4660 in decimal
k = 0o123 \# octal number, is 8\#123 in IEC and 83 decimal
l = 0b101010 \# binary number, is 2\#101010 in IEC and 42 in decimal
print(j, k, l)
m = (2 + 3)*10 \# k is 50 now
print(m)
n = 10 ** 100 \# 10 to the power of 100
print(n)
Resulting output:

```
```

Messages - Total 0 error(s), 0 warning(s), 0 message(s)
Script Messages * \$0 error(s) © 0 warning(s) ©0 message(s)}
Description
1
46608342
50
10000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000

```

There is also only one floating-point type in Python which is similar to the IEC data type LREAL. It provides 64-bit IEEE floating point arithmetic.
The syntax is like C-based languages for the most part:

\section*{Example: Floating-point types}
```

# A simple float...

a = 123.456

# A float containing the integral value 2

b}=2

# Leading zeroes can be left off

c = . 3 \# same as 0.3

# Exponential / scientific representation

d = -123e-5

```

Two special cases are True and False, two constants that define the Boolean truth values. They behave similar to the integer values 0 and 1, except when they are converted into strings and return their names.

\section*{Example: \\ Booleans.py}
```

# booleans behave like integers, except when converted to strings.

# The built-in function "type" can be used to query the type of a

value.
print("True: ", True, type(True))
print("False: ", False, type(False))
print("1: ", 1, type(1))
print("False + 0: ", False + 0, type(False + 0))
print("True * 5: ", True * 5, type(True * 5))

```

Resulting output:
\begin{tabular}{l} 
True: True <type 'bool'> \\
\hline False: False <type 'bool'> \\
\hline 1: \(1<\) type 'int'> \\
\hline False \(+0: 0<\) <type 'int'> \\
\hline True * \(5: 5<\) type 'int'> \\
\hline
\end{tabular}

\section*{Strings}

In IronPython, strings are always in Unicode and any length. It does not make any difference if they are enclosed in ' or ". Strings can also have triple quotation marks "" " or ' ' ' , which allows for multiline string literals.
Similar to C, special characters can be excluded by means of backslash characters. As a comparison, the dollar sign (\$) is used in IEC for this purpose.
There are also raw strings that have other rules for the backslash. This is practical when the string should have literal backslashes. Example: Windows file paths or regular expressions.

\section*{Example： \\ Strings．py}
```

# encoding:utf-8

from __future__ import print_function
a = "a simple string"
b = 'another string'
c = "strings may contain 'quotes' of the other type."
d = "multiple string literals" ' are concatenated ' '''by the
parser'''
e = "Escaping: quotes: \" \' backslash: <br> newline: \r\n ascii
code: \x40"
f = """triple-quoted strings may contain newlines, "single"
'quotes' and '''multiquotes''' of the other type"""

```

```

h = r"c:\raw\strings\retain\backslashes.txt"

# we iterate over a sequence of all the variables defined above:

for i in (a,b,c,d,e,f,g,h):
print(i) \# prints the contents of the variable

```

Resulting output：
ascii code：＠
    triple-quoted strings may contain newlines, "single"
    'quotes' and "'multiquotes"' of the other type
    Üñiçóđe is also possible: 北京, Mockba, A日ŕva, القاهرة
    c:Vaw|strings\retain\backslashes.txt

Python does not have characters types．Characters are expressed by the use of strings with a length of 1 ．In this way，iteration via a string，or indexing in a string，returns a single－string．

\section*{Lists and tuples（data sets）}

Lists and tuples basically correspond to arrays in C and IEC，but there are some noticeable differences：
－The index access is always checked．Accessing a list or a tuple with an invalid index throws an exception．
－Both lists and tuples can contain elements of different types（also other lists and tuples）．In contrast in C and IEC，arrays can contain only elements of a single type．
－Lists are dynamic，and elements can be added，removed，or replaced at any time．
－Tuples are not changeable：Once a tuple is created，it cannot be modified anymore．
Lists are created with the list（）constructor．As an alternative，you can use brackets［］．
Tuples are created with the tuple（）constructor or parentheses（）．
```

Example:
list_tuples.
py

```
```

from __future__ import print_function

```
from __future__ import print_function
print("Testing tuples and lists")
print("Testing tuples and lists")
# We define a tuple with the numbers from 1 to 10:
# We define a tuple with the numbers from 1 to 10:
t = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)
t = (1, 2, 3, 4, 5, 6, 7, 8, 9, 10)
print("Tuple:", t)
print("Tuple:", t)
# We can access the 6th element of the tuple.
# We can access the 6th element of the tuple.
# As in C, index counting starts with 0.
# As in C, index counting starts with 0.
print("Element 5:", t[5])
print("Element 5:", t[5])
# Subscription is more powerful using the range syntax:
# Subscription is more powerful using the range syntax:
print("Range[2:5]:", t[2:5]) # lower bound is inclusive, upper
print("Range[2:5]:", t[2:5]) # lower bound is inclusive, upper
bound is exclusive.
bound is exclusive.
print("Range[2::2]:", t[2::2]) # start with 3rd element, and print

del l[1:3] # Remove the elements at index 1 and 2, the 13 and the
'8'.
'8'.
print("Removed[1:3]:", l)
```

print("Removed[1:3]:", l)

```

\section*{Resulting output:}
```

List: $[11,12,13, ~ ' 8 ', ~(1, ~ 2, ~ 3, ~ 4, ~ 5, ~ 6, ~ 7, ~ 8, ~ 9, ~ 10)] ~] ~$
List with 9: $\left[11,12,13,{ }^{\prime} 8\right.$ ', (1, 2, 3, 4, 5, 6, 7, 8, 9, 10), 9]
List Range[3:6:2]: [8', 9]
Removed[1]: [11, 13, '8', (1, 2, 3, 4, 5, 6, 7, 8, 9, 10), 9]
Removed[1:3]: [11, (1, 2, 3, 4, 5, 6, 7, 8, 9, 10), 9]

```

\section*{Dictionary}

Python also has a hash table type ( also "hashmap"). In contrast to the list, it can be indexed with any elements, for example strings. Its constructor is dict () and its literals are declared with braces \{\}.

The sample script dictionaries. py creates the output displayed below. In the last line, the script is terminated with a "KeyError" exception:

\section*{Example: dictionaries \\ . py}
```

from future__ import print function
print("Testing dictionaries")

# Declare a dictionary with three entries, the third being a list

d = {1: "a", 2: "b", "my list": [1, 2, 3]}
print(d)

# print the value of the key 1

print(d[1])

# remove the value with the key "my list"

del d["my list"]

# Add a value 4 with the key 3

d[3] = 4
print(d)

# The "get" method returns the second argument if the key cannot be

found.
print(d.get(1, 42))
print(d.get(23, 42))

# print all keys in the dictionary

for key in d:
print(key)

# index access for unknown keys will throw a "KeyError" exception!

print(d[23])

```

\section*{Resulting output:}
\begin{tabular}{|l|}
\hline Testing dictionaries \\
\(\{1:\) 'a', 2: 'b', 'my list': \([1,2,3]\}\) \\
\hline a \\
\(\{1:\) 'a', \(2:\) 'b', \(3: 4\}\) \\
\hline a \\
\hline 42 \\
\hline 1 \\
\hline 2 \\
\hline 3 \\
\hline
\end{tabular}

And then in the last line, the script terminates:

\section*{Python Control Structures (with Examples)}

Loops
As opposed to C and ST , for loops in Python do not count loop variables, but iterate over a sequence. This kind of sequence can be a "dictionary", a list, a tuple, the characters in a string, or lines in a file.
The following example shows some for loops:
```

Example:
loops.py

```
```

from __future__ import print_function

```
from __future__ import print_function
print("Enumerating over a simple list:")
print("Enumerating over a simple list:")
for i in (1,2,3,4):
for i in (1,2,3,4):
    print(i, end=", ") # end= replaces the newline with ", "
    print(i, end=", ") # end= replaces the newline with ", "
print() # but we still need a newline at the end of
print() # but we still need a newline at the end of
this case.
this case.
print("Enumerating over the characters in a string:")
print("Enumerating over the characters in a string:")
for i in "CODESYS": # characters are representet as strings of
for i in "CODESYS": # characters are representet as strings of
length 1.
length 1.
    print(i, end=", ")
    print(i, end=", ")
print()
print()
print("Enumerating over the integers 1 to 4:")
print("Enumerating over the integers 1 to 4:")
for i in range(1, 5): # upper bound is exclusive.
for i in range(1, 5): # upper bound is exclusive.
    print(i, end=", ")
    print(i, end=", ")
print()
print()
print("Enumerating using xrange:")
print("Enumerating using xrange:")
for i in xrange(5): # xrange is similar to range, but needs less
for i in xrange(5): # xrange is similar to range, but needs less
memory for large ranges.
memory for large ranges.
    print(i, end=", ")
    print(i, end=", ")
print()
print()
print("Enumerating including the item number:")
print("Enumerating including the item number:")
for i, v in enumerate("CODESYS"):
for i, v in enumerate("CODESYS"):
    print(i, v)
    print(i, v)
Resulting output:
\begin{tabular}{l} 
Enumerating over the characters in a string: \\
\(\mathrm{C}, \mathrm{O}, \mathrm{D}, \mathrm{E}, \mathrm{S}, \mathrm{Y}, \mathrm{S}\), \\
Enumerating over the integers 1 to 4 : \\
\(1,2,3,4\), \\
Enumerating using xrange: \\
\(0,1,2,3,4\), \\
Enumerating including the item number: \\
0 C \\
1O \\
2D \\
\hline 3 E \\
\hline 4S \\
\hline 5 Y \\
\hline 6 S \\
\hline
\end{tabular}
```

If you require an index or number in addition to the item, then you should use enumerate as shown in the last case of the sample script. The following code is considered as poor style:

Example: Poor
style

```
text = "CODESYS"
for i in range(len(text)): # BAD STYLE!
    v = text[i] # DON'T TRY THIS AT HOME!
    print(i, v)
```

Besides for loops, Python also has while loops which are very similar to those in C and ST:

## Example of "while" loop

```
i = 0
while i < 3;
    print(i)
    i += 1
```

Note: This example is not very practical. You would more likely use a for loop with a range.

## IF / ELSE

The if/else construct is similar to those in other programming languages. Here is a short example:

```
Example:
"if_else.py"
from __future__ import print_function
\(i=i n t\left(s y s t e m . u i . q u e r y \_s t r i n g(" P l e a s e ~ e n t e r ~ a n ~ i n t e g r a l\right.\)
number..."))
if i \(<0:\)
    print("Your number was negative.")
elif i > 0:
    print("Your numer was positive.")
else:
    print("It seems your number was zero.")
```

The else branch is optional and there can be zero, one, or many elif branches.

## Functions, classes, and methods

Python allows for defining functions and classes with methods. A class with methods is basically similar to a function block in ST, or classes in languages such as C++, Java, or C\#. However, Python does not support interfaces.

For detailed information, see the Python documentation for defining Functions and Classes.

```
Examples:
Functions,
classes, and
methods
#defining a function with name sum and two parameters a and b:
def sum(a, b):
        return a + b # we return the sum of a and b.
# we can now call the function defined above:
print(sum(5,7))
# Now we define a class Foo:
class Foo:
    # The class gets a method "bar".
    # Note: for methods, the first parameter is always "self" and
    # points to the current instance. This is similar to "this" in
    # ST and other languages.
    def bar(self, a, b):
                print("bar(%s,%s)" % (a,b))
# We create an instance of the class:
f = FOO()
# We call the method bar on the instance.
f.bar("some", "params")
```

## Modules and standard libraries

In IEC, you can import libraries for reuse by other written code. As a pendant, there is the possibility in Python of importing modules.

The Python standard library contains many modules for different purposes, such as:

- String processing
- Date and time handling
- Collections
- Threading
- Mathematical functions
- File handling
- Persistence
- Compression and archiving
- Database access
- Encryption services
- Network and Internet access
- Sending of emails

To create your own modules, write a Python file that defines the functions and classes that you want to provide. Save this file to the same directory as our sample script. If you name the file mymodule.py, then you can import it with import mymodule.

Here is an example of importing and using the cosine function and the pi constant from the math module:

```
Example:
Import mathe-
matical func-
tion
```

```
from math import cos, pi
```

from math import cos, pi
print(pi) \# prints 3.14159265359
print(pi) \# prints 3.14159265359
print(cos(pi)) \# prints -1.0

```
print(cos(pi)) # prints -1.0
```

The following contains more examples that access information about the operating system, the Python version, and the interpreter:

## More import examples

```
import os
print(os.environ["OS"])
from sys import platform, version, executable
print(platform)
print(version)
print(executable)
```

```
Windows_NT
cli
2.7.1 (CODESYS.exe CODESYS V3.5 SP4, ScriptEngine.plugin 3.5.4.0)
CODESYS.exe
```

There is a special module $\qquad$ future $\qquad$ for activating new language features. Above all, it is used when Python developers introduce new functionalities that are backward compatible. These kinds of functionalities have to be activated with special "_future imports". One example that we use in most of our sample scripts here is the activation of the new power syntax of print as a function instead of a statement.

## Example:

```
"__future__
```

\# make print() a function instead of a statement
from __future__ import print_function

The Python documentation provides a complete list of all imports.
In addition to the normal Python modules, IronPython code can also access .NET assemblies as if they were Python modules. This opens the access to the .NET framework class library and third-party libraries. Here is an example how to open a dialog by means of the Windows Forms library:

## Example: <br> Opening <br> a .NET dialog

```
import clr
clr.AddReference("System.Windows.Forms")
from System.Windows.Forms import MessageBox
MessageBox.Show("Hello")
```

## Transitioning from Python 2 to Python 3

With Python version 3, Python developers introduced some incompatible changes and removed some obsolete functionalities. At this time, the Python community is still in the transitional phase from version 2 to version 3.

IronPython does not yet support Python 3, but it is being worked on. As the Python community no longer supports Python 2, we intend to up0grade to Python 3 as soon as it is supported by IronPython.

Although we strive for a smooth transition, script writers should take care that their scripts are created in a future-proof style. For example, by using the expression from __future__ import print_function.

For more information, see: Python 2 or Python 3? and New in Python 3

## Comparison of IronPython and cPython

There are some small differences and Incompatibilities between IronPython and "standard" Python ("cPython"). Some are direct errors in IronPython and should be removed in future versions. However, others are considered "implementation details" and will remain. Some of them are very challenging topics.
The difference that is most obvious for users is the handling of strings. Original cPython has two different string types for "byte strings" and "Unicode strings". This concept is similar to the data types STRING and WSTRING in IEC. IronPython simply uses .NET strings that are always Unicode-capable and use UTF-16 internally. However, IronPython implements a trick to hide the difference to cPython from the programmer. (Interesting: For the new Python version 3, the developers have completely reworked their string handling. The result was a model which is much closer to IronPython. Unicode strings are always used after that and there is a separate data type for handling raw bytes)
Python modules that are written in C cannot be imported into IronPython because cPython uses internal data structures that are completely different from IronPython. Most of the standard library modules were reimplemented in IronPython. However, some modules (such as the TK interface) are not available as long as they are not ported to IronPython explicitly. On the other hand, IronPython provides access to .NET assemblies including the .NET framework (as shown above), which more than compensates for this feature.
While cPython uses reference counting and a deterministic garbage collector for cleaning up cyclic garbage, IronPython relies on the non-deterministic .NET garbage collector. In most cases, this difference does not matter. But when you open files or other resources from the Python standard library or the .NET framework, you should make sure to close them later. It is best to use the with statement with the Python context manager or .NET IDisposable instances.
For more information, see: Content Managers and .NET IDisposable

### 6.6.11.1.7 Using Scripts to Access CODESYS Functionalities

All objects and command which CODESYS provides for scripting are also available in the "scriptengine" Python module. Whenever a script is started, an implicit <code>from scriptengine import *</code> results. This allows for easy access to CODESYS. However, if your script imports modules that require access CODESYS APIs, then these modules have to import the module scriptengine themselves.
In the following table, you will find the main objects (categories) that can be used in Python scripts as entry points. For comprehensive documentation about entry points, see the for the CODESYS ScriptEngine.

| Objects | Description |
| :---: | :---: |
| System | Access to general CODESYS functionalities <br> Examples: <br> - Exiting CODESYS <br> - Handling the general user interface <br> - Access to the message memory (including compiler messages) <br> - Control of delay and progress bars |
| projects | Access to the CODESYS project as an object tree that combines the three navigator views (devices, POUs, modules) in one project tree <br> Also allows for the loading, creating, saving, and closing of projects <br> For most objects in a project, there are special methods with detailed functionality, for example compiling, access to ST POUs, export, import, device configuration, etc. |
| online | Access to online functionalities <br> Examples: <br> - Log in to devices and applications <br> - Management of access data (user name, password) <br> - Performance of network scans <br> - Gateway management |
| librarymanager | Permits the management of library repositories and viewing, installation, and removal of libraries |
| device_repository | Handling of device repositories; import and export of device descriptions |
| modulerepository | Management of CODESYS Application Composer modules and CODESYS Application Composer repositories |

See the following specific sample scripts for ways to access CODESYS functionalities. For detailed information, see the for the CODESYS.

## Example: Printing the device tree of the current project

The script PrintDeviceTree. py is an example for navigating in a project. It creates the output of a hierarchical display of all devices in the open project.

Load a project that contains some device objects and execute the script.

```
Example:
PrintDeviceT
ree.py
# encoding:utf-8
# We enable the new python 3 print syntax
from __future__ import print_function
# Prints out all devices in the currently open project.
print("--- Printing the devices of the project: ---")
# Define the printing function. This function starts with the
# so called "docstring" which is the recommended way to document
# functions in python.
def print_tree(treeobj, depth=0):
    """ Print a device and all its children
    Arguments:
    treeobj -- the object to print
    depth -- The current depth within the tree (default 0).
    The argument 'depth' is used by recursive call and
    should not be supplied by the user.
        """
        # if the current object is a device, we print the name and
device identification.
        if treeobj.is_device:
            name = treeobj.get_name(False)
            deviceid = treeobj.get device identification()
            print("{0}- {1} {2}".format("--"*depth, name, deviceid))
        # we recursively call the print_tree function for the child
objects.
        for child in treeobj.get_children(False):
            print_tree(child, depth+1)
# We iterate over all top level objects and call the print_tree
function for them.
for obj in projects.primary.get_children():
        print_tree(obj)
print("--- Script finished. ---")
```

The device tree (from the "Devices" view) is displayed in the message view and all non-device objects are left out:

## Example: Reading of variables

The script ReadVariable.py logs in to the device and starts the application if necessary. Then the value of the variable PLC_PRG.iVar1 is read and output. To try the script, you have to modify the project path and variable names.

```
Example:
ReadVariable
.py
```

```
# encoding:utf-8
```

# encoding:utf-8

from __future__ import print_function
from __future__ import print_function

# close open project if necessary:

# close open project if necessary:

if projects.primary:
if projects.primary:
projects.primary.close()
projects.primary.close()

# opens project

# opens project

proj = projects.open(r"D:\data\projects\Ampel.project")
proj = projects.open(r"D:\data\projects\Ampel.project")

# set "Ampel.project" to active application

# set "Ampel.project" to active application

app = proj.active_application
app = proj.active_application
onlineapp = online.create_online_application(app)
onlineapp = online.create_online_application(app)

# login to device

# login to device

onlineapp.login(OnlineChangeOption.Try, True)
onlineapp.login(OnlineChangeOption.Try, True)

# set status of application to "run", if not in "run"

# set status of application to "run", if not in "run"

if not onlineapp.application_state == ApplicationState.run:
if not onlineapp.application_state == ApplicationState.run:
onlineapp.start()
onlineapp.start()

# wait 1 second

# wait 1 second

system.delay(1000)
system.delay(1000)

# read value of iVar1

# read value of iVar1

value = onlineapp.read_value("PLC_PRG.iVar1")
value = onlineapp.read_value("PLC_PRG.iVar1")

# display value in message view or command line

# display value in message view or command line

print(value)
print(value)

# log out from device and close "Ampel.project"

# log out from device and close "Ampel.project"

onlineapp.logout()
onlineapp.logout()
proj.close()

```
proj.close()
```

In the extension of the script ReadVariable.py, the script MailVariables.py loads variables and expressions from a recipe file and reads their current values from the controller. Then these values are written back to the same file. In addition, is uses the Python SMTP library to send an email with an attachment containing a list of all variables.
To use the script, you have to modify the paths, email address, and the name of the SMTP server to your environment.

```
Example:
MailVariable
s.py
# encoding:utf-8
from __future__ import print_function
# Close current project if necessary and open "ScriptTest.project"
if not projects.primary == None:
    projects.primary.close()
project = projects.open("D:\\Data\\projects\\scriptTest.project")
# retrieve active application
application = project.active_application
# create online application
online_application = online.create_online_application(application)
# login to application.
online_application.login(OnlineChangeOption.Try, True)
# start PLC if necessary
if not online_application.application_state == ApplicationState.run:
    online_application.start()
# wait 2 seconds
system.delay(2000)
# open recipe file to read values.
recipe_input_file = open("D:\\Data\\projects\\RecipeInput.txt", "r")
watch_expressions = []
for watch_expression in recipe_input_file:
        watch_expressions.append(wātch_expression.strip())
print watch_expressions
# read values from the controllerd
watch_values = online_application.read_values(watch_expressions)
print watch_values
# open output file to write values
recipe_output_file = open("D:\\Data\\projects\\RecipeOutput.txt",
"w")
for i in range(len(watch_expressions)):
    recipe_output_file.write(watch_expressions[i])
    recipe_output_file.write(" = ")
    recipe_output_file.write(watch values[i])
    recipe_output_file.write("\n")
# Close files
recipe_input_file.close()
recipe_output_file.close()
# send Email
# import respective libraries
import smtplib
from email.mime.text import MIMEText
#open output file
recipe_output_file = open("D:\\Data\\projects\\RecipeOutput.txt",
"r")
mail = MIMEText(recipe_output_file.read())
```

```
recipe_output_file.close()
#email address sender and recipient
fromm = "info@example.com"
to = "info@example.com"
# set sender and recipient
mail["Subject"] = "Attention value has changed"
mail["From"] = fromm
mail["To"] = to
# send email
smtp = smtplib.SMTP("name of smtp server")
smtp.sendmail(fromm, [to], mail.as_string())
smtp.quit()
# logout and close application
online_application.logout()
projec\overline{t.close()}
```

## Example: Creating and editing of POUs

The script CreateDut. py creates the objects MyStruct, MyAlias, and MyUnion in the CODESYS project. The folder DataTypes already has to be present.

## CreateDut.py

```
# encoding:utf-8
from __future__ import print_function
STRUCT_CONTENT = """\
    a : BOOL;
    b : BIT;
    c : BIT;
UNION_WHOLE = """\
TYPE M
UNION
        Zahl : INT;
        Prozent : MyAlias;
        Bits : MyStruct;
END_UNION
END_TYPE
"""
proj = projects.primary
folder = proj.find('DataTypes', recursive = True)[0]
# Create a struct DUT and insert the list of variables just into
the right
# place in line two, row 0 (line numbering starts with line 0)
struktur = folder.create_dut('MyStruct') # DutType.Structure is the
default
struktur.textual_declaration.insert(2, 0, STRUCT_CONTENT)
# Alias types get their "content" via the base type, which will
just end up
# as one line in the declaration part:
# TYPE MyAlias : INT (0..100); END_TYPE
bereich = folder.create_dut('MyAlias', DutType.Alias, "INT
(0..100)")
# Instead of injecting the variables into the existing declaration,
# one can also just replace the complete declaration part,
including the
# boilerplate code.
union = folder.create_dut('MyUnion', DutType.Union)
union.textual_declaration.replace(UNION_WHOLE)
```

Example: User interface / Interaction with the user
In some cases, scripts have to interact with the user. We provide some simple APIs for the most common interactions. The sample script System_UI_Test. py shows all of the possible functions in this regard.

```
Example:
System_UI_Te
st.py
    # encoding:utf-8
    from __future__ import print_function
"""Performs some tests on the messagestore and UI."""
print("Some Error, Warning and Information popups:")
system.ui.error("Fatal error: Everything is OK. :-)")
system.ui.warning("Your bank account is surprisingly low")
system.ui.info("Just for your information: 42")
print("Now, we ask the user something.")
res = system.ui.prompt("Do you like this?", PromptChoice.YesNo,
PromptResult.Yes);
print("The user selected '%s'" % res)
print("Now, the user can choose between custom options:")
res = system.ui.choose("Please choose:", ("First", 2, 7.5,
"Something else"))
print("The user selected option '%s'" % str(res)) # res is a tuple
print("Now, the user can choose several options:")
res = system.ui.select_many("Please select one or more options",
PromptChoice.OKCancel, PromptResult.OK, ("La Premiere", "The
Second", "Das Dritte"))
print("The returned result is: '%s'" % str(res)) # res is a tuple
print("Now, the user can select files and directories")
res = system.ui.open_file_dialog("Choose multiple files:",
filter="Text files (*.txt)|*.txt|Image Files(*.BMP;*.JPG;*.GIF)|
*.BMP;*.JPG;*.GIF|All files (*.*)|*.*", filter_index = 0,
multiselect=True)
print("The user did choose: '%s'" % str(res)) # res is a tuple as
multiselect is true.
res = system.ui.save_file_dialog("Choose a file to save:",
filter="Text files (\overline{*}.txt)|*.txt|Image Files(*.BMP;*.JPG;*.GIF)|
*.BMP;*.JPG;*.GIF|All files (*.*)|*.*", filter_index = 0)
print("The user did choose: '%s'" % res)
res = system.ui.browse_directory_dialog("Choose a directory",
path="C:\\")
print("The user did choose: '%s'" % res)
print("Now we query a single line string")
res = system.ui.query_string("What's your name?")
print("Nice to meet you, dear %s." % res)
print("Now we query a multi line string")
res = system.ui.query_string("Please tell me a nice story about
your life!", multi_line=True)
if (res):
    print("Huh, that has been a long text, at least %s
characters!" % len(res))
else:
    print("Hey, don't be lazy!")
print("Username and passwort prompts...")
res = system.ui.query_password("Please enter your favourite
password!", cancellable=True)
if res:
    print("Huh, it's very careless to tell me your favourite
```

```
password '%s'!" % res)
else:
    print("Ok, if you don't want...")
res = system.ui.query_credentials("Now, for real...")
if res:
    print("Username '%s' and password '%s'" % res) # res is a
2-tuple
else:
    print("Sigh...")
```

## Example: Manipulating the "Project Information" object

In the script ProjectInfoExample.py, we set some information in the "Project Information" object. The most important information items, such as "Title" and "Version", have explicit properties. However, you can read and write any other information fields by means of the dictionary syntax. For example, those that are recommended for the properties of a library project.
The example below may seem somewhat unrealistic, but similar code is used in build servers that create, test, and possibly release automatic library projects and other projects. The ScriptEngine is one of the key elements for creating Cl (Continuous Integration) and CD (Continuous Delivery) systems.

```
Example:
ProjectInfoE
xample.py
```

```
# encoding:utf-8
```

# encoding:utf-8

from __future__ import print_function
from __future__ import print_function
proj = projects.load("D:\Some.library")
proj = projects.load("D:\Some.library")
info = proj.get_project_info()
info = proj.get_project_info()

# Set some values

# Set some values

info.company = "Test Library Ltd"
info.company = "Test Library Ltd"
info.title = "Script Test Project"
info.title = "Script Test Project"
info.version = (0, 8, 15, 4711)
info.version = (0, 8, 15, 4711)
info.default_namespace = "testlibrary"
info.default_namespace = "testlibrary"
info.author = "Python von Scriptinger"
info.author = "Python von Scriptinger"

# some values recommended in the library toolchain

# some values recommended in the library toolchain

info.values["DefaultNamespace"] = "testlibrary"
info.values["DefaultNamespace"] = "testlibrary"
info.values["Placeholder"] = "testlibrary"
info.values["Placeholder"] = "testlibrary"
info.values["DocFormat"] = "reStructuredText"
info.values["DocFormat"] = "reStructuredText"

# now we set a custom / vendor specific value.

# now we set a custom / vendor specific value.

info.values["SpecialDeviceId"] = "PLC0815_4711"
info.values["SpecialDeviceId"] = "PLC0815_4711"

# Enable generation of Accessor functions, so the IEC

# Enable generation of Accessor functions, so the IEC

# application can display the version in an info screen.

# application can display the version in an info screen.

info.change_accessor_generation(True)
info.change_accessor_generation(True)

# And set the library to released

# And set the library to released

info.released = True;
info.released = True;
proj.save()

```
proj.save()
```

## Example: Calling external commands and importing PLCOpenXML files

The sample script DeviceImportFromSVN.py gets a PLCOpenXML file from an external program (in this case a SVN client) and imports it into a new created CODESYS project.
To use the script, you have to modify the paths to your environment.

## Example: <br> DeviceImport <br> FromSVN.py

```
# encoding:utf-8
# Imports a Device in PLCOpenXML from Subversion via command line
svn client.
# We enable the new python 3 print syntax
from
```

$\qquad$

``` future
``` \(\qquad\)
```

import print_function
import sys, os

# some variable definitions:

SVNEXE = r"C:\Program Files\Subversion\bin\svn.exe"
XMLURL = "file:///D:/testrepo/testfolder/TestExport.xml"
PROJECT = r"D:\test.project"

# clean up any open project:

if projects.primary:
projects.primary.close()

# Fetch the plcopenxml data from subversion.

# We'll catch the output of the program into the xmldata variable.

# The 'with' construct automatically closes the open pipe for us.

with os.popen('"' + SVNEXE + '" cat ' + XMLURL, 'r') as pipe:
xmldata = pipe.read()

# create a new project:

proj = projects.create(PROJECT)

# import the data into the project.

proj.import_xml(xmldata, False)

# and finally save. :-)

proj.save()
print("--- Script finished. ---")

```

\section*{Advanced example: Calling a library from SVN and installing it in CODESYS}

The following sample script can perform the calling and installing of a library as part of a CT (Continuous Testing) environment so that they can be tested. In addition to standardCODESYS, the CODESYS SVN add-on also has to be installed with a valid license.

\section*{Example}
```

import tempfile
if projects.primary:
projects.primary.close()
tempdir = tempfile.mkdtemp()
URL = "svn://localhost/testrepo/trunk/SvnTestLibrary/"
proj = svn.checkout(URL, tempdir, "testlibrary", as_library=True)
proj.save()
repo = librarymanager.repositories[0]
librarymanager.install_library(proj.path, repo, True)
proj.close()

```

\subsection*{6.7 Human machine interface}

\subsection*{6.7.1 Control panels}

The CP600-eCo, CP600 and CP600-Pro control panels in different screen sizes provide comprehensive HMI functions for a wide range of applications. The engineering tool Panel Builder, part of Automation Builder, ensures easy scalability on the platform of the control panels.

\section*{Application examples/ application notes}

Control panels can be used with the AC500 PLCs for different purposes and different application environments. Example projects (application examples; ending with *.zip) and step-by-step instructions (application notes; ending with *.pdf) that demonstrate a specific use case can be found on the following topics:

A CP600 project can be converted to a project for control panels of the \(2^{\text {nd }}\) generation. The conversion procedure is described in the application note Converting a CP600 project.

Installation, licensing and configuration of the control panel runtime is described in the application note Control panel PC runtime.

How to enable and handle the runtime logging on control panels is demonstrated in the application example Control panel runtime logging.

How to dump data like trends, alarm buffers, audit trail buffers, recipes, etc. from the control panels to a network shared folder is described in the application note How to store data on a network shared folder.

Modbus RTU can be used for communication between an AC500-eCo V3 PLC and a control panel. The connection principle is described using the CP604 control panel as an example: CP604 connection via Modbus RTU.

How to upload a disk image from a control panel is described in the application note Upload disk image.

A summary of frequently asked questions related to the Boot Support Packages (BSP) and the control panels can be found in the application note FAQ on BSP.

How to check the BSP version of a CP600 HMI is described in the application note Check BSP version.
For a description of how to update the BSP in order to improve the control panel security and how to use enhanced product functionality see the application note Update BSP version.

How to update or reinstall a micro browser on an CP600-WEB control panel is described in the application note CP600-WEB and micro browser.

The control panels support web visualization via Chromium browser. How to setup and configure the Chromium browser for the usage in control panels is described in the application note Control panels and Chromium browser.

CP600 control panels contain a buzzer that can be used to give acoustic signals on certain events. The application note CP600 buzzer control describes how the buzzer can be controlled by using AC500 PLC tags on the connected PLC.

How to design and create control panel projects that comply with 21 CFR part 11 standard is described in the application note PB610 Panel Builder 600 V2.8.

The procedure for changing from a CP600 device to a CP600 device of the 2nd generation is described in the application example Converting a CP600 project. A description of the differences between both device variants can also be found in this application example.

How to connect an MQTT message broker with a CP600 is described in the application example CP600 MQTT.

\subsection*{6.7.2 Panel Builder interface}

\subsection*{6.7.2.1 General}

This document describes HMI CP600 Control Panel configuration in Automation Builder and starting HMI configuration and programming software Panel Builder 600 from Automation Builder. The Panel Builder project created for the HMI CP600 is stored within the Automation Builder project.

\section*{6．7．2．2 Adding desired AC500 PLC to the project}

\section*{Configuring the} Symbol File

1．In the Automation Builder device tree，right－click the＂Application＂node and click＂Add object＂
\begin{tabular}{|c|c|c|c|}
\hline \multicolumn{3}{|l|}{Add object below ：Application} & x \\

\end{tabular}

2．Click on＂Symbol Configuration＂and click＂Add object＂
\(\Rightarrow\) A＂Symbol Configuration＂object is added to the＂Application＂node．
3．Double－click on the＂Symbol Configuration＂object，then click on＂Build＂

\(\Rightarrow\) A list of all variables in the project is generated．Single variables or groups of variables can be selected by checking the corresponding item in the list．
4. After the symbols have been configured, download the project or click "Build \(\rightarrow\) Generate code" in the Automation Builder to create an .xml file containing all the variables read to be imported in the Tag Editor.

\subsection*{6.7.2.3 Creating a Panel Builder project}

\section*{Adding a panel} object
1. Right-click in the Automation Builder device tree and click "Add object \(\rightarrow\) Panel-CP600"
2. Click on "CP600 Control Panel" and click "Add object"
\(\Rightarrow\) A Control Panel object is added to the Automation Builder device tree.

\section*{Starting a Panel Builder project}
1. In the device tree, double-click "Panel CP600" object to start Panel CP600 screen.

2. Select the required PLC and enable the checkbox in the 'Use Standard Connection Settings' column to use it as a standard gateway connection.
You can set communication settings using the application program or by creating custom communication settings. Custom communication settings can be configured by clicking the button in the 'Details' column.
3. Enable the "Update Panel Builder project on launch" checkbox and click [Launch Panel Builder Editor].

If you update Automation Builder project with new variables and data types or if there are changes in existing Automation Builder project variables and data types (new, modified, deleted), recompile CODESYS application to refresh the symbol file, then launch Panel Builder editor.
4. Select "New" and click "Open" to create a new HMI project.
\(\Rightarrow\) A project wizard is displayed.

If you want to import an already existing Panel Builder project file from the file system, select "Import existing project file" and proceed.
5. Select the required panel type and orientation and click "Finish".
\(\Rightarrow\) A new project wizard starts only if the Panel project is empty.

The panel projects can be compared in Automation Builder using the "Compare Objects" option.

\section*{Changing panel type}
1. In the Panel project, double-click "Project properties" to change the panel type to the panel which is used.
\(\Rightarrow\) The Properties dialog is displayed.

2. In the Properties dialog, expand "Project" and click "Project Type ".
\(\Rightarrow\) A project wizard dialog is displayed.
3. Select the desired panel type and click "Finish".

Project informa- The project information view provides an overview of the Panel Builder project without opening tion the project. To open the project information, double-click the "Panel_CP600" object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.

The Panel Builder project information shows the list of PLCs added to the project.

\subsection*{6.7.2.4 Configuring Panel Builder}

Configuring communication protocols

The user can configure a panel project manually in Panel Builder editor when there is a need to create individual panel projects. Otherwise, the configuration is updated in the panel project while launching Panel Builder editor in Automation Builder.
1. In the Panel Builder project structure, double-click "Config \(\rightarrow\) Protocols".
2. Click \(\pm\) to add a protocol.

3. Select "OPC UA Client" to ensure an encrypted communication between AC500 V3 devices and the control panels. This is necessary to protect passwords and other data in terms of cyber security.
Set the IP address, port, protocol type and PLC models. Click [OK].

\section*{Importing tags}
1. In the Panel project view, click "Config \(\rightarrow\) Tags".
2. Select the protocol from the drop-down list and click \(\sqrt{\boxed{ } 1}\) to import tags.

If the Panel Builder contains multiple tag importers, a dialog is displayed to select the required importer type.
3. Select the symbol file which was exported to the file system.
4. In the lower part of the tag editor, mark the desired tags and click "Import Tag (s)" to import the tags to the Panel Builder project.

Attaching tags to widgets
1. In the project view, expand "Pages" and double-click Page1.
2. In the Panel Builder 600 main menu, select "View \(\rightarrow\) Toolbars and Docking Windows \(\rightarrow\) Widget Gallery".
3. Drag-and-drop the desired widget to the page editor.
4. Right-click on the widget value and select "Attach To" to attach a tag to the widget.

5. Select the desired tag and select the desired option for the authorization "Read Only" or "Read/ Write" or "Write Only". Then, click [OK].

\section*{Downloading a project to panel}
1. In the Panel Builder main menu, click "Run \(\rightarrow\) Download To Target".
2. Select the CP600 project from the drop-down list and click "Download".

Importing an existing Panel Builder project
1. In the Automation Builder device tree, right-click the Panel project and click "Import \(\rightarrow\) Panel Builder Project".
System prompts to overwrite the exiting project object data.
2. Click "Yes" to confirm.
3. Select the existing Panel Builder 600 project from the file system and click "Open".
\(\Rightarrow\) The imported project is displayed.

\section*{Exporting Panel} Builder project
1. In the Automation Builder device tree, right-click the Panel Builder 600 project and click "Export \(\rightarrow\) Panel Builder Project".
2. Click "Browse" and select the desired location in the file system and save the project file.
\(\Rightarrow\) A success message is displayed, if the project file exports successfully.

When you double-click the Panel Builder project node, the compressed information of the node is extracted into a temporary folder and then the external Panel Builder program is started. After the external Panel Builder program is closed, the corresponding Panel Builder files can be compressed back into the node and saved in the Automation Builder project.

We recommend to edit the Panel Builder project by starting Panel Builder through the Automation Builder. You can also export a Panel Builder project to the file system to edit the project by using the external Panel Builder. Then, reimport it to Automation Builder.

\subsection*{6.7.3 SCADA Integration}

\subsection*{6.7.3.1 General}

This document describes SCADA integration configuration in Automation Builder using zenon editor. The configured device network address information and variables are synchronized with zenon editor to avoid double entry.
The Automation Builder supports both standard and multi-user functionality.

\subsection*{6.7.3.2 Creating Workspace and Project}
1. In the device tree, double-click "zenon_Project".

\(\Rightarrow\) To launch the zenon editor, click [Launch Zenon Editor].
To update the zenon project with latest changes of application program, click [Update zenon project].
2. Select the required PLC and select the "Use Standard Conn. Settings" option to use as a standard gateway connection.

This enables the user to use the same communication settings that Automation Builder uses to communicate to the PLC.

The configured gateway communication settings made in Automation Builder are displayed in the column 'Connection Type'.

As an alternative you can create custom communication settings: Deselect the "Use Standard Conn. Settings" option and click the button in the 'Details' column.
3. Click [Launch Zenon Editor] to create a new workspace and project.

Fig. 356: Connect to zenon project

4. Select the "Create a new workspace" option and select the file location to create a new workspace.
5. Select the "Create new project" option to create a project.
\(\Rightarrow \mathrm{ABB}\) zenon editor is displayed.

If you update or change an Automation Builder project with new variables or data types (new, modified, deleted), recompile the application to refresh the symbol file and click [Update zenon project].

After creating the project and workspace in Automation Builder, it is not required to set it again for the zenon object. A double-clicking on the zenon project shows the previously configured zenon project and the workspace.

\subsection*{6.7.3.3 Loading existing Workspace and Project}

You can load an existing workspace and project to ABB zenon supervisor.
1. In the zenon_Project screen, click [Update zenon project].
\(\Rightarrow\) Connection to the zenon project dialog is displayed.
2. In the workspace area, enable "Load existing workspace" and select the location.
3. In the project area, enable "Select loaded project" and click [OK].
\(\Rightarrow\) Zenon editor loads the selected existing workspace and the project.

\subsection*{6.7.3.4 Checking the Gateway Settings in a Zenon Project}

The gateway settings configured in Automation Builder can be checked in a zenon project. The IP address configured in Automation Builder are displayed in the zenon driver configuration.
In the Project Manager structure of the zenon editor, click "Variables \(\rightarrow\) Drivers" to configure the driver configuration.

The "Settings" tab shows all gateway settings based on the number of configured PLCs in Automation Builder. The IP address should be similar to the project gateway settings in Automation Builder.

In the zenon project window, the Connect column should be checked to transfer the desired number of PLC connection settings to the zenon editor.

\subsection*{6.7.3.5 Creating a symbol configuration}

Requirement: The project can be compiled without any errors.
1. Select the "Application" object in the device tree.
2. Click "Project \(\rightarrow\) Add Object \(\rightarrow\) Symbol Configuration".
\(\Rightarrow\) The "Symbol Configuration" object is added to the device tree and the objects editor opens.
3. Open the "View" menu of the editor and activate the categories of variables that should be provided in the configuration editor. Click "Build" in the symbol configuration editor.
\(\Rightarrow\) All variables (according to the currently defined filter in the "View" menu) are displayed in a tree structure.
4. Select the check boxes of individual variables.

Pay attention to the current settings (see the "Settings" button in the menu bar of the editor).
\(\Rightarrow\) In the field below the menu bar of the editor, information is provided about the current situation with accompanying instructions, as well as controls for corrective actions.
5. Follow the prompt in the field below the menu bar. In the following case, this should be only the information that the modified symbol configuration is transferred with the next download or online change.
6. Click "Build Generate Code" on the CODESYS menu bar.
\(\Rightarrow\) The <project name>.<device name>.<application name> .xml file is generated in the project directory.

CODESYS transmits the symbol configuration to the PLC for an application download or online change.

\subsection*{6.7.3.6 Updating Standard Data Types}

The standard data types created in CODESYS application can be updated to the zenon project by clicking on "Update zenon project".

Data types and variables can be updated from the desired number of PLCs configured in the zenon project of Automation Builder.

In the zenon project, double-click "Variables" and check the updated standard data type.

\subsection*{6.7.3.7 Creating Data Types}
1. In the CODESYS application open the "Data types" tab. Right-click "Data types \(\rightarrow\) Add object" to create a new data type.
2. Enter the user defined data type name.
3. In "POUs" tab, add the user defined variable data type and compile.
\(\Rightarrow\) The user defined data type is created and can be imported in the zenon editor.

If you modify or delete the data types in CODESYS application, compile with
"Rebuild all option".

\subsection*{6.7.3.8 Importing Data Types in zenon Editor}
1. In the zenon project, click [Update zenon project] to update the data types.
2. Click "Update" to update the variables and data types to the zenon project.
\(\Rightarrow\) The user defined variables and data types are imported to the zenon project.

Fig. 357: User defined variables

\subsection*{6.8 System technology}

\subsection*{6.8.1 General}

This chapter provides advanced information on the system technology of AC500 control systems from a general perspective. It provides information to link the details from the hardware descriptions (provided in the device specifications section) with detailed information on configuring/programming a corresponding library (provided in the individual library sections).

Configuration of a specific device with Automation Builder is described in the PLC configuration section.

\section*{6．8．2 System technology of CPU and overall system}

\section*{6．8．2．1 Handling of remanent variables for AC500 V3 products}

\section*{68．8．2．1．1 Introduction}
The retain／persistent memory must be buffered by a battery TA521 for the
PLCs PM56xx－2ETH．Following described functionalities are only working if a
battery is inserted．Take care about the handling for TA521 battery．
』 4 Chapter 5．2．8．2．3＂TA521－Battery＂on page 1319
The AC500－eCo V3 PLCs，PM50xx－ETH PLCs don＇t need a battery．
』＂Detailed data＂on page 188

All operands supported by CODESYS are described in＇Configuring I／O links＇\({ }^{\mu}\) Chapter 6．4．1．8 ＂Configuring I／O Links＂on page 1835．For the memory sizes of the different CPUs，see for AC500－eCo V3＇Memory sizes＇圱＂AC500－eCo V3 processor modules＂on page 4413 and for AC500 V3＇Memory sizes＇«＂AC500 V3 processor modules＂on page 4413.

This part of the documentation describes the declaration of remanent variables for AC500 V3 products．

\section*{Different handling of remanent variables in AC500 FW \(\geq\) V3．0．2}
－No more \％R memory area（use instead \％M with \｛no＿init\} \({ }^{\mu}\) Chapter 6．8．2．1．6＂Initialization of \％M variables＂on page 4417）
－Creating of addresses for＂VAR RETAIN PERSISTENT＂variables automati－ cally by IEC Compiler

It is NOT possible to change the structure（e．g．add，delete，change order，．．）of retain／persis－ tent variables of a project and update the project via memory card．
Up to version of SystemFW 3．4．x the boot project will be deleted（renamed into application．err） and the PLC will not load the boot project anymore．Also download of new／other project with Automation Builder failes．

Workaround：
－Automation Builder \(\rightarrow\) PLC Shell \(\rightarrow\) clearsram all \(\rightarrow\) retain persistent／retain area is deleted （not the \％M area）\(\rightarrow\) application is running after reboot with initialized／retain／persistent data
－Automation Builder \(\rightarrow\) PLC Shell \(\rightarrow\) clearsram all \(\rightarrow\) retain persistent／retain area is deleted \(\rightarrow\) sram c m（clear \％M）\(\rightarrow\) \％M area is deleted \(\rightarrow\) reboot \(\rightarrow\) application is running with initialized／retain／persistent／\％M data
－Automation Builder empty project \(\rightarrow\) Reset Origin Device \(\rightarrow\) retain persistent／retain area／ \(\% \mathrm{M}\) area is deleted \(\rightarrow\) new update via SD card \(\rightarrow\) application is running after reboot with initialized data
－For midrange reboot without battery \(\rightarrow\) application is running after reboot with initialized data

The application is running with initialized persistent and／or retain after updating the application via memory card and rebooting the PLC．
In version of SystemFW 3．5．x the changed retain persistent／retain area is deleted．Application is running after reboot with initialized／retain／persistent data．
In case of trouble use the above described workaround．

\subsection*{6.8.2.1.2 Memory sizes}

\end{tabular}} & & \\
\hline PM5675-2ET
H & & & & 8 GB & \\
\hline
\end{tabular}

It is not possible to use 100 \% of a device's memory space. About \(10 \%\) of the total available space must remain unused at any time to maintain normal device operation.

\subsection*{6.8.2.1.3 Adding a global list of persistent/retain variables}

A global list of persistent variables will be added with the standard definition for persistent variables "VAR RETAIN PERSISTENT" « Chapter 6.4.1.20.2.14 "Retain Variable - RETAIN" on page 2124 \({ }^{〔}\) Chapter 6.4.1.20.2.13 "Persistent Variable - PERSISTENT" on page 2122.

First steps:
1. Expand the object path of your PLC
2. After right click on "App" select "Add object" in the context menu.

The window "Add object below: Application" appears.

3. Select "Persistent Variables" and click [Add object].

The object name can be chosen freely. In the application it will be reused to reference the persistent variables.

\subsection*{6.8.2.1.4 Declaring a new variable in global list}

Declare a new variable in the window "GlobPersist".

Afterwards the variable can be selected in the program.

In this way the persistent variable can be accessed directly.

Do not use the same persistent variable in different IEC tasks, to avoid problems with consistency.
6.8.2.1.5 Declaring a new persistent/retain variable in local POU

It is also possible to declare a persistent/retain variable in a local POU and not in the global list of persistent variables.

It is not recommended to declare a large number of persistent variables locally, due to the potentially effect to performance.

The auto-declare mechanism declares always a persistent variable locally and not in the global list. If the program will be executed, the following warning appears in the message window:

C0244: No VAR_PERSISTENT-list is part of the application to enter instance path for variable PLC_PRG.new_var1 The locally declared persistent variable has to be added to the global list.

\section*{NOTICE!}

For the initialization of a Retain/Persistent variable the value of the global list is used NOT the value of the local declaration.

For further information see "RetainPersistentExample.project".

1. Right-click in window "PersistentVars".
2. Select option "Add all instance paths".
\(\Rightarrow\) Afterwards the persistent variables are added.

The application can be downloaded to the PLC

> It is NOT recommended to declare a new persistent variable in the application due to performance problems.

For example PM5650-2ETH:
1000 DWORD \(\approx 600 \mu\) s additional cycle time of task.

\subsection*{6.8.2.1.6 Initialization of \(\% M\) variables}

After download or restart, all \%M variables will be initialized to 0 . This can be prevented by setting the "no_init" attribute.

In doing so the \%M variables behave similar to the "VAR RETAIN PERSISTENT" variables.
```

cnt : DWORD := 0;
setvar : BOOL := FALSE;
(attribute 'no init'}
ProzMivar AT \&MW0: WORD;
ProzMivarField AT \&MW1: ARRAY [1..1000] OF WORD;
ProzMivar1 AT \&MW1001: WORD;
adतn UarDeva1 . mNTNTPD m ntave.

```

In the example above variable "ProzMivar" has the attribute "no_init". This variable will not be initialized and keeps its last value.

The attribute "no_init" is always and only valid for the next following variable \({ }_{\mu} \Rightarrow\) Chapter 6.4.1.20.6.3.32 "Attribute 'noinit"' on page 2299.

The following two variables "ProzMivarField" and "ProzMivar1" will be further on initialized to 0.

\subsection*{6.8.2.1.7 Behavior of retain variables}

The declaration of the retain variables strictly follows the 3 Standard (see Remanent variables « Chapter 6.4.1.20.2.14 "Retain Variable - RETAIN" on page 2124 y Chapter 6.4.1.20.2.13 "Persistent Variable - PERSISTENT" on page 2122).

For retain variables it does not matter if they are declared locally in a program or in the global variable list.
6.8.2.1.8 PLC shell command for import and export of retain/persistent variables

The syntax of the command is: sram <direction><area><path>

\section*{Supported options:}
\begin{tabular}{|l|l|}
\hline Direction: & i=import, \(\mathrm{e}=\) export \\
\hline Area: & rp=Retain/Persistent, \(\mathrm{m}=\% \mathrm{M}\) area \\
\hline Path: & Any pathname \\
\hline
\end{tabular}

The file will be stored in the user partition of the PLC. This data can be imported or exported via the FTP-Server or the Files dialog in Automation Builder.
If no path is indicated, the files are saved under "PlcLogic/<ApplicationName>/<ApplicationName>.ret or .prozm".
If a path is indicated, the files are saved under or accessed via
"<path>/<ApplicationName>.ret or .prozm".
A non-existing path is created with the exception of the memory card. The path for the memory card must be an existing path. On the memory card a non-existing path leads to an error message.
\begin{tabular}{|l|l|l|}
\hline Data area & File extension & Path \\
\hline Retain/Persistent & .ret & \begin{tabular}{l} 
PlcLogic/<ApplicationName>/<Application- \\
Name>.ret \\
<path>/<ApplicationName>.ret
\end{tabular} \\
\hline \%M (memory area) & .prozm & \begin{tabular}{l} 
PlcLogic/<ApplicationName>/<Application- \\
Name>.prozm \\
<path>/<ApplicationName>.prozm
\end{tabular} \\
\hline
\end{tabular}

\section*{Examples:}
\begin{tabular}{|l|l|l|}
\hline Application & Command & File \\
\hline \multirow{3}{*}{ myApp } & sram e rp & PlcLogic/myApp/myApp.ret \\
\cline { 2 - 3 } & sram e ep data & data/myApp.ret \\
\hline Application & sram i m & \begin{tabular}{l} 
PlcLogic/Application/Applica- \\
tion.prozm
\end{tabular} \\
\cline { 2 - 3 } & sram i m data & data/Application.prozm \\
\hline
\end{tabular}

If the path "data" does not exist, tha path is created. The path for the memory card must be an existing path. The path "sdcard/data" leads to an error message if the path "data" does not exists on the memory card.

Only if the application uses Retain or Retain/Persistent variables the command generates an output file.

\subsection*{6.8.2.1.9 Import and export of retain/persistent variables by library functions}

\section*{General}

It is also possible to import or export the Retain/Persistent variables and the \%M markers via system function calls from the PLC Application. The required system functions are implemented in the IEC library ABB_IntUtils_AC500.library.
It provides the following functions or function blocks:
- SRAM_IMPORT

Chapter 6.8.2.1.9.2 "SRAM_IMPORT" on page 4419
- SRAM_EXPORT
* \({ }^{\wedge}\) Chapter 6.8.2.1.9.3 "SRAM_EXPORT" on page 4419
- SRAM_CLEARED
\({ }^{4}\) ) Chapter 6.8.2.1.9.4 "SRAM_CLEARED" on page 4419

\section*{SRAM_IMPORT}

The function block SRAM_IMPORT is used to import the \%M markers and the Retain/Persistent variables from the specified files in the userdisk.

Import only those \%M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

位 area is not accessed by the application.

Otherwise inconsistencies are possible.

For a complete description of the function block see ABB_IntUtils_AC500.library.

\section*{SRAM_EXPORT}

The function block SRAM_EXPORT is used to export the \%M markers and the Retain/Persistent variables to the specified files in the userdisk.

Export only those \%M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

It is recommended to export only when the \%M and/or the Retain/Persistent area is not accessed by the application.
Otherwise inconsistencies are possible.

For a complete description of the function block see ABB_IntUtils_AC500.library.

\section*{SRAM_CLEARED}

The Function SRAM_CLEARED is used to check if the SRAM was deleted.
For a complete description of the Function see ABB_IntUtils_AC500.library.

\subsection*{6.8.2.2 System processing}

\subsection*{6.8.2.2.1 System start-up / Program processing}

\section*{Definitions: PLC system start-up}

\section*{Cold start}

Warm start - A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables \({ }^{*}>\) Chapter 6.4.1.21.3.7.11 "Command 'Reset Warm"' on page 2634.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.
- By booting the CPU the connected IO modules are re-initialized and parameterized, therefore the IO output fails for a short time.

RUN -> STOP - RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- The behavior of outputs in stop state is configurable. Double click on PLC_AC500_V3 in the project tree. In the "PLC_AC500_V3" tab click on "PLC Settings".
- To activate update of I/O while in stop state, click the checkbox left of "Update I/O while in stop".
- To specify the behavior of the outputs in stop state, select an option in the pull down menu right of "Behavior for outputs in stop". Options are:
"Keep current values"
"Set all outputs to default"
"Execute program" (If the "Execute program" option is selected, the "Input Assistant" must be opened via the [...] button and a program must be selected which is executed exactly once.)
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP - START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- The behavior of the outputs in stop state is configurable. Double click on PLC_AC500_V3 in the project tree. In the "PLC_AC500_V3" tab click on "PLC Settings".
- To activate update of I/O while in stop state, click the checkbox left of "Update I/O while in stop".
- To specify the behavior of the outputs in stop state, select an option in the pull down menu right of "Behavior for outputs in stop". Options are:
"Keep current values"
"Set all outputs to default"
"Execute program" (If the "Execute program" option is selected, the "Input Assistant" must be opened via the [...] button and a program must be selected which is executed exactly once.)
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset - Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for \(\geq 5 \mathrm{~s}\) in STOP mode.

Reset (cold) - Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original) - Resets the controller to its original state (deletion of Flash, SRAM (\%M, area, \%R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP \(\rightarrow\) RUN - STOP \(->\) RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START • STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.

Download
- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
- changed PLC configuration
- changed task configuration
- changed library management
- changed compile-specific settings (segment sizes)
- execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change - After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/ Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
- changes in the PLC configuration
- changes in the task configuration
- changes in the library management
- changed compile-specific settings (segment sizes)
- performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering - Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
- Data in the addressable flag area ( \(\% \mathrm{M}\) area)
- RETAIN variable
- PERSISTENT variable (number is limited, no structured variables)
- PERSISTENT area (\%R area)
- In order to buffer particular data, the data must be excluded from the initialization process
* Chapter 6.8.2.1 "Handling of remanent variables for AC500 V3 products" on page 4412.

\section*{Start of the user program}

The user program (UP) is started according to the following table. It is assumed that a valid user program is stored to the Flash memory \({ }^{\wedge}>\) Chapter 5.2.9.4 "Storage device details" on page 1336.
\begin{tabular}{|c|c|c|c|c|}
\hline Action & \begin{tabular}{l}
No memory card with UP installed \\
Auto run = ON
\end{tabular} & \begin{tabular}{l}
No memory card with UP installed \\
Auto run = OFF
\end{tabular} & \begin{tabular}{l}
Memory card with UP installed \\
Auto run = ON
\end{tabular} & \begin{tabular}{l}
Memory card with UP installed \\
Auto run = OFF
\end{tabular} \\
\hline Voltage ON or Warm start or Cold start & UP is loaded from Flash into RAM and started from Flash. & No UP is loaded from Flash. When logging in, the message "No program available in the controller ..." is displayed. & UP is loaded from the memory card into Flash memory and RAM and then started from RAM. & UP is loaded from the memory card to the Flash memory. RAM remains empty. When logging in, the message "No program available in the controller ..." is displayed. \\
\hline STOP -> RUN & UP in RAM is started. & UP in RAM is started & UP in RAM is started. & UP in RAM is started. \\
\hline STOP -> START & UP in RAM is started. & UP in RAM is started. & UP in RAM is started. & UP in RAM is started. \\
\hline Download \({ }^{1)}\) & The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM. & The built UP is loaded from the PC into the PLC's RAM. \\
\hline Online Change \({ }^{2)}\) & Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed. & The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized. & Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed. & The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized. \\
\hline
\end{tabular}

\section*{Remarks:}
1): After the download is completed, the program is not automatically stored to the Flash memory. To perform this, create a boot project \({ }^{\wedge} \geqslant\) Chapter 6.4.1.11.7 "Generating boot applications" on page 1978. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON. Start the program either by pressing the RUN/STOP function key or using Automation Builder.
2): After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.
2): After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project \({ }^{\wedge} \Rightarrow\) Chapter 6.4.1.11.7 "Generating boot applications" on page 1978. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.

\section*{User flash memory for AC500 V3 products}

AC500 processor modules for V3 products (PM56xx) are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications. The user flash memory can be accessed from the user program using the CAA_File library .

\section*{Health monitoring}

AC500 V3 products are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications.

Keep the amount of cyclic written data low to assure long availability of the user flash memory. The spent/remaining lifetime information of the user flash memory can be acquired with the function block PmDiskStatus and PmDiskLifetimeUsed.
« Chapter 5.2.9.4.2 "Flash disk" on page 1336

Further information is provided in the documentation of the AC500_Pm library. \(\Leftrightarrow\) Chapter 6.5.14 "Reference, function blocks" on page 4086

Since FW version 3.3.0, there is also a diagnosis message issued when the user flash memory reaches the end of its lifecycle. Please refer to the diagnosis documentation for more info.

\section*{PID controller}

Using PID function blocks, such as HaModPidFixCycle, a PID controller can be configured and used in AC500 PLCs. The procedure is described in the application note PID - function block.

\section*{Task configuration}

\section*{General}

\section*{This statement is applicable to PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W) and PM5082-T-2ETH.}

If the main task cycle is faster than 10 ms , remove the onboard inputs I8..I11 and I/O channels of option boards or option boards for serial communication from the main task cycle, but use a separate task cycle.

The task model processes the following kind of tasks:
- Non-real-time system tasks: system tasks with no real-time property (e.g. file access, Ethernet communication, OPC UA, ...)
- Non-real-time IEC tasks: IEC tasks with no real-time property
- Real-time system tasks: system tasks with real-time property
- Real-time IEC tasks: IEC tasks with real-time property

The possible number of tasks depends on the type of processor module. How to distribute the IEC tasks over multiple CPU cores and on how to use the IEC task configuration for Automation Builder is described in detail in the CODESYS task configuration section.
- Task configuration \({ }^{〔}\) Chapter 6.4.1.9.17 "Task Configuration" on page 1914
- Tab 'Configuration' «̌ Chapter 6.4.1.21.2.30.2 "Tab 'Configuration'" on page 2538

\section*{Watchdog handling in IEC tasks}

If a new project is created or a new task is inserted in the task configuration \(\Leftrightarrow\) Chapter 6.4.1.9.17 "Task Configuration" on page 1914, the task is created with the "default task settings" priority \(=15\) and cycle time \(=10 \mathrm{~ms}\). The watchdog is activated, set to 20 ms and sensitivity \(=1\).

The watchdog handling depends also on the setting of the CPU parameter "Missed cycle behavior":
\begin{tabular}{|c|c|c|c|c|c|}
\hline Parameter - Error LED & \begin{tabular}{l}
Type \\
Enumeration of BYTE
\end{tabular} & Value On & Default Value On & Unit & Descripti Error LED: \\
\hline - Check battery & Enumeration of BYTE & On & On & & Check bat \\
\hline - Stop on error class & Enumeration of BYTE & Diagnosis of at least error class 2 & Diagnosis of at least error class 2 & & Prevents : \\
\hline Diagnosis - Add PLC name to node name & Enumeration of BYTE & Off & Off & & Diagnosis \\
\hline - PLC behaviour after voltage dip & Enumeration of BYTE & Halt & Halt & & Behaviour \\
\hline - Diagnosis history & Enumeration of BYTE & On & On & & Enables / \\
\hline - Max. diagnosis history entries & WORD(0..50000) & 1000 & 1000 & & Max. num \\
\hline - Missed cycle behavior & Enumeration of BYTE & Next & Next & & Behavior I \\
\hline -. Communicaton Schema & Enumeration of BYTE & Default & Default & & Communic \\
\hline
\end{tabular}

This parameter configures the behavior of a real-time task if the processing time of the task is longer than the cycle time.
"Next" means - skip the missed cycle and start the task on the next cycle on time. This might result in skipped tasks, but at least the highest priority task is always started on time, if it is not skipped (= default value).
"ASAP" means - start the task immediately when possible.

This parameter is valid for all real-time tasks (priorities \(0 \ldots 15\) ) of the PLC application.

Example 1: default task settings, \(\mathrm{t}_{\text {Task }}\) - processing time of the task in [ms]
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|c|}
\hline \(\mathrm{t}_{\text {Task }}\) & Par. & \multicolumn{9}{|l|}{} \\
\hline 6 & Next & & & & & & & & & \\
\hline & & & - & & & - & , &  & & \\
\hline 12 & ASAP & & & & & & , & & & \\
\hline 12 & Next & & & & & & & & & \\
\hline & & & & & & & & & & \\
\hline
\end{tabular}

No watchdog occurs, also if the processing time of the task is longer than the cycle time (cases 2 and 3 ) since the processing time is shorter than the watchdog time.

Example 2: default task settings, \(\mathrm{t}_{\text {Task }}\) - processing time of the task \(24 \mathrm{~ms}, \mathrm{~S}_{\mathrm{WD}}\) - sensitivity of the watchdog

Watchdog occurs in all 3 cases since the processing time of the task is longer than the watchdog time. According to the setting of the sensitivity the watchdog occurs after 1 or 3 cycles.

Beside the task watchdog there is the so-called "omitted cycle watchdog" (OMCW). The omitted cycle watchdog is only active if a watchdog has been configured for the task.
The "normal" Watchdog triggers only if the processing time of the task exceeds the set Watchdog value.
The omitted cycle watchdog on the other hand checks completely "failed" cycles. E.g. if the scheduler has a problem and the task never executes its cycle again, then the "normal" watchdog will not be triggered. Therefore, the run time does an additional check, if a task has been executed within the double cycle time or the double watchdog time (the bigger of both is valid). If not, the omitted cycle watchdog is triggered.

Example 3: default task settings, \(\mathrm{t}_{\text {Task }}\) - processing time of the task in ms, \(\mathrm{C}_{\text {lost }}\) - lost cycles
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|c|c|c|}
\hline \(\mathrm{t}_{\text {Task }}\) & \(\mathrm{C}_{\text {lost }}\) & \multicolumn{11}{|l|}{} \\
\hline 6 & \(3 \ldots 6\) & & & & & & & & & & & \\
\hline & & & & & & & & &  & & & \\
\hline 12 & \(3 \ldots 6\) & & & & & & & 0 & & & & \\
\hline \(\infty\) & 2 ff & & & & 詨 & & & & & & & \\
\hline
\end{tabular}

Omitted cycle watchdog occurs after double watchdog time ( \(2 \times 20 \mathrm{~ms}=40 \mathrm{~ms}\) ).

Example 4: Two tasks with following settings:
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline Task & Priority & \begin{tabular}{l} 
Cycle time \\
[ms]
\end{tabular} & \begin{tabular}{l} 
Watchdog \\
time \([\mathrm{ms}]\)
\end{tabular} & Sensitivity & Parameter & \begin{tabular}{l} 
Task pro- \\
cessing \\
time \([\mathrm{ms}]\)
\end{tabular} \\
\hline 1 & 10 & 10 & 20 & 1 & Next & 6 \\
\hline 2 & 15 & 50 & 50 & 1 & & 30 \\
\hline
\end{tabular}

Watchdog of task 2 is triggered since the task cannot run in the defined task cycle.

Example 5: Two tasks with following settings
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline Task & Priority & \begin{tabular}{l} 
Cycle time \\
[ms]
\end{tabular} & \begin{tabular}{l} 
Watchdog \\
time [ms]
\end{tabular} & Sensitivity & Parameter & \begin{tabular}{l} 
Task pro- \\
cessing \\
time \([\mathbf{m s}]\)
\end{tabular} \\
\hline 1 & 10 & 10 & 20 & 1 & ASAP & 12 \\
\hline 2 & 15 & 30 & 60 & 1 & 6 \\
\hline
\end{tabular}

Watchdog of task 2 is triggered since the task cannot start in the defined task cycle.

Example 6: Two tasks with following settings
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline Task & Priority & \begin{tabular}{l} 
Cycle time \\
{\([\mathrm{ms}]\)}
\end{tabular} & \begin{tabular}{l} 
Watchdog \\
time \([\mathrm{ms}]\)
\end{tabular} & Sensitivity & Parameter & \begin{tabular}{l} 
Task pro- \\
cessing \\
time \([\mathrm{ms}]\)
\end{tabular} \\
\hline 1 & 10 & 10 & 20 & 1 & Next & 12 \\
\hline 2 & 15 & 30 & 60 & 1 & 6 \\
\hline
\end{tabular}

No watchdog is triggered, but task 1 is running in 20 ms cycle instead of configured 10 ms cycle. Task 2 is running alternating every 20 ms or 40 ms .

\section*{PLC utilization}

\section*{General}

Non real time
system tasks
(priority 16)

\section*{Non real time \\ IEC tasks \\ (priority 16)}

File access,
OPC UA, etc.

\section*{cpuload}

Real time IEC

\section*{picload}

The parameters cpuload and plcload represent the actual CPU load or PLC load of the system.
- cpuload: This value represents the time the PLC requires to calculate all processes running on the PLC. For a good system performance this value should be less than \(80 \%\). In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC or by reducing the amount of processes.
- plcload: This value represents the time the PLC requires to calculate all real-time processes. Real-time processes are either high priority system tasks or IEC tasks with a priority between 0 and 15. For a good system performance this value should be less than \(60 \%\). In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC.

During commissioning we recommend to monitor the CPU and PLC values online with one of the following methods:

\section*{Automation Builder}
- Commissioning via 'PLC shell commands' \(\Leftrightarrow\) Chapter 6.9.2.4.4 "PLC shell commands" on page 4647 (command 'plcload' and 'cpuload').
- Commissioning via 'Application at runtime' \({ }^{\Perp}\) Chapter 6.4.1.13.3 "Data Recording with Trace" on page 2007. In order to display the load of the CPU or PLC, create a new Device Trace object in your PLC project. Then upload the data into the views 'Command 'Upload Trace' \({ }^{4}\) ) Chapter 6.4.1.21.3.22.19 " Command 'Upload Trace"' on page 2742.

IEC applications/IEC program

To access the parameters plcload and cpuload please use system functions as follows:
- plcload: SchedGetProcessorLoad() included in library 'CmpSchedule’.
- cpuload: SysMCGetLoad() included in library 'SysCpuMultiCore'.

\section*{Managing priorities by selecting the appropriate communication schema}

The AC500 V3 PLCs have an integrated preemptive real-time operating system that supports 100 priorities from 0 (lowest priority) to 99 (highest priority). Hereof \(0 \ldots 49\) in the non-real-time area and 50 ... 99 in the real-time area.

For real-time tasks in the IEC user program 16 priorities 0 (highest priority) ... 15 (lowest priority) can be used. They correspond to the operating system priorities 67 (for IEC task priority 0 ) ... 52 (for IEC task priority 15).

The file system, the memory card and flash tasks run on lowest real-time priority 50.
The non-real-time IEC task priority 16 runs in the non-real-time area. Likewise, all Ethernet protocols and the diagnosis system run in the non-real-time area.

As of Automation Builder 2.4.1 and "SystemFW" 3.4.1 provides a new PLC boot parameter Communication Schema (non-real time vs. real-time Ethernet data) for AC500 V3:
- Name: "Default"

Description: Balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.
๕ Further information on page 4429
- Name: "Communication modules"

Description: Priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and I/O bus.
\& Further information on page 4430
- Name: "Onboard Ethernet"

Description: Priority for onboard Ethernet communication (e. g. via Modbus TCP). Lower priority for communication via communication modules (CMs)
\(\boldsymbol{y}\) Further information on page 4431
- Name: "Realtime onboard Ethernet"

Description: Very high priority for onboard Ethernet communication (e. g. EtherCAT, PROFINET, Ethernet/IP). Low priority for communication via communication modules (CMs)出) Further information on page 4431

The value "Realtime onboard Ethernet" is reserved for later use and has currently the same settings as "Onboard Ethernet" and in addition the I/O bus on the same priority as the Ethernet.

In version of "SystemFW" 3.5.0 the priority of onboard CAN interface has been adapted and is now included in the priority schemas.
In addition the parameter Communication Schema is now also available for the eCo-V3 PLCs.

\section*{The „Default" priority schema in "SystemFW" 3.4.1}

The default value of the boot-parameter Communication Schema is the balanced priority for communication via communication modules (CMs) and onboard Ethernet communication. The following figure gives an overview about the main task priorities in the AC500 V3 PLCs.

The default setting of the priorities is suitable for most applications and corresponds to the settings in the firmware versions 3.4.0 and before.

The "Communication modules" priority schema in "SystemFW" 3.4.1
The communication modules priority schema has been established for priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and I/O bus.

The priority schema communication module should be used in applications with one or more communication modules CM5xx with sync mode. As of Automation Builder 2.4.1 these are the CM579-ETHCAT EtherCAT master and CM598-CN CANopen master communication modules.

The sync task with priority 0 will be interrupted only by system interrupts. Since the IEC scheduler observer task is located below IEC priority 0 , the watchdog for this task is also ineffective. However, this should not interfere with a sync task.

If more than one CM 5 xx are used in sync mode, the priority order must be defined. The sync task of highest priority CM5xx receives IEC priority 0 , the next priority 1 and so on.

In a mixed PLC configuration with communication modules with and without sync mode the interrupts of the communication modules without sync mode will be handled on the priority of the lowest sync task. Currently supported communication modules without sync mode are CM579-PNIO PROFINET IO controller and SM560-S Safety PLC.

\section*{The "Onboard Ethernet" priority schema in "SystemFW" 3.4.1}

The "Onboard Ethernet" priority schema has been established for priority for onboard Ethernet communication (e. g. via Modbus TCP).

This priority schema should be used for applications with much Ethernet communication, e. g. Modbus TCP communication with a high number of Modbus TCP clients/servers.

\section*{NOTICE!}

Since the Ethernet interrupt task is running in this mode in the real-time priority area, the Ethernet communication can block IEC tasks with priorities 12-15.

Working with real-time priority at onboard Ethernet and using a high number of Modbus TCP client connections can force high CPU load. To avoid this, it is recommended to call the Modbus function blocks in steps.

Example
100 Modbus TCP client connections shall be used in a 20 ms task.
Call 20 function blocks in a first cycle, 20 function blocks in a second cycle and so on.

\section*{The „Default" priority schema in "SystemFW" 3.5.0}

The default value of the boot-parameter Communication Schema is the balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.

The following figure gives an overview about the main task priorities in the AC500 V3 midrange PLCs in version "SystemFW" 3.5.0.
\begin{tabular}{|c|c|}
\hline  & \begin{tabular}{l}
The highest IEC task priority 0 should be used for high prior functions in the PLC with short execution time. \\
The communication modules interrupts (CM5xx), the I/O bus, the IEC scheduler observer task and the CAA event task are processed with higher priority than all user IEC tasks. \\
Ethernet runs on non-real-time priority. \\
The CAN onboard interrupt is moved from non-real-time priority to real-time priority 69, one priority above the CAN transmit and receive threads.
\end{tabular} \\
\hline
\end{tabular}

The default setting of the priorities is suitable for most applications and corresponds to the settings in the firmware versions 3.4.0 and before.

\section*{The "Communication modules" priority schema in "SystemFW" 3.5.0}

The communication modules priority schema has been established for priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and I/O bus.

The highest IEC task priority 0 should be used for the sync task of the highest priority communication module, e. g. CM579-ETHCAT, priority 1 for the sync task with second highest priority, and so on.
Only the communication modules interrupts (CM5xx) and the CAA Event task is processed with higher priority than the IEC tasks.

The IEC scheduler observer task has been moved to priority 66, means below IEC task priority 0 and on the same level as IEC task priority 1.
The priority of the I/O bus has been moved to priority 59 , means inside the IEC task priority area, but below the external event task priorities.

The CAN onboard interrupt has the same priority as the I/O bus and the CAN transmit and receive threads one priority below, means 58.
Ethernet runs on non-real-time priority.

The priority schema communication module should be used in applications with one or more communication modules CM5xx with sync mode. As of Automation Builder 2.4.1 these are the CM579-ETHCAT EtherCAT master and CM598-CN CAN master communication modules.

The sync task with Prio 0 will be interrupted only by system interrupts. Since the IEC scheduler observer task is located below IEC Prio 0, the watchdog for this task is also ineffective. However, this should not interfere with a sync task.
If more than one CM5xx are used in sync mode, the priority order must be defined. The sync task of highest priority CM5xx receives IEC Prio 0, the next Prio 1 and so on.
In a mixed PLC configuration with communication modules with and without sync mode the interrupts of the communication modules without sync mode will be handled on the priority of the lowest sync task. Currently supported communication modules without sync mode are CM579-PNIO PROFINET IO controller and SM560-S safety PLC.

\section*{The "Onboard Ethernet" priority schema in "SystemFW" 3.5.0}

The "Onboard Ethernet" priority schema has been established for priority for onboard Ethernet communication (e. g. via Modbus TCP).

This priority schema should be used for applications with much Ethernet communication, e. g. Modbus TCP communication with a high number of Modbus TCP clients/servers.

\section*{NOTICE!}

Since the Ethernet interrupt task is running in this mode in the real-time priority area, the Ethernet communication can block IEC tasks with priorities 12-15.

Working with real-time priority at Onboard Ethernet and using a high number of Modbus TCP client connections can force a high CPU Load. To avoid this, we recommend calling the Modbus FB's in steps.

100 Modbus TCP client connections shall be used in a 20 ms task.
Call 20 function blocks in a first cycle, 20 function blocks in a second cycle and so on.
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Cycle & 1 & 2 & 3 & 4 & 5 & X \\
\hline 1 & \multicolumn{6}{|l|}{} \\
\hline 2 & \multicolumn{6}{|l|}{} \\
\hline 3 & \multicolumn{6}{|l|}{} \\
\hline & -. & -- & .. & -. & -. & -. \\
\hline Y & \multicolumn{6}{|l|}{} \\
\hline
\end{tabular}

\section*{Communication schema onboard Ethernet/EtherCAT}

\section*{General}

Due to the broad variety of functionality which can run in parallel on AC500 V3 PLCs, it is recommended, or even mandatory depending on the desired functionality, to adjust system behavior to better match the needs of the individual application.

Due to hardware limitations and constraints, it's necessary to prioritize functionality, especially if it's intended to execute multiple features in parallel. Prioritizing can be very difficult due to the complexity of the underlying software components. Besides of task priorities, it might also be necessary to adjust low level system configuration to achieve the best possible performance for a specific feature.
To reduce complexity, and thus the risk of negative side-effects the CPU parameter Communication schema has been introduced. This parameter enables the user to specifically define the primary purpose of the corresponding PLC and lay focus on a specific functionality.
The following table shows the available communication schemas for both, PM50xx eCo and PM56xx PLCs.
\begin{tabular}{|c|c|c|c|}
\hline Schema & PM50xx & PM56xx & Description \\

on page 4442
\end{tabular} & X & & X \\
\hline
\end{tabular}

Changing communication schema might have significant impact on the behavior of the user application and should therefore only be done if,
- a feature is configured which relies on a specific schema (e.g., onboard EtherCAT).
- there's need of optimization of system behavior in terms of performance (decrease of reaction times, increase of throughput etc.).
Note that the increase of flexibility and freedom comes with an increase of responsibility because IEC task configuration and IEC user code might block important system functionality for too long. The following provided information should help to identify appropriate settings to prevent runtime errors like timeout exceptions or communication problems.

Priority classifi- The functionality prioritized by each communication schema is grouped into 3 different classes:
cations and their purpose
- High priority real-time functionality
- IEC tasks with real-time priority
- Low priority non-real-time functionality

Functionality with strict timing requirements, e.g., drivers with hardware access or hardware watchdog monitoring failures might lead to exception errors, loss of communication with hardware and other problems which are non-recoverable and might cause a stop of the user application.
Functionality of this class can't be influenced by activity of user defined IEC tasks. As a result of this, related functionality can interrupt or delay IEC tasks and therefore increase IEC task jitter and the duration of IEC task cycles.

IEC tasks with This is the priority range of user defined real-time IEC tasks. Priorities 0 to 15 are real-time real-time priority priorities (IEC priority 16 is mapped to non-real-time priority) and can be used to define an IEC task's priority in Automation Builder.
Task in this range can be interrupted or delayed by high priority functionality. It's not possible for IEC user code to suppress high priority activity, thus increasing safety and reducing the risk of negative side effects caused by bugs in IEC user code or libraries or misconfiguration of IEC tasks.

\section*{Low priority \\ non-real-time \\ functionality}

The low priority range is intended for non-real-time functionality which doesn't have any specific timing requirements and which is supposed to execute its activity without delaying or interrupting the user application and its related functionality.
Activity assigned to this range can be suppressed by high priority and real-time IEC tasks. Therefore might show high jitter, sporadic activity or large reaction times, depending on the overall system load.
To avoid suppression of the tasks of this group, the system reserves a short time slot to process low-priority functionality if the CPU load reaches nearly \(100 \%\). Under normal circumstances (below an average system load of 80\%), this mechanism shouldn't be engaged. Although this time slot could cause high priority tasks to jitter slightly ( \(\pm 100\) microseconds), it ensures that the system remains responsive and will always be able to run fundamental jobs which must be executed regularly. Note that tasks of low priority still play an important role and need to be scheduled regularly to meet their individual timing requirements.

\section*{Ensure that the average CPU load doesn't exceed 80\% to ensure that there's} enough time for the system to process low-priority functionality.
The functionality might not be important for the individual application, but it is still necessary to keep alive other functionality like the Automation Builder login or access to diagnosis data.
Once the CPU load exceeds \(80 \%\), it will be difficult for the system to correctly schedule tasks.

\section*{Communication schema "Default"}

Communication schema "Default" is the default schema selected when creating a new AC500 V3 application. It is the recommended setting to start with and suitable for most applications.

The schema leads to a well balanced task priority setup which lays focus on stability and low risk of negative side effects caused by high IEC task load or hardware activity.

The highest IEC task priority 0 should be used for high prior functions in the PLC with short execution time.
The communication modules interrupts (CM5xx), the I/O bus, the IEC scheduler observer task and the CAA event task are processed with higher priority than all user IEC tasks.
Ethernet runs with non-real-time priority to avoid denial-of-service scenarios and system overload caused by devices located in the same network.

The default setting of the priorities is suitable for most applications and should be used unless there are special requirements or performance issues.

Features and In this schema, the range of IEC task priorities is only shared with tasks related to CM598-CN their priorities (CAN communication module) and its CAN2A/2B IO POUs and common POU background job handling. The priorities 9 and 15 can still be used though.

Note that tasks above IEC task priority 9 might have negative side effects on CAN communication in terms of reaction time and throughput, while IEC tasks with priority lower than 9 might be interrupted or delayed by an active CAN communication.

POU background jobs are assigned the lowest IEC real-time priority to avoid negative side effects on IEC tasks and thus on process data synchronization or user code. POUs usually are related to tasks of lower priority and shall not have an impact on higher priority tasks.

\section*{Communication schema "Communication modules"}

This communication schema is only available for PM56xx series AC500 V3
PLCs supporting communication modules.

The communication schema "Communication modules" is intended for users of a communication module which can be configured to synchronize its stack activity with the user application by a dedicated (external event triggered IEC task) which is mapped to an event ("CouplerEventX", \(X=\) slot number of the communication module).
The bus synchronized IEC task is not scheduled by the PLC runtime system but the stack of the communication module. As a result of this, it's necessary for the PLC to quickly react on the related event of the communication module. The schema ensures that negative side-effects on the bus synchronized IEC task are reduced as much as possible by adjusting priorities of high priority functionality.

Features and The following figure shows the changes the schema applies to the available features of the their priorities PLC. The primary goal of this schema is to reduce the number of tasks which are capable of interrupting or delaying the bus synchronized IEC task, while providing as much flexibility as possible. By making use of the priority range of IEC tasks, users can decide whether existing IEC tasks will influence the corresponding features.
- Use IEC priority 0 for the bus synchronized IEC task and a priority lower than 0 . For all other features to avoid negative side-effects on the bus synchronized IEC task.
- Use IEC priorities 1 to 5 for functionality which is more important than high priority features like IO bus or CAN.
- To ensure that a high priority feature is not influenced by any IEC user code (besides of the bus synchronized IEC task), use an IEC task priority which is lower than the priority of the corresponding feature.

It is not forbidden to make use of IEC task priorities which are assigned to other PLC functionality.

\section*{NOTICE!}

Be careful when using this schema to avoid unwanted side-effects on features besides of the protocol realized by the corresponding communication module, caused by violation of individual timing constraints or requirements!
I/O bus must be able to refresh all connected S500 I/O devices within 20 ms . Otherwise, an exception will be raised which will lead to a stop of the application. Use PLC shell command io-bus desc to dump information on the bus timing. The output contains information on the IO bus cycle time:
--- I/O bus information -
Baud rate [baud]: 1714286
Min. cycle time [us]: 1037
Max. cycle time [us]: 10936
Last cycle time [us]: 1567
y Chapter 6.4.1.21.2.8.11 "Tab 'PLC Shell"' on page 2441
The maximum cycle time must be below 20 ms to ensure that the system runs stable and won't raise a timeout exception error.

If the cycle time reaches the limit, try to reduce the amount of code executed by IEC user tasks of higher priority than I/O bus or adjust task priorities if possible.

\section*{Communication schema "Onboard Ethernet"}

This schema is intended for users who make use of Ethernet protocols which rely on a lot of parallel network connections, like Modbus TCP or IEC 61850.

\section*{Features and} their priorities

As shown in the diagram below, Ethernet related tasks will be assigned a priority within IEC task priority range to reduce reaction times and increase throughput to meet the requirements of protocols like Modbus TCP or IEC 61850. By making use of IEC task priority 8, users can decide whether their IEC user tasks are capable of interrupting or delaying Ethernet communication or not, depending on the individual requirements.

\section*{Communication schema "Onboard EtherCAT" since "SystemFW" 3.4.1}

Schema "Onboard EtherCAT" is intended for users who intend to make use of the EtherCAT master protocol, configured at one of the available onboard Ethernet ports of the corresponding AC500 V3 PLC.

Due to the special requirements of EtherCAT, it's necessary to modify the configuration of system components related to onboard Ethernet, and thus provide a low-latency Ethernet port. In addition to that, priorities of various functionality are adjusted to reduce negative side-effects on the EtherCAT IEC task and achieve best possible performance.

Features and their priorities

The following diagram shows the changes the schema applies to the available features of the PLC. The primary goal of this schema is to reduce the number of tasks which are capable of interrupting or delaying the Ethernet IEC task, while providing as much flexibility as possible. By making use of the priority range of IEC tasks, users can decide whether existing IEC tasks will influence the corresponding features.
- Use IEC priority 0 for the EtherCAT IEC task and a priority lower than 0 for all other features to avoid negative side-effects on EtherCAT.
- Use IEC priorities 1 to 5 for functionality which is more important than high priority features like IO bus or onboard I/O.
- To ensure that a high priority feature isn't influenced by any IEC user code (besides of EtherCAT), use an IEC task priority which is lower than the priority of the corresponding feature.

It is not forbidden to make use of IEC task priorities which are assigned to other PLC functionality.

\section*{NOTICE!}

Be careful when using this schema to avoid unwanted side-effects on features other than EtherCAT, caused by violation of individual timing constraints or requirements!

I/O bus must be able to refresh all connected S500 I/O devices within 20 ms . Otherwise, an exception will be raised which will lead to a stop of the application. Use PLC shell command io-bus desc to dump information on the bus timing. The output contains information on the IO bus cycle time:
--- I/O bus information -
Baud rate [baud]: 1714286
Min. cycle time [us]: 1037
Max. cycle time [us]: 10936
Last cycle time [us]: 1567
药 Chapter 6.4.1.21.2.8.11 "Tab 'PLC Shell"" on page 2441
The maximum cycle time must be well below 20 ms to ensure that the system runs stable and won't raise a timeout exception error.
If the cycle time reaches the limit, try to reduce the amount of code executed by IEC user tasks of higher priority than I/O bus or adjust task priorities if possible.

Low latency Besides the adjustment of task priorities, schema "Onboard EtherCAT" also changes the low port level Ethernet driver configuration to offer a dedicated low latency port to the user.
Due to technical constraints, the port number of the low latency port depends on the type of PLC which is used:
\begin{tabular}{|l|l|l|}
\hline PLC type & ETH1 & ETH2 \\
\hline PM50xx eCo V3 & Low latency & Maintenance and visualization \\
\hline PM56xx V3 & Maintenance and visualization & Low latency \\
\hline
\end{tabular}

The other port remains on low priority to minimize the impact on the activity of the v protocol. It is intended for login (Automation Builder), visualization services or similar (non-real-time) activities.

When configuring eCo V3 CPU "Onboard EtherCAT" parameters, the ETH1 interface is set to the IP address 0.0.0.0. After switching to a different communication scheme than "Onboard EtherCAT", IP configuration of the Ethernet port used for Onboard EtherCAT remains invalidated (IP address 0.0.0.0). It needs to be re-applied by the user should the port be required by the new application.
The "Onboard EtherCAT" functionality is only usable/visible for the eCo V3 CPU from SystemFW 3.7.0.

\subsection*{6.8.2.2 . Setting standard configuration}

If the target setting configuration is changed, standard configuration can be restored:
1. Open CODESYS.
2. In the "Resources" tab, double-click "PLC Configuration".
3. Select "Menu Extras \(\rightarrow\) Standard Configuration".

\subsection*{6.8.2.3 Real-time clock and battery}

\subsection*{6.8.2.3.1 Real-time clock}

Notes on realtime clock

The real-time clock is an optional function for AC500-eCo V3 Basic processor modules (e.g. PM5012-x-ETH) require a TA5131-RTC. All other AC500-eCo V3 processor modules have an integrated real-time clock.

The real-time clock operates as a PC clock. It saves date and time to a DWORD in DT format (DATE AND TIME FORMAT), i.e., in seconds passed since the start time: 1 January 1970 at 00:00.

For AC500-eCo V3, Basic CPU with TA5131-RTC buffers the real-time clock for 7 days, and Standard/Pro CPU buffers the integrated real-time clock for 20 days. When the CPU is not powered over the buffering time, the real-time clock data will be cleared.
If a battery is connected and full, the real-time clock continues to run even if the control voltage is switched off.

If no battery is inserted or the battery is empty, the real-time clocks starts with the value 0 (=1970-01-01, 00:00:00).

When switching on the control voltage, the system clock of the operating system is set to the value of the real-time clock.

Real-time clock The PLC browser/PLC shell commands date and time are used to set the real-time clock. with PLC browser

The commands date <ENTER> or time <ENTER> display the current date and time of the real-time clock.

The command: date yyyy-mm-dd<ENTER> (year-month-day) sets the date.
The command: time hh-mm-ss<ENTER> (hours-minutes-seconds) sets the time.

\section*{Example:}

The real-time clock should be set to 22 February 2005, 16:50.
1. Enter the date:
```

date 2005-02-22<ENTER>
=> Display:date 2005-02-22 Clock set to 2005-02-22 08:01:07

```
The time remains unchanged.
2. Enter the time:
time 16:50<ENTER>
\(\Rightarrow\) Display: time 16:50 Clock set to 2005-02-22 16:50:00

Real-time clock The following function blocks located in the folder "Realtime clock" of the system library with user pro- \(\quad A B B \_E x t U t i l s \_A C 500\).lib can be used to set and display the real-time clock (RTC) with help gram of the user program:
\begin{tabular}{|l|l|}
\hline Function block & Function \\
\hline CLOCK (V3) "Library Manager \(\rightarrow\) ABB-AC500 & Sets and displays the real-time clock with \\
\(\rightarrow\) Use Cases \(\rightarrow\) AC500 Utils & values for year, month, day, hours, minutes \\
\(\rightarrow\) PM<Version> (ABB) \(\rightarrow\) Function Blocks & and seconds. \\
\(\rightarrow\) Realtime clock" & Also the day of week is indicated (Mo=1, \\
& Tue=2, Wed=3, Thu=4, Fr=5, Sa=6, Su=0). \\
& \begin{tabular}{l} 
Note: The week of day cannot be set. It \\
\\
\\
\\
\\
\\
\\
is given by the real-time clock. The input \\
DAY_SET is ignored.
\end{tabular} \\
\hline \begin{tabular}{l} 
CLOCK_DT (V3) "Library Manager \\
\(\rightarrow\) ABB-AC500 \(\rightarrow\) Use Cases \(\rightarrow\) AC500 Utils \\
\(\rightarrow\) PM<Version> (ABB) \(\rightarrow\) Function Blocks \\
\(\rightarrow\) Realtime clock"
\end{tabular} & \begin{tabular}{l} 
Sets and displays the real-time clock in DT \\
format, for example DT\#2005-02-17-17:15:00.
\end{tabular} \\
\hline
\end{tabular}

Reference for function blocks, functions, structures etc. \({ }^{\Downarrow}\) Chapter 6.5.14 "Reference, function blocks" on page 4086

\subsection*{6.8.2.3.2 AC500 battery}

The AC500 battery buffers the following data in case of "control voltage off":
- Retentive variables in SRAM (VAR_RETAIN..END_VAR) « Chapter 6.8.2.1 "Handling of remanent variables for AC500 V3 products" on page 4412
- Date and time of the real-time clock

Further information:
- \({ }^{4}\) Chapter 6.9.3 "Diagnosis messages" on page 4655

To prevent data loss when using the AC500 battery, the battery status should be periodically monitored by the user program.

Battery status The battery status can be monitored either with the help of a user program on the PLC or in Automation Builder.

In the PLC shell of Automation Builder the command "BATT" can be used. \({ }^{\circ}\) Chapter 6.9.2.4.4 "PLC shell commands" on page 4647. The following is output:
\begin{tabular}{|l|l|}
\hline 0 & Battery empty \\
\hline 20 & Remaining battery charge below \(20 \%\) \\
\hline 100 & Battery charge OK \\
\hline
\end{tabular}

In the user program, the battery status can be checked with the function BATT which is available in the folder "Battery" of the system library ABB_ExtUtils_AC500.lib ("Library Manager \(\rightarrow\) ABB-AC500 \(\rightarrow\) Use Cases"). The following is output:
\begin{tabular}{|l|l|}
\hline 0 & Battery empty \\
\hline 20 & \begin{tabular}{l} 
Remaining battery charge below \(20 \%\), battery \\
must be replaced
\end{tabular} \\
\hline 100 & Battery charge OK \\
\hline
\end{tabular}

On the device, the battery status can be checked with the function keys of a processor module.
\(>\) Chapter 6.8.2.5 "Display, LEDs and function keys on the front panel" on page 4452
y Chapter 6.8.2.5.5.3 "VAL - reading out state values" on page 4459

\subsection*{6.8.2.3.3 AC500-eCo V3 data buffering}

The AC500-eCo V3 buffers the following data in case of "control voltage off":
- Retentive variables in FLASH (VAR_RETAIN..END_VAR) \(\left.{ }^{*}\right\rangle\) Chapter 6.8.2.1 "Handling of remanent variables for AC500 V3 products" on page 4412
- Date and time of the real-time clock are using an integrated gold-capacitor with a lower retention time as a battery.

The AC500-eCo V3 has no battery but stores the remanent data in flash or the real-time clock using a gold-capacitor, there is no battery or gold-capacitor status or survey.
In case of "control voltage off", the real-time clock is buffered for about 7 days for Basic CPU with TA5131-RTC and about 20 days for Standard or Pro CPUs at \(40^{\circ} \mathrm{C}\) using temperature.

\subsection*{6.8.2.4 AC500-eCo V3 processor module, LEDs, RUN/STOP switch on front panel}

\subsection*{6.8.2.4.1 Features}

Fig. 358: Example: PM5072-T-2ETH
Micro memory card slot
5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1) RUN button
RJ45 female connector for Ethernet1 connection
RJ45 female connector for Ethernet2 connection (available for PM50x2-T-2ETH)
3-pin terminal block for power supply 24 V DC 2 holes for screw mounting
Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9 Cable fixing
10 13-pin terminal block for onboard I/Os
1 12-pin terminal block for onboard I/Os (not available on PM5012-x-ETH)
1212 LEDs to display the states of the signals
1310 LEDs to display the states of the signals
14 Cable fixing accessory TA5301-CFA on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable fixing accessory on the top of the housing is optional.
Please use TA5301-CFA cable fixing accessory to provide strain relief.
It can also be used for AC500-eCo I/O modules.

\section*{The PM50x2 processor modules are supplied with option board slot covers as standard.}

There are various TA51xx option boards for the processor modules that can be ordered separately.

Which and how many option boards can be plugged, depends on the respective processor module.

\subsection*{6.8.2.4.2 State LEDs and operating elements}

RUN/STOP The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

State LEDs The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.
\begin{tabular}{|c|c|c|c|c|c|}
\hline LED & State & Color & LED = ON & LED = OFF & LED flashing \\
\hline PWR & Power supply & Green & Power supply present & Power supply missing & - \\
\hline MC & Micro memory card indication & Yellow & Micro memory card is in the socket & Micro memory card is not in the socket & Micro memory card is in read/ write state: any file on card is opened, means activity on card \\
\hline ERR & Error indication & Red & An error occurred & \begin{tabular}{l}
No errors or only warnings encountered (E4 errors). \\
The LED behavior for the error classes 2 to 4 is configurable.
\end{tabular} & Fast flashing (4 Hz ) displays together with the RUN LED a currently running firmware-upgrade or writing data to the FlashEPROM. Slow flashing ( 1 Hz ) alone displays shutdown of Request To Send. Medium flashing ( 2 Hz ) alone displays at start of PLC if reboot after watchdog. \\
\hline MOD1 & Mode 1 indication & Yellow & Processor module is in mode 1 state & Processor module is not in mode 1 state & - \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|l|l|}
\hline LED & State & Color & LED = ON & LED = OFF & LED flashing \\
\hline RUN & RUN/STOP state & Green & \begin{tabular}{l} 
Processor \\
module is in state \\
RUN
\end{tabular} & \begin{tabular}{l} 
Processor \\

The processor \\
module is \\
reading/writing \\
data from/to the \\
memory card. \\
If the ERR-LED \\
is also flashing, \\
data is being \\
written to the \\
Flash-EPROM.
\end{tabular} \\
& & & & & \\
\hline
\end{tabular}

User configurable LEDs

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.
The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

I/O LEDs

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH(W), PM5082-T-2ETH) to display the states of the inputs and outputs.

\end{tabular}

\subsection*{6.8.2.5 Display, LEDs and function keys on the front panel}

\subsection*{6.8.2.5.1 Overview}

The display of a processor module is equipped with a background-lighted 7-segment display. This display consists of 6 digits for plain text or error codes.

Some functionalities may be not yet supported by the product. Please refer to the release notes of the product at time of release.

Display indicators
- A black square ( \(\square\) ) denotes the state/working activity of the corresponding object on the left/right side of the display. The black square flashes according to the device's activity, e.g. during data exchange on ETH1, ETH2, COM1, etc.

\section*{MC activity}

For the activity of the memory card the black square ( is shown as long as a file is open on memory card.
- A black triangle ( ) points to the selected item/interface on the left/right side of the display to be configured or read. Further, it acts as a cursor for the count up/count down function keys.

The indicators point to the following items on the left side of the display:
\begin{tabular}{|l|l|l|}
\hline No. & On the left side & Description \\
\hline 1 & MC (memory card) & Refers to the memory card state. \\
\hline 2 & SYS (system) & Refers to the system state. \\
\hline 3 & BATT (battery) & Refers to the battery state. \\
\hline 4 & I/O bus & Refers to I/O bus connection. \\
\hline
\end{tabular}

The indicators point to the following items on the right side of the display:
\begin{tabular}{|l|l|l|}
\hline No. & On the right side & Description \\
\hline 5 & ETH1 & Refers to the first Ethernet interface. \\
\hline 6 & ETH2 & Refers to the second Ethernet interface. \\
\hline 7 & COM1 & Refers to COM1 interface. \\
\hline 8 & CAN & Refers to CAN interface. \\

\mathfrak{c}
\] & \begin{tabular}{l}
Only in RUN mode and as of SystemFW V3.2.0 \\
10 minutes step reminder: license was removed \\
PLC runs in „Grace mode", since at least one feature license which has been available disappeard. PLC is waiting for this license. \\
Will be displayed for 5 minutes \\
If „Grace time" expires, PLC will go to „Stop".
\end{tabular} \\
\hline
\end{tabular}

\subsection*{6.8.2.5.4 Description of LEDs}

The LEDs below the display indicate the state of the processor module:
\begin{tabular}{|l|l|l|l|l|l|}
\hline LED & State & Color & LED = ON & LED = OFF & LED flashes \\
\hline \begin{tabular}{l} 
Power LED \\
(PWR)
\end{tabular} & \begin{tabular}{l} 
Denotes the power \\
supply state of the \\
processor module
\end{tabular} & Green & \begin{tabular}{l} 
Voltage is present \\
(24 V DC)
\end{tabular} & \begin{tabular}{l} 
Voltage is \\
missing
\end{tabular} & - \\
\hline \begin{tabular}{l} 
Run LED \\
(RUN)
\end{tabular} & \begin{tabular}{l} 
Denotes the \\
activity state of the \\
processor module
\end{tabular} & Green & \begin{tabular}{l} 
Processor module \\
is in RUN mode
\end{tabular} & \begin{tabular}{l} 
Processor \\
module is in \\
STOP mode
\end{tabular} & \begin{tabular}{l} 
If the LED flashes fast (4 \\
Hz) a firmware update is \\
finished with no errors. \\
If the Run LED flashes fast
\end{tabular} \\
\(\left(\begin{array}{lll}4 \text { Hz), alternating with a } \\
\text { flashing Run LED the firm- } \\
\text { ware is updated. }\end{array}\right.\) \\
\hline \begin{tabular}{l} 
To enforce boot mode 1, \\
keep the RUN function \\
key pressed during the \\
boot procedure. In this \\
case, the Run LED flashes \\
slowly (1 Hz). A subsequent
\end{tabular} \\
project download (from \\
within Automation Builder) \\
cancels the blinking.
\end{tabular}\(\left|-\begin{array}{l}\text { If the Error LED flashes } \\
\text { slowly (1 Hz) a firmware } \\
\text { update from the memory } \\
\text { card is finished with errors. }\end{array}\right|\)

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

\subsection*{6.8.2.5.5 Description of the function keys}

\section*{Overview}

The processor module can be operated manually using the function keys on the front panel:
\begin{tabular}{|l|l|l|}
\hline Function key & Description & Description \\
\hline RUN & Run & \begin{tabular}{l} 
Toggles between RUN and STOP mode. Switching \\
into RUN mode is only possible if an error free \\
project has been created and downloaded with \\
Automation Builder.
\end{tabular} \\
\hline VAL & Value & \begin{tabular}{l} 
Shows different state values of the processor \\
module.
\end{tabular} \\
\hline ESC & Escape & \begin{tabular}{l} 
Quits the current menu, submenu or function without \\
saving.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|}
\hline Function key & Description & Description \\
\hline OK & OK/Acknowledgement & \begin{tabular}{l} 
Acknowledges the current value or selects a menu/ \\
submenu. Changes that have been sent to the pro- \\
cessor module successfully are confirmed with donE \\
on the display.
\end{tabular} \\
\hline DIAG & Diagnostic & Allows evaluation of error messages in detail. \\
\hline CFG & Configuration & \begin{tabular}{l} 
Show/set IP configuration, PLC startup mode and \\
Ethernet address. \\
Enters submenus.
\end{tabular} \\
\hline Sount up/navigate in & \begin{tabular}{l} 
Press the function key repeatedly in order to \\
increase the value each time by 1, or navigate in \\
submenu to previous entry. \\
submenu
\end{tabular} \\
Keep the function key pressed in order to count up \\
fast.
\end{tabular}

Backlight is switched on for about 20 seconds by pressing any function key.

\section*{RUN - start and stop PLC}

\section*{Function key} RUN

\subsection*{6.8.2.5.6 Enable flashing of display}

Blink functionality

As of SystemFW 3.1.0 and AB 2.1.0 the blink functionality is implemented. "Blink" means activate flashing of backlight of AC500 display in Automation Builder via "IP-Configuration" tool.

Wink function- As of SystemFW 3.1.0 and AB 2.0.0 the wink functionality is implemented. "Wink" means ality activate flashing of backlight of AC500 display in Automation Builder via communication settings wink functionality.

\subsection*{6.8.2.5.7 Function blocks}

PmErrLedSet This function block switches the ERR-LED ON and OFF.

PmDispSetText With this function block a text can be displayed on the CPU.
«y Chapter 6.5.14 "Reference, function blocks" on page 4086

\section*{Default open Ethernet ports of PM50xx-x-xETH}

After startup without a PLC project the AC500-eCo V3 PM50xx-x-xETH contains the following Ethernet ports and sockets:
\begin{tabular}{|l|l|}
\hline Protocol & Port \\
\hline ABB NetConfig \({ }^{1}\) ) & UDP 24576 \\
\hline Online access with driver 3S Tcp/lp BIkDrvTcp (no scan) & TCP 11740 \\
\hline OPC UA server \({ }^{2}\) ) & TCP 4840 \\
\hline \begin{tabular}{l} 
Remarks: \\
1): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by \\
deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2. \\
\({ }^{2}\) ): The port 4840 for OPC UA server is closed by default as of System FW V3.1.0.
\end{tabular} \\
\hline
\end{tabular}

All other ports are closed by default.

Overview of protocols, sockets and ports

\section*{Ethernet protocols and ports for AC500 V3 products}

\section*{General}

The communication module CM5640-2ETH acts as a port extender of the used AC500 V3 CPU.
It is not offloading the CPU for the protocols.
- the stacks are still executed in CPU.
- the performance is slightly lower or the load is slightly higher than directly from the main CPU, because each communication module and the communication module bus must also be handled.

Each CM5640-2ETH provides:
- 2 additional independent onboard Ethernet interfaces controlled by the CPU and not switched.
- all Ethernet ports, wherever located - on the communication module or on the CPU - must be in different subnets.
Addressing is not done via slot numbers but via IP addresses.
The Ethernet limitations of the CPU used together with CM5640-2ETH apply to all onboard and additional interfaces.

All interfaces of the onboard and CM5640-2ETH modules need to be in different subnets. Overlapping of subnets must be avoided. The selection of the used interface (ETH port) is done automatically according the match of the IP-address of the server and the subnet of the interfaces.

\section*{Default open Ethernet ports of PM56xx-2ETH}

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:
\begin{tabular}{|l|l|}
\hline Protocol & Port \\
\hline ABB NetConfig \({ }^{1}\) ) & UDP 24576 \\
\hline Online access with driver 3S Tcp/lp BlkDrvTcp (no scan) & TCP 11740 \\
\hline OPC UA server \({ }^{2}\) ) & TCP 4840 \\
\hline
\end{tabular}

\section*{Remarks:}
\({ }^{1}\) ): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.
\({ }^{2}\) ): The port 4840 for OPC UA server is closed by default as of SystemFW V3.6.0.

All other ports are closed by default.

Overview of protocols, sockets and ports
\begin{tabular}{|c|c|c|}

* Changing the IP addresses using the Automation Builder
\& Changing the IP addresses using the CFG key

Online access
3S TCP/IP block driver. This driver requires at least 2 sockets:
- 1x driver "BIkDrvTcp" on port 11740
- \(1 x\) listen on port 11740 if PLC has established online connection
```

Online access can be established from:

- Automation Builder command 'Login' « Chapter 6.4.1.21.3.7.2 "Command 'Login'" on page 2624
- CODESYS OPC DA server
- Panel CP600 series

```

Each established connection needs one socket. In addition one socket on port 11740 is listening.
1. Startup the PLC. \(\Rightarrow\) One socket on port 11740 (listen).
2. Login from Automation Builder via driver "BIKDrvTcp".
\(\Rightarrow 2\) sockets on port 11740 ( 1 x online, 1 x listen)
3. Additional login out of OPC server with the same driver. \(\Rightarrow 3\) sockets on port 11740 ( \(2 x\) online, \(1 x\) listen)
4. Additional connect CP600 via driver "BlkDrvTcp".
\(\Rightarrow 4\) sockets on port 11740 ( \(3 x\) online, \(1 x\) listen)

\section*{SNTP client and server}

As of version 3.1.0 the SystemFW provides a SNTP Protocol implementation which can be used for time synchronization of PLC clock. It can be used as SNTP Client or / and SNTP Server. But only one instance of each can be executed at the same time on one PLC .

> The SNTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an SNTP server on several Ethernet interfaces.

To read diagnosis information from the SNTP protocol within an IEC application the function block PmSntpInfo can be used. This Function block is part of the library ABB_Pm_AC500.lib. It can also be used to determine the synchronization state of the PLC clock.

\section*{Using network variables in AC500 V3}

When using network variables via UDP broadcast, the default broadcast address is set to 255.255.255.255.

This will not work on PLCs with multiple Ethernet interfaces, because of undecidable routing.
Set the broadcast address to a matching subnet broadcast address, depending on which interface should be used to send the variables into the network.

Example - ETH1 with IP 192.168.0.10 netmask 255.255.255.0
- ETH2 with IP 192.168.1.10 netmask 255.255.255.0

If you want the network variables to be broadcast on ETH1, use broadcast address 192.168.0.255.

\subsection*{6.8.2.6.2 Onboard CAN configuration}

AC500 V3 PLCs provide the following methods for CAN integration:
- Onboard CAN interface
- CANopen master-slave arrangement (with CM598-CN as a master device)

Table 814: Differences in supported protocols
\begin{tabular}{|l|l|l|}
\hline & Onboard CAN & CM598-CN \\
\hline CANopen Manager & X & X \\
\hline CAN 2A/2B & X & X \\
\hline J1939 & X & \\
\hline
\end{tabular}

Onboard CAN interface is not available on AC500-eCo V3!

Supported pro- Onboard CAN interface supports the following protocols
tocols
- CANopen Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter 'CANopen' \({ }^{\Leftrightarrow}\) Chapter 6.3.2.11.1.1 "CM598-CAN - CANopen Manager communication module" on page 1521.
Further information can be found in chapter 'CAN onboard' \(\Leftrightarrow\) Chapter 6.3.2.16 "CAN onboard" on page 1594

\subsection*{6.8.2.7 Hot swap}

\subsection*{6.8.2.7.1 Preconditions for using hot swap}

\section*{Hot swap}

\section*{WARNING!}

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

\section*{WARNING!}

Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

\section*{NOTICE!}

\section*{Risk of damage to I/O modules!}

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

\section*{Hot swap}

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

\section*{NOTICE!}

Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

\section*{NOTICE!}

Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.
\begin{tabular}{|l|l|}
\hline Device & \begin{tabular}{l} 
Min. required device index for I/O module as of \\
FW Version 3.0.14
\end{tabular} \\

Diagnosis Err 9480 is automatically \\
acknowledged
\end{tabular}

\subsection*{6.8.2.8 KNX IP integration}

\subsection*{6.8.2.8.1 Introduction}

KNX is a bus system used more on the room and floor level in buildings (e.g. for lighting, shading and local HVAC devices).
The KNX as such doesn't necessarily need a dedicated controller for simple connection of sensor/switch to receiving/actuator devices.
The signals exchanged via the protocol are so called "group addresses" ("objects"), which are downloaded via ETS to all the thereby linked (=grouped) devices.
On the room level it typically has a serial wiring called KNX TP (twisted pair), which then is linked to floor or central building or management level via IP routers. On Ethernet it is called KNXnet/IP abbreviated also as KNX IP.

After the engineering in Automation Builder, the AC500 V3 PLC is a standard KNX device. KNX communication is done via the IP network interface. The PLC is arranged topologically on the area / main line of the KNX IP routers. The PLC communicates with the routers via the KNXnet/IP protocol.

\subsection*{6.8.2.8.2 Engineering workflow}

Both engineering software systems for AC500 V3 PLC (Automation Builder) and KNX (ETS) are directly linked.

A data exchange for the group objects (hereinafter also called communication objects) from the Automation Builder to ETS (via an XML file) and received by a DCA (Device configuration APP) for ETS is available.

The AC500 V3 PLC is integrated into the ETS via a certified KNX "device" with the transferred group objects as configured in Automation Builder and a physical KNX address (transferred via ETS and KNX IP to the AC500 V3 PLC).

Programming and commissioning of the AC500 V3 PLC starts with Automation Builder:

Configuration of the AC500 V3 PLC, its communications, here KNX, and I/O modules and all necessary parameters.
1. Configure programmable KNX controller in Automation Builder by adding group objects to the device.
2. Use group objects as inputs and outputs in the IEC application.
3. Download of the above into the AC500 V3 PLC (via the engineering interface)
4. Export of the group objects for ETS via XML file.

The subsequent linking of the AC500 V3 PLC and the other KNX devices takes place with the vendor independent KNX commissioning software ETS:
5. Install DCA Plugin and the AC500 V3 PLC device description in ETS
6. Connect group objects in ETS and assign group addresses.
7. KNX IP download to AC500 V3 PLC.
8. The physical KNX address of the AC500 V3 PLC must be set before or during download of the KNX configuration.

The programming of the AC500 V3 PLC and the KNX commissioning can be done also by different people at different times and with same or separate engineering PCs. Both projects carry out their own download parts of their respective configurations to the AC500 V3 PLC.
The only data exchange between the two Engineering programs are the details about the KNX group objects defined in the ABB Automation Builder. This is done flexibly via the XML configuration file.

\subsection*{6.8.2.8.3 Prerequisites}
- Basic AC500 and Automation Builder know-how.
- Basic experience and expertise in use of KNX and ETS (engineering software for KNX).
- \(\mathrm{PC}(\mathrm{s})\) with Windows 7 or higher with administrator right(s)
- At least temporary network access to the internet for downloading and installing of:
- Automation Builder as of version AB 2.1.2, (and e.g. example .project)
- ETS5 and the necessary additional files (DCA .etsapp, device description .knxprod) plus possibly an matching example .knxproj) to above Automation Builder .project
- Network access to the local network, were the AC500 V3 PLC and KNX devices are connected.
- PS5604-KNX AC500 runtime license for each dedicated AC500 V3 PLC used in KNX networks.
- The current IP address of the engineering PC(s) where Automation Builder and ETS are located in same Network / masked IP range, as the AC500 V3 PLC to be used.

\subsection*{6.8.2.8.4 General settings and system behavior}

The KNX interface at the AC500 V3 PLC is only active during the PLC is in RUN.
1. Download Automation Builder program.
2. Run PLC.
3. Set physical address or download KNX application Programm via ETS.
\(\Rightarrow\) The bus status can be viewed in Online View of Automation Builder.

KNX communication is only working after download the matching ETS application to the AC500 V3 PLC. Until then, the AC500 V3 PLC KNX communication is deactivated and marked with a warning symbol.

Fig. 359: KNX Interface not ready
However in this state the AC500 V3 PLC can still be switched to the KNX programming mode and the physical KNX address can be programmed. Also the device info can be read by ETS.
If the KNX interface is ready, this can be recognized by the green symbol on the KNX interface in the Automation Builder.

Fig. 360: KNX Interface ready

\subsection*{6.8.2.8.5 Start-up behavior}

\section*{Start/Stop PLC}

KNX bus works only in RUN mode.
If the PLC is in "STOP" mode the KNX bus and the outputs are reset.

To avoid this behavior in "STOP" mode set the following preferences at the PLC_AC500_CPU:
1. Double-click PLC_AC500_V3 < ...> and click PLC Settings.
2. Enable checkbox Update IO while in stop and select in dropdown-menu Behavior for Outputs in Stop "Keep current values".

Warm start / If the PLC is reset also the connected objects will be reset on the KNX bus.

\section*{Cold start}

Power ON/Off
After Power ON the KNX Interface need approximately 1 s to start after the PLC program had started. During this period no inputs will be recognized by the PLC and no outputs will be send to the bus.
6.8.2.8.6 Engineering of KNX in Automation Builder

Creation of KNX group objects

The data exchange with the KNX bus is done via KNX group objects.
1. Double-click node "KNX" in the device tree "click General \(\rightarrow\) click Add".
\(\Rightarrow\) The window Communication object appears.
2. Enter your properties:
- Group Object Number:

The number of the KNX Group Object must match within the controller. It is displayed in the ETS and influences the display order in the ETS and the Automation Builder.
- Type:

Selection of the communication direction.
- Input means that the controller receives values from the KNX bus.
- Output means that the controller sends values to the KNX bus.
- Data Point Type:

Specification of the KNX data point type (DPT) of the Group Object. This determines the memory size, scaling and unit. For further information see the KNX Standard.
- Group Object Name:

The name of the KNX Group Object. It is freely selectable and is displayed in the ETS under the field name.
- Group Object Function:

The name of the function of the Group Object. It is freely selectable and is displayed in the ETS under the field Function.

Based on this selection, the flags of the KNX Group Object are set accordingly in the ETS.
You can use the [Export CSV...] button in the "General" tab menu bar to display the list of KNX group objects in a spreadsheet program such as Excel and edit and extend it flexibly. Then you can import them again via [Import CSV].

After you have created all the required KNX group objects, export them using the [Export to ETS] button. This exported file contains the configuration of the KNX group objects of the AC500 V3 PLC and is imported by ETS for linking to other KNX devices. If you have not yet created project information under main menu "Project \(\rightarrow\) Project Information", the default values will be used during the export.

To use these KNX group objects in your application program, you must assign them with IEC61131-3 variables. This additional abstraction layer of an additional variable allows you to create modular automation programs that are independent of the used bus system or input / output modules.
The assignment is possible either via the parameter page "KNX I/O Mapping" or "//O mapping list". Both editors offer the same function in different representations.
On the KNX I/O Mapping page, the KNX variables are shown hierarchically. Each KNX Group Object consists of several channels with additional information. These differ depending on whether it is an input or an output.
The view is structured as follows:
- Variable:

Enter the name of the IEC 61131-3 variable that you want to assign to this channel (KNX Group Object).
- Mapping

Shows if the channel is already linked
- Channel:

Name of the Channel (Channel name)
- Address:

The memory address under which the information is stored in the memory of the AC500 V3 PLC. Inputs start with \%I and outputs start with \%Q.
- Type:

Specification of the IEC 61131-3 variable type
- Default Value:

The value used after starting the controller.
- At a KNX Group Object input, this value is used by the automation program until a value has been received from the KNX bus.
- At a KNX Group Object output, this value is sent to the bus when the controller is started.
- Unit:

Specification of the KNX data point type (DPT)
- Description:

Note text
A KNX Group Object "input" consists of a status and a control part:
The Channel name of the status part consists of: Object Number + Object Name + Object Function and include the following informations:
- UpdateFlag:

This status flag is set to the value "true" for one cycle as soon as a new KNX telegram has been received. Even if the value of the telegram does not differ from the previous one.
- ValueChanged:

This status flag is set to the value "true" as soon as a new KNX telegram has been received and the value differs from the previous one.
- ValueValid:

This status flag is set to the value "true" as soon as a KNX telegram has been received for the first time after the controller has been started.
- WatchdogTimeout:

As of Automation Builder 2.2.1 it will be possible to define a Watchdog Timeout for each input object. If a timeout occur this flag will be set to the value "true" for one cycle.
- Value:

The current value of the KNX Group Object received from the KNX bus.
The Channel name of the control part consists of: "Control" + Object Number + Object Name + Object Function and include the following control possibilities:
- Reset status flags:

When this flag is set from "false" to "true" by the automation program then the above-mentioned status flags of the KNX Group Object are reset to the value "false".
- Send value read:

When this flag is set from "false" to "true" by the automation program, a ValueRead telegram is sent to the KNX bus. This causes the KNX remote device to send back its current value.
A KNX Group Object "output" is represented as follows:
The Channel name of the Group Object consists of: Object Number + Object Name + Object Function
- Trigger Output:

When this flag is set from "false" to "true" by the automation program, the current value is sent immediately to the KNX bus. The sending conditions that are may be activated in the ETS (send on change and cyclic sending) will be restarted
- Disable Output:

As long this flag is set to "true" by the automation program, the sending conditions send on change and cyclic sending in the ETS are deactivated.
- Value:

The current value of the KNX Group Object that is sent to the KNX bus.
The permanently defined Program LED Status represent the function as known in other KNX devices, showing the status of the programming LED.

\section*{Create an application program}

The KNX variables defined on the KNX I/O Mapping page are available programwide under loConfig_Globals_Mapping.

These you can see if you click in to the programming window and either via right-click select "Input Assistant" or press F2.

\section*{Export XML file}

To exchange the configured KNX group objects the configuration has to be exported via XML file.

If later both projects (from Automation Builder and ETS) are loaded on the PLC, the PLC checks if the two projects have the same source and fit together. This will be done by an automatically calculated Checksum. For calculating the Checksum the following information's from the Project information will be used:
- Company
- Title
- Version
- Timestamp

This Information will also be shown in the ETS after loading the XML file. If the user has not entered any project information some default values will be set.

\subsection*{6.8.2.8.7 Integration of the PLC in KNX}

\section*{Insert controller}
1. Start the ETS and insert the PS5604-KNX AC500 as controller from the ETS device catalog into your ETS project.
2. Assign a physical KNX address to the controller.
\(\Rightarrow\) The controller is placed topologically on the IP Main Area.
\begin{tabular}{|c|c|c|c|c|c|c|c|}

\hline
\end{tabular}

Import configuration

1. Select the "PS5604-KNX AC500" in the ETS explorer tree and click on "DCA" tab in the editor window.
2. Click on Load Configuration and select the configuration XML file.
\(\Rightarrow\) The KNX group objects defined in AC500 V3 PLC in Automation Builder are displayed in the ETS.

\section*{Connect controller with KNX devices}
1. Right-click on a "PS5604-KNX AC500" group object and assign a KNX group address or drag and drop from group address window.
2. Interlink group objects by assigning the same KNX Group Address.

\section*{Parameters of the device}

The following settings are possible in the ETS parameters of the PS5604-KNX AC500.

Tab General settings
\begin{tabular}{|l|ll} 
General Settings & Default Gateway & \(\boxed{239.0 .0 .0}\) \\
\hline \multirow{3}{*}{ Object \(1 . .3\)} & Telegram rate & Max. 10 telegrams per second \\
& & \\
& Project Title & CODESYS KNX \\
& Application date & \(2018-11-13 T 12: 01: 42.60356\) \\
& Identifier & 252617197 \\
& Version & 0.0 .0 .1 \\
& Application state & undefined \\
& Description & \\
\hline
\end{tabular}
- Default Gateway:

The used KNXnet/IP broadcast address. This must match the KNX system (KNX IP router). It is the default setting that is usually not changed.
- The entry field Default Gateway can contain another IP address for the Multicast communication. The normal Multicast IP address for KNX ist 224.0.23.12.
- If another Multicast IP address is to be used, it can be chosen in the area from 239.0.0.0 to 239.255.255.255. This alternative Multicast IP address can be defined in the input field Default Gateway.
- Telegram rate:

The maximum transmission rate of the AC500 V3 PLC can be limited in order to prevent an excessive bus load and thus to avoid malfunction of the KNX system.
The KNX telegrams are buffered until they have been sent. New values which have been calculated by the automation program in the meantime are updating the cached values. The old cached value is discarded and not sent.
- Project Information:

At this point, the project information of the Automation Builder project is displayed.

\section*{Tab Object 1 .. 3}
1.0.1 PS5604-KNX AC500 KNX runtime license > Object 1 .. 3

For each KNX Group Object of the AC500 V3 PLC an Object entry is displayed in the device parameters. This is named after the number of the KNX Group Object.
For outputs (controller sends to the KNX bus) the KNX transmission conditions can be set:
- Communication direction

Setting of the transmission direction of the object.
- Input (KNX to PLC): The controller receives values from the KNX bus.
- Output (PLC to KNX): The controller sends values to the KNX bus.
- Send condition (only for outputs):

Setting whether the Controller sends a telegram to the KNX bus automatically when the object value is changed. The following options are available
- No automatic sending:

No automatic sending to the KNX bus. This must be done via the program code by the Trigger Output flag.
- Send on change: Every time the object value changes, a telegram is sent to the KNX bus. No matter how minor this change is.
- Send on difference (only for group objects which are not DPT 1.* Boolean): Every time the object value changes, this value is only sent to the KNX bus if it differs from the last sent value at least by the settable difference.
- Sending difference (only if Send on difference is active):

Input of the difference by which the object value must change to be send. You can enter numbers with decimal places.
- Cyclic sending (only for outputs):

Setting whether in addition the object value is sent cyclically repeatedly to the bus. This also happens if this object value has not changed. Two different range of values for the cycle time can be specified.
- Cycle time (only when Cyclic sending is active):

Specification of the cycle time for the cyclic transmission.
Input format:
hour:minute:second
Note: The cycle time of the KNX stack depends on the cycle time of the task that executes the stack. A long task time causes long download times from ETS. Consider the CPU load and cycle times of other processes running on the CPU when selecting a cycle time for the KNX stack.

Regardless of the set transmission conditions, the program code can trigger by the flag Trigger Output a sending of the value to the KNX bus at any time.

By activating the flag Read on Init of the KNX group objects in the right ETS properties panel, the Controller sends a value read query to the connected KNX device at startup. This then responds with its current object value.

In this properties panel you can also select the appropriate subdata point type of the KNX Group Object. This defines the unit of the value in the KNX system. For example DPT 9.001 represents temperature in \({ }^{\circ} \mathrm{C}\).
\begin{tabular}{|c|c|c|}
\hline \multicolumn{2}{|l|}{Eit Properties} & > \\
\hline Settings & Comm. &  \\
\hline \begin{tabular}{l}
Name \\
Room 2 La \\
Descriptio
\end{tabular} & state & \\
\hline \multicolumn{3}{|l|}{Aktor A Status} \\
\hline \multicolumn{3}{|l|}{Priority} \\
\hline Low & & - \\
\hline \multicolumn{3}{|l|}{Flags} \\
\hline  & cation

Init & \\
\hline \multicolumn{3}{|l|}{Data Type} \\
\hline \multicolumn{2}{|l|}{\begin{tabular}{l}
1.001 switch \\
1.002 boolean \\
1.003 enable \\
1.004 ramp \\
1.005 alarm \\
1.006 binary value \\
1.007 step \\
1.008 up/down \\
1.009 open/close
\end{tabular}} & \(\wedge\) \\
\hline Default & & \\
\hline
\end{tabular}

If for example the response of an actuator state is needed for an input "Aktor A Status", this feature can be enabled in the parameter of the Switch Actuator (e.g. 1.1.6 SA/S4.10.1).

The current IP address as well as further information of the AC500 V3 PLC can be read via the ETS Device Info function. For this the physical KNX address is necessary. You can determine the address by the ETS function Programming Mode.
With the ETS function Group Monitor you can analyze the telegrams on the KNX bus. You can also use it to write/read KNX telegrams.

\section*{Download ETS configuration to controller}

The download of the ETS configuration to the AC500 V3 PLC is done via the ETS function "Download" in the menu bar. This download happens via the KNX interface directly to the AC500 V3 PLC.

Best you select in ETS the network interface of the computer as the bus interface. Thus, a fast data exchange is possible and the data is not routed via the KNX TP bus.

At the first download, the physical KNX address of the controller is programmed. To do this, set the AC500 V3 PLC to KNX programming mode.

This can be done either via the display or functions inside the application program of the controller (e.g. connected to a Webvisu like done in the example program).

Via AC500 display

²) Chapter 6.8.2.5.5.5.2 "Configuration with SystemFW >=V3.5.0 and DisplayFW >=V4.1" on page 4466

\section*{Attention!}

The activation of the KNX programming mode via the display only works with Automation Builder as of version 2.2.0.

The KNX configuration of AC500-eCo V3 uses TA5130-KNXPB.

The AC500 V3
PLC must be in RUN mode.
1. Press the \(\mathbf{C F G}\) function key.
\(\Rightarrow\) Switch is OFF (S OFF) is displayed.
2. Press the Arrow Down function key
\(\Rightarrow\) Pbut 0 is displayed.
(Pbut is standing for progamming button, the 0 (or the 1 ) showing the status of the programming LED ( \(0=0 \mathrm{ff} ; 1=\mathrm{ON}\) ))
3. Press the CFG function key.
\(\Rightarrow\) The display shows Pbut 1 flashing.
4. Confirm this with the \(O K\) function key.
\(\Rightarrow\) The display permanently shows Pbut 1. The AC500 V3 PLC is in KNX programming mode.

AC500-eCo V3
via TA5130-
KNXPB
1. Ensure the TA5130-KNXPB is plugged in during power up, PLC is in RUN mode.
2. Ensure that TA5130-KNXPB is configured inside Automation Builder configuration.
3. Push the button on the TA5130-KNXPB.
\(\Rightarrow\) The LED on the option board should turn ON. The AC500-eCo V3 is in KNX programming mode.

The AC500 V3 PLC automatically terminates the KNX programming mode after the programming of the physical KNX address.

Alternatively you can terminate the programming mode with Pbut 0 by pressing the CFG function key.
For AC500-eCo V3: push the button on the TA5130-KNXPB again to terminate the programming mode, the LED should turn OFF.

You can exit the menu at any time with the ESC function key.

Via AC500 appli- Please use the following variable for setting the KNX Program Button: cation

AC500_IoDrvKNX.GVL.IoDrvKNXCopyChannels.ProgramButton
The controller automatically terminates the programming mode after programming the physical address with the ETS.
The AC500 V3 PLC has then besides the Automation Builder configuration also the appropriate ETS configuration and starts its KNX communication.
Download all other linked KNX devices as well as the KNX IP routers. The ETS automatically creates the filter tables of the KNX IP routers so that the KNX telegrams are routed from the KNX TP lines to the IP line of the AC500 Controller.

\subsection*{6.8.2.8.8 Make changes}

Changes can be made in the Automation Builder as well as in the ETS without the need for a change in the other software or the need for a new data exchange.

Only if changes are made to the KNX group objects in the Automation Builder, a data exchange with the ETS is again necessary. Afterwards, a download is required both in the Automation Builder and in the ETS. Only when these two configurations have been downloaded again to the AC500 V3 PLC, the KNX communication is in operation again.
The DCA detects changes to names and numbers of the KNX group objects when importing the configuration file in the ETS and keeps the already made settings and linked Group Addresses of these changed group objects.

\subsection*{6.8.2.8.9 Data conversion}

The KNX standard defines a big-endian byte order while the IEC 61131-3 is based on the little-endian byte order. Therefore, the controller automatically converts the data point types.
However, if you access the bits of the structured KNX data point types (DPT) for time, date (DPT 10.*, DPT 16.*, DPT 19.*) in your program code, you have to note the reverse byte order. Therefore, as of Automation Builder version 2.2.0, corresponding function libraries are available that provide conversion functions for these data point types.

\subsection*{6.8.2.8.10 Further information}
- Example projects can be found in the example folder, "Help \(\rightarrow\) Project examples".

Prerequisite: Install the related library package with Automation Builder Installation Manager - [Modify].
- Programming in IEC61131 is described in the application example AC500 V3 KNX IP Integration.
- Further information can be found on the ABB website: \(\underline{A B B}\) products and services.

\subsection*{6.8.2.9 Communication with Modbus RTU}

\subsection*{6.8.2.9.1 Protocol description}

The Modbus RTU protocol is implemented in the AC500 processor modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server and receives the responses.

The Modbus operating mode of a serial interface is set in the PLC configuration \({ }^{\Perp}\) Chapter 6.3.2.14.2 "Configuring Modbus RTU on serial interface" on page 1588.

To use the AC500 V3 or AC500-eCo V3 as a Modbus RTU client two possible programming methods can be used:
- ModRtuMast
- ModRtuToken with Read/Write function blocks

\section*{ModRtuMast}

With this method the Modbus client function block ModRtuMast is used to program all read and/or write jobs in a sequence. If more than one ModRtuMast function block is used, e.g. for several sever connections, the sequence must take care that only one of those ModRtuMast function blocks is active at a time.
A summary of the function codes that are supported for Modbus RTU communication with an AC500 PLC is given in the application example Modbus RTU and function block ModRtuMast.

ModRtuToken with Read/Write function blocks

With this method the function block ModRtuToken is used along with ModRtuRead and/or ModRtuWrite and/or ModRtuReadWrite23.

Instead of programming a sequence a simple connection via structure variables between the function blocks is necessary to ensure the sequencial functionality of Modbus RTU.

A sample project for Modbus client and server in order to enable Modbus RTU communication with an AC500 PLC is given in the application example Modbus RTU and function block ModRtuMast.

To use Modbus RTU protocol on an AC500-eCo V3 PLC, the CPU must be equipped with an option board for COMx serial communication TA5141-RS2321, TA5142-RS485 or TA5142-RS485I option board. The type of the option board adapter must be selected according to the type of physical serial interface needed.

According to the CPU type, up to 3 option boards for COMx serial communication can be used \(\stackrel{y}{ } \Leftrightarrow\) Chapter 6.3.2.8.4 "Attach an option board for COMx serial communication" on page 1505.

Modbus RTU can be used for communication between an AC500-eCo V3 PLC and a control panel. The connection principle is described using the CP604 control panel as an example: CP604 connection via Modbus RTU.

Modbus client In this operating mode, the telegram traffic with the server(s) is handled via the function block ModRtuMast.
This function block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus blocks transferred by the server contain the following information:
- Modbus address of the interrogated server (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged ( \(n\) bytes)
- CRC16 control code (2 bytes)

Modbus server In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:
\begin{tabular}{|l|l|l|}
\hline \multicolumn{2}{|l|}{ Function code } & HEX \\
\multirow{2}{|l|}{ Description } \\
\hline DEC & 01 or 02 & Read n bits \\
\hline 01 or 02 & 03 or 04 & Read n words \\
\hline 03 or 04 & 05 & \begin{tabular}{l} 
Write one bit (encoded in one \\
word)
\end{tabular} \\
\hline 05 & 06 & Write one word \\
\hline 06 & \(0 F\) & \begin{tabular}{l} 
Write n bits (encoded in one \\
byte)
\end{tabular} \\
\hline 15 & 10 & Write n words \\
\hline 16 & 16 & Mask write \\
\hline 22 & 17 & \begin{tabular}{l} 
Read/write multiple words in \\
one telegram
\end{tabular} \\
\hline 23 & & \\
\hline
\end{tabular}

The following restrictions apply to the length of the data to be sent:
\begin{tabular}{|c|c|c|}
\hline \multicolumn{2}{|l|}{Function code} & \multirow[t]{2}{*}{Max. length} \\
\hline DEC & HEX & \\
\hline 01 or 02 & 01 or 02 & 2000 bits \\
\hline 03 or 04 & 03 or 04 & 125 words / 62 double words \\
\hline 05 & 05 & 1 bit \\
\hline 06 & 06 & 1 word \\
\hline 15 & OF & 2000 bits \\
\hline 16 & 10 & 123 words / 61 double words \\
\hline 22 & 16 & Write: 1 word \\
\hline 23 & 17 & \begin{tabular}{l}
Read: 125 words / 62 double words \\
Write: 121 words / 60 double words
\end{tabular} \\
\hline
\end{tabular}

\subsection*{6.8.2.9.2 Technical data}

Setting of the Modbus operating mode and the interface parameters

\end{tabular}

Calculation of the bit variable from the hexadecimal address:

\section*{Formula:}
\begin{tabular}{|l|l|l|l|}
\hline & \multicolumn{3}{|l|}{ Bit variable (BOOL) \(:=\%\) MXBYTE. BIT } \\
\hline & DEC & Decimal address & \\
\hline & where: & BYTE & DEC \(/ 8\) \\
\\
\hline & BIT & DEC mod 8 & (Modulo division) \\
\hline
\end{tabular}
```

Examples: - Address hexadecimal = 16\#2002
DEC := 8194
BYTE := 8194 / 8 := 1024
BIT := 8194 mod 8 := 2
Bit variable: %MX1024.2
- Address hexadecimal = 16\#3016
DEC := 12310
BYTE := 12310 / 8 := 1538,75 -> 1538
BIT := 12310 mod }8:=
Bit variable: %MX1538.6

- Address hexadecimal = 16\#55AA
DEC := 21930
BYTE := 21930 / 8 := 2741,25 -> 2741
BIT := 21930 mod }8:=
Bit variable: %MX2741.2

```

Calculation of the hexadecimal address from the bit variable:
```

Examples: - Bit variable := %MX515.4
DEC := 515 * 8 + 4 := 4124
Address hex := 16\#101C
- Bit variable := %MX3.3
DEC := 3 * 8 + 3 := 27
Address hex := 16\#001B
- Bit variable := %MX6666.2
DEC := 6666 * 8 + 2 := 53330
Address hex := 16\#D052

```

\section*{Peculiarities for accessing Modbus addresses}

Peculiarities for bit access:
- A WORD in the \%M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range \%MW0 .. \%MW4095

\section*{Areas protect from read/write access by Modbus client}

As described in 'Protocols and special servers' \(\Leftrightarrow\) Chapter 6.3.4.3.2 "Configuration of Modbus TCP/IP server" on page 1714, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

\subsection*{6.8.2.9.5 Local data of the Modbus client}

The address of the area from which data are to be read or to which data are to be written is specified in the function block ModRtuMast at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:
- Inputs area (\%I area)
- Outputs area (\%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for \%M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

\subsection*{6.8.2.9.6 Modbus telegrams}

\section*{General}

The sending and receiving of telegrams shown in this section are not visible in the PLC.
However, the complete telegrams can be made visible using a serial data analyzer connected to the connection line between server and client, if required.

The amount of user data depends on the capabilities of the server and the client.
For the following examples, it is assumed that one AC500 Modbus module is used as client and another one is used as server. There may be different properties if modules of other manufacturers are used.

FCT 1 or 2: Read \(\mathbf{n}\) bits

\hline
\end{tabular}

\section*{FCT 3 or 4: Read \(n\) double words}

The function code "read double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer) ⓨ Chapter 6.8.2.9.6.3 "FCT 3 or 4: Read \(n\) words" on page 4513.

FCT 5: Write 1 bit
For the function code "write 1 bit", the value of the bit to be written is encoded in one word.
BIT = TRUE -> Data word = FF 00 HEX
BIT = FALSE -> Data word = 0000 HEX

\section*{Exception response by server}

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the ModRtuMast inputs are logically correct.
Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Table 837: Server response
\begin{tabular}{|l|l|l|l|l|}
\hline Server address & OR 80HEX & Error code & \multicolumn{2}{|l|}{ CRC } \\
\cline { 4 - 5 } & & & High & Low \\
\hline
\end{tabular}

Possible error codes of the client
\begin{tabular}{|l|l|}
\hline Code & Description \\
\hline 01DEC & \begin{tabular}{l} 
ILLEGAL FUNCTION \\
The server does not support the function requested by the client
\end{tabular} \\
\hline 02DEC & \begin{tabular}{l} 
ILLEGAL DATA ADDRESS \\
Invalid operand address in the server or operand area exceeded
\end{tabular} \\
\hline 03DEC & \begin{tabular}{l} 
ILLEGAL DATA VALUE \\
At least one value is outside the permitted range of values
\end{tabular} \\
\hline 04DEC & \begin{tabular}{l} 
SERVER DEVICE FAILURE \\
An unrecoverable error occurred while the server was attempting to \\
perform the requested action
\end{tabular} \\
\hline 05DEC & \begin{tabular}{l} 
ACKNOWLEDGE \\
Specialized use in conjunction with programming commands. \\
The server has accepted the request and is processing it, but a \\
long duration of time will be required to do so. This response is \\
returned to prevent a timeout error from occurring in the client. \\
The client can next issue a Pooll Program Complete message to \\
determine if processing is completed
\end{tabular} \\
\hline 06DEC & \begin{tabular}{l} 
SERVER DEVICE BUSY \\
Specialized use in conjunction with programming commands.
\end{tabular} \\
\hline 07DEC & \begin{tabular}{l} 
The server is engaged in processing a long-duration program com- \\
mand. The client should retransmit the message later when the \\
server is free.
\end{tabular} \\
\hline \begin{tabular}{l} 
NEGATIVE ACKNOWLEDGE \\
Specialized use in conjunction with programming commands.
\end{tabular} \\
\hline \begin{tabular}{l} 
The server cannot perform the programming functions. Client \\
should request diagnostic or error information from server.
\end{tabular} \\
\hline \begin{tabular}{l} 
MEMORY PARITY ERROR \\
Specialized use in conjunction with function codes 20 and 21 and \\
reference type 6, to indicate that the extended file area failed to \\
pass a consistency check. The server attempted to read record file, \\
but detected a parity error in the memory. The client can retry the \\
request, but service may be required on the server device.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Code & Description \\
\hline 10DEC & \begin{tabular}{l} 
GATEWAY PATH UNAVAILABLE \\
Specialized use in conjunction with gateways, indicates that the \\
gateway was unable to allocate an internal communication path \\
from the input port to the output port for processing the request. \\
Usually means that the gateway is misconfigured or overloaded.
\end{tabular} \\
\hline 11DEC & \begin{tabular}{l} 
GATEWAY TARGET DEVICE FAILED TO RESPOND \\
Specialized use in conjunction with gateways, indicates that no \\
response was obtained from the target device. Usually means that \\
the device is not present on the network.
\end{tabular} \\
\hline
\end{tabular}

\subsection*{6.8.2.9.7 Processing bits}

\section*{General}

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.
Data type 'BIT' \({ }^{\wedge} \gg\) Chapter 6.4.1.20.5.11 "Data Type 'BIT"' on page 2243 must not be mixed up with data type 'BOOL' \(\Longleftrightarrow\) Chapter 6.4.1.20.5.2 "Data type 'BOOL'" on page 2235. Variables of both types may have values 'TRUE' or 'FALSE'. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

\section*{Modbus client}

When accessing bits in a Server, the local data referred to at Client function blocks input data is always expected to be of format BOOL.
```

VAR
abBoolArray : ARRAY [0..15] OF BOOL;
ModMast : ModTcpMast;
END_VAR
abBoolArray[0] := TRUE;
abBoolArray[15] := FALSE;
ModMast (Execute:= ModMastExecute,
Eth:= ETH1,
IPAdr:= IP_ADR_STRING_IO_DWORD('192.168.0.100'),
UnitID:= 0,
Fct:= 15,
Addr:= 16\#0000,
Nb:= SIZEOF (abBoolArray),
Data:= ADR(abBoolArray));

```

\section*{Modbus server}

\section*{Using the bit offset}

The simplest way to access a certain bit within a larger variable is to directly use the bit offset ( 0 based; \(\Leftrightarrow\) Chapter 6.4.1.20.4.11 "Bit Access in Variables" on page 2229).
```

VAR
awWordVariable AT %%NWO : ARRAY [0..7] OF WORD;
END VAR
awWordVariable[0].0 := TRUE;
awWordVariable[7].15 := FALSE;

```

\section*{Defining symbolic names for the bit offsets}

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset « Chapter 6.4.1.20.4.11 "Bit Access in Variables" on page 2229.
```

VAR GLOBAL CONSTANT
(*bit offsets in avWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in av|ordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END VAR

```
VAR
awWordVariable AT sMWO : ARRAY [0..7] OF WORD;
END VAR
awWordVariable[0].NameBitOffset_0_00 := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;

\section*{Defining a data type}

A further alternative is to define your own data types \& Chapter 6.4.1.21.2.9 "Object 'DUT"' on page 2461 according to the requirements of your particular application * "Symbolic bit access in structure variables" on page 2230.
```

TYPE ControlWordType :
STRUCT
NameBitOffset_00 : BIT;
NameBitOffset_01 : BIT;
NameBitOffset_02 : BIT;
NameBitOffset_03 : BIT;
NameBitOffset_04 : BIT;
NameBitOffset_05 : BIT;
NameBitOffset_06 : BIT;
NameBitOffset_07 : BIT;
NameBitOffset_08 : BIT;
NameBitOffset_09 : BIT;
NameBitOffset_10 : BIT;
NameBitOffset_11 : BIT;
NameBitOffset_12 : BIT;
NameBitOffset_13 : BIT;
NameBitOffset_14 : BIT;
NameBitOffset_15 : BIT;
END_STRUCT
END_TYPE

```

\section*{VAR}
atTypeVariable AT sMw : ARRAY [0..7] OF ControlWordType;
END VAR
atTypeVariable [0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;

\section*{Defining a complex data type}

In case your application requires some more complex data types you can combine data types (DUT; \({ }^{4}\) "Symbolic bit access in structure variables" on page 2230).
```

TYPE ControlWordOType :
STRUCT
NameBitOffset_0_00 : BIT;
NameBitOffset_0_01 : BIT;
NameBitOffset_0_02 : BIT;
NameBitOffset_0_03 : BIT;
NameBitOffset_0_04 : BIT;
NameBitOffset_0_05 : BIT;
NameBitOffset_0_06 : BIT;

\section*{6．8．2．9．8 Function block ModRtuMast}

This function block is only required in the operating mode Modbus client．It handles the commu－ nication（transmission of telegrams to the servers and receipt of telegrams from the servers）． The function block can be used for the local serial interfaces of the controller．A separate instance of the function block has to be used for each interface．

ModRtuMast is contained in the library AC500＿ModRtuMast．

\subsection*{6.8.2.10 Communication with Modbus TCP/IP}

\subsection*{6.8.2.10.1 Protocol description}

The Modbus TCP protocol is implemented in the AC500 processor modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server and receives the responses. Each Ethernet interface can work as Modbus client and server interface in parallel if required.

The Modbus operating mode of an Ethernet interface is set in Modbus on TCP/IP protocol \(\boldsymbol{y}^{2}\) Chapter 6.3.4.3.1 "Modbus on TCP/IP protocol" on page 1713.

Modbus client In this operating mode, the telegram traffic with the server(s) is handled via the function block ModTcpMast, which can be found through the Library Manager \({ }^{\wedge}\), Chapter 6.5.3 "Library Manager functionality" on page 3773. This function block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus function blocks transferred by the client contain the following information:
- Transaction identifier for synchronization between messages of server and client (2 byte)
- Protocol identifier (0 for Modbus/TCP) (2 byte)
- Length field (Number of bytes in frame) (2 byte)
- Unit identifier (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged ( n bytes)

Modbus server In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.
The AC500 CPUs process the following Modbus operation codes:
\begin{tabular}{|l|l|l|}
\hline \multicolumn{2}{|l|}{ Function code } & HEX \\
\cline { 1 - 2 } DEC & 01 or 02 & Description \\
\hline 01 or 02 & 03 or 04 & Read n bits \\
\hline 03 or 04 & 05 & \begin{tabular}{l} 
Read n words \\
Write one bit (encoded in one \\
word \()\)
\end{tabular} \\
\hline 05 & 06 & Write one word \\
\hline 06 & \(0 F\) & \begin{tabular}{l} 
Write n bits (encoded in one \\
byte)
\end{tabular} \\
\hline 15 & 10 & Write n words \\
\hline 16 & 16 & Mask write \\
\hline 22 & 17 & \begin{tabular}{l} 
Read/write multiple words in \\
one telegram
\end{tabular} \\
\hline 23 & & \\
\hline
\end{tabular}

The following restrictions apply to the length of the data to be sent:
\begin{tabular}{|l|l|l|}
\hline Function code & HEX & \multirow{2}{*}{ Max. length } \\
\hline DEC & 01 or 02 & 2000 bits \\
\hline 01 or 02 & 03 or 04 & 125 words / 62 double words \\
\hline 03 or 04 & &
\end{tabular}
\begin{tabular}{|l|l|l|}
\hline Function code & HEX & Max. length \\
\hline DEC & 05 & 1 bit \\
\hline 05 & 06 & 1 word \\
\hline 06 & 0 F & 2000 bits \\
\hline 15 & 10 & 123 words \(/ 61\) double words \\
\hline 16 & 16 & Write: 1 word \\
\hline 22 & 17 & \begin{tabular}{l} 
Read: 125 words \(/ 62\) double \\
words \\
Write: 121 words \(/ 60\) double \\
words
\end{tabular} \\
\hline 23 & & \\
\hline
\end{tabular}

\subsection*{6.8.2.10.2 Technical data}

Configuration of Modbus on TCP/IP is described in the chapter 'Protocols and special servers' ² Chapter 6.3.4.3 "Modbus protocol" on page 1713.

\subsection*{6.8.2.10.3 Modbus addresses for AC500-eCo V3 processor modules PM50xx}

Modbus A range of maximum 64 kB is allowed for the access via Modbus to the addressable flag area address table (\%M area). Thus, the complete address range 0000hex up to 7FFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the \%M area can be found in the technical data of the CPUs and in the target system settings.
Inputs and outputs cannot be directly accessed using Modbus.
Following values apply:
\begin{tabular}{|c|c|c|c|c|c|}
\hline & PM5012-x-ETH & PM5032-x-ETH & PM5052-x-ETH & \[
\begin{array}{|l|}
\hline \text { PM5072- } \\
\text { T-2ETH(W) }
\end{array}
\] & PM5082-T-2ETH \\
\hline Size of the \%M area & 4 kB & 16 kB & 16 kB & 64 kB & 64 kB \\
\hline \multicolumn{6}{|l|}{Modbus address range (Word accesses)} \\

\hline
\end{tabular}

Calculation of the bit variable from the hexadecimal address:

\section*{Formula:}
\begin{tabular}{|l|l|l|l|}
\hline & \multicolumn{3}{|l|}{ Bit variable (BOOL) \(:=\%\) MXBYTE. BIT } \\
\hline & DEC & Decimal address & \\
\hline & where: & BYTE & DEC \(/ 8\) \\
\\
\hline & BIT & DEC mod 8 & (Modulo division) \\
\hline
\end{tabular}
```

Examples: - Address hexadecimal = 16\#2002
DEC := 8194
BYTE := 8194 / 8 := 1024
BIT := 8194 mod 8 := 2
Bit variable: %MX1024.2
- Address hexadecimal = 16\#3016
DEC := 12310
BYTE := 12310 / 8 := 1538,75 -> 1538
BIT := 12310 mod }8:=
Bit variable: %MX1538.6
- Address hexadecimal = 16\#55AA
DEC := 21930
BYTE := 21930 / 8 := 2741,25 -> 2741
BIT := 21930 mod }8:=
Bit variable: %MX2741.2

```

Calculation of the hexadecimal address from the bit variable:
```

Examples: - Bit variable := %MX515.4
DEC := 515 * 8 + 4 := 4124
Address hex := 16\#101C
- Bit variable := %MX3.3
DEC := 3 * 8 + 3 := 27
Address hex := 16\#001B
- Bit variable := %MX6666.2
DEC := 6666 * 8 + 2 := 53330
Address hex := 16\#D052

```

\section*{Peculiarities for accessing Modbus addresses}

Peculiarities for bit access:
- A WORD in the \%M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range \%MW0 .. \%MW4095

\section*{Areas protect from read/write access by Modbus client}

As described in 'Protocols and special servers' \(\Leftrightarrow\) Chapter 6.3.4.3.2 "Configuration of Modbus TCP/IP server" on page 1714, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

\subsection*{6.8.2.10.5 Local data of the Modbus client}

The address of the area from which data are to be read or to which data are to be written is specified in the function block ModTcpMast at input "Data", via the ADR operator.

For more information about the function blocks use the Library Manager \({ }^{\$ y}\) Chapter 6.5.3 "Library Manager functionality" on page 3773.

For the AC500, the following areas can be accessed using the ADR operator:
- Inputs area (\%l area)
- Outputs area (\%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for \%M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

\subsection*{6.8.2.10.6 Modbus telegrams}

For a detailed description of the Modbus TCP telegrams and their elements please see the corresponding specifications on public websites.

\section*{Exception response by server}

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MODMAST inputs are logically correct. Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

\section*{General telegram description}

Table 842: Server response
\begin{tabular}{|l|l|l|}
\hline \multirow{2}{*}{ Error code } & CRC & Low \\
\cline { 2 - 3 } & High & \multicolumn{1}{|l|}{} \\
\hline
\end{tabular}

Possible error codes of the client
\begin{tabular}{|l|l|}
\hline Code & Description \\
\hline 01DEC & \begin{tabular}{l} 
ILLEGAL FUNCTION \\
The server does not support the function requested by the client
\end{tabular} \\
\hline 02DEC & \begin{tabular}{l} 
ILLEGAL DATA ADDRESS \\
Invalid operand address in the server or operand area exceeded
\end{tabular} \\
\hline 03DEC & \begin{tabular}{l} 
ILLEGAL DATA VALUE \\
At least one value is outside the permitted range of values
\end{tabular} \\
\hline 04DEC & \begin{tabular}{l} 
SERVER DEVICE FAILURE \\
An unrecoverable error occurred while the server was attempting \\
to perform the requested action
\end{tabular} \\
\hline \begin{tabular}{l} 
ACKNOWLEDGE \\
Specialized use in conjunction with programming commands.
\end{tabular} \\
\begin{tabular}{l} 
Ses \\
The server has accepted the request and is processing it, but a \\
long duration of time will be required to do so. This response is \\
returned to prevent a timeout error from occurring in the client. \\
The client can next issue a Poll Program Complete message to \\
determine if processing is completed
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{|l|l|}
\hline Code & Description \\
\hline 06DEC & \begin{tabular}{l} 
SERVER DEVICE BUSY \\
Specialized use in conjunction with programming commands. \\
The server is engaged in processing a long-duration program \\
command. The client should retransmit the message later when \\
the server is free.
\end{tabular} \\
\hline 07DEC & \begin{tabular}{l} 
NEGATIVE ACKNOWLEDGE \\
Specialized use in conjunction with programming commands. \\
The server cannot perform the programming functions. Client \\
should request diagnostic or error information from server.
\end{tabular} \\
\hline 08DEC & \begin{tabular}{l} 
MEMORY PARITY ERROR \\
Specialized use in conjunction with function codes 20 and 21 and \\
reference type 6, to indicate that the extended file area failed to \\
pass a consistency check. The server attempted to read record \\
file, but detected a parity error in the memory. The client can retry \\
the request, but service may be required on the server device.
\end{tabular} \\
\hline 09DEC & \begin{tabular}{l} 
UNDEFINED \\
Actually not defined by Modbus specification but might be used by \\
particular servers.
\end{tabular} \\
\hline 10DEC & \begin{tabular}{l} 
GATEWAY PATH UNAVAILABLE \\
Specialized use in conjunction with gateways, indicates that the \\
gateway was unable to allocate an internal communication path \\
from the input port to the output port for processing the request. \\
Usually means that the gateway is misconfigured or overloaded.
\end{tabular} \\
\hline \(11 D E C\) & \begin{tabular}{l} 
GATEWAY TARGET DEVICE FAILED TO RESPOND \\
Specialized use in conjunction with gateways, indicates that no \\
response was obtained from the target device. Usually means that \\
the device is not present on the network.
\end{tabular} \\
\hline
\end{tabular}

\end{tabular}

\subsection*{6.8.2.10.7 Processing bits}

General
Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type 'BIT' \({ }^{\wedge} \gg\) Chapter 6.4.1.20.5.11 "Data Type 'BIT"' on page 2243 must not be mixed up with data type 'BOOL' \(\Longleftrightarrow\) Chapter 6.4.1.20.5.2 "Data type 'BOOL'" on page 2235. Variables of both types may have values 'TRUE' or 'FALSE'. But while BIT means one single bit only, BOOL requires a byte ( 8 bit ) of memory.

\section*{Modbus client}

When accessing bits in a Server, the local data referred to at Client function blocks input data is always expected to be of format BOOL.
```

VAR
abBoolArray : ARRAY [0..15] OF BOOL;
ModMast : ModTcpMast;
END VAR
abBoolArray[0] := TRUE;
abBoolArray[15] := FALSE;
ModMast(Execute:= ModMastExecute,
Eth:= ETH1,
IPAdr:= IP_ADR_STRING_IO_DWORD('192.168.0.100'),
UnitID:= 0,
Fct:= 15,
Addr:= 16\#0000,
Nb:= SIZEOF(abBoolArray),
Data:= ADR(abBoolArray));

```

\section*{Modbus server}

\section*{Using the bit offset}

The simplest way to access a certain bit within a larger variable is to directly use the bit offset ( 0 based; \({ }^{〔}\) Chapter 6.4.1.20.4.11 "Bit Access in Variables" on page 2229).
```

VAR
awWordVariable AT \&MWO : ARRAY [0..7] OF WORD;
END VAR
awWordVariable[0].0 := TRUE;
awWordVariable[7].15 := FALSE;

```

\section*{Defining symbolic names for the bit offsets}

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset \({ }^{*}\) Chapter 6.4.1.20.4.11 "Bit Access in Variables" on page 2229.
```

VAR_GLOBAL CONSTANT
(*bit offsets in avWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in avWordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END VAR

```
VAR
awWordVariable AT sMWO : ARRAY [0..7] OF WORD;
END_VAR
awWordVariable[0].NameBitOffset_0_00 := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;

\section*{Defining a data type}

A further alternative is to define your own data types \(\Leftrightarrow\) Chapter 6.4.1.21.2.9 "Object 'DUT"" on page 2461 according to the requirements of your particular application \({ }^{\star}\) "Symbolic bit access in structure variables" on page 2230.
```

TYPE ControlWordType :
STRUCT
NameBitOffset_00 : BIT;
NameBitOffset_01 : BIT;
NameBitOffset_02 : BIT;
NameBitOffset_03 : BIT;
NameBitOffset_04 : BIT;
NameBitOffset_05 : BIT;
NameBitOffset_06 : BIT;
NameBitOffset_07 : BIT;
NameBitOffset_08 : BIT;
NameBitOffset_09 : BIT;
NameBitOffset_10 : BIT;
NameBitOffset_11 : BIT;
NameBitOffset_12 : BIT;
NameBitOffset_13 : BIT;
NameBitOffset_14 : BIT;
NameBitOffset_15 : BIT;
END_STRUCT
END_TYPE

```

\section*{VAR}
atTypeVariable AT \(\$\) MWO : ARRAY [0..7] OF ControlWordType;
END VAR
```

atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;

```

\section*{Defining a complex data type}

In case your application requires some more complex data types you can combine data types (DUT; «s "Symbolic bit access in structure variables" on page 2230).
```

TYPE ControlWordOType :
STRUCT
NameBitOffset_0_00 : BIT;
NameBitOffset_0_01 : BIT;
NameBitOffset_0_02 : BIT;
NameBitOffset_0_03 : BIT;
NameBitOffset_0_04 : BIT;
NameBitOffset_0_05 : BIT;
NameBitOffset_0_06 : BIT;
NameBitOffset_0_07 : BIT;
NameBitOffset_0_08 : BIT;
NameBitOffset_0_09 : BIT;
NameBitOffset_0_10 : BIT;
NameBitOffset_0_11 : BIT;
NameBitOffset_0_12 : BIT;
NameBitOffset_0_13 : BIT;
NameBitOffset_0_14 : BIT;
NameBitOffset_0_15 : BIT;
END_STRUCT
END_TYPE

```

ControlWord1 Type
TYPE ControlWord1Type :
STRUCT
NameBitOffset_1_00 : BIT;
NameBitOffset_1_01 : BIT;
NameBitOffset_1_02 : BIT;
NameBitOffset_1_03 : BIT;
NameBitOffset_1_04 : BIT;
NameBitOffset_1_05 : BIT;
NameBitOffset_1_06 : BIT;
NameBitOffset_1_07 : BIT;
NameBitOffset_1_08 : BIT;
NameBitOffset_1_09 : BIT;
NameBitOffset_1_10 : BIT;
NameBitOffset_1_11 : BIT;
NameBitOffset_1_12 : BIT;
NameBitOffset_1_13 : BIT;
NameBitOffset_1_14 : BIT;
NameBitOffset_1_15 : BIT;
END_STRUCT
END_TYPE

TYPE ControlWordListType :
STRUCT
ControlWordo : ControlWordOType;
ControlWord1 : ControlWord1Type;
END_STRUCT
END TYPE
VAR
atWordListType AT \$MWO : ControlWordListType; END_VAR
atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;

\section*{Pack／unpack BOOL variables}

In case you prefer variables of type BOOL you can use the functions for packing MEM＿Pack＿BitsToByte and unpacking MEM＿UnpackWord of the CAA＿Memory．library，which can be found with the Library Manager \({ }^{\star}>\) Chapter 6．5．3＂Library Manager functionality＂ on page 3773.

VAR
abBoolVariable ：ARRAY［0．．15］OF BOOL； wWordVariable0 ：AT s⿳⺈⿴囗十一日⿹勹巳 WORD； wWordVariable1 ：AT sMW1 WORD； END＿VAR

VAR
Unpack ：Mem．UnpackWord；
END＿VAR
abBoolVariable［0］：＝TRUE；
abBoolVariable［15］：＝FALSE
wWordVariable0 ：＝Mem．PackBitsToWord（abBoolVariable［0］，abBoolVariable［1］，abBoolVariable［2］，abBoolVariable［3］， abBoolVariable［4］，abBoolVariable［5］，abBoolVariable［6］，abBoolVariable［7］， abBoolVariable［8］，abBoolVariable［9］，abBoolVariable［10］，abBoolVariable［11］， abBoolVariable［12］，abBoolVariable［13］，abBoolVariable［14］，abBoolVariable［15］）；
wWordVariable1 ：＝1；
Unpack（wValue：＝wWordVariable1，
\(x\) Bit0 \(\Rightarrow\) abBoolVariable［0］，xBit1 \(\Rightarrow\) abBoolVariable［1］，xBit2 \(\Rightarrow\) abBoolVariable［2］，xBit3 \(\Rightarrow\) abBoolVariable［3］， \(x\) Bit4 \(\Rightarrow\) abBoolVariable［4］，xBit5 \(\Rightarrow\) abBoolVariable［5］，xBit6 \(\Rightarrow\) abBoolVariable［6］，xBit7 \(\Rightarrow\) abBoolVariable［7］， \(x\) xit \(8 \Rightarrow\) abBoolVariable［8］，xBit9 \(\Rightarrow\) abBoolVariable［9］，xBit10 \(\Rightarrow\) abBoolVariable［10］，xBit11 \(\Rightarrow\) abBoolVariable［11］， \(x B i t 12 \Rightarrow\) abBoolVariable［12］，xBit13 \(\Rightarrow\) abBoolVariable［13］，xBit14＝＞abBoolVariable［14］，xBit15 \(\Rightarrow\) abBoolVariable［15］）；

\section*{6．8．2．10．8 Function block ModTcpMast}

These function blockis only required for the operating mode Modbus client．It handles the communication（transmission of telegrams to the servers and receipt of telegrams from the servers）．The function block can be used for the Ethernet interfaces of the controller．

ModTcpMast is contained in the library ABB＿ModbusTcp＿AC500．

\section*{6．8．2．11 Communication with PROFINET redundancy}

In a high availability system one of the following redundancy solutions can be configured：
－AC500 High Availability CS31 redundancy（HA－CS31）
－AC500 High Availability Modbus redundancy（HA－Modbus TCP）
„ \(\boldsymbol{y}\) Chapter 6．5．9．1．1＂The AC500 High Availability system＂on page 3859
－PROFINET redundancy based on HA－Modbus TCP without CI52x modules．
Normally，two PROFINET IO controllers CM579－PNIO connect to the devices simultaneously． One controller establishes a primary connection that is identical to a regular PROFINET connec－ tion．The second controller establishes a special＇backup＇connection．This connection doesn＇t contain any valid output data and doesn＇t allow the secondary controller to change any options on the devices．If the primary controller fails，the second parallel controller takes over the tasks of the first．

How to set－up and configure PROFINET redundancy communication based on HA－Modbus TCP（without CI52xs modules）is described in the application example PROFINET redundancy．

Network redun－The Media Redundancy Protocol allows in smaller systems rings of Ethernet switches to over－ dancy come any single failure with a maximum recovery times in the following range： \(10 \mathrm{~ms}, 30 \mathrm{~ms}\) ， 200 ms and 500 ms ．
ⓨ Chapter 6．3．4．1．2．2．7．4＂Network redundancy＂on page 1660

\subsection*{6.8.2.12 Fast counters in AC500 devices}

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50x2 modules, according to the CPU type, the fast inputs have different functionality or frequency.

Integrated fast counters are only available for digital I/O modules.
The digital I/O modules on the I/O bus contain two fast counters each.
If the counter is used, it needs up to 2 digital inputs and one digital output.
If the fast counter is deactivated, the inputs and outputs reserved for the counter can be used for other tasks.
\(\Leftrightarrow\) Ehapter 6.3.2.13.9 "Fast counter" on page 1574.
A fast counter is available in the following constellations:
- In digital I/O modules, connected to an AC500 processor module.
- In AC500-eCo V3 processor modules PM50x2 with onboard I/Os
- In CANopen communication interface modules.
- In Modbus, PROFIBUS and PROFINET communication interface modules and in the connected digital I/O modules.
- In digital I/O modules, connected to an EtherCAT communication interface module.

Fast counter integrated in S500 modules

The following table shows the S500 modules which contain a fast counter and which of the digital inputs and outputs are reserved for the counter.
\begin{tabular}{|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{Module} & \multicolumn{2}{|l|}{Assigned inputs \({ }^{1}\) )} & Assigned & \multirow[t]{2}{*}{Remarks} \\
\hline & Channel A & Channel B & Channel C \({ }^{2}\) ) or (CF) & \\
\hline DA501 & DC16 & DC17 & DC18 & \multirow[t]{6}{*}{The counter func tion is not available if the modules are mounted on the communication interface modules CI581CN or CI582-CN} \\
\hline DA502 & DC16 & DC17 & \begin{tabular}{l}
DC18 - in mode 1 and mode 2 \\
DOO - in mode 101 and mode \(102{ }^{3}\) )
\end{tabular} & \\
\hline DC522 & C8 & C9 & C10 & \\
\hline DC523 & C16 & C17 & C18 & \\
\hline DC532 & C24 & C25 & C26 & \\
\hline DI524 & 124 & 125 & No hardware output available & \\
\hline DX522 & 10 & 11 & The counter does not activate any relay output & \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|l|}
\hline \multirow{2}{|l|}{ Module } & \multicolumn{2}{|l|}{ Assigned inputs \({ }^{1}\) ) } & \begin{tabular}{l} 
Assigned \\
output
\end{tabular} & Remarks \\
\cline { 2 - 4 } & Channel A & Channel B & \begin{tabular}{l} 
Channel C \({ }^{2}\) ) or \\
(CF)
\end{tabular} & \\
\hline \begin{tabular}{l} 
CI501-PNIO, \\
CI541-DP, \\
CI581-CN, \\
CI521-MODTCP
\end{tabular} & DI0 & DI1 & DO0 & \\
\hline \begin{tabular}{l} 
CI502-PNIO, \\
CI542-DP, \\
CI582-CN; \\
CI522-MODTCP
\end{tabular} & DI8 & DI9 & DO8 & \\
\hline
\end{tabular}
\({ }^{1}\) ) The two hardware inputs (channels \(A\) and \(B\) ) are also and always available within the normal process image, irrespective of the operating mode of the counter.
\({ }^{2}\) ) The hardware output channel C is activated by the fast counter only in the operating modes 1 and 2.
\({ }^{3}\) ) Especially for module DA502: The counter operating mode 101 is the same as mode 1 , but the assigned output is DO0 instead of DC18. Also the counter operating mode 102 is the same as mode 2, but the assigned output is DO0 instead of DC18.

The counter function is performed within the communication interface module and, accordingly, in the digital I/O module(s). It works independently of the user program and is therefore able to respond quickly to external signals. A simultaneous counter operation of several digital I/O modules is possible.
Each module counter can be configured for one out of 10 possible modes. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).
The data exchange to and from the user program is performed using input and output operands. While integrating a module containing a fast counter in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later on does not cause an address shift.

Features independent of the fast counter operating mode
- The pulses at the fast counters' inputs or the evaluated signals of the traces \(A\) and \(B\) in case of incremental position sensors are counted.
- The counting frequencies of the communication interface modules of PROFINET, PROFIBUS and CANopen are max. 200 kHz (in modes 1 to 6), max. 50 kHz (in mode 7), max. 35 kHz (in mode 9), and max. 20 kHz (in mode 10).
- If the modules DA501, DC522, DC523, DC532 are used, each counting input must be circuited externally in series with a resistor of \(470 \Omega / 1 \mathrm{~W}\), in order to safely avoid influences from the deactivated module outputs to the connected sensors.
- The positive signal edges are counted, if not noted differently.
- By setting the operating mode 0 , the counting function is switched off. In this case, the reserved inputs and outputs can be used for other tasks. Simultaneous use of these terminals for the fast counter and other signals must be avoided.
- The fast counter's actual value is provided as a double word (32 bits).
- The fast counter can count upwards in all operating modes. It counts beginning at the start value (set value) up to the end value (max. from 0 to 4,294,967,295 or hexadecimal from 00000000 to FF FF FF FF. After reaching 4,294,967,295, the counter jumps with the next pulse to 0 . When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the fast counter is set again (set value), CF is reset to FALSE.

Further informa- - Operating modes of the fast counter \(\left.{ }^{\mu}\right\rangle\) Chapter 6.3.2.13.9.1.3 "Operating modes"
tion
on page 1577
- Configuration of the fast counter \({ }^{4} y\) Chapter 6.3.2.13.9 "Fast counter" on page 1574

\subsection*{6.8.2.13 \\ Fast counter in AC500-eCo V3}

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.
The fast counter functionality can be activated within the onboard I/O configuration.
The fast counter can work in pulse/direction mode or A/B track counter mode.
\& Further information about the operating modes of the fast counter
\(\Leftrightarrow\) Further information about the configuration of the fast counter

As AC500-eCo V3 PLCs provide the fast counters via their onboard I/Os not only the correct power distribution to the PLC has to be made, but also the correct wiring to the signal wires. How to connect and use fast counters in AC500-eCo V3 PLCs is described in an application example.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.
The counter can count with quad phases. In the following the behavior of the A/B track counter is described.

\subsection*{6.8.2.14 Onboard I/O on AC500-eCo V3 processor modules}

\subsection*{6.8.2.14.1 Intended purpose}

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

\subsection*{6.8.2.15 Simple motion}

\subsection*{6.8.2.15.1 Introduction}

The AC500-eCo V3 PLC provide several hardware and software features allowing to realize some motion application.
Specific fast onboard I/O and dedicated software library function blocks (simple motion) are available and can manage up to 2 axis on the CPU.
The simple motion capability is based on a library for the onboard I/O and some motion control blocks allowing point-to-point or velocity control.
All the AC500-eCo V3 PLC from Basic, Standard or Pro type offer dedicated feature according to their performance classes.

\subsection*{6.8.2.15.2 Hardware components for motion control}

Basic CPU - PM5012-R-ETH and PM5012-T-ETH

Fig. 361: Example: PM5012-T-ETH
1 High-speed counter 5 kHz frequency measurement interrupt I/O
2 Pulse-width modulation output

\section*{Standard and Pro CPU - PM5032-x-ETH/PM5052-x-ETH/PM5072-T-2ETH(W)/PM5082-T-2ETH}

Fig. 362: Example: PM5052-T-ETH
1 High-speed counter 100 kHz and \(5 \mathrm{kHz} \mathrm{A} / \mathrm{B}\) encoder 200 kHz interrupt I/O standard inputs
2 Pulse-train output \(100 \mathrm{kHz} / 200 \mathrm{kHz}\) pulse-width modulation 30 kHz limit switch standard outputs
3 Drives, encoder, stepper motor
For PLC with relay outputs, the input features are identical.
The digital configurable inputs or outputs can be used for pulse-train output/pulse-width modulalion functions.

\subsection*{6.8.2.15.3 System technology}

General
The following chapters describe the system technology of the AC500-eCo V3 using motion examples.

The simple motion set of function blocks is standard part of the system libraries for AC500-eCo VB.

\section*{Simple motion}

Velocity, point2pointpositioning

\section*{ECO_V3_ONBOARD.Library supports the onboard 10}

\section*{ESTP...}
```

...ENCODER(2), ..FORWARD_COUNTER(4),

```
..INTERRUPT(4), ..LIMIT_SWITCH(8), ..PWM(8),
..STEPPER(2)

\section*{Use the onboard I/Os as encoder with A and B signals}

\section*{Parameter configuration}

The onboard \(I / O\) accept encoder signal \(A\) and \(B\). When configure the encoder track \(A\), the encoder track \(B\) will be automatically inserted.
The user can configure the following input channel as encoder input.
- "Encoder 0 Track - A": Input channel 4
- "Encoder 0 Track - B": Input channel 5
- "Encoder 1 Track - A": Input channel 6
- "Encoder 1 Track - B": Input channel 7

After configuring the encoder input channel, the user can configure the touch/reset for the respective encoder channel.

More information about this topic can be found in the chapter 'Configuration the I/O channel'. « Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}

OBIOEncoder
Counter
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|c|}{OBIOEncoderCounter} \\
\hline Enable BOOL & BOOL Busy \\
\hline Channel BYTE & BOOL Error \\
\hline Set BOOL & Error_ID ErrorID \\
\hline CounterValueSet UDIVT & UDINT CounterValue \\
\hline EnableLimit BOOL & BOOL ReadyRef \\
\hline LimitValueMax UDIVT & BOOL ReadyTouch \\
\hline Mode BYTE & BOOL NewFrequencyResult \\
\hline EnableRef BOOL & BOOL MinFrequencyWarning \\
\hline EnableTouch BOOL & BOOL DirectionChange \\
\hline MaxFrequency UDIVT & UDINT CounterTouchValue \\
\hline & LREAL CounterFrequency \\
\hline
\end{tabular}

If "Enable" is TRUE, the "OBIOEncoderCounter" instruction increments the counter by one base on the input.

If "Set" bit is TRUE, the "OBIOEncoderCounter" instruction moves the "CounterValueSet" to the "CounterValue".

If "Enable" is TRUE, the "OBIOEncoderCounter" instruction increments the counter by one based on the input.

If "EnableLimit" bit is TRUE, the accumulated value continues incrementing.
After "CounterValue" reaches the "LimitValueMax", the "OBIOEncoderCounter" instruction writes 0 to the "CounterValue".

"Encoder Counter Mode": \(0=\) " \(90^{\circ}\) Mode"

In this encoder counter mode, an increasing count results when input \(B\) is \(90^{\circ}\) ahead of input \(A\). The count is initiated on the rising edge of input \(A\), and the direction of the encoder is clockwise (positive).
The module produces a decreasing count when input \(A\) is \(90^{\circ}\) ahead of input \(B\).
The count is initiated on the falling edge of input \(A\), and the direction is counterclockwise (negative).
By monitoring both the number of pulses and the phase relationships of input \(A\) and \(B\), you can accurately determine the position and direction of the rotation.

"Encoder
Counter Mode": 1 = "pulse/ direction"

In this encoder counter mode, the count increases or decreases based on the state of input B, which can be a random signal.

If input \(B\) is high, the counter will count down.
If input \(B\) is low the counter counts up.
Counting is done on the leading edge of input \(A\).

Count Up

Frequency Value \(\square\)

If "Enable" is TRUE, the "OBIOEncoderCounter" instruction increments the counter by one based on the input.
If "EnableRef" bit is TRUE, the "OBIOEncoderCounter" instruction is ready to receive the touch/ reset input.

If the "Touch/Reset" input is TRUE, the current "CounterValue" will be replaced by the "CounterValueSet".

If "Enable" is TRUE, the "OBIOEncoderCounter" instruction increments the counter by one based on the input.

If "EnableTouch" bit is TRUE, the "OBIOEncoderCounter" instruction is ready to receive the "Touch/Reset" input.

If the "Touch/Reset" input is TRUE, the current "CounterValue" will be captured and written to the "CounterTouchValue".

\section*{Use the onboard I/Os as forward counter}

\section*{Parameter configuration}

The onboard I/O accept pulse input as forward counter.
User can configure the following input channel as forward counter.
- "Forward Counter 0": Input channel 4
- "Forward Counter 1": Input channel 5
- "Forward Counter 2": Input channel 6
- "Forward Counter 3": Input channel 7

More information about this topic can be found in the chapter 'Configuration the I/O channel'. \& Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}

\section*{OBIOForward}

\section*{Counter}
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|c|}{OBIOForwardCounter} \\
\hline Enable BOOL & BOOL Busy \\
\hline Channel BYTE & BOOL Error \\
\hline Set BOOL & Error_ID ErrorID \\
\hline CounterValueSet UDIVT & UDINT CounterValue \\
\hline EnableLimit BOOL & \\
\hline LimitValueMax UDIVT & \\
\hline
\end{tabular}

If "Enable" is TRUE, the "OBIOForwardCounter" instruction increments the counter by one based on the input.
If "Set" bit is TRUE, the "OBIOForwardCounter" instruction moves the "CounterSetValue" to the "CounterValue".

If "Enable" is TRUE, the "OBIOForwardCounter" instruction increments the counter by one based on the input.

If "EnableLimit" bit is TRUE, the accumulated value continues incrementing.
After "CounterValue" reaches the "LimitValueMax", the "OBIOForwardCounter" instruction writes 0 to the "CounterValue".

\section*{Use the onboard I/Os as interrupt input with dedicated interrupt task}

\section*{Parameter configuration}

The onboard I/O input can be configured as interrupt input to trigger the interrupt task.

The user can configure the following input channel as interrupt input.
- "Interrupt input 0" : Input Channel 0
- "Interrupt input 1": Input Channel 1
- "Interrupt input 2" : Input Channel 2
-"Interrupt input 3" : Input Channel 3

More information about this topic can be found in the chapter 'Configuration the I/O channel'. \& Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

After configuring the parameter, the user need to create a new task with the "Type" set to "External" and the "External event" set to "OnBoard_Binary_Input".

\section*{Function block}

The "OBIOInterruptPara" instruction is configured for 4 interrupt inputs.
If "EnableInterrupt" bit is TRUE, the "OBIOInterruptInfo" instruction is ready to receive the interrupt input.

If the interrupt input is TRUE, the interrupt task will be executed.

If the second interrupt is TRUE with the interval less than 10 ms (as set), the execution of the interrupt task will be ignored.
If no interrupt occurred in 50 ms (as set), the interrupt task is executed automatically.

\section*{Use the onboard I/Os as output limit switch}

\section*{Parameter configuration}

The user can configure the following output channel as limit switch.
- "LimitSwitch 0": Output channel 0
- "LimitSwitch 1": Output channel 1
- "LimitSwitch 2": Output channel 2
- "LimitSwitch 3": Output channel 3
- "LimitSwitch 4": Output channel 4
- "LimitSwitch 5": Output channel 5
- "LimitSwitch 6": Output channel 6
- "LimitSwitch 7": Output channel 7

More information about this topic can be found in the chapter 'Configuration the I/O channel'. \({ }_{\Downarrow}{ }^{\mu}\) Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}
\begin{tabular}{|c|c|}
\hline OBIOLimitSwitch & \multirow{7}{*}{} \\
\hline Enable BOOL & \\
\hline Channel BYTE & \\
\hline Signal BOOL & \\
\hline UpperLimitOn UDIVT & \\
\hline LowerLimitOn UDIVT & \\
\hline Counter OBIOBaseCounter & \\
\hline
\end{tabular}

If the counter value reaches the "LowerLimitOn" preset, it will write to the limit switch output based on the signal until the "UpperLimitOn" preset is reached.

\section*{Use the onboard I/Os as pulse-train output (PTO)}

100 kHz frequency (max. 2 pulse-train outputs using pulse-train output hardware channels)

\section*{Parameter configuration}

The user can configure the following output channels as pulse-train output (PTO).
- "PTO": Output channel 4
- "PTO": Output channel 5
- "PTO": Output channel 6
- "PTO": Output channel 7

If the user configures the output 4 or 6 as pulse-train output, the output 5 or 7 is automatically configured as pulse-train output.

The input "CwCCw" of the function block "OBIOPulseTrainOutput" determines the output 5 and 7 as "CounterClockWise" or "Direction" if it is set as pulse-train output.

More information about this topic can be found in the chapter 'Configuration the I/O channel'. Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|c|}{OBIOPulseTrainOutput} \\
\hline Enable BOOL & BOOL Busy \\
\hline Channel BYTE & BOOL Error \\
\hline Set BOOL & Error_ID ErrorID \\
\hline CounterValueSet UDIVT & UDINT CounterValue \\
\hline EnableLimit BOOL & \\
\hline LimitValueMax UDIVT & \\
\hline Start BOOL & \\
\hline Halt BOOL & \\
\hline CwCCw BOOL & \\
\hline Invert \(B O O L\) & \\
\hline Direction BOOL & \\
\hline EnableFinesteps BOOL & \\
\hline Frequency \(\angle R E A L\) & \\
\hline NumberOfPulses UDIVT & \\
\hline MaxFrequency UDIVT & \\
\hline CycleTime LREAL & \\
\hline
\end{tabular}

If "Set" bit is TRUE, the instruction moves the "CounterSetValue" to the "CounterValue".

If "EnableLimit" bit is TRUE, the accumulated value continues incrementing.
After "CounterValue" reaches the "LimitValueMax", the instruction writes 0 to the "CounterValue".

If the input "CwCCw" of the "OBIOPulseTrainOutput" is set to FALSE, the pulse-train output channel \(B\) is toggled based on the direction.

If the input "CwCCw" of the "OBIOPulseTrainOutput" is set to TRUE. The pulse-train output channel A will lead by \(90^{\circ}\) or pulse-train output channel \(B\) will lead by \(90^{\circ}\) depending on direction.

200 kHz frequency (max. 2 pulse-train output using pulse-train output hardware channels) and simple motion "OBIOMotionPTO" function block
Parameter configuration
Only the Standard and Pro processor modules can be used with pulse-train outputs. The Basic processor modules PM5012 do not have pulse-train outputs.
The available pulse-train output can be used as pulse-train output with pulse/ direction or pulse-train output with CW/CCW mode when the channels have been configured as pulse-train output.

The user can configure the following output channels as pulse-train output (PTO).
- "PTO": Output channel 4
- "PTO": Output channel 5
- "PTO": Output channel 6
- "PTO": Output channel 7

If the user configures the output 4 as pulse-train output, the output 5 is automatically configured as pulse-train output.
If the user configures the output 6 as pulse-train output, the output 7 is automatically configured as pulse-train output.
The input " CwCCw " of the function block "OBIOPulseTrainOutput" determines the output 5 and 7 as "CounterClockWise" or "Direction" if it is set as pulse-train output.

More information about this topic can be found in the chapter 'Configuration the I/O channel'. \# Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|c|}{OBIOMotionPTO} \\
\hline Enable BOOL & B00L Busy \\
\hline Channel BYTE & B00L Error \\
\hline OpenLoop BOOL & Error_10 Errorid \\
\hline CwCCw BOOL & BOOL InPosition \\
\hline ResetPos BOOL & BOOL InVelocity \\
\hline ExecutePos B00L & DWORD ActFrequency \\
\hline ExecuteVel BOOL & BOOL ActDirection \\
\hline Stop BOOL & \\

\hline MaxFrequency DWORD & \\
\hline MinFrequency DWORD & \\
\hline Cycle INT & \\
\hline ActPosition DIVT & \\
\hline p2p OBIOPoint2Point & \\
\hline
\end{tabular}

If the input "CwCCw" of the "OBIOMotionPTO" is set to FALSE, the pulse-train output channel B is toggled based on the direction.

If the input "CwCCw" of the "OBIOMotionPTO" is set to TRUE. The pulse-train output channel A will lead by \(90^{\circ}\) or pulse-train output channel \(B\) will lead by \(90^{\circ}\) depending on direction.

100 kHz .. 200 kHz frequency (max. 4 pulse-train output using puls-width modulation (PWM) hardware channels) and simple motion "OBIOMotionPWM" function block

\section*{Parameter configuration}

It is possible to have also up to 4 pulse-train output channels only with pulse/direction mode on the AC500-eCo V3 CPU by using the fast outputs O4...O7 configured as pulse-width modulation outputs and using a specific motion function block and standard outputs for direction channel.

Only the Standard and Pro processor modules can be used with pulsetrain output or pulse-width modulation outputs. The Basic processor modules PM5012 do not have pulse-train outputs.

The available software pulse-train outputs can be used as pulse-train output with pulse/direction or pulse-train output with CW/CCW mode when the channels have been configured as PWM outputs.

The user must configure the following output channels as pulse-width modulation outputs and use the "OBIOMotionPWM" function block.
- "PWM": Output channel 4
- "PWM": Output channel 5
- "PWM": Output channel 6
- "PWM": Output channel 7

If the user configures the output 4... 7 as pulse-width modulation using the "OBIOMotionPWM" function block, up to four software pulse-train output can be realized offering then only the pulse/direction mode.
The pulse output will always use the fast output channels \(\mathrm{O} 4 \ldots \mathrm{O}\) and the direction output of the function block can be assigned to any other output e.g. O0...O3 or also outputs from a S500 I/O module.

More information about this topic can be found in the chapter 'Configuration the I/O channel'. \(\Leftrightarrow\) Chapter 6.3.2.5 "Configure the onboard I/O channel" on page 1483

\section*{Function block}
\begin{tabular}{|c|c|}

\subsection*{6.8.2.16 Access to digital I/Os transferred as bit strings WORD/DWORD}

\subsection*{6.8.2.16.1 General}

The AC500 V3 PLCs runs in little-endian mode, means uses little-endian byte order.
\begin{tabular}{|l|l|l|l|l|}
\hline Address & Addr & Addr+1 & Addr+2 & Addr+3 \\
\hline & \(16 \# x x x x \times 000\) & \(16 \# x x x x \times 001\) & \(16 \# x x x x \times 002\) & \(16 \# x x x x \times 003\) \\
\hline BYTE & \(\mathbf{3}\) & \(\mathbf{2}\) & \(\mathbf{1}\) & \(\mathbf{0}\) \\
\hline BOOL & 7 & 7 & 7 & 7 \\
& 0 & 0 & 0 & 0 \\
\hline \multirow{2}{*}{ WORD } & \(\mathbf{1}\) & \(\mathbf{0}\) & \\
\cline { 2 - 5 } & 15 & 7 & 15 & 7 \\
& 8 & 0 & 8 & 0 \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|l|}
\hline Address & Addr & Addr+1 & Addr+2 & Addr+3 \\
\hline DWORD & \(\mathbf{0}\) & \multicolumn{4}{|l|}{} \\
\cline { 2 - 5 } & 7 & 15 & 23 & 31 \\
& & 0 & 8 & 16
\end{tabular}

The layout of the I/Os depends on the byte order of the I/O bus, fieldbus or protocol.

\subsection*{6.8.2.16.2 Bit strings transferred to PLC in little-endian byte order (Intel)}

\section*{Access to bit strings transferred to PLC in little-endian byte order}

If the fieldbus/protocol transfers the data in little-endian byte order, the access to the bits in a bit string will be as followed:
\begin{tabular}{|c|c|c|c|c|}
\hline Address & Addr & Addr+1 & Addr+2 & Addr+3 \\
\hline & 16\#xxxx x000 & 16\#xxxx x001 & 16\#xxxx x002 & 16\#xxxx x003 \\

& 15 \\
& 8
\end{aligned}
\] & \[
\begin{aligned}
& 7 \\
& 0
\end{aligned}
\] \\
\hline
\end{tabular}

\section*{Example}
\%IX0.0 := TRUE
\%IB0 := 1
\[
:=16 \# 01
\]
(Bit \(0=\) TRUE)
\%IW1 := 256
\[
:=16 \# 0100
\]
\[
\text { (Bit } 8 \text { = TRUE) }
\]
\%ID0 := 16777216
:= 16\#01000000
(Bit \(24=\) TRUE)
\%IX3.0 := TRUE
\%IB3 := 1
:= 16\#01
(Bit \(0=\) TRUE)
\%IW1 := 1
:= 16\#0001
(Bit \(0=\) TRUE)
\%ID0 := 1
:= 16\#00000001
(Bit \(0=\) TRUE)

The AC500 V3 PLCs support the following busses/protocols with little-endian byte order:
- Local I/O bus
- Modbus TCP
- PROFINET
- PROFIBUS

\section*{Representation of bitfields in I/O configuration transferred in big-endian byte order}

The values of I/Os can be monitored and controlled in the I/O configuration of a device. If the bit strings are transferred in big-endian byte order the bytes inside the word will be swapped.

Up to Automation Builder version 2.2 the bit channels will be displayed in the following way:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Variable & Mapping & Channel & Address & Type & Default Value & Current Value \\
\hline - SafeDigI_W & * & Digital inputs DIO - DI15 & \%IW7 & UINT & 0 & 2048 \\
\hline * SafeDigI_0 & * & Digital input DIO & \%IX 14.0 & BOOL & & FALSE \\
\hline * SafeDigI_1 & * & Digital input DI1 & \%IX14.1 & BOOL & & FALSE \\
\hline * SafeDigi_2 & * & Digital input DI2 & \%IX14.2 & BOOL & & FALSE \\
\hline \({ }^{4}\) SafeDigI_3 & * & Digital input DI3 & \%IX14.3 & BOOL & & FALSE \\
\hline * SafeDigI_4 & * & Digital input DI4 & \%IX14.4 & BOOL & & FALSE \\
\hline * SafeDigI_5 & * & Digital input DI5 & \%IX14.5 & BOOL & & FALSE \\
\hline 4 SafeDigI_6 & * & Digital input DI6 & \%IX14.6 & BOOL & & FALSE \\
\hline * SafeDigI_7 & * & Digital input DI7 & \%IX 14.7 & BOOL & & FALSE \\
\hline 4 SafeDigI_8 & * & Digital input DI8 & \%IX 15.0 & BOOL & & FALSE \\
\hline * SafeDigI_9 & * & Digital input DI9 & \%IX15.1 & BOOL & & FALSE \\
\hline 4. SafeDigI_10 & * & Digital input DI10 & \%IX 15.2 & BOOL & & FALSE \\
\hline 4. SafeDigI_11 & * & Digital input DI11 & \%IX15.3 & BOOL & & TRUE \\
\hline * SafeDigI_12 & * & Digital input DI12 & \%IX 15.4 & BOOL & & FALSE \\
\hline 4 SafeDigI_13 & * & Digital input DI13 & \%IX15.5 & BOOL & & FALSE \\
\hline *) SafeDigI_14 & * & Digital input DI14 & \%IX15.6 & BOOL & & FALSE \\
\hline * SafeDigI_15 & * & Digital input DI15 & \%IX15.7 & BOOL & & FALSE \\
\hline
\end{tabular}

Input channel DI3 was set in bit string SafeDigi_W. Since the inputs are transferred in bigendian byte order, the input channel SafeDigi_11 or SafeDigI_W. 11 is set. User has to swap the bytes in the IEC application.

As of Automation Builder version 2.3.0 the bit channels will be displayed in the following way:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline Variable & Mapping & Channel & Address & Type & Default Value & Current Value \\
\hline - SafeDigI_W & \({ }^{*}\) & Digital inputs DI0 - DI15 & \%IW7 & UINT & 0 & 2048 \\
\hline * SafeDigI_0 & \% & Digital input DIO & \%IX 15.0 & BOOL & & FALSE \\
\hline * SafeDigI_1 & \% & Digital input DI1 & \%IX15.1 & B0OL & & FALSE \\
\hline * SafeDigI_2 & \% & Digital input DI2 & \%IX 15.2 & BOOL & & FALSE \\
\hline * SafeDigi_3 & * & Digital input DI3 & \%IX15.3 & BOOL & & TRUE \\
\hline \({ }^{*}\) SafeDigI_4 & \% & Digital input DI4 & \%IX15.4 & BOOL & & FALSE \\
\hline 4 SafeDigI_5 & - & Digital input DI5 & \%IX 15.5 & BOOL & & FALSE \\
\hline * SafeDigI_6 & 4 & Digital input DI6 & \%IX 15.6 & BOOL & & FALSE \\
\hline 4 SafeDigl_7 & 4 & Digital input DI7 & \%IX 15.7 & BOOL & & FALSE \\
\hline 4 SafeDigI_8 & \% & Digital input DI8 & \%IX 14.0 & B00L & & FALSE \\
\hline * SafeDigI_9 & \% & Digital input DI9 & \%IX 14.1 & BOOL & & FALSE \\
\hline 4 SafeDigI_10 & - & Digital input DI10 & \%IX 14.2 & BOOL & & FALSE \\
\hline 4) SafeDigI_11 & \% & Digital input DI11 & \%DX14.3 & BOOL & & FALSE \\
\hline 4 SafeDigI_12 & 4 & Digital input DI12 & \%IX 14.4 & BOOL & & FALSE \\
\hline 4 SafeDigI_13 & \% & Digital input DI13 & \%DX14.5 & BOOL & & FALSE \\
\hline - SafeDigI_14 & 4 & Digital input DI14 & \%IX 14.6 & BOOL & & FALSE \\
\hline * SafeDigI_15 & * & Digital input DI15 & \%DX14.7 & B0OL & & FALSE \\
\hline
\end{tabular}

The representation of a bitfield is changed by swapping the bytes correspondingly to the type used in the IO configuration. Now the correct SafeDigI_3 or SafeDigI_W. 3 is set in case of DI3 is set.

In general, it is not recommended to use the "Address", e.g. 으X15. 3 directly in the IEC application. Use always symbolic variables to avoid access to wrong I/O channels.

\subsection*{6.8.3 System technology of the AC500 communication modules}

\subsection*{6.8.3.1 CANopen communication modules}

\subsection*{6.8.3.1.1 Triggering of event tasks with CAN-IDs}

For CM598-CAN module the execution of a PLC application task can be triggered automatically by a certain event, i.e. by incoming CAN 2.0 A or CAN 2.0 B frames. For this, the PLC application task is to be configured as external event task.

\section*{Prerequisites}
- PLC firmware version 3.2.5 and Automation Builder as of version 2.2.5.
- Only one PLC application task can be assigned to a communication module.
- Triggering of event tasks is only supported for the communication module CM598-CAN.

Every incoming CAN frame on a CM598-CAN module processes an event in the AC500 PLC. If the parameter "Trigger PLC Task" is set to TRUE, the CAN protocol task checks via the receive buffer configuration and the corresponding CAN-ID of the CAN frame whether a CAN frame is to be executed or not. Only those CAN-IDs that are configured in the protocol configuration will be processed. All other CAN frames will be rejected. If a CAN frame is to be processed, the CAN frame data is copied to the receive buffer and an event on the IEC event task is triggered.

The IEC event task will be executed for one cycle.
The IEC event task will be triggered continuously until all associated receive buffers have been emptied. Hence, ensure that the buffers are emptied by the task, otherwise the task will run into a loop.

Within the task the function block Cm598CanMsgRecEvt must be used to read the CAN frames from the receive buffers. The function block Cm598CanMsgRec is not suitable as it requires several task cycles for execution.

CAN frame pro- The following figure shows the sequence CAN frames processing when the triggering of event cessing task is used.

- Only one external event task can be assigned to a CM598-CAN.
- There is only one common event for an external event task and all selected CAN-IDs. It must be evaluated which CAN-IDs have been received.
- It is possible that CAN frames are lost when necessary system resources are in use or when the CAN frames could not be processed in time due to high system load. So, the PLC application must monitor the task which consumes the events of the CAN protocol with a watchdog mechanism or something similar.
- Received CAN frames of the same CAN-ID are internally stored in FIFO buffers. Reading and writing of the FIFO buffers is not possible at the same time.
- Within an external event task the function block Cm598CanMsgRecEvt must be used to read the received CAN frames. The function block Cm598CanMsgRec is not suitable since its execution needs more than one task cycle.
- The CAN-IDs that are enabled to trigger an external event task must be read by the associated task. Otherwise the task is triggered again and again, and the CPU load will be high.

Event task con- Add the external event task that should be executed to the task configuration of the PLC figuration application:
1. Right-click on "Task Configuration". Enter a name for the task and click "Add object".
2. Right-click on the new task and append a "Program Call". This contains the program code that is executed by the task.
3. Double-click on the task and setup the task parameters.

A parameter description is given in the chapter 'Tab 'configuration" \({ }^{〔}\) " Chapter 6.4.1.21.2.30.2 "Tab 'Configuration'" on page 2538. Deviations are described in the following:
\begin{tabular}{|l|l|l|l|}
\hline Parameter & Default & Value & Description \\
\hline Priority & 16 & \begin{tabular}{l}
\(0 . .16\) \\
Value '0' indicates the \\

\subsection*{6.8.3.3 CM5640-2ETH Ethernet communication module}

²) Chapter 6.3.2.11.5.1 "CM5640-2ETH - Ethernet communication modul" on page 1562

\subsection*{6.8.4 System technology of the communication interface modules}

\subsection*{6.8.4.1 Modbus communication interface module}

\subsection*{6.8.4.1.1 Overview}

The Modbus TCP communication interface module CI52x-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

\section*{Application examples}

In AC500 V3 projects in which several Modbus connections are needed at the same time, the number of Modbus sockets can be increased. How to increase the socket number with an additional run time license is described in the application note AC500 Line Mode with AC500 V3 CPU's.

A CI52x cluster can be used for the communication between the CPU and CI52x-MODTCP modules. An example on how to create a \(\mathrm{CI} 52 x\) cluster configuration using the bulk data manager tool, is described in the application example CI52x-MODTCP cluster.

A summary of the function codes that are supported for Modbus TCP communication with a PLC is given in the application example Modbus TCP and ModTcpMast2.

A description on how to establish a Modbus TCP communication with fixed and dynamic register mapping in an AC500 PLC is given in the application example Modbus TCP and register mapping.

To operate fast counter on Cl 52 x devices in combination with a V3 PLC correctly via Modbus TCP, a corresponding sample project is available. Setup and use are described in an application example.

CI521-MODTCP I/O channels properties:
- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

\section*{Functionality}
\begin{tabular}{|l|l|}

voltage 24 V DC)
\end{tabular} \\
\hline
\end{tabular}

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels.

The configuration of the inputs/outputs is performed by software.
For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

\subsection*{6.8.4.1.2 Modbus TCP registers}

\section*{Register layout for CI52x-MODTCP}

The registers can be divided in 4 sections:
- Information data section 0x0000 to 0x0D50 (for acyclic use)
- I/O data and diagnosis section 0x0FFA to 0x2B00 (for cyclic use)
- Parameter data section \(0 \times 3000\) to 0x3B00 (for acyclic use)
- Special functionality section \(0 \times 5 \mathrm{~A} 00\) to \(0 \times 6 \mathrm{~A} 00\) (for acyclic use)

\section*{Information data section (acyclic data)}

\section*{General}

The information data section can be used to read out common and module specific information.
This section is read only.

*) supported from CI52x firmware version V3.2.0 (device index F0)
This section can be divided again in two sections:
- The module specific section (containing information for each module CI52x-MODTCP and expansion modules and hot swap terminal units)
\({ }^{4}\) Chapter 6.8.4.1.2.2.2 "Module specific information registers" on page 4570
- The common device information block

② Chapter 6.8.4.1.2.2.3 "Common device information registers" on page 4572

\section*{Module specific information registers}

For each module (CI52x device, expansion modules and hot swap terminal units) the following data can be read out:
- Device and FW information

This section consists of 20 WORDs per module and contains information on each module using the following structure:
\begin{tabular}{|l|l|l|}
\hline Data & DATA TYPE & Description \\
\hline Module ID & WORD & The module ID of the requested module \\
\hline Module name & ARRAY [1..10] OF BYTE & The module name of the requested module \\
\hline Version \(1^{\text {st }}\) processor & ARRAY [1..4] OF BYTE & \begin{tabular}{l} 
The version of the \(1^{\text {st }}\) processor of the \\
requested module
\end{tabular} \\
\hline Version \(2^{\text {nd }}\) processor & ARRAY [1..4] OF BYTE & \begin{tabular}{l} 
The version of the \(2^{\text {nd }}\) processor of the \\
requested module
\end{tabular} \\
\hline Version \(3^{\text {rd }}\) processor & ARRAY [1..4] OF BYTE & \begin{tabular}{l} 
The version of the \(3^{\text {rd }}\) processor of the \\
requested module
\end{tabular} \\
\hline Version 4 \({ }^{\text {th }}\) processor & ARRAY [1..4] OF BYTE & \begin{tabular}{l} 
The version of the \(4^{\text {th }}\) processor of the \\
requested module
\end{tabular} \\
\hline Hardware version \(\left.{ }^{1}\right)\) & ARRAY [1..4] OF BYTE & The hardware version of the 4 processors \\

\({ }^{1}\) ) supported from CI52x firmware version V3.2.0 (device index F0)
\({ }^{2}\) ) from CI52x firmware version V3.2.0 (device index F0) "Reserved" is ARRAY [1..4] OF BYTE
- Production / Traceability data:

This section consists of 25 WORDs per module and contains the traceability data for each module using following structure:
- Article number: Byte \(01 . .15\)
- Index: Byte 16.. 17
- Name: Byte 18.. 29
- Production date: Byte 30.. 33
- Key number: Byte 34.. 38
- Site: Byte \(39 . .40\)
- Year: Byte 41.. 42
- Serial number: Byte \(41 . .50\) (The serial number implies the year)
- Production / Traceability data from \(\mathrm{CI} 5 \times 2\) firmware version V3.2.0 (device index F0): This section consists of 26 WORDs per module and contains the traceability data for each module using following structure:
- Article number: Byte 01.. 15
- Index: Byte 16.. 17
- Name: Byte 18.. 31
- Production date: Byte 32.. 35
- Key number: Byte \(36 . .40\)
- Site: Byte \(41 . .42\)
- Year: Byte 43.. 44
- Serial number: Byte \(42 . .52\) (The serial number implies the year)

\section*{Common device information registers}

Common device This section consists of 80 WORDs (90 WORDs from CI52x firmware version V3.2.0 (device
information block index F0)) and contains cluster wide information (CI52x device and connected expansion modules using the following structure:
\(\left.\begin{array}{|l|l|l|}\hline \text { Data } & \text { DATA TYPE } & \text { Description } \\ \hline \text { Device state } & \text { BYTE } & \begin{array}{l}\text { The actual state of the device: } \\ \text { 0: STATE_PREOP (device booting) } \\ \text { 1: STATE_OPERATION (device in operational, }\end{array} \\ \text { no bus supervision active) } \\ \text { 2: STATE_ERROR (device detected a bus } \\ \text { error, bus supervision active) } \\ \text { 3: STATE_IP_ERROR (the device has a IP } \\ \text { address error) } \\ \text { 4: STATE_CYCLIC_OPERATION (device in } \\ \text { operational, bus supervision active) }\end{array}\right\}\)

This section can be divided again in three sections:
- Module state (containing the state of connected expansion modules and hot swap terminal units)
(4) Chapter 6.8.4.1.2.3.2 "Module state" on page 4574
- Diagnosis data (containing diagnosis data in AC500 specific format)

² Chapter 6.8.4.1.2.3.3 "Diagnosis data" on page 4576
- Process data (containing I/O data)
\& Chapter 6.8.4.1.2.3.4 "I/O data" on page 4576

\section*{Module state}

The module state section consists of 44 WORDs and contains the module state of connected expansion modules and hot swap terminal units using the following structure:
\begin{tabular}{|l|l|l|}
\hline Data & DATA TYPE & Description \\
\hline Module ID & WORD & Module ID of the CI52x \\
\hline Expected module ID & WORD & Expected (configured) module ID of the CI52x \\
\hline Module state & BYTE & \begin{tabular}{l} 
The current module state of the CI52x: \\
0: NO_MOD (no module detected) \\
1: MOD_INIT (module detected, module is in \\
initialization phase) \\
2: MOD_RUN (module detected and running or in \\
failsafe state, input data are valid) \\
3: WRONG_MOD (wrong module detected, module ID \\
doesn't match expected module ID) \\
4: MOD_REMOVED (module removed or defective on \\
hot swap terminal unit, no communication to module \\
possible) \\
5: MOD_ERROR (module defective on hot swap \\
terminal unit, no communication to module possible) \\
6: MOD_LOST (lost communication to module on not \\
hot swap capable terminal unit) \\
7: UNKNOWN (module detected but not configured)
\end{tabular} \\
& & \\
& & \\
& & \begin{tabular}{l} 
Diagnosis flag for the CI52x: \\
0: NO_DIAG (no diagnosis evailable from CI52x I/O \\
cards) \\
1: DIAG_AVAILABLE (diagnosis available for CI52x I/O \\
cards)
\end{tabular} \\
\hline Diagnosis flag & BYTE & \\
& & \begin{tabular}{l} 
Terminal unit state for the CI52x: \\
0: NO_HOTSWAP_TU (not hot swap terminal unit \\
detected) \\
1: HOTSWAP_TU_RUNNING (hot swap terminal unit \\
detected and working) \\
2: HOTSWAP_TU_ERROR (hot swap terminal unit \\
detected, but communication errors for hot swap \\
terminal unit detected)
\end{tabular} \\
\hline Terminal unit state & BYTE & \\
& & \\
& &
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline Data & DATA TYPE & Description \\
\hline Parameter state & BYTE & \begin{tabular}{l}
Parameter state of the CI52x: \\
0 : NO_PARA (module is in initialization phase and not ready for parameterization) \\
1: WAIT_PARA (module awaits parameterization) \\
2: PARA_RUN (parameterization running) \\
3: LEN_ERR (length of parameters not correct) \\
4: ID_ERR (module ID inside parameters not correct) \\
5: PARA_DONE (parameterization finished without errors)
\end{tabular} \\
\hline Module ID & WORD & Module ID of the \(1^{\text {st }}\) connected expansion module \\
\hline Expected module ID & WORD & Expected (configured) module ID of the \(1^{\text {st }}\) connected expansion module \\
\hline Module state & BYTE & The current module state of the \(1^{\text {st }}\) connected expansion module \\
\hline Diagnosis flag & BYTE & \begin{tabular}{l}
Diagnosis flag for the \(1^{\text {st }}\) connected expansion module 0 : NO_DIAG (no diagnosis evailable for expansion module) \\
1: DIAG_AVAILABLE (diagnosis available for expansion module)
\end{tabular} \\
\hline Terminal unit state & BYTE & Terminal unit state for the \(1^{\text {st }}\) connected expansion module \\
\hline Parameter state & BYTE & Parameter state of the \(1^{\text {st }}\) connected expansion module \\
\hline \(\ldots\) & & \\
\hline Module ID & WORD & Module ID of the \(10^{\text {th }}\) connected expansion module \\
\hline Expected module ID & WORD & Expected (configured) module ID of the \(10^{\text {th }}\) connected expansion module \\
\hline Module state & BYTE & The current module state of the \(10^{\text {th }}\) connected expansion module \\
\hline Diagnosis flag & BYTE & Diagnosis flag for the \(10^{\text {th }}\) connected expansion module \\
\hline Terminal unit state & BYTE & Terminal unit state for the \(10^{\text {th }}\) connected expansion module \\
\hline Parameter state & BYTE & Parameter state of the \(10^{\text {th }}\) connected expansion module \\
\hline
\end{tabular}

\section*{Diagnosis data}

The diagnosis data section contains one diagnosis message with the following structure (according to AC500 diagnosis):
\begin{tabular}{|c|c|c|}
\hline Byte Number & Description & Possible Values \\
\hline \multirow[t]{4}{*}{1} & \multirow[t]{4}{*}{Diagnosis Byte, slot number} & 31 = CI52x-MODTCP (e. g. error at integrated 8 DI / 8 DO) \\
\hline & & 1 = \(1^{\text {st }}\) connected S500 I/O Module \\
\hline & & \(\ldots\) \\
\hline & & \(10=10^{\text {th }}\) connected S500 I/O Module \\
\hline 2 & Diagnosis Byte, module number & According to the I/O bus specification passed on by modules to the fieldbus master \\
\hline 3 & Diagnosis Byte, channel & According to the I/O bus specification passed on by modules to the fieldbus master \\
\hline 4 & Diagnosis Byte, error code & \begin{tabular}{l}
According to the I/O bus specification Bit 7 and Bit 6, coded error class
\[
\begin{aligned}
& 0=E 1 \\
& 1=E 2 \\
& 2=E 3 \\
& 3=E 4
\end{aligned}
\] \\
Bit 0 to Bit 5, coded error description
\end{tabular} \\
\hline 5 & Diagnosis Byte, flags & \begin{tabular}{l}
According to the I/O bus specification \\
Bit 7: 1 = coming error \\
Bit 6: 1 = leaving error
\end{tabular} \\
\hline 6 & Reserved & 0 \\
\hline
\end{tabular}

If a diagnosis message is read out, the next one will be automatically filled in.
If no more diagnosis messages are available the buffer will be reset to zero.
This ensures that each diagnosis message can be delivered to the Modbus TCP client/slave and no diagnosis will be lost.

\section*{I/O data}

The I/O data section can use two different formats according to the module parameter "I/O Mapping Structure".
- Fixed I/O mapping

In case of fixed I/O mapping each module has a predefined register range for each Inputs and Outputs.
- Dynamic I/O mapping

In case of dynamic I/O mapping the mapping is build according to the actual configuration.
The dummy output at the end of the I/O data section can be used to retrigger the bus supervision and has no effect on the HW outputs.

Fixed I/O mapping

In case of fixed I/O mapping the following predefined register table is used:
\begin{tabular}{|r|l|l|l|}
\hline \begin{tabular}{r} 
Register \\
(hex)
\end{tabular} & Description & \begin{tabular}{l} 
Readable by \\
Modbus function \\
code
\end{tabular} & \begin{tabular}{l} 
Writeable by \\
Modbus function \\
code
\end{tabular} \\
\hline 1000 & Inputs CI & \(3,4,23\) & \(x\) \\
\hline 1100 & Inputs 1.EXP & \(3,4,23\) & x \\
\hline\(\ldots\) & \(\ldots\) & & x \\
\hline \(1 \mathrm{A00}\) & Inputs 10.EXP & \(3,4,23\) & x \\
\hline 2000 & Outputs CI & 3,23 & \(6,16,23\) \\
\hline 2100 & Outputs 1.EXP & 3,23 & \(6,16,23\) \\
\hline\(\ldots\) & \(\ldots\) & & \\
\hline 2 A 00 & Outputs 10.EXP & 3,23 & \(6,16,23\) \\
\hline \(2 \mathrm{B00}\) & Dummy output & 3,23 & \(6,16,23\) \\
\hline
\end{tabular}

If a certain expansion module has no inputs or outputs the corresponding registers remain empty.

Dynamic I/O mapping

In case of dynamic mapping only the start addresses of inputs and outputs are predefined:
\begin{tabular}{|r|l|l|l|}
\hline \begin{tabular}{r} 
Register \\
(hex)
\end{tabular} & Description & \begin{tabular}{l} 
Readable by \\
Modbus function \\
code
\end{tabular} & \begin{tabular}{l} 
Writeable by \\
Modbus function \\
code
\end{tabular} \\
\hline 1000 & Inputs CI & \(3,4,23\) & x \\
\hline\(\ldots\) & \(\ldots\) & & x \\
\hline 2000 & Outputs Cl & 3,23 & \(6,16,23\) \\
\hline\(\ldots\) & \(\ldots\) & & \\
\hline \(2 \mathrm{B00}\) & Dummy output & 3,23 & \(6,16,23\) \\
\hline
\end{tabular}

The register addresses of the connected expansion modules are calculated dynamically based on the number of inputs and outputs of the previous modules (each module starts directly on the next register after the previous module).

The register addresses of each module can be read out via the common device register \(\Leftrightarrow\) Chapter 6.8.4.1.2.2.3 "Common device information registers" on page 4572.

Comparative The difference between fixed I/O mapping and dynamic I/O mapping is shown in the following example table.

For this comparison a cluster with CI522, AX522, DC532, AX521, DC523, DC532, AO523, AI523, DI524, AX522 and DC523 is used.
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline \multicolumn{4}{|c|}{Fixed Mapping} & \multicolumn{4}{|c|}{Dynamic Mapping} \\
\hline Register (hex) & Description & Type & Data & Register (hex) & Description & Type & Data \\
\hline 1000 & Inputs Cl & \[
\begin{aligned}
& 8 \mathrm{DC}, 8 \mathrm{DI}, \\
& \text { FC }
\end{aligned}
\] & \[

For each connected module the following parameter data are defined (the parameters are represented as ARRAY OF BYTE):
- Actual used parameter for each module

In these sections the actual parameters are stored. This section is also used to write parameters to the module.
« Chapter 6.8.4.1.3.2 "Parameterization" on page 4587
- Stored parameters for each module

If the module has stored nonvolatile parameters these can be read out using the corresponding registers.

The controlword/statusword is used to trigger a parameterization process.

\section*{Parameters of connected expansion modules}

The parameters of the connected expansion modules are represented as byte array (the parameters valid for "CPU" in the corresponding module are used):
\begin{tabular}{|c|l|l|}
\hline Parameter & \multicolumn{1}{c|}{ Description } & \multicolumn{1}{c|}{ Additional Info } \\
\hline 0 & Module ID (high byte) & \begin{tabular}{l} 
Fixed, see corresponding module (the \\
module ID of FBP is used)
\end{tabular} \\
\hline 1 & Module ID (low byte) & \begin{tabular}{l} 
Fixed, see corresponding module (the \\
module ID of FBP is used)
\end{tabular} \\
\hline 2 & Ignore module & Reserved must be 0 \\
\hline 3 & Length of following parameter block & Fixed, see corresponding module \\
\hline \(4 \ldots\) & \begin{tabular}{l} 
The rest of the parameter are \\
described in the corresponding \\
module
\end{tabular} & \\
\hline
\end{tabular}

\section*{Special functionality}

This section contains special services like firmware update or single parameterization.
\begin{tabular}{|c|c|c|c|}
\hline Register (hex) & Description & Readable by Modbus function code & Writeable by Modbus function code \\
\hline 4000 & Firmware download & 3 & 16 \\
\hline 4100 & Firmware download state & 3 & X \\
\hline 5000 & Write single parameterization of Cl & X & 16 \\
\hline 5100 & Write single parameterization of 1 . EXP & X & 16 \\
\hline \(\ldots\) & & & \\
\hline 5A00 & Write single parameterization of 10 . EXP & X & 16 \\
\hline 6000 & Read single parameterization of Cl & 3 & 16 \\

\hline \(\ldots\) & & & \\
\hline 6A00 & Read single parameterization of 10. EXP & 3 & 16 \\
\hline
\end{tabular}

\subsection*{6.8.4.1.3 Behavior}

\section*{IP address assignment}

\section*{General}

The delivery IP address of the CI52x-MODTCP is 192.168.0.xx. xx is the hardware address switch position of the device.
The devices support BOOTP, DHCP and fixed IP address setting. These can be set individual or together.

If BOOTP and DHCP are enabled the following priority takes place:
- If DHCP configuration fails, the device will fall back to BOOTP.
- In case of a BOOTP failure, the fixed IP address will be used.

A new IP address (or changing of BOOTP and DHCP) can be set in two different ways:
- With the address switches of the corresponding module
- With the IP configuration tool
y Chapter 6.3.2.9.2 "Configuration of the IP settings with the IP configuration tool" on page 1506

\section*{Using the address switches}

With the address switches only the last byte of the IP address can be changed.
The IP address can only be set via the address switches in case of factory default or in case of the last byte of the IP address is set to zero.
„ Chapter 6.3.2.9.2 "Configuration of the IP settings with the IP configuration tool" on page 1506

The not allowed IP addresses are mapped as followed:
- Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings (by IP Configuration Tool).
This is a backup so the module can always get a valid IP address and can be configured by the IP Configuration Tool.
- Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

\section*{Using the IP configuration tool}

With the 'Configuration of the IP settings with the IP configuration tool' a network scan can be executed, and the found devices can be assigned with new settings, e.g. enable BOOTP or DHCP and set a new fixed IP.
\(\left.{ }^{*}\right\rangle\) Chapter 6.3.2.9.2 "Configuration of the IP settings with the IP configuration tool" on page 1506

If the last byte of the IP address of the CI52x-MODTCP devices is set to 0 with the IP Configuration Tool the address switch position is used instead.
\& Chapter 6.8.4.1.3.1.2 "Using the address switches" on page 4587

\section*{Parameterization}

The parameterization is done via the corresponding registers explained in the Modbus TCP registers \({ }^{4}\), Chapter 6.8.4.1.2.4 "Parameter data (acyclic data)" on page 4581.

In addition to that the parameters can be directly transferred via Automation Builder.
ⓨ Chapter 6.3.2.12.2 "Unbundled CI52x-MODTCP configuration" on page 1565
There are two different parameter sections with different behavior.

\section*{Actual used parameters}

After startup this section contains the following data:
- Default parameters (only module id and parameter length set all others zero) if no valid stored parameters are available (no or invalid parameters stored).
- Actual used / stored parameters if valid parameters are stored nonvolatile.

These parameters can be read out and changed by reading or writing of the corresponding registers, but will not be used automatically after writing them, the use of new written parameters has to be triggered by writing the parameter control word with the corresponding bits set (see below).

\section*{Stored parameters}

This section always contains a copy of the nonvolatile stored parameters, if no parameters are stored nonvolatile this sections will be 0 .

\section*{Controlword/statusword parameter}

This parameter can be used to trigger and save new parameters.
The direction of the first 8 bit is client to server (master to slave). The direction of the second 8 bits is server to client (slave to master).
\begin{tabular}{|c|l|l|}
\hline Bit & \multicolumn{2}{c|}{ Description } \\
\hline 0 & \begin{tabular}{l} 
Use parameters / start \\
parameterization
\end{tabular} & \begin{tabular}{l}

The device will set this bit if new parameters are \\
available in the actual parameter data section and these \\
were not activated by setting bit 0 in the control word.
\end{tabular} \\
\hline 10 N..15 & Reserved & - \\
\hline
\end{tabular}

\section*{Cyclic I/O data exchange}

The I/O data can be exchanged cyclic by the master by reading, writing the corresponding registers.

I/O data exchange is only possible after successful parameterization of the device.
For writing of outputs bus failure detection can be activated by setting the corresponding parameter. This bus failure detection is described in the following chapter.

Bus failure If the parameter ""timeout"" in the module parameters of the CI52x-MODTCP is set, the module detection will supervise the Modbus TCP "write telegrams".

After the first "write telegram" the bus will be supervised. If no new "write telegram" arrives at the CI52x-MODTCP within the configured time, the module will detect a bus failure and switch off its outputs or switch them to the configured failsafe state \({ }^{*} \Rightarrow\) Chapter 5.2.6.5.1.8 "Parameterization" on page 1090 \# Chapter 5.2.6.5.2.8 "Parameterization" on page 1120.

\section*{Configurable With the module parameters "Master IP"- "Master IP 7" it is possible to set write restrictions on write restriction the \(\mathrm{CI} 52 \mathrm{x}-\mathrm{MODTCP}\) device.}

If none of the parameters is set, all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device.

All other masters / clients still have read access to the CI52x-MODTCP device.

\section*{Diagnosis behavior}

Each diagnosis message signals if this error is coming or going, so it is possible to create a list in the master of actual pending diagnosis.

Diagnosis messages will be transferred again after a bus failure detection and reconnection.
Diagnosis messages can be read out with function code \(3,4,23\). Function codes 3 and 4 can always read out diagnosis messages, function code 23 can only read out after successful parameterization of the device. See also table 'Diagnosis data' \(\Leftrightarrow\) Chapter 6.8.4.1.2.3.3 "Diagnosis data" on page 4576.

\section*{Single parameterization}

The single parameterization services can be used to read or write parameters during run time of device without the need of triggering a new parameterization process.

For indexes used for single parameterization services see parameter lists in section Modbus TCP registers of this document.

The read and write parameterization services are explained below, for each module (CI52x-MODTCP and connected expansion modules) a different section for read and write is defined see chapter Modbus TCP registers in this document). Both services are using the following data structure:

The length of the read / write service depends on the count of parameters that should be transferred (length \(=4+\) count* \(^{*} 8\) ).

\section*{Reading of single parameters}

The read single parameterization works in two steps:
- Writing of a request list containing the indexes that should be read using the structure explained above.
Only CNT and PARA_IDX has to be set.
Up to 5 parameters can be requested with one telegram.
The length of the write service depends on the count of parameters that should be transferred (length \(=4+\) count \(^{*} 8\) ).
- Reading of the parameters list with the same length then the previous write request. If the internal reading process inside the CI 52 x -MODTCP device is done the data will be read out.
If the internal reading process inside the \(\mathrm{CI} 52 \mathrm{x}-\mathrm{MODTCP}\) device is not yet finished the read service will be rejected with Modbus TCP exception code 6 (device busy).

Writing of single For writing of single parameters only one step is necessary, the parameters are transferred with parameters one write request using the structure described above.

The length of the write service depends on the count of parameters that should be transferred (length \(=4+\) count* 8 ).

In case of write of single parameters the following values have to be set:
- CNT: number of parameters to be set
- And for each parameter:

Parameter index
Parameter length
New parameter value
Written single parameters are not stored volatile and not stored nonvolatile. That means after a bus reconnection or power cycle the written parameters will be discarded.

\subsection*{6.8.4.1.4 Commissioning example}

Set IP Address:
- The setting of the IP address is the first step to integrate the CI52x-MODTCP devices into a running system.
- The setting of the IP address of the CI52x-MODTCP devices is described in the chapter 'IP address assignment' \(\Leftrightarrow\) Chapter 6.8.4.1.3.1 "IP address assignment" on page 4586 in this document

Set Parameters (optional read parameters):
- The second step in configuring the CI52x-MODTCP devices is to set the module and channel parameters.
- A read of parameters is optional but can be used the get the module IDs and the parameter length.
- The reading and or writing of parameters is described in chapter 'Parameterization' \& Chapter 6.8.4.1.3.2 "Parameterization" on page 4587.
Set Control Word:
- After setting the parameter data these have to be activated by writing the control word.
- The meaning and usage of the control word is described in chapter 'Parameterization' Chapter 6.8.4.1.3.2 "Parameterization" on page 4587.

Exchange data:
- After setting and activating the parameters the CI52x-MODTCP device is ready for data exchange.
- The registers for data exchange are described in chapter 'I/O / Process data and diagnosis section (Cyclic data)' \(\Longleftrightarrow\) Chapter 6.8.4.1.2.3 "I/O / Process data and diagnosis section (cyclic data)" on page 4573.

\subsection*{6.8.4.1.5 Hot swap}

\section*{Introduction}

With hot swap for AC500 and S500 it is possible to exchange I/O modules (with same type) during runtime.

\section*{Preconditions for using hot swap}

\section*{Hot swap}

\section*{WARNING!}

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

\section*{WARNING!}

\section*{Electric shock due to negligent behavior during hot swapping!}

To avoid electric shock
- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

\section*{NOTICE!}

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

\section*{Hot swap}

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index FO.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

\section*{NOTICE!}

Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

\section*{NOTICE!}

Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.
\begin{tabular}{|l|l|}

\section*{Hot swap behavior}

Table 852: Behavior in case of I/O attached to communication interface module for Modbus
TCP, CI521-MODTCP or CI522-MODTCP
\begin{tabular}{|c|c|}
\hline Hot swap behavior & Modbus TCP remote I/O \\
\hline Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H & \begin{tabular}{l}
Remote I/O station is not starting \\
As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged \(I / O\) module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged. As the Automation Builder checks that all modules are available during configuration process, it is necessary that all I/O modules are available and in working order during configuration via Automation Builder. As the parameters are stored nonvolatile inside the Cl 52 x devices later one the parameters have effect for power cycle or reconnection operations.
\end{tabular} \\
\hline Start-up behavior with wrong I/O module type on any terminal unit & Remote I/O station is not starting \\
\hline Diagnosis of presence of hot swap terminal unit & \begin{tabular}{l}
Information is available in Modbus registers of the communication interface module which can be accessed by the application program \\
As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.
\end{tabular} \\
\hline Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit & \begin{tabular}{l}
Information can be obtained by reading Modbus registers in the communication interface module. Those Modbus registers contain: \\
- Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit \\
- Diagnosis In case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration \\
- Production data and version index of the modules
\end{tabular} \\
\hline Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working & Diagnosis is available in Modbus registers in the communication interface module \\
\hline Input state in process image of controller while module is pulled or module is not operational & Input = ZERO \\
\hline Diagnosis after plugging the I/O module on the hot swap terminal unit & Diagnose "diagnosis gone" is available in Modbus registers in the communication interface module \\
\hline
\end{tabular}

\section*{System behavior}

If an expansion module is removed or defective during run time, the input data of this module will be set to " 0 " and the module state will be set to the corresponding value (see \({ }^{4}\) ) Chapter 6.8.4.1.2.3 "I/O / Process data and diagnosis section (cyclic data)" on page 4573). A diagnosis message will be created in that case (see hardware description of CI521 \({ }^{\mu}\) Chapter 5.2.6.5.1 "Cl521-MODTCP" on page 1070 / CI522 \(\Leftrightarrow\) Chapter 5.2.6.5.2 "CI522-MODTCP" on page 1111 for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms ).

If the bus failure detection is active for Cl 52 x and failsafe is configured \(\Leftrightarrow\) Chapter 6.8.4.1.3.3 "Cyclic I/O data exchange" on page 4588 the following behavior applies if a module is removed and replugged during failsafe condition:
- Last value configured for output:
- After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
- If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is " 0 " in that case.
- Substitute value configured for output:
- After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
- If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for \(x\) seconds configured for output:
- After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
- If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

\section*{Mandatory rules for hot swapping}

Mandatory rules for hot swapping:
- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
- That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI52x all configured expansion modules have to be physically available.
- Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the common device information registers. These can be accessed when the version of the communication interface module supports hot swap.
- This has to be checked by application:

Best way for checking if a hot swap terminal unit is available or not, is reading out the common device information registers \(\stackrel{y}{ } \boldsymbol{y}\) Chapter 6.8.4.1.2.2 "Information data section (acyclic data)" on page 4570 . If the CI 52 x rejects this read out the CI 52 x doesn't support hot swap at all.

\subsection*{6.8.4.2 PROFINET communication interface module}

\subsection*{6.8.4.2.1 Hot swap}

\section*{Introduction}

With hot swap for AC500 and S500 it is possible to exchange I/O modules (with same type) during runtime.

\section*{Preconditions for Using Hot Swap}

\section*{Hot swap}

\section*{WARNING!}

Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

\section*{WARNING!}

Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
- make sure the following conditions apply:
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
- Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

\section*{NOTICE!}

\section*{Risk of damage to I/O modules!}

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

\section*{Hot swap}

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index FO.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!

The index of the module is in the right corner of the label.

\section*{NOTICE!}

Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

\section*{NOTICE!}

Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.
\begin{tabular}{|l|l|}

Input = ZERO \\
In addition a standard PROFINET state information is transmitted saying "Inputs not valid"
\end{tabular} \\
\hline Diagnosis after plugging of the I/O module on the hot swap terminal unit & PROFINET channel diagnosis is generated together with standard "plug alarm" which must be acknowledged \\
\hline
\end{tabular}

\section*{System behavior}

If an expansion module is removed or defective during run time, the input data of this module will be set to " 0 " and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of CI501 \(\Leftrightarrow\) Chapter 5.2.6.7.2 "Cl501-PNIO" on page 1203 / CI502 \(\Rightarrow\) Chapter 5.2.6.7.3 "CI502-PNIO" on page 1244 for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms ).
If the bus failure detection is active for CI 50 x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:
- Last value configured for output:
- After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
- If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is " 0 " in that case.
- Substitute value configured for output:
- After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
- If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for \(x\) seconds configured for output:
- After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
- If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

\section*{Mandatory rules for hot swapping}

Mandatory rules for hot swapping:
- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
- That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI50x all configured expansion modules have to be physically available.
- Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the process data area or can be read out via acyclic read. These can be accessed when the version of the communication interface module supports hot swap.
- This has to be checked by application: Best way for checking if a hot swap terminal unit is available or not, is checking the corresponding information inside the process image.

\subsection*{6.8.4.3 PROFIBUS communication interface module}

\subsection*{6.8.4.3.1 Hot swap}

\section*{Cl54x-DP, index >= F1}

To support the hot swap feature for PROFIBUS below V3 PLCs, new slaves are available for the CI54x-DP - Cl541-DP, index >= F1 and the CI542-DP, index >=F1.
To be able to configure and to use the hot swap functionalities for the S 500 modules below PROFIBUS of V3 PLCs, these slaves have to be configured. A double-click on a device object in the device tree opens the associated device editor. The editor provides generic and devicespecific tabs for the device configuration.
Copy and paste of I/O modules between the CI54x-DP and the CI54x-DP, index \(>=F 1\) is possible.
Drag and drop between the \(\mathrm{Cl} 54 \mathrm{x}-\mathrm{DP}\) and the \(\mathrm{CI} 54 \mathrm{x}-\mathrm{DP}\), index \(>=\mathrm{F} 1\) is not possible .

If the I/O modules must be moved from one CI54x-DP to the other one, cut and past must be executed. Drag and drop is not possible.

\subsection*{6.9 Diagnosis and debugging}

\subsection*{6.9.1 The diagnosis system}

\subsection*{6.9.1.1 General}

The diagnosis system enables uniform diagnosis of the CPU and its local interfaces, of the I/O bus with the connected S500 I/O devices and of the fieldbuses connected via communication modules, considering the special features of the various fieldbuses. The safety CPU is also integrated into the diagnosis system.

Diagnosis data of the devices can be accessed by
- CPU display
- Automation Builder
- IEC application

To forward the information to notify them by, e.g., webserver or OPC UA server, the data retrieved in IEC application can be stored in variables.

Fig. 364: Overview of the diagnosis system
All diagnosis data is assigned to a device. System diagnosis (e.g., battery low) is coming from the CPU device or one of the child objects (e.g., watchdog diagnosis of a task object).
Diagnosis is available for devices with representation in the Automation Builder device tree.
Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC \(\Leftrightarrow\) Chapter 6.9.1.6.1 "Error severity" on page 4638.

Details on how to integrate and use function blocks to receive diagnosis messages from the CPU and fieldbus devices are given in the application examples:
- AC500 V3 diagnosis in IEC application
- AC500 V3 diagnosis

Types of diagnosis messages
- An event describes the current state of the device. It does not have to be acknowledged.
- An alarm describes that at a certain point of time, there was a diagnosis message. It does not say anything about the current state of the device.
Alarms must be acknowledged by the user. After acknowledging, the alarm disappears for all consumers.

Every diagnosis message has a come time.

\section*{Device state With reference to diagnosis, there are different device states:}
- Device without events and without unacknowledged alarms.
- Device with events or unacknowledged alarms.
- Device does not respond and is not available for online connection.

Diagnosis Diagnosis messages are always available for all consumers.
descriptions
- ABB AC500 V3 devices:
- Events and unacknowledged alarms.
- Every diagnosis message with come time, location, error number and text.
- \(3^{\text {rd }}\) party devices:
- Events and unacknowledged alarms.
- Every diagnosis message with come time, location and error number.
- Clear text information if available either from a standard or from the device description.
- If available: Extended diagnosis: Additional data coming from the device for manual analysis.

Extended diag- Some devices are able to provide extended diagnosis. This additional device-dependant diagnosis nosis will only be collected on request and will be device type specific (e.g. bus scan request on PROFINET I/O controller). Main intention is to cover commissioning use cases, when very specific information is required that typically cannot be stored in error numbers in a reasonable way.

\subsection*{6.9.1.2 Access to diagnosis data}

Access to device state
- Error LED on CPU \({ }^{\star}\) Chapter 6.9.1.3 "Diagnosis in CPU display" on page 4607
- Automation Builder device tree \({ }^{\wedge}>\) Chapter 6.9.1.4 "Diagnosis in Automation Builder" on page 4611
- IEC application via device name \(\Leftrightarrow>\) Chapter 6.9.1.5.4 "Device diagnosis" on page 4628
- IEC application via list of all available diagnosis \({ }^{*} \Rightarrow\) Chapter 6.9.1.5.3 "System diagnosis" on page 4619
- External access via global IEC variables Fig. 364

Access to diagnosis descriptions
- CPU display \({ }^{\circledR}\) Chapter 6.9.1.3.2 "Diagnosis descriptions" on page 4607 (for CPU, I/O bus and connected S500 I/O modules, not for communication modules and field buses)
- Automation Builder via "All messages" window \(\stackrel{y}{ }\) Chapter 6.9.1.4.2 "Diagnosis descriptions" on page 4611:
- Support for (bulk) acknowledgement of alarm
- Access to extended diagnosis data of \(3^{\text {rd }}\) party devices devices (if available), without any interpretation
- IEC application via a list of all current diagnosis either of a device (device object from the Automation Builder tree) \(\stackrel{y}{ }{ }^{\circ}\) Chapter 6.9.1.5.4 "Device diagnosis" on page 4628 or of the complete PLC \(\Longleftrightarrow\) Chapter 6.9.1.5.3 "System diagnosis" on page 4619:
- Navigation chronologically in both directions (starting either from the oldest or newest diagnosis)
- Access to the diagnosis numerically (evaluation by IEC application), textual (use on HMI ) or to extended diagnosis data of \(3^{\text {rd }}\) party devices (if available)
- Acknowledgement of alarms
- External access via global IEC variables by using the IEC application features for getting all relevant information

Access to Extended diagnosis data will be displayed in Automation Builder via "All messages" window.
extended diag-
nosis

The data is displayed as it is provided from the device without any interpretation. Refer to e.g., the manual of the device to get information about the extended diagnosis data.

\subsection*{6.9.1.3 Diagnosis in CPU display}

\subsection*{6.9.1.3.1 Device state}

If there is at least one active diagnosis message, the error LED ERR is on.
The behavior of the error LED depends on the setting of CPU parameter "Error LED" « Table on page 1474.

General information on the LEDs, the display and the function keys can be found in chapter 'Displays, LEDs and function keys on the front panel' \(\Longleftrightarrow\) Chapter 6.8.2.5 "Display, LEDs and function keys on the front panel" on page 4452.

\subsection*{6.9.1.3.2 Diagnosis descriptions}

\end{tabular}

The display of the processor module does not show any communication modules or fieldbus diagnosis. To view these diagnosis messages use Automation Builder or IEC application.

Chapter 6.9.1.4 "Diagnosis in Automation Builder" on page 4611
« Chapter 6.9.1.5 "Diagnosis in IEC application" on page 4615
This is valid for:
- all external communication modules including safety processor module
- CANopen on onboard CAN interface
- fieldbuses on Ethernet interfaces ETH1/ETH2 like PROFINET IO controller, EtherCAT master, etc.

The location of a diagnosis is shown in the CPU display with 3 characters.
\begin{tabular}{|c|c|}

\subsection*{6.9.1.4 Diagnosis in Automation Builder}

\subsection*{6.9.1.4.1 Device state}

In Automation Builder, colored icons next to the devices' nodes in the device tree indicate the device state of each single device \(\gg\) Chapter 6.9.2.3 "Project tree in online mode" on page 4641.

\subsection*{6.9.1.4.2 Diagnosis descriptions}

Displayed text For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.
\begin{tabular}{|c|c|c|c|}

\end{tabular}

It is necessary to include a visualization，even if visualization will not be used． \({ }^{〔}\) Chapter 6．4．5＂CODESYS Visualization＂on page 2852

Without visualization the text lists will not be included．

Displayed text The text lists for \(3^{\text {rd }}\) party devices are created during reading of the device description sheets， for \(3^{\text {rd }}\) party devices e．g．，GSDML files for PROFINET I／O devices．

The text lists are generated automatically．We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting．
Example \(\quad\)\begin{tabular}{l} 
CI501－PNIO：Diag＿PNIO＿26＿22 \\
\(26=\) vendor ID ABB， \(22=\) device ID CI501－PNIO
\end{tabular}

The text list for the AC500 PROFINET I／O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling．
Which texts are used，depends on parameter＂Selection of diagnosis method＂：Double－click on a PROFINET I／O module and open tab＂General＂．

\section*{6．9．1．4．3 System diagnosis}

In Automation Builder the system diagnosis is activated by default and can be deactivated in：
＂Tools \(\rightarrow\) Options \(\rightarrow\) Diagnosis \(\rightarrow\) Enable subtree diagnosis＂

\section*{6．9．1．4．4 Device diagnosis}

Each node in the device tree has a diagnosis view，which displays the diagnosis messages for this device only．
The message consists of：
－Type \({ }^{\circ}\)－Chapter 6．9．1．4．5＂Diagnosis history＂on page 4614
－Timestamp in date and time YYYY－MM－DD hh：mm：ss．ms
－Error severity
－Error code
－Diagnosis description
－Additional data
To view the diagnosis message：
1．Double－click on a device．
2．Select the tab＂Diagnosis＂．
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{Example} & \multicolumn{6}{|l|}{Battery empty or missing．} \\
\hline & \multicolumn{6}{|l|}{ius 戒 PLC＿AC500＿V3 x} \\
\hline & \multicolumn{6}{|l|}{Start refresh Stop refresh Acknowledge Selected Alarms} \\
\hline & Type & Device & Timestamp & Severity & Error Code & Description \\
\hline & ＋ & PLC＿AC500＿V3 & 1970－01－01；12：00：13．916 & 4 & 8 & Battery，Device，Empty or missing \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline \multirow[t]{5}{*}{Example} & \multicolumn{7}{|l|}{Wrong module configured on I／O bus．} \\
\hline & \multicolumn{7}{|l|}{；Y㧫 PLC＿AC500＿V3 比 DI524 x} \\
\hline & \multicolumn{7}{|l|}{Start refresh Stop refresh Acknowledge Selected Alarms} \\
\hline & Type & Device & Timestamp & Severity & Error Code & Description & Additi \\
\hline & ＋ & DI524 & 1970－01－01；12：16：30．633 & 11 & 16158 & Module 1，Ty & \\
\hline
\end{tabular}

Device diagnosis is disabled by default．
To enable／disable device diagnosis：
1．Double－click on the PLC．
2．Select the tab＂PLC Settings＂．

3．Under＂Additional Settings＂enable／disable＂Diagnosis for devices＂．
\(\Rightarrow\) When the device diganosis is disabled，this symbol will be displayed in the device tree and no diagnosis messages will be shown．

\section*{6．9．1．4．5 Diagnosis history}

The＇Diagnosis History＇view provides an overview of the current and past system events that resulted in a diagnosis event．
－Incoming diagnosis events are indicated with＋．
After the problem that causes a diagnosis event has been resolved，this diagnosis event is indicated automatically with－．
－Alarm events，e．g．PROFINET alarm are indicated with 7.
In the＇Diagnosis＇view the user can acknowledge an alarm．Note that an alarm event can be acknowledged though the problem that causes the alarm still persists．
The acknowledge action is indicated with \(\checkmark\) on the concerning event entry．If the icon changes to \(\checkmark\) ，the acknowledge action has been completed by the PLC．

The following buttons are available in the＇Diagnosis History＇view：
－Start／Stop refresh：
Enables or disables the automatic refresh mode．In refresh mode new diagnosis events will be displayed automatically．Only the last 100 entries are shown in this view，the latest events on top of the list．
－Get next entries：
Adds the previous（older） 100 diagnosis events at the bottom of the list．
－Export complete history：
Creates a csv file with all events from the diagnosis history（not only the visible ones）．
\begin{tabular}{|c|c|c|c|c|c|c|c|}

\section*{6．9．1．5 Diagnosis in IEC application}

\section*{6．9．1．5．1 General}

There are two possibilities for accessing the diagnosis messages in the IEC application：
－System diagnosis：Access to diagnosis messages of the whole PLC
－Device diagnosis：Access to the diagnosis messages of a device
For both possibilities common data types（structures and enumerations）are defined in the library AC500＿DiagTypes \(\stackrel{\text { \＆Chapter 6．9．1．5．2＂Data types in library AC500＿DiagTypes＂}}{ }\) on page 4616．The library is automatically included in PLC project．

Details on how to integrate and use function blocks to receive diagnosis messages from the CPU and fieldbus devices are given in the application examples：
－AC500 V3 diagnosis in IEC application
－AC500 V3 diagnosis

Displayed text For output of diagnosis messages in textual format Automation Builder and IEC application use text lists．Both application use the same text lists．The text lists are part of the device description．When inserting a new device in device tree of project，the corresponding text list is loaded．This text lists are part of PLC program and will be downloaded into the PLC．

\hline
\end{tabular}

It is necessary to include a visualization，even if visualization will not be used． ② Chapter 6．4．5＂CODESYS Visualization＂on page 2852

Without visualization the text lists will not be included．

The text lists are generated automatically．We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting．

Displayed text The text lists for \(3^{\text {rd }}\) party devices are created during reading of the device description sheets, for \(3^{\text {rd }}\) party devices e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID
```

Example CI501-PNIO: Diag_PNIO_26_22
26 = vendor ID ABB, 22 = device ID CI501-PNIO

```

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.
Which texts are used, depends on parameter "Selection of diagnosis method": Double-click on a PROFINET I/O module and open tab "General".

\subsection*{6.9.1.5.2 Data types in library AC500_DiagTypes}

\section*{General}

All data types regarding diagnosis are defined in the library AC500_DiagTypes.

\section*{Structure DIAG_VAL_TYPE}

This data type specifies the format of all kinds of diagnosis messages in numeric format. It consists of one element for each detail of a diagnosis message.
\begin{tabular}{|l|l|l|l|}
\hline Name & Type & Initial & Comment \\
\hline diTimestamp & DT & DATE_AND_TIME\#1970-1-1-0:0 & RTC time of eDiagEvent_Occured \\
\hline uiMs & UINT & 0 & Milliseconds of event \\
\hline eClass & teClass & teClass.eDiagClass_4_Warning & Error severity of diagnosis message \\
\hline szDevice & STRING(80) & "" & Name of device, max. 80 characters \\
\hline eHwInterfaceld & teHwId & teHwId_CPU & Identifier of hardware interface \\
\hline dwSubSysteminfo & DWORD & 0 & \begin{tabular}{l} 
Any number describing details or loca- \\
tion within device, device-specific
\end{tabular} \\
\hline dwAdditional & DWORD & 0 & \begin{tabular}{l} 
Additional number describing details or \\
location within device, optional, device- \\
specific
\end{tabular} \\
\hline dwErrorCode & DWORD & 0 & Error code \\
\hline wSizeExtDiag & DWORD & 0 & \begin{tabular}{l} 
Number of bytes of extended diagnosis \\
data
\end{tabular} \\
\hline
\end{tabular}

\section*{Structure DIAG_TXT_TYPE}

This data type specifies the format of all kinds of diagnosis messages in textual format. It consists of a single string containing all details of a diagnosis message.
\begin{tabular}{|l|l|l|l|}
\hline Name & Type & Initial & Comment \\
\hline szDiag & STRING(512) & "" & \begin{tabular}{l} 
Diagnosis message as text, max. 512 \\
characters
\end{tabular} \\
\hline
\end{tabular}

The text consists of the following data, separated by semicolon:
- Timestamp in Date_And_Time (DT) format of eDiagEvent_Occured and added milliseconds
- Error severity
- Device name (max. 80 characters) as defined in Automation Builder device tree
- The error text itself, composed of the interpretation of dwSubSysteminfo and dwAdditional and the error text plus remedy (if available) from Automation Builder text list according dwErrorCode. Displayed as: error text -> remedy.

\section*{Example \(\quad\) Battery empty or missing.}
```

= strData0utTxt

## Enumeration ERROR_ID

Type of the return values of all methods and functions to request information on diagnosis.

| Name | Type | Comment | Remedy |
| :--- | :--- | :--- | :--- |
| NO_ERROR | $16 \# 0$ | Execution successfully completed |  |
| ERR_PARAMETER | $16 \# 1$ | Invalid parameter value in function call | Correct parameter |
| ERR_NO_SINK | $16 \# 2$ | Failed to register as sink |  |
| ERR_NO_TEXT_LIST | $16 \# 3$ | Failed to get a device text list | Check text lists |
| ERR_NO_TEXT_ <br> CONTENT | $16 \# 4$ | Failed to get at least one content from text <br> list |  |
| ERR_COMPETING | $16 \# 5$ | Failed due to competing access of other <br> method | Try again |
| ERR_ASYNC | $16 \# 6$ | Failed to create async process |  |
| ERR_INTERNAL | $16 \# 7$ | Any internal error during execution |  |
| BUSY | $16 \# F F F$ | Busy | Call again to get final result |
| NO_ERROR_NO_DATA | $16 \# F F F F$ | Execution successfully completed, no more <br> diagnosis messages |  |

All values except "BUSY" are final results. In case "NO_ERROR" is returned, the requested action has been successfully performed. "NO_ERROR_NO_DATA" also indicates a successful completion. The only difference to "NO_ERROR" is the fact, that there is one (more) data to be provided. All other return values (except "BUSY") are final error states. In case a method or function returns "BUSY", it has to be called again in the following cycles until it returns a final result.

## Enumeration teClass

Specifies the error severity of diagnosis messages ${ }^{\wedge} \Rightarrow$ Chapter 6.9.1.6.1 "Error severity" on page 4638.

| Name | Error severity |
| :--- | :---: |
| eDiagClass_2_SeriousError | 2 |
| eDiagClass_3_Error | 3 |
| eDiagClass_4_Warning | 4 |
| eDiagClass_Parameter | 11 |

## Enumeration teEvent

The enumeration teEvent specifies the severity of diagnosis messages.

| Name | Type | Initial | Comment |
| :--- | :---: | :---: | :--- |
| eDiagEvent_Occured | DINT | 1 | Error occurred, remains "active" until <br> eDiagEvent_Disappeared |
| eDiagEvent_Disappeared | DINT | 2 | Error disappeared, became "active" due to <br> eDiagEvent_Occured earlier on |
| eDiagEvent_Received | DINT | 4 | Received a diagnosis message which cannot be analyzed in <br> detail, cannot disappear, needs to be acknowledged |
| eDiagEvent_Acknowledged | DINT | 8 | Acknowledge a diagnosis message which has been received <br> by eDiagEvent_Received, removes diagnosis message from <br> diagnosis system although error may still be present |

## Enumeration teHwid

The enumeration teHwld specifies the hardware component as location of a diagnosis message.

| Name | Initial | Comment |
| :--- | :---: | :--- |
| eDiagHwld_CPU | 0 | Any diagnosis message regarding CPU itself, like "battery", "sd card", <br> etc. |
| eDiagHwld_Coupler1 | 1 | Any diagnosis message regarding communication module at slot 1. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |
| eDiagHwld_Coupler2 | 2 | Any diagnosis message regarding communication module at slot 2. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |
| eDiagHwld_Coupler3 | 3 | Any diagnosis message regarding communication module at slot 3. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |
| eDiagHwld_Coupler4 | 4 | Any diagnosis message regarding communication module at slot 4. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |

| Name | Initial | Comment |
| :--- | :---: | :--- |
| eDiagHwld_Coupler5 | 5 | Any diagnosis message regarding communication module at slot 5. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |
| eDiagHwld_Coupler6 | 6 | Any diagnosis message regarding communication module at slot 6. <br> May be indicated by any corresponding communication module driver <br> (instance) or a protocol driver (instance) |
| eDiagHwld_COM1 | 7 | Any diagnosis message regarding COM1. May be indicated by any corre- <br> sponding interface driver (instance) or a protocol driver (instance) |
| eDiagHwld_COM2 | 8 | Any diagnosis message regarding COM2. May be indicated by any corre- <br> sponding interface driver (instance) or a protocol driver (instance) |
| eDiagHwld_CAN | 9 | Any diagnosis message regarding CAN interface. May be indicated <br> by any corresponding interface driver (instance) or a protocol driver <br> (instance) |
| eDiagHwld_OnboardIO | 10 | Onboard I/O, AC500-eCo only |
| eDiagHwld_OptionBoard1 | 11 | Option board 1, AC500-eCo only |
| eDiagHwld_OptionBoard2 | 12 | Option board 2, AC500-eCo only |
| eDiagHwld_OptionBoard3 | 13 | Option board 3, AC500-eCo only |
| eDiagHwld_IOBus | 14 | l/O bus |
| eDiagHwld_ETH1 | 15 | Any diagnosis message regarding ETH1. May be indicated by any corre- <br> sponding interface driver (instance) or a protocol driver (instance) |
| eDiagHwld_ETH2 | 16 | Any diagnosis message regarding ETH2. May be indicated by any corre- <br> sponding interface driver (instance) or a protocol driver (instance) |

The hardware ID Hwld is only used for diagnosis output in CPU display to identify the location of a diagnosis message ${ }^{\mu} \Rightarrow$ Chapter 6.9.1.3 "Diagnosis in CPU display" on page 4607.

### 6.9.1.5.3 System diagnosis

## Introduction

Library AC500_Diag provides several methods and functions to access the diagnosis messages on all devices in the PLC application. It contains also a function to convert numeric diagnosis into a textual format.

The variables and their assigned values can be referred to within the IEC application as well as they can be used to transfer diagnosis messages to any visualization client.

## Device state

## General

The library contains a single function block named "Diag", providing several methods to process the device state.

| Method | Description |
| :--- | :--- |
| NumTotal | Provides the total number of currently active diagnosis messages |
| NumClass | Provides the number of currently active diagnosis messages related to the <br> error severity |

## Method NumTotal

This method provides the total number of currently active diagnosis messages (including parameter errors, etc.).

| Scope | Name | Type | Comment |
| :--- | :--- | :--- | :--- |
| Return | NumTotal | DWORD | Number of diagnosis messages |

```
Example VAR
    fbDiag: AC500_Diag.Diag; (* instance of FB Diag *)
    dwNumTotal : DWORD;
END_VAR
```

dwNumTotal := fbDiag.NumTotal();

## Method NumClass

This method provides the number of currently active diagnosis messages related to the error severity.

| Scope | Name | Type | Initial | Comment |
| :--- | :--- | :--- | :--- | :--- |
| Return | NumClass | DWORD |  |  |
| Input | DatalnVal | AC500_DiagTypes.teClass | eClass.eDiagClass_2 <br> _SeriousError | Error severity <br> of diagnosis <br> message |

```
Example
VAR
    fbDiag:AC500_Diag.Diag;
    eDiagClass_4: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_4_Warning; (* 4 *)
    eDiagClass_3: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_3_Error; (* 3 *)
    eDiagClass_11: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_Parameter; (* 11 *)
    dwNumClass_4 : DWORD;
    dwNumClass_3 : DWORD;
    dwNumClass_11: DWORD;
END_VAR
dwNumClass_4 := fbDiag.NumClass(eDiagClass := eDiagClass_4);
dwNumClass_3 := fbDiag.NumClass(eDiagClass := eDiagClass_3);
dwNumClass_11 := fbDiag.NumClass(eDiagClass := eDiagClass_11);
```

## Diagnosis descriptions

## General

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

Table 856: Methods for handling diagnosis entries

| Method for system diagnosis | Method for device diagnosis | Description |
| :---: | :---: | :---: |
| Ack | DiagAck | Acknowledge a diagnosis alarm previously requested by using any Get. . . / DiagGet. . . method ${ }^{4}$ Chapter 6.9.1.5.3.3.2 "Method Ack / DiagAck: acknowledgement" on page 4623 |
| GetFirstVal | DiagGetFirstVal | Get the first (oldest) diagnosis message, numeric values ${ }^{4}$ Chapter 6.9.1.5.3.3.3 "Methods Get... / DiagGet...: get and sort diagnosis messages" on page 4623 |
| GetNextVal | DiagGetNextVal | Get the next diagnosis message, numeric values ${ }^{*}$ " Chapter 6.9.1.5.3.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4624 |
| GetLastVal | DiagGetLastVal | Get the last (newest) diagnosis message, numeric values Chapter 6.9.1.5.3.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4624 |
| GetPrevVal | DiagGetPrevVal | Get the previous diagnosis message, numeric values ${ }^{\circ}$ " Chapter 6.9.1.5.3.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4624 |
| GetFirstValExt | DiagGetFirstValExt | Get the first (oldest) diagnosis message, numeric and extended numeric values (2) Chapter 6.9.1.5.3.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4624 |
| GetNextValExt | DiagGetNextValExt | Get the next diagnosis message, numeric and extended numeric values ${ }^{4}$ Chapter 6.9.1.5.3.3.5 "Method Get-xxx-ValExt / Dia-gGet-xxx-ValExt: numeric values and extended numeric values" on page 4624 |
| GetLastValExt | Diag GetLastValExt | Get the last (newest) diagnosis message, numeric and extended numeric values \# Chapter 6.9.1.5.3.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4624 |
| GetPrevValExt | DiagGetPrevValExt | Get the previous diagnosis message, numeric and extended numeric values \# Chapter 6.9.1.5.3.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4624 |

| Method for system diagnosis | Method for device diagnosis | Description |
| :---: | :---: | :---: |
| GetFirstValAndTxt | DiagGetFirstVaIAndTxt | Get the first (oldest) diagnosis message, numeric values and text $\Leftrightarrow$ Chapter 6.9.1.5.3.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4625 |
| GetNextValAndTxt | DiagGetNextVaIAndTxt | Get the next diagnosis message, numeric values and text ${ }^{\circ} \boldsymbol{y}$ Chapter 6.9.1.5.3.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxxValAndTxt: numeric values and text" on page 4625 |
| GetLastValAndTxt | DiagGetLastVaIAndTxt | Get the last (newest) diagnosis message, numeric values and text $\Leftrightarrow$ Chapter 6.9.1.5.3.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4625 |
| GetPrevValAndTxt | DiagGetPrevVaIAndTxt | Get the previous diagnosis message, numeric values and text ${ }^{\circ} \Rightarrow$ Chapter 6.9.1.5.3.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4625 |
| GetFirstValAndTxtExt | DiagGetFirstVaIAndTxtExt | Get the first (oldest) diagnosis message, numeric, extended numeric values and text ${ }^{4} \boldsymbol{z}$ Chapter 6.9.1.5.3.3.7 "Method Get-xxxValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetNextValAndTxtExt | DiagGetNextVaIAndTxtExt | Get the next diagnosis message, numeric, extended numeric values and text $\stackrel{y}{ } \Rightarrow$ Chapter 6.9.1.5.3.3.7 "Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetLastValAndTxtExt | DiagGetLastVaIAndTxtExt | Get the last (newest) diagnosis message, extended numeric values and text ${ }^{3} \boldsymbol{z}$ Chapter 6.9.1.5.3.3.7 "Method Get-xxxValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetPrevValAndTxtExt | DiagGetPrevVaIAndTxtExt | Get the previous diagnosis message, extended numeric values and text $\stackrel{\leftrightarrow}{ }$ Chapter 6.9.1.5.3.3.7 "Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |

## Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get. . . / DiagGet . . . method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

| Scope | Name for <br> device <br> diagnosis | Name for <br> device <br> diagnosis | Type | Comment |
| :--- | :--- | :--- | :--- | :--- |
| Return | Ack | DiagAck | AC500_DiagTypes.ERROR_ID |  |
| Input | Data | Data | AC500_Dia- <br> gTypes.DIAG_VAL_TYPE | Variable containing <br> details of diagnosis <br> alarm to be acknowl- <br> edged |

| Example | System diagnosis: acknowledge first diagnosis message |
| :--- | :--- | :--- |

eErrorID_First := fbDiag.Ack(Data := sFirstVal);

## Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxxValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required ${ }^{\&}$ \& Chapter 6.9.1.5.3.3.8 "Function DiagValToTxt" on page 4627. Alternatively, the methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel ${ }^{\mu}>$ Chapter 6.9.1.5.3.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4625 " ${ }^{\text {s }}$ Chapter 6.9.1.5.3.3.7 "Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result $\stackrel{\text { ® }}{ }$ Chapter 6.9.1.5.2.4 "Enumeration $E R R O R$ _ID" on page 4617.

All diagnosis messages sorted by time, ascending

1. Call any GetFirst. . . method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext . . . method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, descending

1. Call any GetLast . . . method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev . . . method as long as its final result is "NO_ERROR".

Method Get-xxx-Val / DiagGet-xxx-Val: numeric values
-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

| Scope | Name for <br> device diag- <br> nosis | Name for <br> device diag- <br> nosis | Type | Comment |
| :--- | :--- | :--- | :--- | :--- |
| Return | Get-xxx-Val | DiagGet-xxx- <br> Val | AC500_DiagTypes.ERROR_ID |  |
| Inout | Data | Data | AC500_Dia- <br> gTypes.DIAG_VAL_TYPE | Variable to write data <br> to |

| Example | System diagnosis: get values for first diagnosis message |  |
| :---: | :---: | :---: |
|  | VAR <br> fbDiag: AC500_Diag.Diag; <br> eErrorID_First: AC500_DiagTypes.ERROR_ID; <br> sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE; <br> END VAR | (* instance of FB Diag *) (* return value *) (* structure of returned values *) |
|  | eErrorID_First := fbDiag.GetFirstVal(Data $:=$ sFirstVal); |  |

Example Online mode: battery empty or missing

## Function DiagValToTxt

Call this function to convert a numeric diagnosis message into a textual one at any time, in case this has not yet been done using a method providing both types when requesting this information.

| Scope | Name | Type | Comment |
| :--- | :--- | :--- | :--- |
| Return | DiagValToTxt | AC500_DiagTypes.ERROR_ID |  |
| Inout | DataInVal | AC500_DiagTypes.DIAG_VAL_TYPE | Variable to convert |
| Inout | DataOutTxt | AC500_DiagTypes.DIAG_TXT_TYPE | Variable to write text to |

| Example | System diagnosis: convert first diagnosis message from numeric value to text |  |
| :---: | :---: | :---: |
|  | VAR <br> eErrorID_ValToTxt : AC500_DiagTypes.ERROR_ID; <br> sFirstVal:AC500_DiagTypes.DIAG_VAL_TYPE; szDataOutTxt:AC500_DiagTypes.DIAG_TXT_TYPE; | (* return value *) <br> (* structure of returned values *) <br> (* string of converted data *) |

eErrorID_ValToTx := DiagValToTxt(DataInVal := sFirstVal, DataOutTxt := szDataOutTxt);

### 6.9.1.5.4 Device diagnosis

## Activate device diagnosis

While the notification of diagnosis messages at the display and the Automation Builder is enabled by default, the functionality to access diagnosis messages from within the IEC application needs to be explicitly enabled.

1. Double-click on the CPU in the device tree.
2. Select tab "PLC Settings".
3. Under "Additional Settings" select "Enable Diagnosis for devices".
$\Rightarrow$ Library CAA Device Diagnosis (namespace DED) is automatically included in the project. This library is needed for displaying and processing the device state.

In case the functionality of diagnosis is no longer needed in IEC application, we recommend to disable this setting.

## Device state

1．Open one of the IEC application code editors．
2．Type the device＇s name as it is written in the device tree，followed by a dot（＂．＂）．
3．Select the method GetDeviceState from the context menu or type the name of the method on yourself．

```
State_DC532 := DC532.
```

| －${ }_{\text {M }}$ DiagGetNextValAndTxt | ＊ |
| :---: | :---: |
| 产DiagGetNextValAndTxtExt |  |
| 二M DiagGetNextValExt |  |
| $\cdots{ }^{-1}$ DiagGetPrevVal |  |
| 产 DiagGetPrevValAndTxt |  |
| 誊DiagGetPrevValAndTxtExt |  |
| 产DiagGetPrevValExt | 三 |
| $\bar{Z}^{-1}$ GetDeviceInfo |  |
| － 7 GetDeviceState |  |
| －${ }_{\text {M }}$ IoDrvGetInfo | $\checkmark$ |

4．Assign the function＇s parameters．

```
eError : DED.ERROR
bDiagAvailable : BOOL; (* at least one diagnosis avilable for this device *)
DeviceState_DC532 : DED.DEVICE_STATE; (* general device state *)
DeviceState_DC532 := DC532.GetDeviceState(xDiagnosisInfoAvailable => bDiagAvailable, eError => eError);
```

| Scope | Name | Type | Comment |
| :--- | :--- | :--- | :--- |
| Return | GetDeviceState | DEVICE＿STATE <br> ¿ Further information <br> on page 4629 | Current device state |
| Output | xDiagnosisInfoAvailable | BOOL | If TRUE，diagnosis messages <br> are available regarding the <br> concerning device（＝node）． |
| Output | eError | ERROR \＆Fur－ <br> ther information <br> on page 4630 | Type of the return values of <br> all methods and functions of <br> library CAA Device Diagnosis |

Table 857：Enumeration DEVICE＿STATE（part of the library CAA Device Diagnosis（DED））

| Name | Type | Initial | Icon in AB | Comment |
| :--- | :---: | :---: | :---: | :--- |
| UNKNOWN | INT | 0 |  | The device is in state unknown． <br> Example：No supervision mechanism <br> active |
| STOPPED | INT | 1 |  | The device is stopped． |
| RUNNING | INT | 2 |  | The device is running． |
|  |  |  |  |  |
| ERROR | INT | 3 |  | The device is in error state． |
| DISABLED | INT | 4 |  | The device is disabled in device tree． |

| Name | Type | Initial | Icon in AB | Comment |
| :--- | :---: | :---: | :---: | :--- |
| NOT_CONFIG- <br> URED | INT | 5 |  | The device has not been yet configured by <br> the stack. <br> Example: Configuration phase not yet <br> started |
| CONFIGURED | INT | 6 |  | The device has been configured by the <br> stack. <br> Example: Configuration phase finished but <br> the device is not in running state |
| NOT_FOUND | INT | 7 | $\mathbf{A r}$ | The device was not found on bus. |

Table 858: Enumeration ERROR (part of the library CAA Device Diagnosis (DED))

| Name | Type | Initial | Comment |
| :--- | :---: | :--- | :--- |
| NO_ERROR | INT | 0 | No error |
| FIRST_ERROR | INT | 1300 | First library-specific error |
| TIME_OUT | INT | 1301 | Timeout occured. |
| ABORT | INT | 1302 | Operation was aborted. |
| REF_INVALID | INT | 1303 | The interface reference was invalid. |
| NOT_SUPPORTED | INT | 1304 | The function is not supported. |
| ERROR_IO | INT | 1305 | A general I/O configuration error occured. |
| PARAM_INVALID | INT | 1306 | Invalid parameter |
| NODE_NOT_EXISTING | INT | 1307 | The specified node does not exist. |
| NO_MEMORY | INT | 1308 | Dynamic memory allocation is disabled, or <br> system is out of memory. |
| ADR_NOT_FOUND | INT | 1309 | The specified I/O address is not valid. |
| INST_NOT_FOUND | INT | 1310 | There is no associated [Device] instance <br> for the specific I/O address. |
| NO_DATA | INT | 1311 | There is no data available. |
| OPERATION_INVALID | INT | 1312 | Operation not possible due to the current <br> state |
| FIRST_MF | INT | 1350 | First manufacturer-specific error |
| LAST_ERROR | INT | 1399 | Last error |

## Diagnosis descriptions

## General

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

Table 859: Methods for handling diagnosis entries

| Method for system diagnosis | Method for device diagnosis | Description |
| :---: | :---: | :---: |
| Ack | DiagAck | Acknowledge a diagnosis alarm previously requested by using any Get. . . / DiagGet. . . method ${ }^{4}$ Chapter 6.9.1.5.4.3.2 "Method Ack / DiagAck: acknowledgement" on page 4633 |
| GetFirstVal | DiagGetFirstVal | Get the first (oldest) diagnosis message, numeric values ${ }^{4}$ Chapter 6.9.1.5.4.3.3 "Methods Get... / DiagGet...: get and sort diagnosis messages" on page 4633 |
| GetNextVal | DiagGetNextVal | Get the next diagnosis message, numeric values ${ }^{*}$ " Chapter 6.9.1.5.4.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4634 |
| GetLastVal | DiagGetLastVal | Get the last (newest) diagnosis message, numeric values ${ }^{*}$, Chapter 6.9.1.5.4.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4634 |
| GetPrevVal | DiagGetPrevVal | Get the previous diagnosis message, numeric values ${ }^{\circ}$ " Chapter 6.9.1.5.4.3.4 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4634 |
| GetFirstValExt | DiagGetFirstValExt | Get the first (oldest) diagnosis message, numeric and extended numeric values (2) Chapter 6.9.1.5.4.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4634 |
| GetNextValExt | DiagGetNextValExt | Get the next diagnosis message, numeric and extended numeric values ${ }^{4}$ Chapter 6.9.1.5.4.3.5 "Method Get-xxx-ValExt / Dia-gGet-xxx-ValExt: numeric values and extended numeric values" on page 4634 |
| GetLastValExt | Diag GetLastValExt | Get the last (newest) diagnosis message, numeric and extended numeric values \# Chapter 6.9.1.5.4.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4634 |
| GetPrevValExt | DiagGetPrevValExt | Get the previous diagnosis message, numeric and extended numeric values \# Chapter 6.9.1.5.4.3.5 "Method Get-xxxValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4634 |

| Method for system diagnosis | Method for device diagnosis | Description |
| :---: | :---: | :---: |
| GetFirstValAndTxt | DiagGetFirstVaIAndTxt | Get the first (oldest) diagnosis message, numeric values and text $\Leftrightarrow$ Chapter 6.9.1.5.4.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4635 |
| GetNextValAndTxt | DiagGetNextVaIAndTxt | Get the next diagnosis message, numeric values and text ${ }^{\circ} \boldsymbol{y}$ Chapter 6.9.1.5.4.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxxValAndTxt: numeric values and text" on page 4635 |
| GetLastValAndTxt | DiagGetLastVaIAndTxt | Get the last (newest) diagnosis message, numeric values and text $\stackrel{\leftrightarrow}{\leftrightarrows}$ Chapter 6.9.1.5.4.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4635 |
| GetPrevValAndTxt | DiagGetPrevVaIAndTxt | Get the previous diagnosis message, numeric values and text $\Leftrightarrow$ Chapter 6.9.1.5.4.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4635 |
| GetFirstValAndTxtExt | DiagGetFirstVaIAndTxtExt | Get the first (oldest) diagnosis message, numeric, extended numeric values and text ${ }^{4} \boldsymbol{z}$ Chapter 6.9.1.5.3.3.7 "Method Get-xxxValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetNextValAndTxtExt | DiagGetNextVaIAndTxtExt | Get the next diagnosis message, numeric, extended numeric values and text $\stackrel{y}{ } \Rightarrow$ Chapter 6.9.1.5.3.3.7 "Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetLastValAndTxtExt | DiagGetLastVaIAndTxtExt | Get the last (newest) diagnosis message, extended numeric values and text ${ }^{3} \boldsymbol{z}$ Chapter 6.9.1.5.3.3.7 "Method Get-xxxValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |
| GetPrevValAndTxtExt | DiagGetPrevVaIAndTxtExt | Get the previous diagnosis message, extended numeric values and text $\stackrel{\leftrightarrow}{ }$ Chapter 6.9.1.5.3.3.7 "Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4626 |

## Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get. . . / DiagGet . . . method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

| Scope | Name for <br> device <br> diagnosis | Name for <br> device <br> diagnosis | Type | Comment |
| :--- | :--- | :--- | :--- | :--- |
| Return | Ack | DiagAck | AC500_DiagTypes.ERROR_ID |  |
| Input | Data | Data | AC500_Dia- <br> gTypes.DIAG_VAL_TYPE | Variable containing <br> details of diagnosis <br> alarm to be acknowl- <br> edged |

| Example | System diagnosis: acknowledge first diagnosis message |
| :--- | :--- | :--- |

eErrorID_First := fbDiag.Ack(Data := sFirstVal);

## Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxxValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required ${ }^{\&}$ \& Chapter 6.9.1.5.3.3.8 "Function DiagValToTxt" on page 4627. Alternatively, the methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel ${ }^{\mu}>$ Chapter 6.9.1.5.4.3.6 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4635 " $\stackrel{\text { Chapter 6.9.1.5.4.3.7 "Method Get-xxx-Val- }}{ }$ AndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text" on page 4636.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result $\stackrel{\text { ® }}{ }$ Chapter 6.9.1.5.2.4 "Enumeration $E R R O R$ _ID" on page 4617.

All diagnosis messages sorted by time, ascending

1. Call any GetFirst. . . method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext . . . method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, descending

1. Call any GetLast . . . method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev . . . method as long as its final result is "NO_ERROR".

Method Get-xxx-Val / DiagGet-xxx-Val: numeric values
-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

| Scope | Name for <br> device diag- <br> nosis | Name for <br> device diag- <br> nosis | Type | Comment |
| :--- | :--- | :--- | :--- | :--- |

## Function DiagValToTxt

Call this function to convert a numeric diagnosis message into a textual one at any time, in case this has not yet been done using a method providing both types when requesting this information.

| Scope | Name | Type | Comment |
| :--- | :--- | :--- | :--- |
| Return | DiagValToTxt | AC500_DiagTypes.ERROR_ID |  |
| Inout | DataInVal | AC500_DiagTypes.DIAG_VAL_TYPE | Variable to convert |
| Inout | DataOutTxt | AC500_DiagTypes.DIAG_TXT_TYPE | Variable to write text to |

| Example | System diagnosis: convert first diagnosis message from numeric value to text |  |
| :---: | :---: | :---: |
|  | VAR <br> eErrorID_ValToTxt : AC500_DiagTypes.ERROR_ID; <br> sFirstVal:AC500_DiagTypes.DIAG_VAL_TYPE; <br> szDataOutTxt:AC500_DiagTypes.DIAG_TXT_TYPE; <br> END VAR | (* return value *) <br> (* structure of returned values *) <br> (* string of converted data *) |

eErrorID_ValToTx := DiagValToTxt(DataInVal := sFirstVal, DataOutTxt := szDataOutTxt);

### 6.9.1.6 Structure of error numbers

### 6.9.1.6.1 Error severity

| Error severity | Type | Description | Example |
| :--- | :--- | :--- | :--- |
| 1 | Fatal errors | Safe operation of the <br> operating system is no <br> longer ensured. | Checksum error in <br> system flash, RAM error |
| 2 | Severe error | The operating system <br> works correctly, but the <br> error-free execution of <br> the user program is not <br> ensured. | Checksum error in user <br> flash, task cycle times <br> exceeded |
| 3 | Minor errors | It depends on the appli- <br> cation whether the user <br> program has to be <br> stopped by the operating <br> system or not. The user <br> decides which reaction is <br> to be done. | Flash memory cannot be <br> programmed, I/O module <br> failed |

| Error severity | Type | Description | Example |
| :--- | :--- | :--- | :--- |
| 4 | Warnings | Errors that occur on <br> peripheral devices or <br> that will have an effect <br> only in the future. The <br> user decides which reac- <br> tions are to be done. | Short circuit in an <br> I/O module, battery <br> empty/not installed |
| 11 | Parameter error | Error occurred during <br> parameter setting | Different I/O devices in <br> PLC configuration and <br> hardware installation |

## Errors with error severitiy 1 - fatal errors

Errors with error severity 1 are not entered in the diagnosis system. These errors do not allow normal operation of the PLC. These errors are detected during PLC start-up and stop the PLC immediately.

Examples are RAM errors or checksum errors when starting the firmware.
Such errors are indicated by rapid flashing of the ERR LED.

### 6.9.1.7 Diagnosis history file

The diagnosis history file "DiagHistory.csv" collects diagnosis information. It is stored in the root directory of the user disk and provides a maximum of 2.000 entries. When 2.000 entries are reached, the oldest entry is overwritten. The maximum size of extended data is 32 bytes.

The diagnosis history can be accessed with the Automation Builder or with the IEC application.
Chapter 6.9.1.4.5 "Diagnosis history" on page 4614

The diagnosis history file must be interpreted according to the device and/or the fieldbus. A demonstration of how to read out and receive diagnosis history messages with the IEC application is given in the application example AC500 V3 - Diagnosis History

Example entry - An entry consists of following data:
Diagnosis his-
tory file

| Name | Type | Comment | Example |
| :--- | :--- | :--- | :--- |
| timestamp | ARRAYDT OF <br> BYTE | RTC time of event in milliseconds <br> consists of diTimestamp in DT <br> format and uiMs milliseconds. <br> See « Chapter 6.9.1.5.2.2 <br> "Structure DIAG_VAL_TYPE" <br> on page 4616 STRUCT. | 1603371910177 |
| event | BYTE | Event type (1=comes, 2=gone). <br> See « Chapter 6.9.1.5.2.6 "Enu- <br> meration teEvent" on page 4618. | 1 |
| class | BYTE | Severity of error event. <br> 乡 Chapter 6.9.1.5.2.5 "Enumera- <br> tion teClass" on page 4618. | 4 |
| compID | UDINT | Component ID |  |

| Name | Type | Comment | Example |
| :--- | :--- | :--- | :--- |
| conn | UDINT | Connector | $0 x b 17777$ ac |
| connldx | UDINT | Connector index | 0 |
| sub | DWORD | SubsystemID: Any number <br> describing detail/location within <br> device, device specific | 369098752 |
| addl | DWORD | AdditionalID: Additional number <br> describing detail/location within <br> device, optional, device specific | 0 |
| error | DWORD | Error code | 9 |
| extended data | ARRAYDT OF <br> BYTE | Extended diagnosis data, max. 32 <br> bytes |  |

With the entries compID, conn and connID, the device generating the event is clearly identified in the device tree.
If the PLC configuration is changed, the values of this entries may be changed also.

Therefore, the diagnosis history will be deleted during each download.

### 6.9.2 Online diagnosis in Automation Builder

### 6.9.2.1 Short description and overview

To use the diagnosis system in Automation Builder, login to the online mode is required
Chapter 6.9.2.2 "Entering/leaving the online mode" on page 4640. The online diagnosis in Automation Builder consists of a set of partly animated, mostly read only views. They can be invoked by a double-click on a project tree element which shows a circle indicating that this element is able to show diagnosis messages $\stackrel{y}{ } \Rightarrow$ Chapter 6.9.2.3 "Project tree in online mode" on page 4641.

Available online diagnosis and statistics:

- Diagnosis messages

When the Automation Builder is switched to online mode, incoming diagnosis messages are displayed as plain-text $\stackrel{\leftrightarrow}{ }{ }^{\circ}$ Chapter 6.9.1.4 "Diagnosis in Automation Builder" on page 4611.

- CPU/PLC diagnosis

² Chapter 6.9.2.4 "CPU diagnosis views" on page 4645.

- I/O module diagnosis
y Chapter 6.9.2.5 "Live values in views with I/O components" on page 4649.
- Communication module and fieldbus diagnosis

² Chapter 6.9.2.6 "Communication module and fieldbus diagnosis" on page 4649

- Diagnosis in IEC application
«2 Chapter 6.9.1.5 "Diagnosis in IEC application" on page 4615
For information on the disk status, diagnosis information can be read out with the function blocks PmDiskStatus and PmDiskLifetimeUsed. $\Leftrightarrow$ Chapter 6.8.2.2.1.4 "Health monitoring" on page 4424

### 6.9.2.2 Entering/leaving the online mode

Prerequisite: Set the gateway before entering the online mode. $\Leftrightarrow$ Chapter 6.3.2.15 "Gateway configuration" on page 1593

Enter the online Right-click the "Application" node and select "Login". mode

The Automation Builder project login to online mode updates the latest changes of the project.

The online mode can be entered or left for each PLC in the project separately.

Leave the online Right-click the "Application" node and select Logout. mode

When online mode is active, a thread is running on Automation Builder project which sends cyclically a message to the PLC and expects a response. If the PLC does not respond, the online mode is left programmatically.

### 6.9.2.3 Project tree in online mode

When Automation Builder enters the online mode internally, it shows the state of all configured communication modules.

The connection status can be recognized by a symbol in the device tree:

- Device without diagnosis messages
- 3 Device with diagnosis messages or device diagnosis is disabled $\Leftrightarrow$ Chapter 6.9.2.4.6 "Device diagnosis" on page 4648
- Device without diagnosis messages, but with diagnosis messages on at least one device in the branch below
- (4. Device with diagnosis messages and with diagnosis messages on at least one device in the branch below
- $\boldsymbol{\Delta}$ Device does not respond to identification message and is not available for online connection

## The identification is done in online mode.

- Double-click an element of the device-tree and select "Status" tab. Diagnosis information will be available.

## Diagnosis

 descriptions

The user will be notified in the device tree with an exclamation mark beside the device having diagnosis messages. The diagnosis messages are provided in the "Diagnosis" tab.
Alarms will be presented with a thunderbolt in the first column of the diagnosis grid.
Acknowledging 1. Stop diagnosis refreshment by clicking [Stop refresh].
an alarm
2. Select one or more alarms and click [Acknowledge selected alarms].

Some diagnosis messages contain additional data. Click [View] button to see the additional diagnosis (in hex) for further analysis. If [View] button is not available, no additional data is available for this diagnosis message.
You can copy the additional data to the clipboard with [CTRL] + [C].

When building an IEC application in Automation Builder, diagnosis text lists will be generated and added to the device tree below the diagnosis folder. These text lists contain the device type specific diagnosis texts which are used by the diagnosis functions in the PLC application to show corresponding texts for error numbers.

The diagnosis text lists will only be downloaded to the PLC when a visualization is present in the project.

The text lists will be downloaded automatically to the PLC with the visualization.
If there is a problem with downloading the text lists, make sure that the settings are correct:

1. Right-click on a text list and select "Properties".
2. Open the "Text List" tab. The check box "Download by visualization" has to be selected.

### 6.9.2.4 CPU diagnosis views

### 6.9.2.4.1 Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the "Version information" tab.

Remarks:

- The "Version information" tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder supported versions. It might be required to upgrade or downgrade the current firmware for using the PLC with the current Automation Builder.
- The "Required Version" might contain more than one user selectable version (drop-down list), this is indicated by an asterisk after the file name.

State icons

| (8) | Firmware version on device matches version supplied with <br> Automation Builder. |
| :--- | :--- |
|  | Firmware version (or type) on device is different from version supplied <br> with Automation Builder. Upgrade/downgrade to version supplied with <br> Automation Builder is recommended. |
| No icon | Only for communication modules if CPU firmware must be updated <br> first. This happens when CPU firmware has version below 2.5.0.0. <br> Firmware version (or type) on device is different from version supplied <br> with Automation Builder. Upgrade/downgrade to version supplied with <br> Automation Builder is recommended. |
|  | Identified device is different from configured device, thus no firmware <br> update is possible. Happens only for Communication Modules. |
|  | Firmware of device is not updateable or no newer firmware than the <br> initial version is available. |

[Update Firmware] to download the new firmware is only enabled if there is updateable firmware.

### 6.9.2.4.2 Statistics

The "Statistics" tab shows the following information:

- Date and time: The actual date and time of the PLC is shown. It can be set or synchronized with the date/time of the PC via "Set PLC Date \& Time" button.
- Overview resource usage: This tab shows all the required information (it is collected at latest when the command "Generate Code" is executed, some of the information is not available before then.)
For the limitation "User program code and data" a [Details] button will be available. Clicking this button will open a modal window showing a more detailed view of the memory usage.

You can view the PLC log in this tab．It lists the events that were recorded on the target system． This concerns：
－Events during the startup and shutdown of the system（components loaded，with version）
－Application download and loading of the boot application
－Custom entries
－Log entries from I／O drivers
－Log entries from data sources

| Offline logging | $\square$ Default settings <br> The PLC also records actions that are not related to the connection with the controller． |
| :---: | :---: |
| UTC time | Standard setting；the time stamp is converted to the local time on the com－ puter as indicated by the time zone of the operating system． <br> The time stamp of the runtime system is displayed． |
| Severity | There are four categories for the severity of the event： <br> －© ：Message <br> －© ：Warning <br> －© Error <br> －© Debugging <br> You can show or hide each category with the help of the corresponding button in the bar above the list．Each button shows the number of log entries of the category concerned． |
| Time stamp | Date and time（example：12－01－2007 09：48） |
| Description | Description of the event，for example Import function failed of |
| Component | Name of the runtime system component concerned，e．g．CmpApp |
| Drop－down list with component names | The log list displays only events that concern the selected component |
| Logger | Drop－down list with all available recordings．The standard setting is the＜Default Logger＞specified by the target system，at present identical to＇PlcLog＇for the CODESYS runtime system |
| 6 | Refreshes the log list |
| 10 | Exports the list contents to an XML file．You can select the file name and storage directory． |
| 第 | Imports a log list from an XML file．The list is then displayed in a separate window． |
| $x$ | The displayed log list is emptied，i．e．all entries are deleted． |

## 6．9．2．4．4 PLC shell commands

The PLC shell is used for requesting specific information from the controller．By entering a device－specific command the response is returned in a result window．The PLC shell can be issued without login．
Proceed as fol－1．Ensure the gateway is configured properly and a connection to the controller can be lows： established．

2．In Automation Builder double－click the PLC node and open the tab＂PLC Shell＂．
3．Enter＂？＂in the command line of the tab window．All available PLC commands are listed．

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

```
The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.
ⓨ Chapter 6.4.1.21.2.8.11 "Tab 'PLC Shell"" on page 2441
« Chapter 6.2.6 "Version information" on page 1384
Chapter 6.3.1.4 "Firmware identification and update" on page 1419.
```

### 6.9.2.4.5 Status

This tab displays status information, for example 'Running' or 'Stopped', and specific diagnosis messages from the respective device, also information about the card used and the internal bus system.

| Communication modules | n/a |
| :---: | :---: |
| Interfaces | n/a |
| //0-Bus | n/a |
| CPU-Parameters | n/a |
| PM5630-2ETH | n/a |

### 6.9.2.4.6 Device diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.
The message consists of:

- Type $\Perp^{\circledR}$ Chapter 6.9.1.4.5 "Diagnosis history" on page 4614
- Timestamp in date and time YYYY-MM-DD hh:mm:ss.ms
- Error severity
- Error code
- Diagnosis description
- Additional data

To view the diagnosis message:

1. Double-click on a device.
2. Select the tab "Diagnosis".

## Example $\quad$ Battery empty or missing.

| us 圌 PLC_AC500_V3 x 屏 DI524 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Start refresh Stop refresh Acknowledge Selected Alarms |  |  |  |  |  |
| Type | Device | Timestamp | Severity | Error Code | Description |
| + | PLC_AC500_V3 | 1970-01-01; 12:00:13.916 | 4 | 8 | Battery, Device, Empty or missing |

## Example Wrong module configured on I/O bus.

| [7] PLC_AC500_V3 四 DI524 x |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Start refresh Stop refresh Acknowledge Selected Alarms |  |  |  |  |  |  |
| Type | Device | Timestamp | Severity | Error Code | Description | Additi |
| + | DI524 | 1970-01-01; 12:16:30.633 | 11 | 16158 | Module 1, Ty |  |

Device diagnosis is disabled by default.
To enable/disable device diagnosis:

1. Double-click on the PLC.
2. Select the tab "PLC Settings".
3. Under "Additional Settings" enable/disable "Diagnosis for devices".
$\Rightarrow$ When the device diganosis is disabled, this symbol will be displayed in the device tree and no diagnosis messages will be shown.

### 6.9.2.5 Live values in views with I/O components

"//O mapping list" tab: In online mode, all Automation Builder views, which contain I/O component mapping tables, show animated live values which are updated every second.

| D0573 Parameters <br> D0573 1/O Mapping | $\checkmark$ Tool Bar |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Object Name } \\ & \text { D0573 } \end{aligned}$ | Variable | Channel | Address | Current Value |  | Description | Termina |
|  |  |  | Relay outputs NOO - NO\%QWO |  | 65280 | WORD |  |  |

|  | 00573 |  | Relay output NO14 | \%QX1.6 | FALSE | B00L |  | 16 |
|  | D0573 |  | Relay output NO15 | \%QX1.7 | FALSE | B00L |  | 17 |

### 6.9.2.6 Communication module and fieldbus diagnosis

### 6.9.2.6.1 Fieldbus commissioning

## General

Common online diagnosis views for all netX-based communication modules (e. g. CM579ETHCAT, CM579-PNIO) can be accessed whenever the related PLC is in online mode.
${ }^{\text {² }}$ ) Chapter 6.9.2.2 "Entering/leaving the online mode" on page 4640

## Master/controller modules

Master/controller modules like CM579-ETHCAT or CM579-PNIO, provide the following diagnosis views:

- "Diagnostics main": provides diagnosis messages which are common for all protocols (e.g., protocol state and error)
- "Diagnostics live list": provides a list of connected slaves/devices and their state " ${ }^{4}$ Chapter 6.9.2.6.1.4 "PROFINET scan and comparison view" on page 4651
- "Diagnostics eventlog": provides diagnosis messages from the master/controller and its connected slaves/devices

## Slave/device communication modules

Diagnosis views for slave/device communication modules like CM589-PNIO:

- "Diagnostics main": provides diagnosis messages which are common for all protocols
- "Diagnostics details": provides protocol specific diagnosis messages

## PROFINET scan and comparison view

## PNIO_Controller

1. After going online, double-click on "PNIO_Controller (PROFINET-IO-Controller)" in the device tree.
$\Rightarrow$ The editor "PNIO_Controller" is displayed.
2. Select tab "Diagnostics live list" and click [Scan] to find all hardware devices that exist. $\Rightarrow$ The found devices are listed in a table.
3. Click [Compare] to compare the found hardware I/O devices with the current project configuration.

Unknown hard- If any I/O hardware device is unknown:

- The devices will be marked with a red exclamation mark.
- A message box will be appear for each unknown device.
- Automation Builder generates a message with information about its vendor ID and device ID.

## Comparison view

1. To display the comparison view, install the device description for the unknown device.
2. After installing the device description, click [Scan] and click [Compare].

$\Rightarrow$ The message box informs you, that the application will go offline to display the comparison view.
3. Click [Yes].
$\Rightarrow$ The "Project Comparison - Differences" tab displays the difference between the PROFINET configuration in Automation Builder (left side) and the real hardware configuration (right side).

4. Click [Accept Single] to accept only a part of the differences or [Accept Block] to accept all differences.
$\Rightarrow$ After clicking on the Button [Accept Single] or [Accept Block] the found devices will be moved from the right side to the left side.
5. Close tab "Project Comparison - Differences".
$\Rightarrow$ A message will be displayed to ask if you want to commit the new changes into project.

6．Click［Yes］．
$\Rightarrow$ The changes will be saved and the devices will be added to the project．

```
Devices

            + 的自 PNIO_Device (PROFINET-IO-Device)
```

## 6．9．2．6．2 CI52x Modbus diagnosis

1．Double－click node＂CI52x＿MODTCP＂in the device tree．
2．Select＂CI52x Diagnosis＂tab．
$\Rightarrow$ The button［Get Diagnosis］appears in the tab view．
3．Click on the button［Get Diagnosis］．
$\Rightarrow$ One of the following use cases will be displayed：
－Device not connected $\Leftrightarrow$＂Device not connected＂on page 4654
－No Errors on the device ${ }^{4}$＂No errors on the device＂on page 4654
－Diagnosis list $\xi^{4}$＂Diagnosis list＂on page 4654

Device not con- If there is no device connected to the project, the following dialog will be displayed:

## nected

1. Select tab "Connection Settings" and enter the IP address for the device.
2. Click again button [Get Diagnosis].

No errors on the If there are no errors on the device the following dialog will be displayed:

## device

Automation Builder

OK

Diagnosis list If the device is not correctly configured the errors will be displayed with "Error Code" and "Code Description".

|  | Error <br> Code | Code Description |
| :--- | :--- | :--- |
| - | 234946507 | Process voitage too low |
| 234946541 | Process voitage switched off |  |
| 234881072 | Module number: 1: Measurement overflow or cut wire at the analog input |  |
|  |  |  |

### 6.9.2.6.3 EtherCAT diagnosis

Due to the nature of the EtherCAT bus, diagnostics cannot be standardized and must be individually adapted to the requirements of the PLC system.

A guideline for EtherCAT diagnosis during commissioning and operation of the AC500 V3 series in combination with Automation Builder diagnosis and the IEC programming is given in the application note EtherCAT diagnosis guideline.

### 6.9.3 Diagnosis messages

### 6.9.3.1 Read out the diagnosis messages via display

If the processor module has a display, you can access the diagnosis system via the display and the buttons.
Diagnosis messages can also be accessed within the engineering suite Automation Builder or with the IEC application.
« Chapter 6.9.1.4 "Diagnosis in Automation Builder" on page 4611
*s Chapter 6.9.1.5 "Diagnosis in IEC application" on page 4615

|  |  |  |
| E－ | CMx（communication module） $x=\text { slot number }$ | To view these diagnosis messages use Automation Builder ＊Chapter 6．9．1．4＂Diagnosis in Automation Builder＂on page 4611 or IEC application Chapter 6．9．1．5＂Diagnosis in IEC application＂ on page 4615. |
| Ex | CAn（CAN interface） |  |
| Ex | Et1 or Et2（Ethernet ETH1 or ETH2） |  |

## 6．9．3．6．2 CM579－ETHCAT

Application The principle of the EtherCAT diagnosis system and its use in the IEC application of an AC500 example V3 PLC is described in the application example AC500 EtherCAT－Diagnosis with AC500 V3．

Status codes

| Hexadecimal Value | Definition | Description |
| :--- | :--- | :--- |
| $0 x 00000000$ | TLR＿S＿OK | Status ok |
| $0 x C 0650005$ | TLR＿E＿ETHERCAT＿MASTER＿ERR <br> OR＿BUSSCAN＿FAILED | Existing bus does not match config－ <br> ured bus． |
| $0 x C 0650006$ | TLR＿E＿ETHERCAT＿MASTER＿NOT <br> －ALE＿SLAVES＿AVAIL | Not all slaves are available． |
| $0 x C 065000 \mathrm{~B}$ | TLR＿E＿ETHERCAT＿MASTER＿INV <br> ALID＿BUSCYCLETIME | The requested bus cycle time is <br> invalid． |
| $0 x C 065000 \mathrm{C}$ | TLR＿E＿ETHERCAT＿MASTER＿INV <br> ALID＿BROKEN＿SLAVE＿BEHAV－ <br> IOUR＿PARA | Invalid parameter for broken slave <br> behavior． |
| $0 x C 065000 \mathrm{~F}$ | TLR＿E＿ETHERCAT＿MASTER＿CO <br> E＿INVALID＿SLAVEID | Invalid Slaveld was used for CoE． |
| $0 x C 0650012$ | TLR＿E＿ETHERCAT＿MASTER＿CO <br> E＿INVALID＿INDEX | Invalid Index on slave requested． |

| Hexadecimal Value | Definition | Description |
| :---: | :---: | :---: |
| 0xC0650013 | TLR_E_ETHERCAT_MASTER_CO E INVĀLID COMMŪNICATION_STATE | Invalid bus communication state for CoE-Usage. |
| 0xC0650014 | TLR_E_ETHERCAT_MASTER_CO E_FRAME_LOST | Frame with CoE data is lost. |
| 0xC0650015 | TLR_E_ETHERCAT_MASTER_CO E_TIMEOUT | Timeout during CoE service. |
| 0xC0650016 | TLR_E_ETHERCAT_MASTER_CO E_SL̄AVE_NOT_ADD̄RESSABL̄E | Slave is not addressable (not on bus or power down?). |
| 0xC0650017 | TLR_E_ETHERCAT_MASTER_CO E_INVĀLID_LIST_TYPE | Invalid list type requested (during GetOdList). |
| 0xC0650018 | TLR_E_ETHERCAT_MASTER_CO E_SL̄AVE_RESPONSE_TOO_BIG | Data in slave response is too big for confirmation packet. |
| 0xC0650019 | TLR_E_ETHERCAT_MASTER_CO E_INVĀLID_ACCESS̄BITMASK | Invalid access mask selected (during GetEntryDesc). |
| 0xC065001A | TLR_E_ETHERCAT_MASTER_CO E_WKC_ERROR | Slave Working Counter Error during CoE service. |
| 0xC065001C | TLR_E_ETHERCAT_MASTER_INV ALID_COMMUNICATION_STATE | Command is not usable in the communication state. |
| 0xC065001E | TLR_E_ETHERCAT_MASTER_BUS _SCĀN_CURRENTL̄Y_RUNNIN̄G | The scan is already running. It cannot be started twice at the same time. |
| 0xC065001F | TLR_E_ETHERCAT_MASTER_BUS _SCAN_TIMEOUT | Timeout during bus scan. But at least a link is established. |
| 0xC0650020 | TLR_E_ETHERCAT_MASTER_BUS _SCĀN_NOT_READY_YET | The bus scan was not started before or is not finish yet. |
| 0xC0650021 | TLR_E_ETHERCAT_MASTER_BUS _SCĀN_INVALID_SL̄AVE | The requested slave is invalid. |
| 0xC0650022 | TLR_E_ETHERCAT_MASTER_CO E_INVALIDACCESS | Slave does not allow reading or writing (CoE-Access). |
| 0xC0650023 | TLR_E_ETHERCAT_MASTER_CO E_NO_MBX_SUPPORT | Slave does not support a mailbox. |
| 0xC0650024 | TLR_E_ETHERCAT_MASTER_CO E_NO_COE_SUPPŌRT | Slave does not support CoE. |
| 0xC0650025 | TLR_E_ETHERCAT_MASTER_TAS K_CREATION_FAILED | Task could not be created during run time. |
| 0xC0650026 | TLR_E_ETHERCAT_MASTER_INV ALID_SLAVE_SM_CONFIGURATION | The Sync Manager configuration of a slave is invalid. |
| 0xC0650027 | TLR_E_ETHERCAT_MASTER_SD O_ABORTCODE_TŌGGLE | SDO abort code: Toggle bit not alternated. |
| 0xC0650028 | TLR_E_ETHERCAT_MASTER_SD O_AB̄ORTCODE_TIMEOUT | SDO abort code: SDO protocol timed out. |
| 0xC0650029 | TLR_E_ETHERCAT_MASTER_SD O_ABORTCODE_CC̄S_SCS | SDO abort code: Client/server command specifier not valid or unknown. |
| 0xC065002A | TLR_E_ETHERCAT_MASTER_SD O_ABORTCODE_BLK_SIZE | SDO abort code: Invalid block size (block mode only). |
| 0xC065002B | TLR_E_ETHERCAT_MASTER_SD O_ABORTCODE_SĒQNO | SDO abort code: Invalid sequence number (block mode only). |

### 6.9.3.6.3 CM589-PNIO(-4) errors

In PLC display the diagnosis messages of "CM589-PNIO" are not shown.
The following diagnosis messages are signaled by "CM589-PNIO":

| Error <br> severit <br> y | SubSyste- <br> minfo | Addi- <br> tional | Error code | Meaning | Remedy |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 0 | 1000 | No communication <br> module or wrong <br> type found. | Plug the correct com- <br> munication module. |
| 3 | 0 | 0 | 1001 | Type of CM589- <br> PNIO not supported. | Exchange the com- <br> munication module. |
| 3 | 0 | 0 | 1002 | Firmware version of <br> CM589-PNIO not <br> supported. | Update firmware of <br> CM589-PNIO. |
| 3 | 0 | 0 | 1003 | Identification of com- <br> munication module <br> failed. | Exchange the com- <br> munication module or <br> plug the correct com- <br> munication module. |
| 3 | 0 | 0 | 2000 | Watchdog error |  |
| 3 | 0 | 0 | 2001 | CM589-PNIO is not <br> communicating. | Check bus connection <br> and configuration. |
| 3 | 0 | 0 | 2002 | CM589-PNIO signals <br> communication error. | Check bus connection <br> and configuration. |
| 3 | 0 | 0 | 2003 | Starting of CM589- <br> PNIO's protocol <br> stack failed. | Check bus connection <br> and configuration. |

| Error <br> severit <br> y | SubSyste- <br> minfo | Addi- <br> tional | Error code | Meaning | Remedy |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 0 | 2004 | Stopping of CM589- <br> PNIO 's protocol <br> stack failed. |  |
| 3 | 0 | 0 | 2005 | PLC cannot be set to <br> run due to an error of <br> CM589-PNIO. | Check error log and <br> correct errors. |
| 3 | 0 | 0 | 3000 | Configuration error | Check configuration <br> and correct errors. |
| 3 | 0 | 0 | 3001 | Configuration version <br> mismatch | Use matching CPU <br> firmware version. |
| 3 | 0 | 0 | 4000 | Ethernet link down | Check Ethernet cable <br> connection. |
| 3 | 0 | 0 | 10000 | Wrong module is <br> configured. | Check configuration <br> and correct errors. |
| 3 | 0 | 0 | 10001 | Correct module <br> is configured but <br> locked by another <br> I/O controller. | Check configuration <br> and correct errors. |
| 3 | 0 | 0 | 10002 | Module is configured <br> but not used by I/O <br> controller. | Check configuration <br> and correct errors. |
| 3 | Slot/subslot | 0 | 65636 | Slot/subslot: No <br> module configured. | Check configuration <br> and correct errors. |

### 6.9.3.6.4 CM598-CN CAN communication module diagnosis

In Automation Builder, diagnosis messages of communication module CM598-CN are displayed at device tree node "CM598-CN" and all nodes below,CANopen remote devices and I/O modules (for CI58x modules only).
Click tab "Diagnosis".
Within PLC application, diagnosis messages can be read by diagnosis related methods of function block type "Diag", provided in library "Diag".
In PLC display, diagnosis messages of CM598-CN are not shown.
Following diagnosis messages are signaled by CM598-CN.
CM598-CN communication module specific diagnosis messages:

| Severity | SubSyste- <br> minfo | Additional | Error code | Meaning | Remedy |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 0 | 0 | 6554600 | CM598-CN <br> not found | Plug the cor- <br> rect communi- <br> cation module |
| 3 | 0 | 0 | 6554601 | Type of <br> CM598-CN <br> not supported | Exchange the <br> communica- <br> tion module |
| 3 | 0 | 0 | 6554602 | Firmware ver- <br> sion of <br> CM598-CN <br> not supported | Update firm- <br> ware of <br> CM598-CN |

| Severity | SubSysteminfo | Additional | Error code | Meaning | Remedy |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 0 | 0 | 6554603 | Identification <br> of CM598-CN <br> failed | Exchange the communication module |

| 4 | 0-31 | 0 | 772 | Analog value overflow at an analog output | Check output value |
| 4 | 0-31 | 0 | 775 | Analog value underflow at an analog output | Check output value |
| 4 | 0-31 | 0 | 796 | Different configuration |  |
| 3 | 0-31 | 0 | 1037 | Test error |  |
| 4 | 0-31 | 0 | 1070 | Externally voltage detected on digital output DC0...DC7 | Check terminals |
| 4 | 0-31 | 0 | 1071 | Short circuit at digital output | Check terminals |

### 6.9.3.6.5 CM582-DP PROFIBUS DP slave diagnosis

The diagnosis messages of the communication module CM582-DP are displayed in the tab "Diagnosis" of node "CM582-DP" in the device tree of the Automation Builder. Within PLC application they can be read with the diagnosis methods of IO driver or function block "Diag".

In the PLC display the diagnosis messages of CM582-DP are not shown.
The following diagnosis messages are signaled by CM582-DP:
\(\left.$$
\begin{array}{|l|l|l|l|l|l|}\hline \begin{array}{l}\text { Error } \\

### 6.9.3.6.6 AC500-S: errors from safety CPU and safety I/O modules

Table 865: Error messages for safety CPU

| Severity | Error code | Description | Remedy |
| :---: | :---: | :---: | :---: |
| 2 | 8235 | Internal error | Replace module |
| 2 | 8448 | Operation finished | Change Safety PLC switch address setting or remove memory card from non-safety PLC. Restart Safety PLC. If this error persists, replace Safety PLC. |
| 2 | 8449 | Wrong user data | Delete user data from Safety PLC. Restart Safety PLC and write user data again. |
| 2 | 8450 | Internal PROFIsafe initialization error | Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support. |
| 2 | 8460 | Flash read error | Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support. |
| 2 | 8466 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8476 | Boot project download error | Reload boot project. If this error persists, replace Safety PLC. |
| 2 | 8488 | Wrong firmware version | Update Safety PLC firmware. Restart Safety PLC. If this error persists, replace Safety PLC. |
| 2 | 8491 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8496 | Overvoltage or undervoltage detected | Restart Safety PLC. Check Safety PLC setting for power supply error. If this error persists, replace Safety PLC. |
| 2 | 8500 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8704 | User program triggered safe stop | Check user program |
| 2 | 8705 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8706 | Internal PROFIsafe error | Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support. |
| 2 | 8707 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8714 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8717 | Flash write error | Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support. |
| 2 | 8721 | Internal error | Contact ABB technical support. Replace Safety PLC. |
| 2 | 8722 | Internal error | Contact ABB technical support. Replace Safety PLC. |

| Severity | Error code | Description | Remedy |
| :--- | :--- | :--- | :--- |

ABB technical support.\end{array}\right|\)| 2758 |
| :--- |
| 3 |

| Severity | Error code | Description | Remedy |
| :---: | :---: | :---: | :---: |
| 3 | 32776 | Safety module has wrong type | Check configuration |
| 4 | 16640 | Reserved switch address setting. | Warning |
| 4 | 16644 | Boot project not loaded, maximum power dip reached | Restart Safety PLC |
| 4 | 16648 | Power dip data missed or corrupted. Default power dip data was flashed by Safety PLC | Warning |
| 4 | 16659 | CRC error boot project | Create new boot project and restart Safety PLC |
| 4 | 16909 | Flash write error (production data) | Warning |
| 4 | 16935 | More than one instance of SF_WDOG_TIME_SET or SF_MAX_POWER_DIP_S ET | Warning |
| 4 | 16922 | No or wrong configuration data from PM5x, run state not possible | Create correct boot project at PM5x |
| 4 | 17421 | Flash write error (boot project) | Warning |
| 4 | 17677 | Flash write error (boot code) | Warning |
| 4 | 17933 | Flash write error (firmware) | Warning |
| 4 | 18189 | Flash write error (password) | Warning |
| 4 | 18445 | Flash write error (user data) | Warning |
| 4 | 18701 | Flash write error (user data) | Warning |
| 4 | 18957 | Flash write error (internal) | Warning |
| 4 | 19213 | Flash write error (internal) | Warning |
| 4 | 19469 | Flash write error (internal) | Warning |
| 4 | 32777 | Program not started because of configuration error | Check configuration |
| 4 | 32778 | Program not started, no application running in safety module | Check configuration, download safety application to safety module |

Table 866: Error messages for safety I/O modules (channel or module reintegration is possible)

| Severity | Error code | Description | Remedy |
| :--- | :--- | :--- | :--- |
| 3 | 3 | Discrepancy time expired | Check discrepancy time value, <br> channel wiring and sensor. |
| 3 | 12 | Test pulse error | Check wiring and sensor. |

| Severity | Error code | Description | Remedy |
| :---: | :---: | :---: | :---: |
| 3 | 13 | Channel test pulse crosstalk error | Check wiring and sensor. If this error persists, replace I/O module. Contact ABB technical support. |
| 3 | 25 | Channel stuck-at error | Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module. |
| 3 | 28 | Channel cross-talk error | Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module. |
| 3 | 260 | Measurement overflow at the I/O module | Check channel wiring and sensor power supply. |
| 3 | 263 | Measurement underflow at the I/O module | Check channel wiring and sensor power supply. |
| 3 | 311 | Channel value difference too high | Adjust tolerance window for channels. Check channel wiring and sensor configuration. |
| 3 | 525 | Channel readback error | Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module. |
| 3 | 530 | Channel cross-talk error | Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module. |
| 3 | 16138 | Process voltage too high | Check process voltage |
| 3 | 16139 | Process voltage too low | Check process voltage |
| 3 | 16148 | PROFIsafe communication error | Restart I/O module. If this error persists, contact ABB technical support. |
| 3 | 16153 | PROFIsafe watchdog timed out. | Restart I/O module. If this error persists, increase PROFIsafe watchdog time. |
| 3 | 16171 | Internal error in the device | Replace I/O module |

Table 867: Error messages for safety I/O modules (channel or module reintegration ist not possible)

| Severity | Error code | Description | Remedy |
| :--- | :--- | :--- | :--- |
| 3 | 16146 | Plausibility check failed <br> (iParameter) | Check configuration |
| 3 | 16147 | Checksum error in the I/O <br> module | Check safety configuration and <br> CRCs for I-and F-Parameters. |
| 3 | 16154 | Parameter value | Check master or configuration |
| 3 | 16156 | F-Parameter configuration <br> and address switch value <br> do not match. | Check I/O module F-Param- <br> eter configuration and module <br> address switch value. |

### 6.9.3.6.7 CM579-PNIO - PROFINET I/O controller diagnosis

Diagnosis data for CM579-PNIO is not displayed in PLC display. In Automation Builder, we recommend to use methods with text output to get diagnosis messages in clear text format. E.g., DiagGetFirstValAndTxt.

Output string:
<timestamp>; <error severity>; <device name>; <error location>; error ID <id>: <error text>

Advanced
Direct access to the diagnosis data of CM579PNIO

If you need to access the diagnosis data directly, you have to interpret them manually
② Chapter 6.9.3.6.8 "Advanced: Manual interpretation of CM579-PNIO diagnosis" on page 4704

### 6.9.3.6.8 Advanced: Manual interpretation of CM579-PNIO diagnosis

General
Diagnosis messages are included in diagnosis text lists "Diag_PNIO_Controller" and "Diag_PNIO_Vendor ID_Device ID".
(4) We recommend that you refer to the example to learn how to perform the manual interpretation in the correct way.

## Example

Type of diagnosis

For better understanding, we show the manual interpretation of CM579-PNIO diagnosis with an example.

System: AC500 CM579-PNIO + CI501-PNIO + optional S500 I/O inserted as PROFINET standard device
Error: discrepancy time expired (class 3, error ID 3) at channel 4 of first attached S500 I/O device on CI501-PNIO

For comparison: If a method with text output is used, e.g. DiagGetFirstValAndTxt the text output will be the string: Timestamp; E3; device name; subslot 1, channel 4, extended channel diagnosis; error ID 3: discrepancy time expired (class 3, error ID 3)

In Automation Builder the following error entry data is displayed:

| - Diag_Val[1] | AC500_DiagTypes.D... |  |  |
| :---: | :---: | :---: | :---: |
| - dtTimestamp | DATE_AND_TIME | DT $=2019-10-15-14: 48: 34$ | RTC time of event |
| - eClass | TECLASS | eDiagClass_3_Error | Severity of error event |
| - szDevice | STRING(80) | 'MO_PN03_M2' | Name of device |
| - eHwinterfaceld | TEHWID | eDiagHwId_Coupler2 | Identifier of hardware interface |
| - dwSubSystemInfo | DWORD | 65540 | Any number describin..ail/location within d... |
| - dwadditional | DWORD | 131076 | Additional number des...ng detai/location wi... |
| - dwErrorCode | DWORD | 196867 | Actual error code |
| - wSizeExtDiag | WORD | 44 | Number of bytes of extended diagnosis data |
| + pExtDiagData | POINTER TO BYTE | 16=0079EA40 | internal reference ne... for acknowledgement |
| + hSource | POINTER TO BYTE | $16=0077$ ABE8 | internal reference needed for text convertion |
| + pConn | POINTER TO IoStan... | 16=8573DDD8 | internal reference needed for text convertion |

Analyze the data in the following order: Element "dwAdditional" for the type of diagnosis, element "Error Code", element "SubSysteminfo".

1. Analyze element "dwAdditional", column "Additional" in error lists.

Convert the given value from decimal to hexadecimal format.
"dwAdditional" = $131076=16 \# 20004$
2. Interpretation:

Word 2 = 2
Word $1=4$
3. Generate error text Add_Word 1_Word 2 = Add_4_2
4. Look up which error type it is.

Add_4_2 = extended channel diagnosis

## Data analysis

1. Analyze element "Error Code":
"dwErrorCode" = $196867=16 \# 30103 \rightarrow$
Word 2 (extended error type) $=16 \# 0003$
Word 1 (error type) =16\#0103
$\rightarrow$ Error text: Err_Word 1 (hex)_Word 2 (hex)
$\rightarrow$ Err_0103_0003 $\rightarrow$
Error ID 3 - discrepancy time expired (class 3, error ID 3)
2. Analyze "SubSysteminfo"
"dwSubSysteminfo" $=65540=16 \# 10004 \rightarrow$
Word 2 (subslot index) = 1
Word $1($ channel index) $=4$

## Download

Compact PLCs
Safety PLCs
IEC 61131-3 editor, integrated in engineering suite Automation Builder

Safety PLCs suitable for extreme environmental conditions

Range of AC500 and AC500-eCo CPUs
Range of AC500 and AC500-eCo CPUs
Standard PLCs suitable for extreme environmental conditions
Diagnosis message which must be acknowledged by the user. The alarm will continue to be displayed even if the issue has been resolved in the meantime until it is acknowledged.

Engineering suite for configuration and programming of all PLCs

Note: The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the "cold start" mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased $\Leftrightarrow$ Chapter 6.4.1.21.3.7.10 "Command 'Reset Cold'" on page 2633.
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Control panels for application visualizations

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500eCo V3 CPU. The following data can be buffered completely or in parts:
- Data in the addressable flag area (\%M area)
- RETAIN variable
- PERSISTENT variable (number is limited, no structured variables)
- PERSISTENT area (\%R area)
- In order to buffer particular data, the data must be excluded from the initialization process $\stackrel{y}{ } \stackrel{y}{c}$ Chapter 6.8.2.1 "Handling of remanent variables for AC500 V3 products" on page 4412.
- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
- changed PLC configuration
- changed task configuration
- changed library management
- changed compile-specific settings (segment sizes)
- execution of the commands "Project/Clean all" and "Project/Rebuild All".
Event $\quad$ Diagnosis message which does not require acknowledgement. The event describes the
HMI Human machine interface

Online change

Panel
Builder PB610

- After a project has changed, only these changes are compiled when pressing the key $<$ F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
- changes in the PLC configuration
- changes in the task configuration
- changes in the library management
- changed compile-specific settings (segment sizes)
- performing the commands "Project/Clean all" and "Project/Rebuild All".

Engineering tool for control panels, integrated in engineering suite Automation Builder

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for $\geq 5 \mathrm{~s}$ in STOP mode.
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.
- Resets the controller to its original state (deletion of Flash, SRAM (\%M, area, \%R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.
- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0 .
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP

STOP -> RUN

STOP START

Warm start

- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0 .
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".
- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.
- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.
- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables ${ }^{\circ}>$ Chapter 6.4.1.21.3.7.11 "Command 'Reset Warm"' on page 2634.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

[^0]:    As a specialist for AC500 V2 CPU range, new to AC500 V3 CPU range

[^1]:    Complete reset of the CPU

    To do a complete reset of the CPU thereby erasing the application from the RAM and flash EEPROM do the following.

[^2]:    Complete reset of the CPU

    To do a complete reset of the CPU thereby erasing the application from the RAM and flash EEPROM do the following.

[^3]:    Engineering Provides access from the programming system to an external project database in which the interface program source code of one or several automation projects is managed. Optionally, a version control system can be used in order to ensure data consistency of the program code for several different users and projects.

[^4]:    1 MC5141 memory card
    2 MC5102 micro memory card
    3 Micro memory card adapter
    4 Memory card slot

[^5]:    *) The value is the sampling time on the option board. The complete conversion cycle time is also related to the CPU cycle time.

[^6]:    Remarks:
    ${ }^{11}$ : The values are for information only and cannot be fulfilled altogether. The available resources are limited at the end by the maximal downloadable application size for each CPU.

[^7]:    *) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

[^8]:    5 LEDs for state display
    22 rotary switches for address setting
    3 Label
    42 serial interfaces: COM1 and COM2
    ${ }_{x}^{*}+{ }_{*}^{*}$ Sign for XC version

[^9]:    ${ }^{1}$ ) When inputs are used with 24 VAC , external surge limiting filters are required.

[^10]:    ${ }^{1}$ ) with CS31 and addresses less than 70, the value is increased by 1

[^11]:    ${ }^{1}$ ) Per group in case of group fuse protection. For each channel in case of channel-by-channel fuse protection. The maximum current per group must not be exceeded.

[^12]:    ${ }^{1}$ ) Per group in case of group fuse protection. For each channel in case of channel-by-channel fuse protection. The maximum current per group must not be exceeded.

[^13]:    ${ }^{1}$ ) With CS31 and addresses smaller than 70 and FBP, the value is increased by 1

[^14]:    ${ }^{1}$ ) With CS31 and addresses less than 70 and FBP, the value is increased by 1
    ${ }^{2}$ ) Not with FBP

[^15]:    Connection of sensors with frequency outputs

[^16]:    1 Din rail 15 mm
    2 Din rail 7.5 mm

[^17]:    ${ }^{1}$ ) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission
    ${ }^{2}$ ) For a description of the counter operating modes, please refer to the fast counter section
    ${ }^{4}$ Chapter 5.2.4.3.2.9 "Fast counter" on page 606.

[^18]:    *) The parameters behaviourAOatCommunicationFault and behaviourDOatCommunicationFault are only analyzed if the Failsafe-mode is ON.

[^19]:    *) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.

[^20]:    *) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V . Following this, the input voltage must range from $-12 \mathrm{~V} \ldots+30 \mathrm{~V}$ when $\mathrm{UPx}=24 \mathrm{~V}$ and from $-6 \mathrm{~V} . .+30 \mathrm{~V}$ when $\mathrm{UPx}=30 \mathrm{~V}$.

[^21]:    Remarks:

[^22]:    \& Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

[^23]:    *) Priorization with the aid of VLAN-ID including priority level

[^24]:    *) Priorization with the aid of VLAN-ID including priority level

[^25]:    « Chapter 6.8.2.12 "Fast counters in AC500 devices" on page 4536

[^26]:    *) Priorization with the aid of VLAN-ID including priority level

[^28]:    Remove user accounts further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.

[^29]:    I/Os

    Mapping of the Double-click on the desired "PROFINET-IO-Device" module object in the device tree to show current I/O mappings connected to this module.

[^30]:    ${ }^{1}$ ) Note that columns "Port State", "Frame Error Counters", "Physical Layer Error Counters" and "Link Lost Counters" show "LLD: Timeout", if this state is NOT CONNECTED, because this information is not accessible.
    ${ }^{2}$ ) Note that this column contains "LLD: Timeout", if slave state is NOT CONNECTED.

[^31]:    Firmware $\quad$ As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware update updates for CI52x-MODTCP devices.

[^32]:    Alternative branch

    The horizontal line before and after the branch is a single line.
    In an alternative branch, the branch lines must begin and end with transitions. The branch lines can contain additional branches.

[^33]:    Monitoring a scalar variable

[^34]:    Subtracting pointers

    The result of the difference between two pointers is a value of type DWORD, even on 64-bit platforms when the pointers are 64-bit pointers.

[^35]:    Status bar The status bar which is always visible notifies you about the data source type and the most important communication settings. When the communication is established by means of the data source type CODESYS Symbolic, the name of the data source type, the connection type, and the network name of the remote device are displayed. When the communication is established by means of data source type CODESYS ApplicationV3, then the name of the data source type, the location of the remote project, and the instance name of the remote application.
    Example:
    CODESYS Symbolic (CODESYS V3): PLC_Name

[^36]:    Example of the "<device name> I/O Mapping" tab for a CAN bus slave:

[^37]:    Calling a function In ST, you can use the call of a function as an operand in expressions. In SFC, you can use a function call only within step actions or transitions.

[^38]:    Special methods of a function block

[^39]:    NOTICE!
    An implicit monitoring function call does not occur for THIS pointer and SUPER pointer.

[^40]:    Input field
    'Single scaling
    (factor)'
    The input variable is multiplied by the factor.

[^41]:    Diagram pre- Requirement: A diagram is selected in the tree view "Presentation (Diagrams)" view

[^42]:    Predefined con- Use this option to employ existing connections from an EDS file. The data that can be changed nection (EDS are defined in the EDS file.
    file)

[^43]:    Element property 'Absolute movement'

    The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

[^44]:    Element property 'Access
    rights'

[^45]:    Element property 'Position'

    The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal $x$-axis runs to the right. The positive vertical $y$-axis runs downwards.

[^46]:    Element property 'References'

[^47]:    Element property 'Access
    rights'

[^48]:    Element prop-
    erty 'Display
    type'

[^49]:    Element prop- The variables control the element behavior dynamically. erty 'State variables'

[^50]:    ${ }^{1}$ ) Slot input in the block can be ignored. Similar to ETH input of the ModMast blocks.
    ${ }^{2}$ ) Error generated only in the primary PLC, to reset ACK input to be used.
    ${ }^{3}$ ) No runtime error in function block. Module generates S-Err and ZP Blinks.
    ${ }^{4}$ ) No runtime error in function block. Module generates S-Err.
    ${ }^{5}$ ) Runtimer Error bit2 gets reset when the PLC is switched over and error won't be available in any of the PLC regardless of its Primary status.

[^51]:    "Dynamic limits"

    Users can update the maximum limits here. Some parameters depend on the drive settings and needs to be set correctly to get the desired result.

    The user can set the "Maximum application velocity" to a desired value to limit the maximum application speed.

[^52]:    You can undo the changes that the "Extract function" command made in your project by positioning the cursor in the device tree and clicking "Edit $\rightarrow$ Undo".

[^53]:    "Filter" $\quad$ Input field for strings to be searched for
