

M-T-T-M Close Transition

This document is intended to describe the components, required inputs and outputs, sequence of operations and the basic logic to implement ABB's transfer scheme for M-T-T-M applications.

Single Line Diagrams

The following is a one line diagram of the connections required to the relays for the implementation of the transfer scheme

ABB Inc.

SINGLE LINE DIAGRAM

Schemes: M-T-T-M Closed Transition

Relays: Main 1 Relay Order Code: HAFDDADAFHE5BBN12E

Main 2 Relay Order Code: HAFDDADAFHE5BBN12E

Tie Relay Order Code: HAFFFAFAFHE5BBN12E

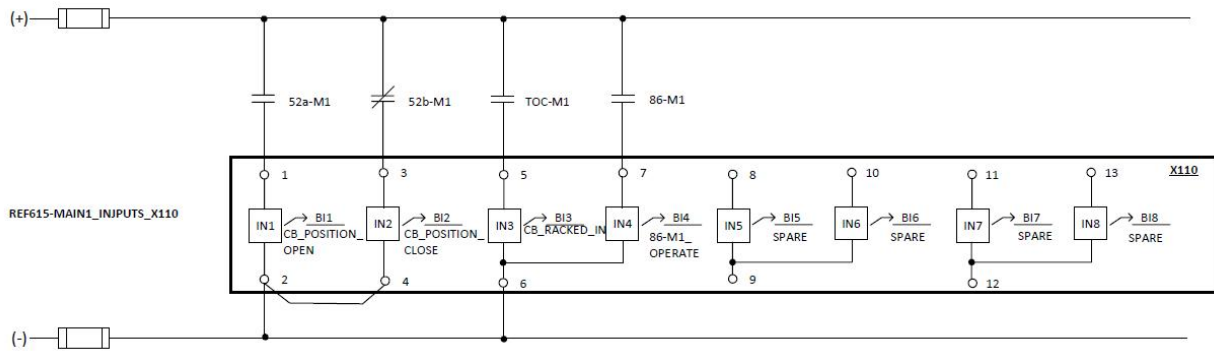

Required Inputs

The following inputs to the each relays being used for the transfer scheme are required for the proper operation of this automatic transfer scheme.

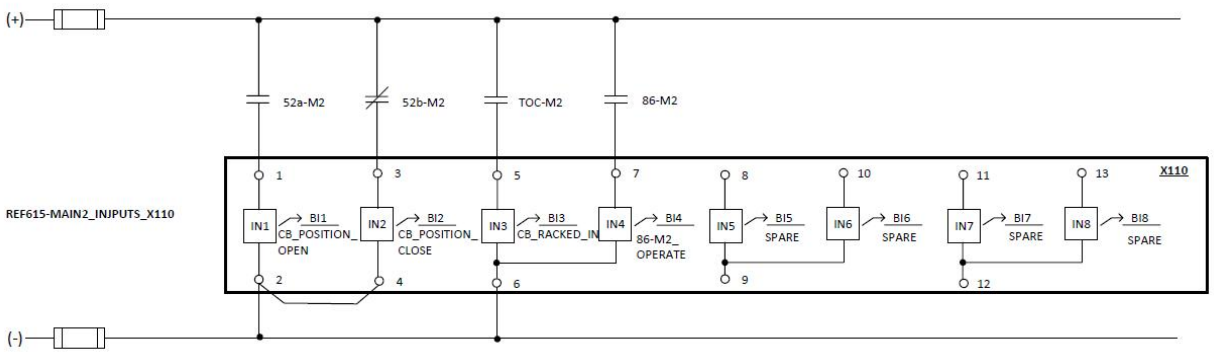

Main 1 Relay

ABB Inc.

ABB

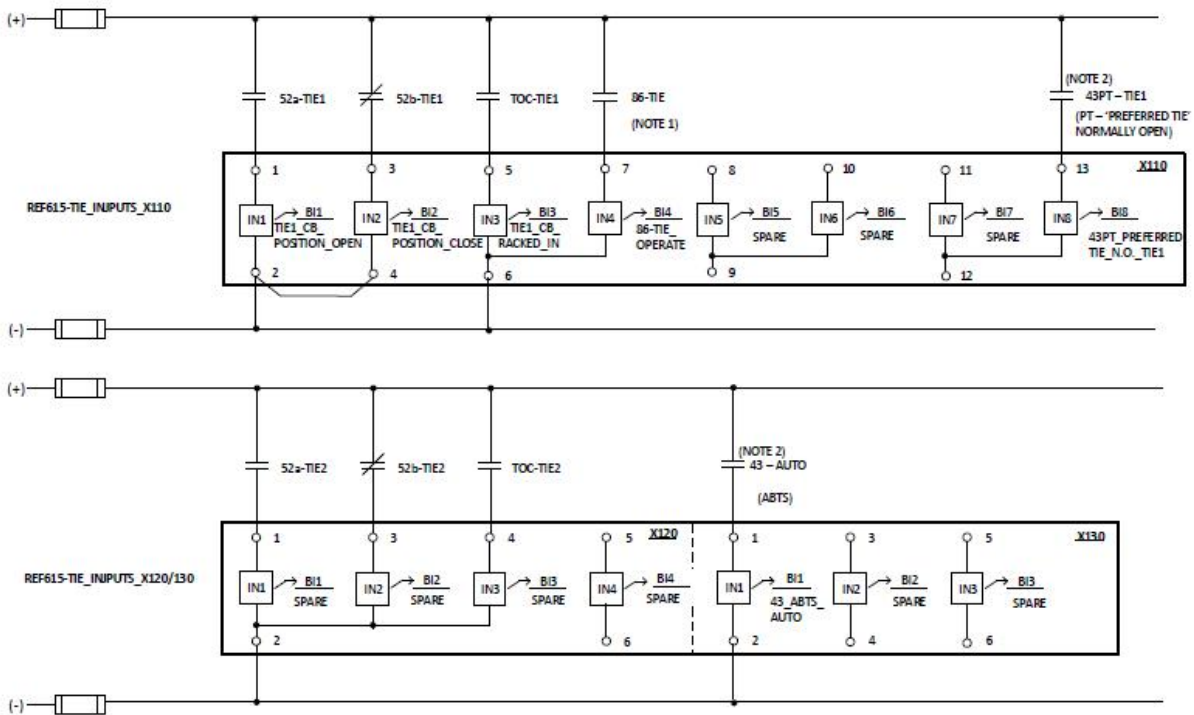

Main 2 Relay

Tie Relay

ABB Inc.

ABB

Required Outputs

The following outputs from each of the relays being used for the transfer scheme are required for the proper operation of this automatic transfer scheme.

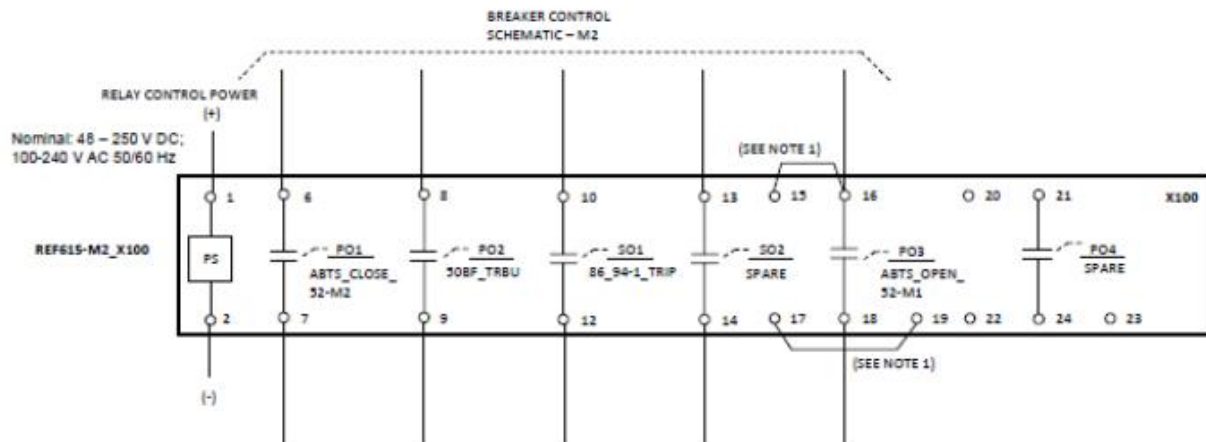

Main Breaker 1

ABB Inc.

ABB

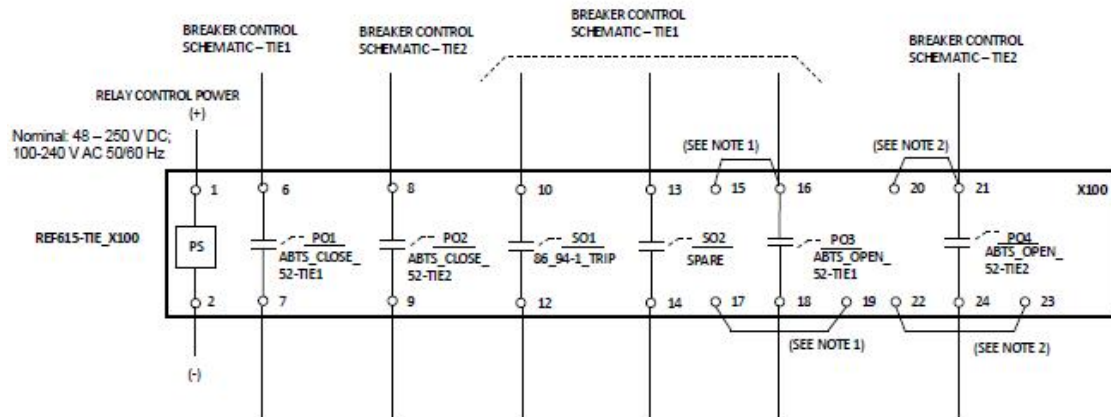

Main Breaker 2

Tie Breakers

ABB Inc.

Breaker Schematics

The following breaker schematics represent all the connections and electrical interlocks required for the proper operation of the Automatic Transfer Scheme

Main Breaker 1

ABB Inc.

ABB

Main Breaker 2

ABB

Tie Breaker 1

ABB Inc.

Tie Breaker 2

The sequence of operations for the ATS scheme would be as follows

Selector Switches

43 M/A Manual/Auto Switch

Describes manual or automatic operation for the transfer scheme

43PT T1/T2 Preferred Tie Switch

ABB Inc.

Only when 43 M/A switch is in "Auto", used to indicate what tie breaker should be normally open when system is in "Auto" and both incoming lines are available

Normal Mode of Operation

The normal mode of operation would be with device 43 M/A switch in "Auto" mode, both incoming lines will be normally closed, and preferred tie breaker will be open as indicated by 43-PT switch. The alternate (non-preferred) tie breaker shall always be closed when 43 M/A switch is in "Auto" in order for the Automatic Transfer Scheme to work properly.

Electrical interlocks

Under manual operation there is an electrical interlock between all incoming sources to prevent paralleling.

Under automatic operation it would only be possible to parallel the incoming sources momentarily if the lines are synchronized.

Automatic Mode

In order for any of the Automatic mode described in this section to work properly, please make sure that the preferred tie breaker is open as indicated by selector switch 43PT, and the non-preferred tie breaker is always closed.

Selector switch device 43 in "Auto"

(a)

Loss of voltage (UV or NEG SEQ) on either incoming line will after a time delay cause its main breaker to open and then the preferred tie breaker will close, provided that voltage is present on the other incoming line.

When the voltage is restored, the main breaker would after a time delay automatically close and then the tie preferred breaker will open.

(b)

However, if the voltage is subsequently lost on the second line after the transfer has occurred as described in (a) above, the second line will after a time delay open and then the preferred tie would open.

Return of voltage on either line will after a time delay cause its main breaker to close, and then the preferred tie would close. When voltage returns to the other line, the main breaker will after a time delay close, and then the preferred tie breaker will open, restoring the system to normal.

ABB Inc.

(c)

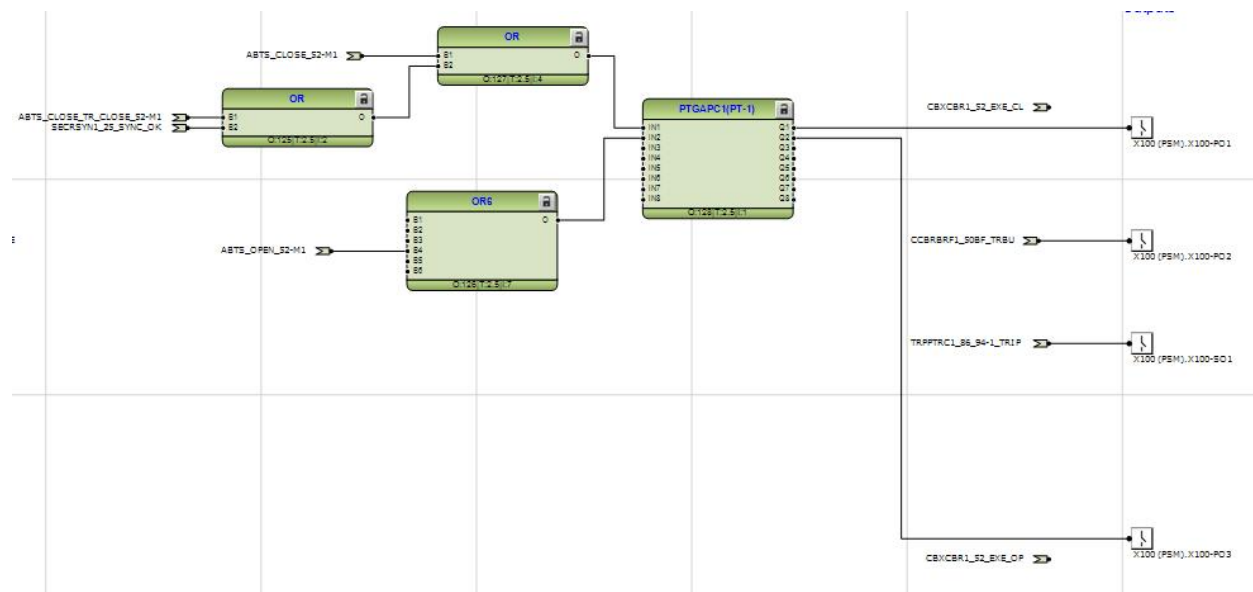

Simultaneous loss (or restoration) of both sources will after a time delay cause both main breakers to open (or close), leaving the preferred tie breaker open.

ATS Logic

The following logic describes what it has been implemented within each of the protective to perform the sequence of operation, as described under the sequence of operation section
